Many papers have been published in the field of harmonics, and research is still ongoing to reduce harmonic distortion and improve circuit efficiency. Among the many research papers, one titled "harmonics in power system and its mitigation technique" by A.J. Mehta and K.L. Mokariya discussed harmonics, their causes, and how to prevent them. LC circuits are most often employed in electrical networks to decrease harmonics and boost power factor. There are two kinds of techniques for normalizing harmonics in a circuit: active filtering and passive filtering, harmonics' effects on transformers and other devices, and harmonics' impacts on load. MATLAB simulation of an electrical circuit to identify voltage and current waveform behavior. Harmonics have an impact on the load and the device, causing load rupture (abnormal operation), insulation stress (voltage effects), and thermal stress (current effect). This study also shows the design of active and passive filters, as well as the analysis of a single frequency tuned filter for the fifth, as well as the current waveform with filter [10].

Ritesh Dash, Aradhana Pradhan, Manas Ranjan Sarang, and Pratik RanjanBeherad wrote a case study titled Fundamental of Harmonics and Their Effect on the Power System. In this paper, they discussed the concept of fourier transform and how it can help to reduce harmonics, as well as MATLAB simulations of different types of loads such as linear, inductive, and capacitive loads. A linear load transforms all of its electrical energy into another kind of energy; it has 100 percent active power and zero percent reactive power. The generation of harmonics is never caused by a linear load. The basics of harmonics were also addressed in this article [11].

DISCUSSION

The topic of this article is Harmonics in power systems, particularly in AC, are mostly generated by a rapid rise in non-linear loads, which is caused by specialized devices, such as variable frequency drives, that alter their value when a circuit is disrupted. This is owing to technological advancements including the usage of power electronics circuits and devices. These harmonics

problems are caused by the use of digital technology, which is becoming more prevalent as everything becomes digital. Due to the extremely sensitive nature of nature, electronics such as microprocessors, microcontrollers, and arduino are responsible for producing output fluctuation.

When current and voltage waveforms deform, harmonics is the amount of energy wasted. Harmonic effects may occur when large amounts of power electronics equipment are used, especially in digital equipment with switched mode power supplies. The higher-to-lower-rated transmission line is intended to handle these types of distortion currents caused by harmonics, short circuit effects, and other factors. To minimize the harmonics impact in a circuit, engineers employ LC filters to provide reactive power to the circuit, while filters like active and passive filters are used to display the system's enhanced output.

Switch-mode power supplies (SMPS), variable-speed actuators and drives, copy machines, computers, LaserJet, fax machines, battery chargers, and UPSs are examples of nonlinear loads. Single-phase non-linear loads are prevalent in modern office buildings, while three-phase quasi loads are frequent in factories and industrial facilities. Harmonics are not to be confused with spikes, dips, surges, oscillation, or other kinds of hobos. Figure 4 depicts the harmonics generation for the 5th, 6th, and 7th harmonics, as well as the consequent with a fundamental sine wave component.

CONCLUSION

Harmonics in the power system are caused by nonlinear loads that change their resistive value as the voltage changes. Nonlinear equipment used in electrical circuits, such as variable frequency drives, may also generate harmonics. Because there is no fluctuation in resistance when voltage is adjusted, linear loads contain only active power and no reactive power. Any circuit's active power is the altered form of electrical energy, such as light or heat energy, thus active power is the amount of energy utilized by the circuit, while reactive power is the amount of energy transferred through the circuit or returned energy. When current and voltage waveforms deform, harmonics is the amount of energy wasted. Harmonic effects may occur when large amounts of power electronics equipment are used, especially in digital equipment with switched mode power supplies. The higher-to-lower-rated transmission line is intended to handle these types of distortion currents caused by harmonics, short circuit effects, and other factors. To minimize the harmonics impact in a circuit, engineers employ LC filters to provide reactive power to the circuit, while filters like active and passive filters are used to display the system's enhanced output.

ABSTRACT

The Internet, a groundbreaking innovation, is constantly evolving into new technology and applications, making it impossible to ignore. We now observe human-human or human-device communication, but the Internet of Things (IoT) promises a bright future for the internet in which communication is machine-machine (M2M). This article seeks to offer a thorough overview of the Internet of Things (IoT) scenario, as well as a discussion of the supporting technologies and sensor networks. It also outlines a six-layered IoT architecture as well as the associated major issues. The basic idea behind the Internet of Things is to enable the autonomous exchange of useful information between invisibly embedded different uniquely identifiable real world devices around us, fueled by cutting-edge technologies such as Radio-Frequency Identification (RFID) and Wireless Sensor Networks (WSNs), which are sensed by sensor devices and further processed for decision making, on the basis of which an automated action is taken.

KEYWORDS: *Internet of Things, Iot Applications, IOT Architecture, Iot Security, Iot Vision.*

39. INTRODUCTION

With ongoing technological developments, the Internet of Things (IoT) is on the horizon, blossoming as a pervasive global computer network where everyone and everything will be connected to the Internet. The Internet of Things (IoT) is a hot research topic with limitless possibilities. It is on the verge of reshaping the current form of the internet into a modified and integrated version due to its limitless imagination[1], [2]. The number of gadgets that use the internet is growing by the day, and having them all linked, whether by wire or wireless, will provide us with a strong supply of information at our fingertips. The notion of allowing sentient devices to communicate is cutting-edge technology, but the technologies that make up the Internet of Things are not new to humans. The Internet of Items (IoT) is a method of merging

data collected from many types of things to any virtual platform using existing Internet infrastructure, as the name suggests.

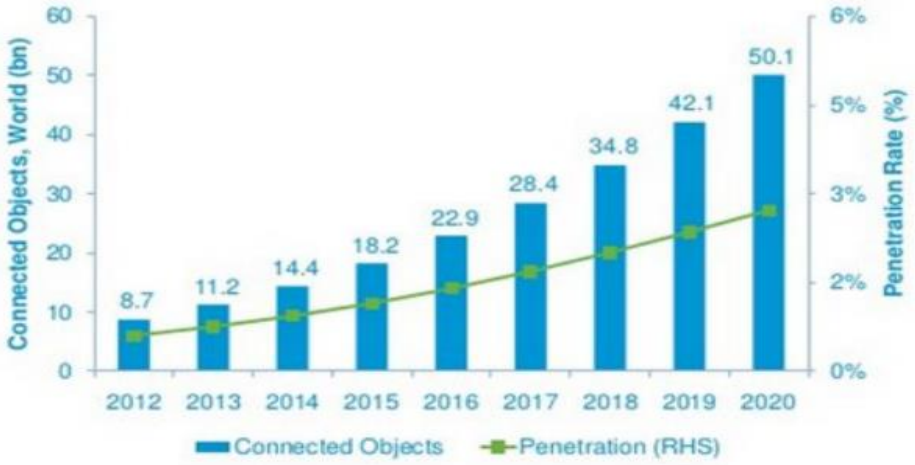

Fig. 1. Expected penetration of connected objects by the year 2020, according to Cisco [3]**.**

The Internet of Things (IoT) was first introduced in 1982, when a modified coke machine was connected to the Internet and was able to report the number of beverages it held and if they were cold[4]. Mark Weiser presented the first current concept of IoT in the form of ubiquitous computing in 1991. Bill Joy, on the other hand, included a clue regarding Device to Device communication in his internet taxonomy in 1999. Kevin Ashton coined the phrase "Internet of Things" to describe a network of interconnected gadgets the same year. Fig 1 illustrates the penetration of connected objects by the year 2020.

40. DISCUSSION

40.1. Architecture:

By 2020, more than 25 billion things are expected to be connected, which is a huge number. As a result, the existing Internet architecture with TCP/IP protocols, which was adopted in 1980, will be unable to handle a network as large as IoT, necessitating the development of a new open architecture that can address various security and Quality of Service (QoS) issues as well as support existing network applications using open sourced software[5].Many people are unlikely to embrace IoT unless it comes with adequate privacy protection. As a result, data security and user privacy are major concerns for IoT.

A variety of multi-layered security designs are suggested for IoT development. W. Chen proposed a three-level IoT design, whereas Suo et al. proposed a four-level architecture[6], [7]. Wu et al. suggested a five-layered architecture based on TCP/IP and TMN models that combines the best characteristics of Internet and Telecommunication management network designs. A six-layered design based on the network hierarchical structure was also suggested [8]. As illustrated in Fig. 2, it is usually split into six levels.

The six levels of the Internet of Things are outlined below:

i. Coding Layer:

The basis of IoT is the coding layer, which identifies the items of interest. Each item is given a unique ID in this layer, making it simple to distinguish between them.

ii. Perception Layer:

This is the IoT device layer, which gives each item a physical meaning. It is made up of data sensors in many forms such as RFID tags, infrared sensors, and other sensor networks that can

detect the temperature, humidity, speed, and position of things. This layer collects valuable information about objects from the sensor devices that are connected to them and transforms it into digital signals, which are then sent on to the Network Layer for further processing.

iii. Network Layer:

This layer's function is to receive valuable data in the form of digital signals from the Perception Layer and send it to the Middleware Layer's processing systems through transmission mediums such as WiFi, Bluetooth, WiMaX, Zigbee, GSM, 3G, and protocols such as IPv4, IPv6, DDS, and MQTT.

iv. Middleware Layer:

The data from the sensor devices is processed by this layer. It comprises technologies such as Cloud computing and Ubiquitous computing, which allow for immediate access to the database and the storage of all required data. The information is processed using Intelligent Processing Equipment, and a completely automated action is performed depending on the processed outcomes of the information.

v. Application Layer:

Based on the analyzed data, this layer enables IoT applications for various types of industries. This layer is extremely useful in the wide scale growth of IoT network because apps encourage the development of IoT. Smart homes, smart transportation, smart planet, and other IoT-related applications are possible.

vi. Business Layer:

This layer is in charge of managing IoT applications and services, as well as any IoT research. It produces several business models that may be used to develop successful company strategies.

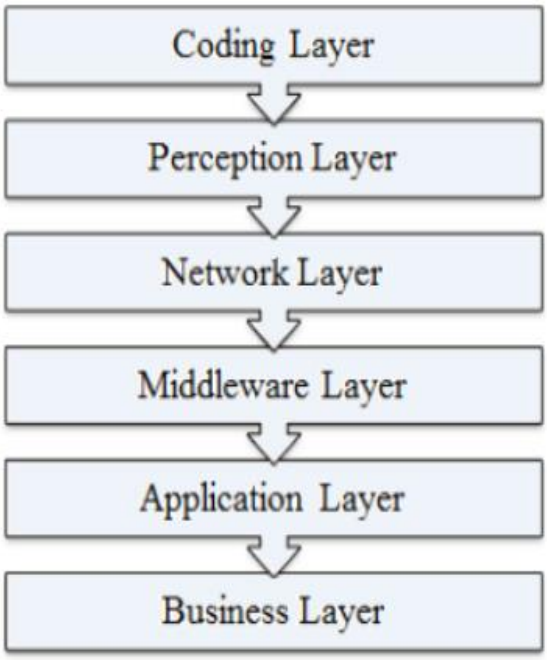

Fig. 2: Six-Layered Architecture of IoT[9]**.**

40.2. Technologies:

The development of a ubiquitous computing system in which digital objects can be uniquely identified and can think and interact with other objects to collect data on which automated actions are taken necessitates the use of a combination of new and effective technologies, which

can only be achieved through the integration of different technologies that can make the objects to be ide. In this part, we'll go through some of the technologies that may assist with IoT development on a big scale.

40.2.1. Radio Frequency Identification (RFID):

RFID is the technology that allows things to be uniquely identified. It may be integrated into any item because to its small size and low cost. It's a transmitter microchip that looks like an adhesive sticker, and it may be active or passive depending on the application[10]. Because active tags contain a battery, they are constantly active and therefore continually transmit data signals, while passive tags are only engaged when they are triggered. Active tags are more expensive than passive tags, but they offer a far wider variety of uses. The RFID system consists of readers and associated RFID tags that, when activated by the production of any suitable signal, emit the object's identity, position, or other details. The generated object-related data signals are sent to the Readers through radio frequencies, where they are subsequently analyzed by the processors shown in Fig.3.

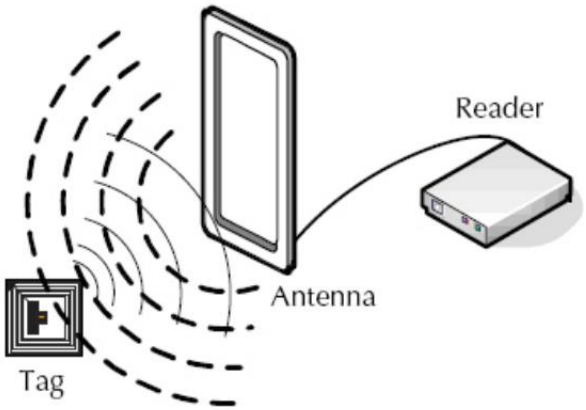

Fig. 3: RFID Scenario

40.2.2. Wireless Sensor Network (WSN):

WSN is a multi-hop bi-directional wirelessly linked network of sensors made up of many nodes distributed across a sensor field, each connected to one or more sensors that may gather object-specific data such as temperature, humidity, and speed and then send it on to processing equipment[11]. Multi-hop communication is used by the sensing nodes. Each sensor is a transceiver with an antenna, a microcontroller, and an interface circuit that serves as a communication, actuation, and sensing unit for the sensors, as well as a power supply that may be a battery or other energy harvesting device. However, some researchers have suggested a Memory Unit, which may be a component of the sensing node, as an extra unit for storing data. Fig. 4 depicts an example of a sensing node.

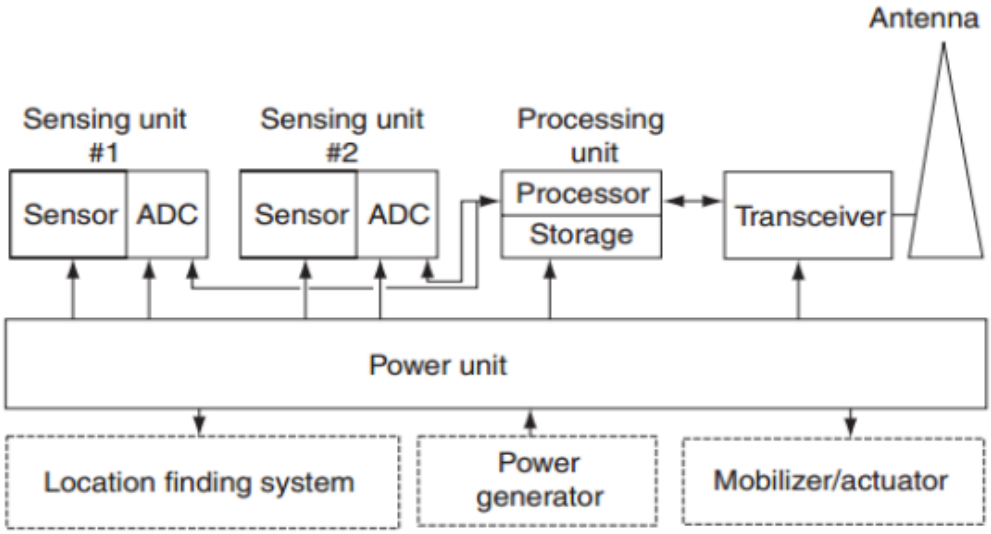

Fig. 4: A typical sensing node

40.2.3. Cloud Computing:

With millions of devices anticipated by 2020, the cloud seems to be the only technology capable of efficiently analyzing and storing all of the data. It is an intelligent computing technique in which a large number of servers are converged on a single cloud platform to enable resource sharing and access at any time and from any location. The most essential aspect of IoT is cloud computing, which not only converges servers but also processes and analyzes the relevant information received from sensors, as well as providing enough storage capacity. However, this is just the beginning of this technology's full potential. Cloud computing combined with smart devices with possibly millions of sensors may provide tremendous advantages and aid IoT growth on a big scale, thus research is underway since IoT will be completely reliant on Cloud Computing shown in Fig.5.

Fig. 5: A typical Cloud Computing Scenario.

40.2.4. Networking Technologies:

Because these technologies are responsible for connecting things, they are critical to the success of IoT. We need a fast and effective network to manage a huge number of potential devices. We

commonly use 3G, 4G, and other wide-range transmission networks, but as we all know, mobile traffic is very predictable because it only has to perform basic tasks like making a call, sending a text message, and so on. As we move into the modern era of ubiquitous computing, however, it will no longer be predictable, necessitating the development of a super-fast, super-efficient fifth generation wireless system. Similarly, we utilize technologies such as Bluetooth, WiFi, and others for a short-range communication network.

40.2.5. Nano Technologies:

This technology allows for the creation of smaller and better versions of linked objects. It may reduce a system's consumption by allowing the creation of nanometer-scale devices that can function as sensors and actuators in the same way that conventional devices do. The network created by such a nano device, which is made up of nano components, establishes a new networking paradigm known as the Internet of Nano-Things.

40.2.6. Optical Technologies:

Rapid advancements in the area of optical technologies, such as Li-Fi and Cisco's BiDi optical technology may represent a big step forward in the development of IoT. Li-Fi, an epoch-making Visible Light Communication (VLC) technology, will offer excellent connection and greater bandwidth for IoT-connected devices. Bi-Directional (BiDi) technology, on the other hand, provides a 40G Ethernet for large data from a variety of IoT devices.

40.3. Applications:

Most of the everyday apps we encounter are already intelligent, but they are unable to interact with one another, and allowing them to converse and exchange valuable information will result in a broad variety of new applications. These new apps, which have some self-driving capabilities, would undoubtedly enhance the quality of our lives. A handful of these applications are already on the market; for example, the Google Vehicle is a project to offer a self-driving car experience with real-time traffic, road conditions, weather, and other data exchanges, all thanks to the Internet of Things idea. There are a lot of potential future uses that may be very beneficial. We'll go through a couple of them in this section.

- Smart Traffic System
- Smart Environment
- Smart Home
- Smart Hospitals
- Smart Agriculture
- Smart Retailing and Supply-chain Management

40.4. Security and Privacy Challenges:

IoT makes everything and everyone accessible and locatable, making our lives more simpler than before; but, without trust in the security and privacy of the user's data, it's unlikely to be widely embraced. As a result, IoT need a robust security architecture in order to gain widespread acceptance. The following are some of the potential IoT-related issues:

- Unauthorized Access to RFID
- Sensor-Nodes Security Breach
- Cloud Computing Abuse

41. CONCLUSION

The idea of the Internet of Things will soon be inexorably growing on a massive scale, thanks to the constant emergence of new IoT technologies. By embedding intelligence into the things around us, this new networking paradigm will impact every aspect of our lives, from automated homes to smart health and environment monitoring. We explored the IoT concept and provided a well-defined architecture for its implementation in this paper. Then we went through some of the enabling technologies and a few of the security risks that go along with them. Finally, we reviewed a variety of IoT-related applications that are anticipated to help us in our everyday lives. Although studies are being conducted in order to broaden its acceptance, it is extremely improbable that it will become an omni-present technology until the difficulties in its development are addressed, as well as the user's privacy and security. The adoption of IoT necessitates concerted efforts to address and offer answers to the security and privacy concerns that it poses.

ABSTRACT

Everything in a language is common to the language community. "Language has a spiritual and material material. Images of words, morphemes, phonemes in human memory are spiritual material. Word forms, morphemes, sounds that appear in a certain set of sounds (complex) in the process of speech formation are material material. This leads to the conclusion that language is a material phenomenon on the one hand, and a spiritual phenomenon on the other. The mental phenomenon of language is determined by its storage in the mind.

KEYWORDS: *Speech, Norm, Activity, Culture, Pronunciation, Phoneme Stress, Language Norm, Morpheme.*

INTRODUCTION

Language and speech are interrelated phenomena. It is unreasonable to separate them. Language is a material material for speech. Speech is formed on the basis of this material. We quickly (automatically) use the rules stored in our memory to form word forms and sentences from words and morphemes that carry grammatical meaning to express an idea. For example, let's say we have an idea of where he got the book from. We bring it up as a question: Where did you get the book? In doing so, we used the lexemes sen, kitab, kayer, ol: the morphemes ni, from, in, of and the question model and rule. In the process of saying this, the lexemes in our minds took on separate morphemes and became word forms, and took on the above order. Language went from a spiritual phenomenon to a material phenomenon. When this process is over, the things that belong to language return to a state of separation and remain in our minds as before. This means that words, phonemes, various linguistic rules, models of sentences, which are stored in the

minds of people in a certain language community as sound images and are always ready to become real, belong to the language. Things related to language are limited.[1]

Their number varies in different languages. The more languages there are, the richer the language. Language, which covers all spheres of community life, develops with the development of society. Elements of language that do not meet the needs of society will become obsolete, and new means of expression will appear in their place.

What appears in the language first appears in the speech of some individuals, and then gradually penetrates into the consciousness of the whole community. After that, when everyone understands and pronounces it the same, it becomes a language. Otherwise, it remains specific to the speech of the individual. For example, in the speech of some people who speak Uzbek, the word “designer” (a person doing something) has been used since 1986. It is not yet fully ingrained in the minds of Uzbek-speakers, nor does it have its own spelling and pronunciation. Therefore, it still belongs to the language of some individuals. The future will show that it will not remain typical of the Uzbek language.

Speech is an idea that has become a reality by using existing means of expression in language. Occurs during the movement of the organs of speech. The means of expression of language, which is a spiritual phenomenon, become reality when it is transferred to the will of speech.[2]

There are two types of speech: internal speech and external speech. Speech can also be formed in the human mind. In doing so, it consists of elements of language that have not yet been realized. This is an inner speech. The fact that people think, argue and think without opening their mouths is an example of internal speech.

The effect of the air from the lungs on the organs of speech, as a result of which the action of their speech occurs as clear sounds, is external speech. Speech is a moving language. Speech connects and moves things related to language in a certain period of time. Speech consists of word forms, free combinations, word order and sentences. When the speech process is over and the thought reaches the listener, the speech also ends. So, word forms, free word combinations, word order, different forms of speech belong to speech. Although the means of expression in language are limited, speech is infinite. Once the means of language are at the disposal of speech, an infinite number of sentences can be formed from them. Speech alone in the community; created by the person. The speech will be addressed to an individual or people in the community. So speech is a social phenomenon. It has the ability to unite people in society, to jump to a specific goal. Speech plays a decisive role in the development of society. There can be no human society without speech. All classes have equal access to language tools. But speech is not like that. It is formed in the interests of a particular class. So speech is a class phenomenon.

Language culture and speech culture: What is the culture of language? The culture of a language means its vocabulary, syntax development and level of enrichment, sharpness of word meanings, and variety of speech tone. The culture of speech is the sum and system of its communicative qualities, which depend on various conditions, such as language culture, ease of language activity, the semantic function and ability of the text.

Language culture consists of the richness and diversity of language tools and lives in the minds of users of this language. But the appropriation of this wealth: the level will be different for each member of the team. The more a person has mastered the means of language culture and turned them into his own speech process, the more civilized his speech will be. Since speech is the work of an individual, its culture also depends on the extent to which a person has mastered the possibilities of language and is able to use them skillfully in accordance with the conditions of speech. Acquisition of the linguistic potential of a language takes place in two stages. The first step is to know the language tools. This is seen in listening to the speech and understanding the

meaning and function of the language tools used in it. That is, the listener understands what he has heard and read. Such a person understands the speech of others well. But his speech is deprived of the various possibilities of language, it is poor. The second stage is to master most of the opportunities provided by the language system, to translate them into the speed of speech. The speech of the person who has achieved this, will be rich, figurative, and appropriate. Constant practice on the means of speech acquired in the first stage, constant attention to their memorization, turns these possibilities into speech speed.

Information about speech activity.

Human speech activity takes three forms. These are speaking, reading and listening. Speaking means giving information, giving advice, ordering, asking about things unknown to the speaker. When speaking, the knowledge, culture, morals and etiquette of the speaker are revealed. Speech can be monologue or dialogic. In a monologue, a person's comments appear without contradictory questions or answers, and are not shared by the interlocutor. In dialogic speech, the communicators are sometimes listeners and sometimes speakers.[3]

Reading is the student's communication with the author of the work, his reputation through written speech. As a result of reading, the student becomes aware of the events reflected in the written speech, under the influence of which there is a change in behavior. Reading is the most important way to get information. One achieves spiritual maturity through reading.

Reading consists of simple reading and scientific reading (underlining important things, copying passages, taking a brief synopsis, reading thoughtfully on the work). In normal reading, the goal is to get acquainted with the content of written speech for the student. In scientific reading, the student aims to analyze the work, to use it for another purpose, to retell its content.

Communication and speaking activities of a social worker: The teacher is responsible for the development of new social forces in society. Society entrusts the young generation, that is, its future, to the teacher. In its development are the means of determining the teacher's worldview, consciousness, culture, speech. The profession of social worker wants high culture, humanity, internationalism.

In teaching and educating students, the teacher’s speech is as important as his work. After all, a teacher does most of his professional work through speech. Therefore, his speech should always be ideologically high, fluent, soft and kind. Uncertainty in speech and work is unworthy of a teacher. Every speech must be structured to take into account the age characteristics, knowledge and understanding of the children. At the same time, the teacher's speech aims to reveal new aspects of the material and spiritual world that surrounds him in the eyes of the younger generation. The speech of a social worker is the basis of education and upbringing. The speech of a social worker should be as syntactically simple, attractive and effective as possible. Any knowledge and education is provided, mainly through the teacher's in-class and out-of-class speech. In speech, in any form, our values must be strictly respected. The peculiarity of pedagogical speech communication is characterized by the fact that the teacher is an educator everywhere, in any situation. The teacher spends more time with his students in the classroom, in class. His speech acquires a scientific pedagogical content. Such a speech reflects the rules, terms, conclusions specific to different areas of science. In such a speech, everything is in its place, in moderation. Explanations of terms, new words are given in simple, teacher-digested syntactic devices. Rules and theories are explained with vivid, reader-friendly examples.[4]

Oral and written forms of speech are their features. It is known that speech has both oral and written forms. Oral speech exists only in the unit of time in which the speaker speaks, and at the end of this process the speech also ends. However, the excitement aroused by the speech, the retention of the information in the mind of the listener for some time, can affect his behavior.

Features of oral speech include:

1. Oral speech is fast (automatic). Together with the concepts, the word "his dress" begins to appear "at lightning speed." Sometimes a word that expresses a concept cannot be found by the speaker at the same speed. Uses words that do not express a concept that is close to him or thought. As a result, the speech (speech, statements) does not hurt the full realization of the intended purpose (idea).

2. In oral speech, models of phrases and sentences are selected quickly in accordance with the intended idea. The construction of speech, the models are controlled by the mind. It is necessary to develop the idea by memorizing what is said. If the memory is a little "lazy", the structure of speech, phrases will not be logically and grammatically connected. Because the new part cannot adapt to it because the previous part is forgotten. For example, "Teacher, we are grateful for your great service to the people." In the example, the speaker forgot the previous part, the previously thought-out model, in the process of thinking about how to develop it after saying the part "Teacher, you". That is why the word in the consonant is not grammatically and logically connected with the following parts.

3. Oral speech is deprived of the ability to edit. It is addressed to the listener in the form in which it came into being.

4. In oral speech, usually only the most necessary things for communication appear. This is due to time savings, on the one hand, and the power of speech, on the other. Therefore, it is rare to have a long introduction and extensive comments. On the contrary, the degree of interdependence of events, things, the degree of their clarity to the listener and the speaker is taken into account. Only when necessary is something explained in advance.

5. Oral speech is much poorer in terms of vocabulary than written speech. In it the same words, the same forms are repeated a little more often. This is due to the difficulty of choosing language tools.

6. In oral speech, the active speech movement of the speaker is a pause, tone, emphasis, various gestures play an important role in the delivery of thought to the listener.

Written speech differs from oral speech by the following features: when writing a speech, the author is able to think freely in terms of time. He can re-edit parts of his speech and the whole speech, choose the most appropriate options for the idea, facilitate the structure of speech. That is why written speech is more fluent than oral speech.

People's speech activity takes the form of monologues, dialogues, polylogues.[5]

Monologue. A monologue is a speech addressed to the speaker or to the audience. In a monologue, the speaker gives information about the events that are known to him, about his inner experiences. Monologic speech does not encourage the audience to actively participate in the conversation; does not require them to respond to what is said. Syntactically, monologue speech is complex and comprehensive.

Monologic speech, depending on its characteristics, can take several forms: internal monologue and external monologue; there are types of external monologue such as dramatic monologue, lyrical monologue, message monologue.

Internal monologue is one of the methodological methods used in fiction. This method allows you to describe the actual events that took place as thoughts that appeared in the inner experiences of the protagonist under their influence. The inner monologue is the inner speech of the speaker.

Although the monologue is strict, this is not the case with lexical norms. Variation in words. Extremely rich than other language forms. Sometimes there are dozens of language options: di and all of them are normative. For example, from the synonyms such as face, face, face, in this combination, which is normative and which is out of the norm: light falls on the face, light falls on the face, light falls on the face. In our opinion, all three options were used appropriately. Probably in view of such cases, some experts say that the lexical norm in general. object to the designation of.

The above example shows that variability is also a phenomenon inherent in the literary norm. When using the lexical richness of the language, this possibility of the norm helps the author to overcome repetition, uniformity, to create a beautiful speech.

IMPROVING THE CONTENT OF PHYSICS EDUCATION BASED ON THE FORMATION OF ELEMENTARY CONCEPTS OF SOLAR ENERGY IN THE CIRCLE

Jasur Hidirovich Khaliyarov*

*Independent Researcher,
Department of Theoretical Physics,
Termez State University, UZBEKISTAN

ABSTRACT

The article presents a methodology for the formation of elementary concepts related to the conversion of solar energy into electricity in school physics circles. The article also describes the ability of students to master the basic concepts of the physical processes of solar energy based on the results of pedagogical experiments.

KEYWORDS: *Solar Energy, Multimedia Teaching Aids, Visual Aids And Handouts, Circle Work, Pedagogical Experiment, Science And Technology.*

INTRODUCTION

The Resolution of the President of the Republic of Uzbekistan "On measures to improve the quality of education and research in physics" dated March 19, 2021 sets tasks to further improve the quality of teaching physics and create new scientific and methodological developments, new scientific and educational literature [1]. There is a need to enrich the theoretical and practical lessons of physics, circles, optional courses, on the basis of new modern knowledge in the effective organization of independent work. A lot of practical work on the enrichment of physics classes on the basis of scientific and technical innovations is being implemented in the educational process.

In particular, many scientific and methodological manuals on modern energy technologies, new types of energy sources, and their use as sources of electricity and heat and methodological developments for their teaching are being developed. Methodological developments, textbooks and manuals have been created in this field by the scientists of the Republic S.Kakhkharov, H.Juraev, U.Abdiev and others [2-5]. Let us consider the possibilities of introducing students to the elementary concepts of the conversion of solar energy into electricity. In this regard, in this article we present a mathematical statistical analysis of the experimental work of the circle on the study of physical processes of solar energy, which is considered the most effective among renewable energy sources. Pedagogical experiments show that in most lesson processes, teachers conduct lessons according to establish (based on the technological map of the lesson) regulations. There are both positive and negative outcomes of these course processes, which may not be sufficient for students and learners to think freely throughout the entire course. It is

recognized by many pedagogical scientists that the modern requirement for the transfer of knowledge and concepts of science to students depends mainly on the organization of more free thinking, non-standard teaching processes.

As an example, we will analyze the following pedagogical experiment and its results, which were conducted using multimedia teaching aids in the lessons of the physics education circle of knowledge in the content of solar energy sources. In this pedagogical experiment, it is intended to organize the process of the circle as a non-standard lesson. The pedagogical experiment was conducted at the secondary school No.11 in Termez. The school has a training circle "Young Physicists", the members of which are 22 people. The members of the club are mainly 10th and 11th grade students, and the club has 2 classes a week. The sequence of topics outlined in the lesson plan is designed to explore innovations in the field of physics, prepare small models and exhibitions, and explore interesting topics and exercises. The selected circle for the pedagogical experiment was on the topic "Types of solar energy sources and opportunities for their use", and the members of the circle were trained twice on this selected topic.

The first organized circle exercise in the group was conducted in the usual, traditional way of testing. The second session included multimedia teaching aids, visual models, slides and crossword puzzles, and handouts with a variety of questions and exercises. In general, the theme of this second round is the same as the previous round, but this lesson was organized in a non-standard way. In this lesson, non-traditional teaching methods were used effectively, ie the following methods and techniques: "Discussion", "Brainstorming", "Question-Answer" and "Working in small groups" and others. Demonstration organizers such as Venn diagram, T-table, T-scheme, "Cluster" were also used effectively in the training. Short videos on the principles of operation of each type of alternative energy sources were presented. Modern designs of solar energy sources and their current maximum efficiency have been compared with other types of energy. At the same time, interesting crossword puzzles on solar energy sources were distributed to each student as separate handouts.

In addition, these handouts serve to provide students with opportunities for free thinking, the formation of scientific worldviews, the development of scientific and creative research and skills. This was followed by a Q&A session at the end of the workshop. The students expressed their views and opinions on controversial issues and interesting questions. At the end of the circle, the members of the circle were evaluated on the basis of test questions designed for this circle. There are a total of 10 test questions, each question is marked with 0.5 points, with a maximum of 5 points (5 marks). Their test scores were then divided according to grades 5, 4, 3, and 2 (Table 1).

Table 1

Test group		Experiment group	
Number of grades	Assimilation rate,%	Number of grades	Assimilation rate,%
5 mark – 3	13,6 %	5 mark – 11 та	50 %
4 mark – 4	18,3 %	4 mark – 8 та	36,4 %
3 mark – 10	45,4 %	3 mark – 3 та	13,6 %
2 mark – 5	22,7 %	2 mark – 0 та	0 %
77,3 %		100 %	

Based on this table, a diagram of the mastery of the experimental groups in the circle is given (Figure 1).

Figure 1. Experimental (T / G) - indicators of students' mastery in circle sessions conducted in test (S / G) groups.

Experiments have shown that the use of scientific and technical innovations, multimedia teaching aids, visual aids and various handouts, as well as the use of interactive teaching methods and techniques in the study of solar energy in students' knowledge, understanding, comprehension and practice of solar energy serves to form and develop application competencies.

ABSTRACT

Language is a factor in the existence of every nation in the world. The criterion of his greatness is his spirituality. So, it is well known that one of the basic branches of spirituality is music. The world of music differs from other fields in that it is very broad and equally relevant to all fields. The world of music is an important means of reflecting the life, lifestyle, life, work, values of humanity. Therefore, music is characterized by its artistic and aesthetic potential. "Music" (Greek - the art of inspiration fairies) - a form of art in which the thoughts of human emotional experiences reflect the musical sounds in the imagination.

KEYWORDS:*Music, Chord, Melody, Image, Religious Songs, Alla, Yalla, Lapar, National Magic Songs.*

INTRODUCTION

The content of music consists of musical artistic images that represent changing moods. Music involves a person's various moods (uplifting, enjoying, joyful, fearful, sad, etc.). Every nation in the world has its own musical traditions. Among them, Uzbek music has a very ancient and unique tradition. Uzbek music has always been formed in two great directions and has developed over the centuries. The first direction is folk music, which is connected with the realities of people's lives. It is music that reflects the daily life, work and activities of mankind. The main criteria of folk music are related to ceremonies and events, and there are four directions. These are:

• Children's music.

• Labor songs.

• Ceremonial songs.

• Religious, magical songs.[1]

In music practice, genres specific to each direction and related to reality have emerged, which have emerged in the national traditions of nations over the centuries. These are genres such as alla, yalla, lapar, terma, song, aytishuv. One of the main features of folk folk music: folk music is created by the people, performed and listened to by the people. However, they are also knowledgeable performers of folk music, and among the people they are called laparchi, yallachi.

In Uzbek folk music: national melodies, gods, lapars, terms, children's songs, labor songs, ceremonial songs, religious and magical songs have been performed and sung in unison throughout history. Nowadays, more vocal works are needed than monophonic works. The science of Harmony explores ways to enrich one-piece works, to make them more interesting, and to make them more effective by harmonizing them with other elements of the piece of music. All these ideas can be seen below the lyric of the composer A. Muhamedo in the example of a small work.

Now, if we listen to this work in harmonic accompaniment, we will hear what “colors” the harmony gave it, how rich the melody was:

Harmony is an important artistic and expressive means of music, the science of chords. Harmony is a Greek word meaning “connection, harmony, proportion”. In music, the combination of sounds into melodies and the sequence of these melodies is called Harmony. Harmony plays a very important role in the development of a musical work, deepening and enriching its expression. Harmony can give the melody a variety of emotional tones and colors. This melody is more pronounced when different melodies are expressed in a series of melodies. Harmony in a

piece of music is associated with melody, metrology, tempo, texture, dynamics. Harmony enriches the melody in the development of the piece of music.

Harmony as a science is studied as follows:

• Chords and their structure and their correct expression in a four-voice statement;

• Functional dependence of chords and their most common sequences;

• Chord connections based on the correct sound direction;

• Different types of cadences;

• Chord and non-chord sounds;

• The basic rules of tonal plan in the development of the work.[2]

A combination of several harmonic sounds that are heard in harmony is called a melody. A melody consisting of three, four, or five sounds of different pitch and name forms a chord."Accord" is a Latin word, accardo means "to harmonize". The main features of a chord are integrity, unity, and the fact that each tone that makes up a chord has a specific function. The inverse structure of the chord is due to the classical harmony of the XVI-XIX centuries. To this day, it has not lost its leading role in music. There are three main types of chords: triplets, seventh chords, and chords. In harmony, a chord consisting of three sounds is called a three-tone chord. This three-tone chord plays a key role in music. much less used.

The chords differ in composition (in terms of the order in which the large or small thirds are preceded). In terms of the base tone, a chord consisting first of a large, then a small third - a major or major triad, first a chord of a small, then a large third - a small or minor trio, two large third - a gain, two small a third - a reduced three is called sound. Triads and septacodes are usually composed of specific steps in a musical soundtrack.[3]

There are three characteristics of each chord:

1 - The sound of a chord is interpreted, for example, as the tones of a third or fifth chord, as well as the sounds of a melody. That is, the horizontal sequence of tones forms the melody side of the chord.

2 - Each chord has its own function. This function is assigned to the tonic;

3 - The brightness, color of the chord, that is, sharp, soft, heavy, light, soft, hard, dark tones, form the phonetic side of it. This aspect of the chord is entirely related to its internal structure, the interval composition, the number of tones, the hesitation, the placement, and the register. The second and third properties of the chord have a general rule that if the functional side of the chord is stronger, the phonemic side will be weaker, and conversely, an effective phonism will loosen the functional connections.

Four voices are most commonly used in music. Four types of four voices:

• High voice - Soprana, also known as melody;

• Low voice - Alt;

• Lower voice - Tenor;

• Lowest sound - So.[4]

The sounds are recorded on two notes combined with the accolade. Bass and tenor sounds are recorded on the bass key, alto and soprano violin key. In the four-voice structure, the bass and bass notes are written downwards, and the tenor and soprano notes are written upwards. These names of chorus sounds are also conditionally preserved in instrumental music. This direction of

sounds is the direction of sounds, which is the basis of the addition of chords. This direction is due to the different movements of the sounds together. The movement of each individual sound can be smooth or jumping. A prima, a second, or a tertiary movement in the path of a sound is considered to be a smooth movement.

The direction of the sounds is different - opposite, oblique, straight and parallel.

The right thing to do is to move the voices to one side.

Parallel motion - all sounds move in the same direction at the same interval. The opposite action is the movement of voices in different directions.

Oblique motion - one of the voices stays in place and the others move. “Lad” is derived from Slavic (Latin - modus, French. Vaingl - mode), which means the harmonization of the tones of the height system. Lad is a system of interactions between stable sounds. In terms of harmony, Lad is a system of interrelationships of tonal power sound chords that tend to unite. This definition also refers to the melodic-interval relations between the sounds of a single melody and the interrelationships between common chords. The three-tone chord, whose main sound is in the first step of the tonality, acts as a stable, tonic. The chord, whose main sound is at the IV level of tonality, is an unstable chord, which acts as a subdominant. The chord, whose main sound is at the V level of the tonality, is again an unstable chord, which performs a dominant function. These chords are the three main sounds of the fret. In natural major, these basic trinities are denoted by uppercase letters, T, S, D. In music, each chord is not considered in isolation from the harmonies that come before and after it, as well as in the tone and mood of the work. Depending on the tone and tone of the work, the nature of the chord, ie the function, changes. For example, the major trinity (domisol) is a stable chord in the major major, because it consists of stable levels of tonality (I, III, V). The same chord is the fourth major triad of Sol major tones, which includes two unstable fourth and fourth major tones. In the major tone, this chord is a V-step triad, which is an unstable chord. The reason is that it includes the leading VII and II levels of tonality. This means that the chord, given according to the mood and tone of the work, has a certain tone and performs a specific function. In the second half of the twentieth century, a lot of work was done in Uzbekistan to translate national folk songs for choirs. Among them are B.Umidjanov, S.Yudakov, M.Burhanov, Ik.Akbarov, N.Norkhojayev, J.Shukurov, A.Mansurov and others. For example, the well-known folk song “Yallamayorim” adapted by J. Shukurov for choral voices.[5]

This work is a clear example of the importance of harmony in enriching music

LEGAL ASPECTS OF DOPING AND DRUGS IN INTERNATIONAL TOURNAMENTS BY SPORTSPERSONS

Dr. Anjana Lohan*

*Associate Professor,
Head, Deptt. Of Physical Education,
S.D. Mahila Mahavidyalaya,
Narwana, Jind, Haryana, INDIA

ABSTRACT

Doping is one of the most vexing problems in sports, and the organisers go to great lengths to discourage it. Doping was widely reported in the media, in which athletes used illegal substances to boost their efficiency and performance. Athletes that use traditional types of doping such as cardio-respiratory-hormonal stimulants don't get tired as easily. In the category of stimulant medications, there are many different types of medicines that aim to improve an athlete's endurance and are often used for doping purposes. They also decrease an athlete's perception of pain and tiredness while simultaneously improving their cognitive function and conduct. Many well-known drugs fall under this category, such as ephedrine, amphetamines, opium, cocaine, and so on. For this reason the organising bodies and boards of the International Olympic Games are constantly monitoring the athletes to ensure that any inappropriate conduct may be legally addressed. World Anti-Doping Agency (WADA) and the National Anti-Doping Agency (NATA) are among the organisations that have shown interest in it (NADA). Between 2009 and 2012, 48 Indian athletes were discovered to be using performance-enhancing substances and medications. There were still 295 instances of doping in athletics in 2019, approximately 300 cases of doping in bodybuilding, and 280 cases in cycling, according to a WADA report released in 2019. There have been many instances when players engaged in such actions have received penalties and other forms of punishment. WADA said the penalties for breaking anti-doping procedures range from a warning to a lifetime ban. According to the circumstances, the ban may vary based on the type and likelihood for recurrence of a violation of an anti-doping legislation. The sports league, on the other hand, is in charge of taking steps to withdraw the medal.

KEYWORDS: *Doping, Drugs, Stimulants In Sports, Doping In Olympics.*

INTRODUCTION

Doping refers to the use of chemicals or medications to improve one's performance in a game or during a sporting event as a threat or curse in sports. While the word "doping" is not new, the

usage of it has occurred many times, notably during the Olympic Games (Petersen, T.S., 2020). There were many performance-enhancing techniques in use before sports doping was invented, which were later adopted by athletes to improve their own performance and efficiency in order to gain notoriety, popularity, and financial gain. There are a variety of doping goods on the market, such as performance-enhancing medications and medicines designed to keep gamers from becoming too tired when playing video games.

Doping has grown to be a significant and difficult issue for sports governing bodies since athletes is always looking for new methods and strategies to avoid being discovered.

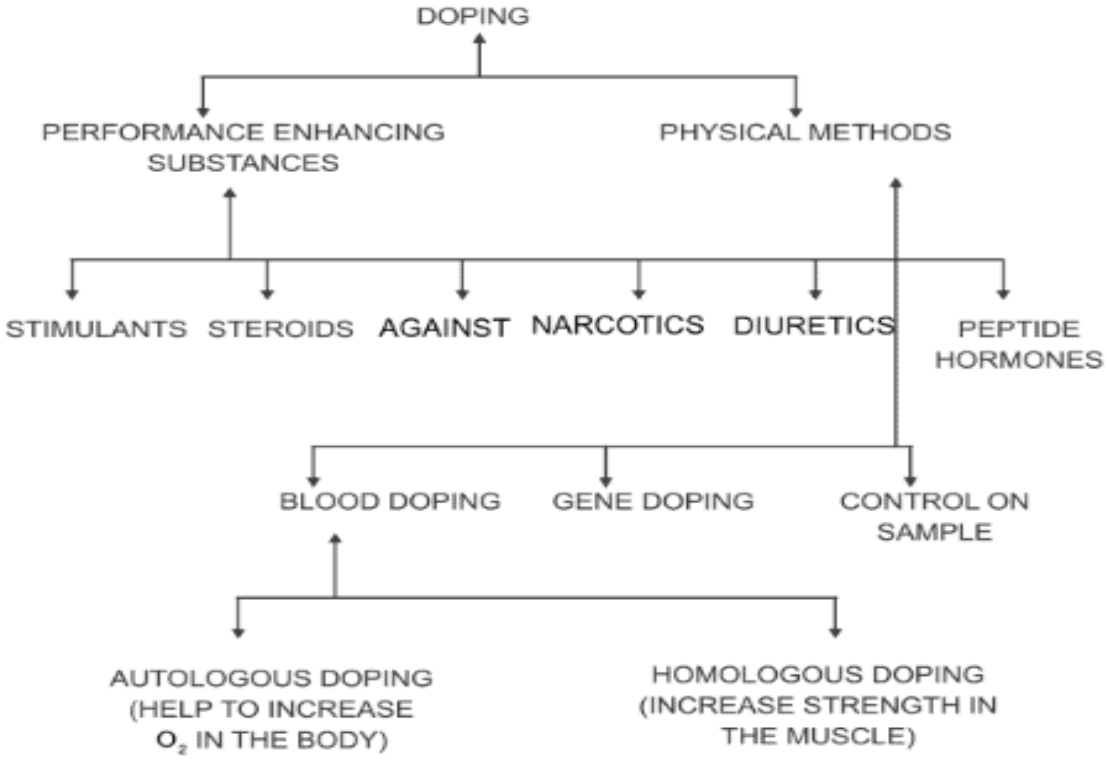

Figure 1 : Doping in Sports

Many Olympic competitors learned in the early 1900s that they might enhance their athletic skills by using testosterone boosters. Increasingly, it was clear that using performance-enhancing drugs not only posed a danger to the integrity of sport but could also have life-threatening consequences for the athlete. Athletic drug usage was only responsible for one fatality during the Olympic Games in Rome in 1960. Danish cyclist Knud Enemark Jensen died after being knocked from hdis bike during a road race. A coroner's investigation revealed that he had been using amphetamines before the race, which contributed to his passing out. The death of Jensen opened the eyes of the world to the widespread usage of performance-enhancing drugs among professional sportsmen. Sports federations began banning performance-enhancing drugs in the mid-1960s, and the International Olympic Committee (IOC) followed suit in 1967.

Hans-Gunnar Liljenwall, a Swedish pentathlete in the 1968 Summer Olympics, was the first Olympic athlete to test positive for the usage of performance-enhancing substances. He forfeited his bronze medal for alcohol use, "two drinks" to calm his nerves.

At the 1968 Olympics, just one competitor, Liljenwall, tested positive for a prohibited drug; nevertheless, as testing technology and methods developed, the number of athletes found to be chemically enhancing their performance grew.

One of the more egregious examples of doping in sports is East Germany's participation in the Olympics in the 1970s and 1980s. Documents found in 1990 revealed that East German coaches and trainers had given anabolic steroids and other medications to numerous female athletes, particularly swimmers. Parents had no idea that girl as young as eleven were being put on a medication regimen without their permission. As early as the 1976 Summer Olympics, American female swimmers, notably Shirley Babashoff, accused the East Germans of doping. According to both the international and domestic press, Babashoff's comments were a case of resentment because Babashoff, who was widely expected to win multiple gold medals, instead took home three silvers, all of which she lost to either East Germans Kornelia Ender or Petra Thümer, and one gold medal in a relay race. Even though their medal total rose from four silvers and one bronze in 1972 to ten golds (out of a possible 12), six silvers, and one bronze in 1976, there was no suspicion of cheating on the side of the East German female swimmers. Until the collapse of the Berlin Wall, there was no conclusive proof that East Germany had engaged in a state-sponsored drug regimen to significantly enhance their competitiveness at the Olympic Games and other international sports events. Many of the East German officials in charge of this operation have since been prosecuted and convicted in the German prison system for a variety of offences.

'Doping in Germany from 1950 to present,' a study shows that government funding contributed to a widespread doping programme in West Germany. For decades, West Germany promoted and covered up a doping culture in many sports. Athletes from West Germany tested positive for doping at the 1972 Summer Olympics in Munich and the 1976 Summer Olympics in Montreal.

KGB colonel, according to British writer Andrew Jennings, said that the agency's operatives had disguised as anti-doping officials from the International Olympic Committee in order to undercut drug tests and that Soviet sportsmen were "rescued with [these] great efforts.".

According to a 1989 Australian investigation, the Summer Olympics of 1980 were a disaster "Nearly all of the medal winners from the Moscow Olympics, including all of the gold medal winners, had used some kind of performance-enhancing medication. These Olympics in Moscow might just as well have been dubbed the Chemists' Games."

In preparation for the 1984 Summer Olympics in Los Angeles, the Soviet Union planned a statewide doping system in track and field, according to documents discovered in 2016. The paper, which was written before the nation decided to boycott the Olympics, outlined the program's current steroid activities and made recommendations for improvements. Dr. Sergei Portugalov of the Institute for Physical Culture drafted the letter to the Soviet Union's director of track and field. A key player in the Russian anti-doping program's execution before to the 2016 Summer Olympics was Portugalov.

TABLE 1: DOPING IN ASIAN GAMES JAKARTA–PALEMBANG 2018

Name	**Sport**	**NOC**	**Banned substance**
Kemi Adekoya	Athletics	Bahrain	Stanozolol
Sanjivani Jadhav	Athletics	India	Probenecid
Nirmala Sheoran	Athletics	India	Drostanolone and Metenolone
Kumush Yuldashova	Kurash	Uzbekistan	Stanozolol
Pürevdorjiin Orkhon	Wrestling	Mongolia	Stanozolol

Rüstem Nazarow	Wrestling	Turkmenistan	Furosemide

In the 1980s and 1990s, China had a state-sanctioned doping programme for athletes.

A Chinese Olympic team doctor, Chen Zhangho, said in an interview with the Sydney Morning Herald in July 2012 that he had tested hormones, blood doping and steroids on around fifty top athletes during the 2012 Summer Olympics in Los Angeles, Seoul and Barcelona. Furthermore, Chen said that the United States, the Soviet Union, and France were all taking performance-enhancing drugs at the same time that China was.

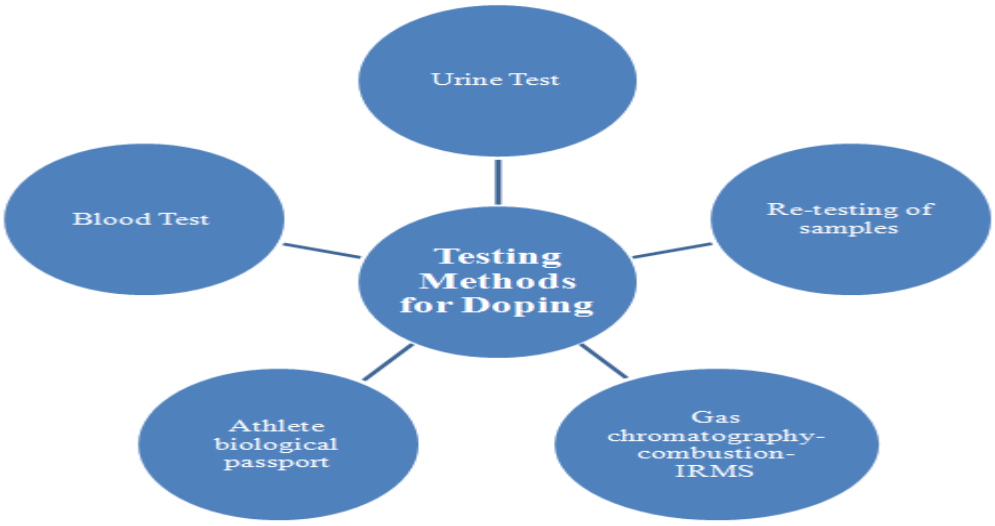

Figure 2 : Testing of Doping

It wasn't until the International Olympic Committee (IOC) seized control of the anti-doping fight in the late 1990s that WADA was officially established in 1999. A number of gold medalists in weightlifting and cross-country skiing were disqualified after failing a drug test at the Summer and Winter Olympics in 2000 and 2002, respectively. During the Winter Olympics of 2006, just one competitor had a medal withdrawn because of a failed drug test. There are several sports federations across the globe that have tried to replicate the IOC's drug testing policy (now known as the "Olympic Standard").

The IOC used the World Anti-Doping Agency to administer testing to 3,667 competitors at the Beijing Games. Detection of prohibited drugs and recent blood transfusions was made possible with the use of urine and blood tests. Six athletes failed drug tests in Beijing, despite the fact that their National Olympic Committees had already banned them from competing.

As the terms doping is associated with "using prohibited substances in sport", it is clear that doping is a threat and do not promote the sports spirit rather only focusing on the winning by unethical ways. When it comes to professional sports, doping is the use of banned substances to enhance an athlete's performance. Athletes often use the term "doping" to describe methods of enhancing performance and decreasing tiredness while competing. Even today, doping in sports is still traceable and regulated by WADA and NADA and a set of regulations. Doping situations in India are governed by the National Anti-Doping Agency (NADA), which decides on future measures against the athletes. However, more effort has to be done to develop mechanisms and legislative standards that are more explicit and have harsher penalties.

CONCLUSION

India now ranks third in the world when it comes to the adoption of medications and pharmaceuticals intended to improve athletic performance. For the enforcement and

administration of India's anti-doping laws, the specialised agency National Anti-Doping Agency (NADA) was set up in the nation. Founded in 1890 under the Societies Registration Act, it was incorporated as a company on November 24th of that year under a stringent code of conduct and anti-doping rules. The anti-doping organisation in India monitors athletes' use of various medications and treatments from a legal standpoint to prevent doping. An analysis of the WFI (World Adverse Analytical Finding Index) shows that India ranked 7th in 2017 and 5th in the list of nations that use these medicines. In 2015, India had the second-highest number of ADRVs (Anti-Doping Rule Violations). For India, enacting tough anti-doping regulations is a top priority in the fight against drug cheaters. NADA's long-term goal is to guarantee that doping in sports is strictly regulated and legalised.

ABSTRACT

Cognitive radio (CR) is the technology that enables dynamic spectrum access, a strategy that solves the spectrum shortage issue that many nations face. With cognitive radio networks, the spectrum sensing issue has taken on new dimensions. In wireless communication, the radio spectrum is the most precious resource. Cognitive radio and cognitive-based networking are converting static spectrum allocation communication systems into dynamic spectrum allocation communication systems. Cognitive radios are cognitive devices that can detect external circumstances and adjust their settings to provide the best possible performance at individual nodes or at the network level. As a result, CR is generally considered as one of the most promising wireless communication technologies of the future.

KEYWORDS: *Cognitive Radio,Dynamic Spectrum Access, Softwaredefined Radio.*

1. INTRODUCTION

The right to access the spectrum in wireless communication networks is usually specified by frequency, transmission power, spectrum owner (i.e., licensee), kind of usage, and license period. Typically, a license is given to a single licensee, and this licensee's usage of spectrum must adhere to the license's specifications. The licensee cannot alter the kind of use or transfer the right to other licensees under the earlier spectrum licensing systems. Furthermore, radio spectrum licenses are issued for greater areas and in larger pieces. All of these issues restrict the use of the frequency spectrum in the present paradigm for spectrum allocation and assignment, resulting in poor utilization. Because current and future wireless applications and services need increased transmission capacity and data transfer, the radio spectrum's usage must be enhanced[1]–[3].

The above-mentioned constraints should be addressed by changing the spectrum licensing system and implementing a dynamic spectrum management model in order to enhance the efficiency and use of the radio spectrum. The fundamental concept is to provide greater flexibility in spectrum access by enabling unlicensed users to use the radio spectrum under specific conditions and limitations. Traditional wireless systems are unable to benefit from the

increased flexibility offered by this spectrum licensing model since they were intended to operate on a specific frequency band.

As a result, the idea of cognitive radio (CR) developed, with the primary aim of providing flexibility to wireless transmission through dynamic spectrum access (DSA) so that frequency spectrum utilization may be improved without sacrificing the advantages of static spectrum allocation. In the sense that it can detect channels including signals from a wide range of heterogeneous devices, networks, and services, the CR is a "smarter radio." The radio will employ complex algorithms based on this sensing to share the restricted bandwidth channel with other users in order to accomplish effective wireless communication. In this way, the CR concept extends the concept of multiple access among devices in a single homogeneous system to multiple access among devices in different radio spectrums using different radio transmission techniques, resulting in different systems (i.e., inter-system multiple access as opposed to the more traditional intra-system multiple access), which have different priorities in accessing information[4]–[7].

2. COGNITIVE RADIOS

Joe Mitola invented the term "Cognitive Radio" (CR) in a number of articles and his PhD thesis in 1999-2000. The phrase was used to characterize intelligent radios that can make choices on their own based on collected knowledge about the RF environment, as well as learn and plan based on their previous experience. Clearly, such intelligence necessitates the radio's self-awareness, as well as content and context awareness. Furthermore, Haykin describes CR as a radio that is capable of being aware of its surroundings, learning, and adapting its operational parameters in real-time with the goal of delivering reliable communication anytime, everywhere, and with spectrally efficient spectral efficiency.

“Cognitive radio is an intelligent wireless communication system that is aware of its surrounding environment,” according to the definition. A cognitive radio transmitter would learn from its surroundings and adapt its internal states to statistical changes in existing RF stimuli by real-time and on-line changing transmission parameters (e.g., frequency band, modulation mode, and transmission power).” This definition basically encapsulates the core idea of CR. A cognitive radio network (CRN) allows us to communicate with other CR nodes and users. Changes in the radio environment, topology, operational circumstances, or user needs may all affect the communication parameters. The two primary goals of the CR are to enhance frequency spectrum utilization and to provide extremely dependable and efficient wireless communications[8], [9].

Cognitive radios are self-aware and intelligent devices that can detect changing environmental conditions and adjust parameters such as frequency, modulation techniques, coding techniques, power, and so on in response to changing statistical communication environments, resulting in efficient resource utilization. Cognitive radios must be capable of learning and deciding on their operational settings, as well as changing transmission and reception parameters to satisfy performance needs and optimize QoS. The Cognitive engine is in charge of the cognitive radio's operations (CE). Sensing, analysis, learning, decision-making, and reconfiguration are all activities performed by the cognitive engine. Users in cognitive radio networks are divided into two categories: main (licensed) and secondary (unlicensed or cognitive). The use of the licensed spectrum is prioritized for licensed users. Unlicensed users, on the other hand, may communicate in licensed spectrum opportunistically by altering their communication settings in an adaptive manner when spectrum gaps become available[10].

Horizontal spectrum sharing and vertical spectrum sharing are the two main types of cognitive radio-based DSA or sharing. All users/nodes have equal regulatory status in the former scenario, while all users/nodes do not have equal regulatory status in the second situation. There are main (licensed) users and secondary (unlicensed) users in vertical spectrum sharing, and the secondary

users opportunistically access the spectrum without impacting the prime users' performance. Horizontal spectrum sharing may take place between homogeneous or heterogeneous networks. Symmetric sharing occurs when all networks in a diverse environment have cognitive/adaptive skills (i.e., all coexisting networks have equal incentives to adapt). Asymmetric spectrum sharing, on the other hand, occurs when one or more networks lack cognitive/adaptive skills (e.g., coexistence of legacy technology and CR technology). The coexistence of high-speed IEEE 802.11 networks with low-power IEEE 802.15.4 networks is an example of this. Opportunistic spectrum access is the term used to describe DSA in vertical spectrum sharing. The technique for the secondary user to operate inside a frequency range that is allocated for the main user is called opportunistic spectrum access.

In 1999, as an extension of Software Defined Radio, the idea of Cognitive Radio (CR) emerged as a new paradigm (SDR). It refers to a scenario in which intelligent radio devices and related network entities interact in such a way that they can change their operational settings in response to the requirements of the user/network while also learning from previous experiences. Since then, there has been a large amount of study on CR-related issues in the scientific community. Many standards organizations have started and advanced standardization efforts on Cognitive Radio Systems (CRS) (including TV White Spaces—TVWS). Almost every regulatory body in the United States, Europe, and Asia–Pacific has recognized the impact of CRS on spectrum allocation.

2.1. Cognitive Capability:

It refers to the CR's capacity to detect the radio spectrum using advanced methods and select suitable settings to adapt to a changing environment. Also known as the cognitive cycle

The cognitive cycle's three major stages are as follows:

- Spectrum sensing: A cognitive radio analyzes the available radio spectrum, records its data, and pinpoints any gaps.
- Spectrum Analysis: Using spectrum sensing, CR analyzes and calculates the features of the observed spectrum hole.
- Spectrum decision: This refers to the ability to choose the best available channel for SU communication based on estimated characteristics and user needs.

2.2. Re-Configurability:

The capacity to respond to changes in operating settings while the radio is in use without modifying the hardware components is known as re-configurability. The following are the re-configurability parameters:

- Frequency of operation
- Techniques for modulation
- Transmission capacity
- Information and communication technologies

2.3. Classification:

There are two major kinds of cognitive radio, depending on broadcast and receiving parameters:

- Full Cognitive Radio (or Mitola radio): Every observable parameter by a wireless node (or network) is taken into account.
- Spectrum-Sensing Cognitive Radio: This kind of cognitive radio solely considers the radio frequency spectrum.

Other kinds are reliant on the spectrum segments that are accessible for cognitive radio:

- Licensed-Band Cognitive Radio: It may utilize bands that are only available to licensed users, such as the UNII or ISM bands. The IEEE 802.22 working group is working on a wireless regional area network (WRAN) protocol that will utilize unused television channels.
- Cognitive Radio with Unlicensed Bands: This technology can only use unlicensed portions of the radio frequency (RF) spectrum. The IEEE 802.15 Task Group 2 standards, which concentrate on the coexistence of IEEE 802.11 and Bluetooth, define one such system.

2.4. Spectrum Sensing Methods for Cognitive Radio:

In cognitive radio, some of the most popular spectrum sensing methods are:

1. Energy Detector-Based Sensing: Due to its minimal computational and implementation complexity, the energy detector-based technique, also known as radiometry or periodogram, is the most popular method of spectrum sensing. It is a more general approach since receivers do not need to be aware of the signal of the main user. The signal is identified by comparing the energy detector's output with a noise-floor-dependent threshold.
2. Waveform-Based Sensing: In wireless systems, patterns are often used to aid synchronization or for other reasons. A preamble is a predetermined sequence that is sent before each burst, whereas a midamble is sent in the midst of a burst or slot. Sensing may be done in the presence of a known pattern by comparing the received signal to a known duplicate of itself. This technique is known as waveform-based sensing or coherent sensing, and it is only applicable to systems with established signal patterns.
3. Cyclostationarity-Based Sensing: Cyclostationarity feature identification uses the cyclostationarity characteristics of received signals to identify main user transmissions. Periodicity in the signal or in its statistics such as mean and autocorrelation may produce cyclostationary characteristics, or they might be deliberately induced to aid spectrum sensing.
4. Matched-Filtering Technique: When the transmitted signal is known, matched-filtering is recognized as the best technique for detecting main users. When compared to other techniques, the primary benefit of matched filtering is the short time it takes to reach a given percentage of false alarm or miss detection. To demodulate received signals, matched-filtering requires cognitive radio. As a result, it requires a thorough understanding of the main users' signaling characteristics, such as bandwidth, operating frequency, modulation type and order, pulse shaping, and frame format.

2.5. Evaluation of Different Sensing Methods:

Because of the coherent processing that results from utilizing deterministic signal components, waveform-based sensing is more robust than energy detector and cyclostationarity-based techniques. However, a priori information about the main user's attributes should be provided, and primary users should provide established patterns or pilots.

When two common assumptions are not true, the performance of energy detector-based sensing is restricted. It's possible that the noise isn't stationary, and its variance is unknown. Baseband filter effects and spurious tones are two more issues with the energy detector. When the noise is stationary, cyclostationary-based techniques perform worse than energy detector-based sensing

methods, according to the literature. Noise becomes nonstationary in the presence of co-channel or neighboring channel interferers. As a result, methods based on energy detectors fail, whereas cyclostationarity-based algorithms are unaffected. Cyclostationary characteristics, on the other hand, may be entirely lost owing to channel fading. An SNR wall for cyclostationary based feature detectors, comparable to energy detectors, is demonstrated in that model uncertainty. Furthermore, it is well known that cyclostationarity-based sensing is sensitive to sample clock offsets.

3. DISCUSSION

One of the most precious natural resources is the radio frequency spectrum. The shortage of frequency spectrum has resulted from the high demand for radio channels. Recent spectrum measurements, however, indicate that the spectrum is underused and that there is unused spectrum. Cognitive Radio (CR) is a crucial technology that allows for efficient spectrum use and alleviates spectrum shortages. CR technology detects unused spectrum, also known as white spaces or spectrum holes, and assigns it to the Secondary User (SU) or unlicensed user without interfering with the Primary User (PU) or licensed user. If a PU arrives on the network and there are no more accessible spectrum bands, one of the SU must release the band, which is then allocated to the main user.

There is no established channel for data communication in CR. Sensors must consult with their neighbors and choose a communication frequency channel. Because there is no coordination between PUs and SUs, it is very difficult. Various methods must be used to anticipate the arrival of the PU on the channel. Many permitted bands are not utilized and stay vacant, according to a study by the Federal Communications Commission (FCC). According to the FCC, spectrum usage in highly populated metropolitan areas seldom exceeds 35 percent at any one moment. It demonstrates that certain frequency bands are extensively utilized, while others are just moderately used. The remaining frequency bands are free. A cognitive radio method is required to address the issue of underutilized spectrum.

The CR method is a novel paradigm that enables the SU to utilise the spectrum opportunistically by detecting unoccupied spectrum, commonly known as spectrum gaps or white spaces. If the PU comes, it uses the dynamic spectrum access method to leave the band without interfering with other users.

One of the primary goals of CR is to take advantage of the spectrum gaps whenever possible. The SU should detect the PU's arrival and relocate to another unoccupied area without interfering with the PU. There are two different kinds of sensing methods.

A) Technique for signal processing

B) Technique of cooperative sensing.

Energy detection, matching filter detection, cyclostationary based detection method, and other techniques are all part of the Signal processing technology. Similarly, cooperative sensing methods are classified as centralized spectrum sensing, decentralized spectrum sensing, and hybrid spectrum sensing.

4. CONCLUSION

A short overview is provided of CR technology and its many sensing methods in this article. A survey of two kinds of sensing methods, signal processing and cooperative sensing approaches, is performed. With the advancement of cognitive radio technology, dynamic spectrum sharing has emerged as a potential method to increasing spectrum efficiency. Cognitive radio, which is one of the attempts to make more effective use of the available spectrum via opportunistic spectrum use, has grown in popularity. Sensing the available spectrum possibilities is an essential aspect of cognitive radio. Licensed users may share their spectrum under the new spectrum management paradigm. We looked at matching filter detection, energy detection, and cyclostationary feature identification as three distinct kinds of signal processing methods. Although the energy detection method is simple and widely used, it has a poor SNR. Matched filter detection needs more power and has a higher complexity, but it reduces sensing time and improves SNR. In addition, the three kinds of cooperative sensing methods, centralized, decentralized, and hybrid sensing systems, are discussed. These methods do not require any previous signal knowledge. Based on the comprehensive study, it can be stated that each sensing method has its own set of advantages and disadvantages. As a result, they must be implemented in accordance with the applications. We went on to identify the research difficulties and discovered that this new study field had a lot of potential.

ABSTRACT

Time critical and delay sensitive multimedia applications require more spectrum and transmission resources. With the provision of cognitive radios (CRs), the underutilized spectrum resources can be exploited to gain more bandwidth for the bandwidth hungry applications (multimedia applications). Cognitive radio networks (CRNs) also have the flexibility to adjust their transmission parameters according to the needs of multimedia services or applications. For this reason, wireless multimedia cognitive radio networks (WMCRNs) have gained much attentions in today's research domain. In this paper, we present a comprehensive survey of WMCRNs. various multimedia applications supported by CRNs, and various CRbased wireless networks are surveyed. We highlight the routing and link layer protocols used for WMCRNs. We cover the quality-of-experience (QoE) design and security requirements for transmitting multimedia content over CRNs. We provide an indepth study of white space, TV white space, and cross-layer designs that have been used for WMCRNs. We also survey the major spectrum sensing approaches used for the communications of bandwidth hungry and time-critical data over CRNs.

KEYWORDS: *Cognitive Radio Network (CRN), Multimedia Communication, Secondary Users, Primary Users, Quality-Of-Service, Quality-Of-Experience.*

1. INTRODUCTION

Recent advancements in wireless communications technology have made it possible to link a huge number of wireless devices in today's environment in a seamless manner. The optimum use of spectrum resources is also required to provide wireless connection to millions of wireless devices. It turns out that reserving a few megahertz (MHz) of spectrum for wireless communications is expensive. Static spectrum allocation has also resulted in underutilization of spectral resources. Cognitive radio networks have resulted as a result of this (CRNs). By using the underused licensed spectrum with the assistance of CRNs, greater utilization of current spectrum resources has been accomplished [1].

Both real-time and non-real-time traffic may be supported by CRNs. Multimedia content transmission via CRNs is difficult due to the dynamic nature of CRNs. Various advances in architecture, communications protocols, spectrum sensing techniques, and interference mitigation approaches have been made to support delay-sensitive and time-critical data transmission in CRNs. Seamless multimedia communications that reside within the limited spectral resources can be well realized with the help of CRNs (by harnessing under-utilized, licensed spectral resources).

1.1. Multimedia Communication in CRNs Is Necessary:

Multimedia applications, which are regarded to be time-sensitive and bandwidth-hungry, have gotten a lot of attention in the academic community lately. Multimedia applications need greater bandwidth, throughput, quality of service (QoS), dependability, and timeliness when sent [2]. End consumers have shown a strong interest in current multimedia apps such as YouTube, Netflix, Skype, and others.Multimedia communications over current spectrum resources present significant difficulties. The premise is that spectral resources have become scarce as a result of the massive growth in wireless devices. However, new spectrum analysis studies have shown that a significant part of the spectrum is underused. CRNs have been generally recommended as a potential approach to alleviate spectrum underutilization by effectively using existing spectrum resources. The traditional static spectrum sensing method has been replaced by dynamic spectrum access thanks to CRNs (DSA). CRNs can now detect idle, licensed bands with the assistance of DSA, allowing secondary users (SUs) to broadcast with little disturbance to main users (PUs).

Researchers must develop new design paradigms in order to provide these bandwidth-hungry and delay-sensitive applications of underused spectrum resources [3]. To address spectrum shortages, the transmission of multimedia applications via CRNs has been developed for this purpose. The literature has extensively investigated the continuous transmission of delay sensitive traffic without significant delay using the DSA method. While utilizing the licensed band, cognitive users, also known as SUs, may usually send delay-sensitive and time-critical data without delay or disruptions [4].

Multimedia traffic, particularly video streaming, is projected to account for 69 percent of all consumer traffic on the Internet. It is anticipated to rise in the near future, and consumers will soon turn to multimedia apps as their primary applications. As a result, measuring the performance of these apps is critical. Typically, the most commonly used network focused measure to evaluate the performance of a network's capacity to handle delaysensitive traffic is Quality of Service (QoS). In addition to QoS, the quality of multimedia services has been assessed in terms of quality of experience from the user's viewpoint (QoE). Both QoS and QoE evaluate the quality of multimedia material from the standpoints of the network and the end user. While using CRNs in multimedia communications, additional metrics must be evaluated in order to measure CRN performance. Spectrum sharing, mobility, administration, sensing, and handoff, in combination with QoS and QoE, provide a comprehensive picture of wireless multimedia cognitive radio networks' quality multimedia applications (WMCRNs).

WMCRNs can handle a wide variety of time-sensitive and delay-sensitive applications. Various CRNs centric or user centric metrics of multimedia traffic have been investigated while a broad variety of applications from video linked to safety, medical, voice-over IP (VoIP), and heterogeneous applications have been studied [5].CRNs must also deal with a number of resource limitations while supporting multimedia applications. WMCRNs suffer a number of limitations, including energy shortage, PU interference, poor CPU performance, and restricted system memory.

2. COGNITIVE RADIO AND MULTIMEDIA COMMUNICATION

2.1. Cognitive Radio Networks:

2.1.1. Dynamic Spectrum Access:

According to reports, the distribution of fixed spectrum resources to licensed users has resulted in the frequency band being underutilized. The static spectrum access technique, as practiced, underutilizes spectrum resources in both the temporal and geographical domains. Traditional wireless networks' static spectrum access technique has been replaced by dynamic spectrum access (DSA) or dynamic spectrum management (DSM), resulting in the development of CRNs. The flexibility of spectrum sharing allows users (SUs) to exploit spectrum gaps or white spaces in the licensed spectrum with the assistance of DSA [6]. This also necessitates licensed users' collaboration in order to prevent interference and ensure the smooth and stable functioning of spectrum sensing. The difficulties of assessing the performance of many variables including spectrum sensing, communications protocols, interference mitigation (self-interference mitigation in the case of full-duplex CRNs), and spectrum use analysis have all been thoroughly studied. Enforcing adherence to spectrum regulations necessitates the development of sophisticated DSA designs to achieve the aim of CRNs in a variety of advanced and developing sectors. The cognitive cycle is at the heart of CRNs' operations.

2.1.2. Cognitive Cycle:

The whole spectrum detection and allocation process has been split into a cycle of four stages, dubbed the cognitive cycle, to make CRN operation seamless and comprehensible. First, different spectrum sensing techniques are used to identify white areas in the spectrum. Spectrum sensing methods have been thoroughly investigated. Second, the spectrum is controlled once it has been sensed. To enable SU communications in the licensed band, interference to PUs is kept to a minimum during spectrum management [7]. Third, the spectrum resources that are detected and controlled are shared. White spaces are utilized in spectrum sharing by using the underlay, overlay, or interweave methods of white space usage. The idle spectrum resource may be shared cooperatively or in a non-cooperative manner. When the PUs arrive, the SUs must leave the licensed spectrum band. Spectrum mobility provides SUs with allocated spectrum holes to maintain continuous connections, avoiding the lengthy delays caused by PU disruptions. The cognitive cycle (spectrum sensing, management, sharing, and mobility) may assist to achieve effective spectrum use while minimizing interference for licensed users.

2.1.3. Spectrum Sensing Approaches:

The primary function of spectrum sensing methods in CRNs is to detect white spaces in the available spectral resources. The efficiency of spectrum sensing methods is entirely responsible for the CRNs' performance. Different spectrum sensing methods have been developed depending on the available bandwidth and application needs. To perceive the available idle spectrum gaps, CRNs often use energy-detection based spectrum sensing methods [8]. Other methods based on spatial correlation, such as cyclostationary spectrum sensing, have also been developed to utilize white space in the license band, in addition to energy detection. QoS-aware spectrum sensing enables time-critical applications, depending on the needs of multimedia applications. Cooperative spectrum sensing for CRNs has also been presented as an energy-detection based spectrum sensing method to enable real-time applications.

2.1.4. Secondary and Primary Users:

With the assistance of CRNs, spectrum underutilization may be reduced while interference to licensed users is reduced. Secondary users (SUs) are often referred to as CRs users, and the networks they utilize are referred to as secondary networks. Licensed users are referred to as

main users (PUs), and the networks that they connect to are referred to as primary networks.In CRNs, SUs detect PU activity on the main networks and begin using licensed spectrum resources after locating white spaces. Underutilization of the licensed spectrum is reduced as a result.

2.2. Multimedia Communication:

The transmission of bandwidth-hungry and delay-sensitive traffic puts a strain on network resources. The radio spectrum is a valuable resource, and multimedia communications that rely on it need that researchers devise effective and optimal solutions. Multimedia information via CRNs may be transmitted with more dependability and reduced latency after effectively using the spectrum with CRNs.Traditional wireless networks and CRNs have both been examined from different angles when it comes to multimedia communications [8]. Multimedia communications, on the other hand, have been studied using a variety of measures. It's difficult to measure the performance parameters of WMCRNs in general. WMCRN performance indicators may be divided into two categories: network focused and user centric.

2.2.1. Network Centric Metrics:

WMCRNs' real performance is captured and quantified using network centric metrics. QoS is the fundamental network centric measure for this purpose, not just for conventional wireless networks but also for WMCRNs. Throughput, end-to-end latency, average delay, jitter, packet loss, and bandwidth are often used to evaluate network performance for different multimedia applications under QoS.

2.2.2. User Centric Metrics:

Users' approval of multimedia apps is measured using user-centric metrics. Network centric metrics have been extended to include user centric metrics. The most commonly used user-centric measure, quality of experience (QoE), assesses user satisfaction with multimedia content delivered via networks [9]. Various additional metrics have been explored in combination with QoE in WMCRNs. Multimedia content consumers may suffer communications interruptions as a result of the spectrum hand-off (in rare cases). As a result, the spectrum hand-off may be considered a performance measure for assessing WMCRN performance. Spectrum allocation methods may be used as user-centric metrics to evaluate user satisfaction with a service or application, in addition to spectrum hand-off.

2.2.3. Popular Multimedia Applications:

Traditional multimedia applications (video, audio, picture, online gaming, and video-on-demand) have been examined from a variety of viewpoints by traditional wireless networks. In addition, much effort has been done to provide support for multimedia communication via CRNs. WMCRNs can now handle the transmission and reception of both time-critical and non-critical data while meeting the media content's QoScriteria.WMCRNs support a broad variety of multimedia applications [10]. WMCRNs have become more versatile thanks to CR-based wireless networks like CRsmart grid, cognitive radio sensor networks (CRSNs), CRcellular networks, CR-mesh networks, and others, which enable a wide variety of multimedia applications. WMCRNs may now offer support for all such delay sensitive and time critical applications, from safety to medical.

2.3. Motivation of Using Cognitive Radio for Multimedia Communication:

Multimedia application communications may be made more dependable and efficient by using CRs. CRNs may now transmit delay-sensitive and bandwidth-hungry applications while remaining within restricted spectrum and transmission resources. The following are the main reasons for utilizing multimedia communications via CRNs:

- Time-critical multimedia applications that are delay sensitive and bandwidth hungry need sufficient spectrum resources to meet user expectations. Multimedia applications may now use the idle licensed spectrum to transmit delay-sensitive data thanks to CRNs.
- When SUs are in short supply, the underused licensed and unlicensed spectrum bands may be used to improve video sessions for a variety of video-related applications such as video conferencing, video-on-demand, and online gaming. Any user may improve multimedia content performance by using underused spectrum resources by using CRs.
- CR-based wireless networks, such as the CR-smart grid, CRSNs, and others, may now be created and tested with a variety of multimedia services or applications. WMCRNs have grown more versatile in enabling a broad range of delay sensitive applications while addressing spectrum constraints by combining CR with various networks.
- Unlike conventional multimedia content users, WMCRN SUs may modify their multimedia and other communications needs in response to network circumstances.
- Multimedia apps use a lot of bandwidth. In comparison to other applications, they need greater data rates. With the assistance of WMCRNs, SUs may estimate desired data rates and then detect and assign idle channels that fit these rates effectively. CRNs for multimedia applications become more reliable as a result of this [11].
- WMCRNs may improve the performance of multimedia communication by using several channels and reusing them on a regular basis. Multi-user video streaming with numerous sessions is simple to accomplish with the assistance of various channels and frequency reuse [12].

3. DISCUSSION

CRNs are capable of supporting a wide range of multimedia applications. The majority of video applications are covered in the current work on WMCRNs. CRNs are adaptable enough to handle time-critical, delay-sensitive, and real-time applications. As a result, it may be used in medical, safety, and other traditional video applications to improve video or audio quality. Different WMCRN applications have been categorized based on the application scenarios and supporting infrastructure. WMCRNs applications have been categorized as video, medical, safety, VoIP, and heterogeneous based on application situations. The following are the details of the various CRN-supported applications:

3.1.Video Related Applications:

The need for video applications has grown as a result of the massive growth in portable mobile devices. To meet the growing demand for video applications, significant work has been done on the creation of additional network and communications infrastructure.

3.2. Safety Applications:

CRNs have also been used in a variety of safety applications. In civil safety applications, WMCRNs with various video or audio processing methods may be used. Vehicle safety is achieved via multi-media applications in CR-based vehicular ad-hoc networks. A new CR-based spectrum sensing method is suggested to offer the necessary bandwidth for delay sensitive safety applications. Spectrum allocation is examined with the assistance of the Nash bargaining method, while network fairness is maintained.

3.3. Medical Applications:

By using licensed and unlicensed spectrum resources, WMCRNs may also serve a variety of medical applications. In combination with CRNs, wireless medical telemetry is investigated. A CRbased medical telemetry design paradigm is presented to transmit patients' vital data to the

distant base station inside the hospitals with minimal latency. A spectrum measurement is carried out near hospitals in this research, and then the spectrum and power allocation are examined using CRs.

4. CONCLUSION

CRNs support a variety of delay-sensitive multimedia applications. Video streaming apps have been thoroughly examined. Other time-sensitive uses, such as medical and safety applications, haven't been thoroughly investigated. Include only medical and safety-related applications. Video conferencing and caching based on CRNs should be explored further using both QoS and QoE measurements. PSNR is the measure used to assess multimedia material in the majority of current work on WMCRN applications. When evaluating the performance of WMCRNs, other metrics like as MOS, jitter, and duration between interruptions should be considered. Existing WMCRN applications are primarily designed to enable multi-users and cross-layer compatibility. However, WMCRNs lack mobility, multi-hop, and multi-channel capability, all of which are required for the transmission of delay-sensitive real-time applications.

ABSTRACT

With the aim of developing an industrial technology for nitrooxidation, we considered the production of a diffusion nitride-oxide layer on the surface of metal products by low-temperature gas nitriding at the first stage of saturation with nitrogen and sequential oxidation of the nitride layer in water vapor at the second stage of processing.For its further oxidation in water vapor, it is experimentally investigated to obtain a pore-free developed nitride layer depending on the nitrogen potential of the atmosphere upon saturation in an ammonia environment. The microstructures of the nitride - oxide layer were studied by nitriding at the first stage of the process in pure ammonia at below the eutectoid temperature for the "Fe-N" system and oxidation at the second stage in water vapor at a temperature below the eutectoid temperature for the "Fe-O" system.It was found that during oxidation, at the beginning of the process, denitrogenation occurs on the surface of the nitride layer with the formation of an oxide layer, which further prevents denitrogenation, acting as a barrier layer on the surface. Nitrogen from the high-nitrogen nitride phase continues deep into the surface with the formation of lower nitride phases with an increase in the thickness of the nitride phase, and at the same time diffusion occurs in the nitride zone of carbon from the steel matrix during decarburization.As a result of the oxidation of the nitride phase with oxygen from the saturating atmosphere and carbon from the steel matrix in the nitride layer, an oxycarbonitride phase is formed, which has the best physic mechanical and physicochemical properties. The change in the concentration of

elements along the depth of the layer and X-ray structural analyzes of the nitride and oxide phases are also given.

INTRODUCTION

In the world mechanical engineering, various varieties of the nitriding process and combinations of nitriding with other methods of surface hardening are widely used.

For specific operating conditions, it is required to create a controlled diffusion nitrided layer with the formation of certain structural and phase components. The nitride zone resulting from nitriding is responsible for performance characteristics such as corrosion resistance, surface hardness, and corrosion resistance.

The structure and phases of the nitride layer, as well as the surface oxide film, obtained on the surface of steels and alloys after the combined process of gas nitriding and oxidation in superheated steam (nitrooxidation) depends on various factors, the main of which are the nitrogen potential, temperature and saturation pressure. In the process of nitrooxidation with a change in one or another of the above factors in the corresponding stages of saturation with nitrogen and oxygen, a nitride-oxide layer with predetermined properties can be formed on the surface of the work-piece to be hardened.

Prediction of the structure, phase and properties of the nitride-oxide layer obtained by low-temperature gas nitriding and subsequent oxidation of metal products is important for optimizing the nitrooxidation technological process.

METHODOLOGY

To study the nitrooxidation process at the first stage of saturation with nitrogen, technical ammonia was used, and at the second stage, superheated steam with the addition of film-formers (mainly ODEP, Trilon-B). The technology was carried out in a sequential scheme. Steel 40X was chosen as the material. We investigated the nitriding process at higher and lower eutectoid temperatures (591^0C) for the “Fe-N” system and oxidation at the second stage in water vapor at higher and lower eutectoid temperatures (570^0C) for the “Fe-O” system. The distribution of elements over the depth of the layer was determined by the method of Auger electron spectroscopy on an electronic spectrometer, and the microstructure of the layer obtained by various versions of hardening treatment was investigated using images taken on a JSM-25 scanning electron microscope (JEOL). The qualitative phase X-ray structural analysis of the layer was carried out on a DRON-3.0 diffractometer using cobalt and iron Kα-radiation.

RESULTS

One of the parameters of the nitrooxidation process for a detailed scientific description of the structure of the diffusion nitride or nitride-oxide layer is the composition of the saturating medium, which determines the saturation processes through the evolution of atomic nitrogen and carbon during nitriding, oxygen during oxidation.

Of all the known saturating media, the most dynamic are gaseous atmospheres, which make it possible to obtain any structural sets and a different range of depths of diffusion layers. In all cases of gas nitriding, ammonia is the basis for creating a saturating atmosphere.

Under certain thermodynamic conditions (temperature, pressure), ammonia dissociates in accordance with the reaction [1]:

$$NH_3 \rightarrow N + 3/2 \cdot H_2 \qquad (1)$$

In the process of saturation, a certain nitrogen potential is formed, and during the process, an equilibrium of the nitrogen potential occurs. According to the ratio (1), a certain part of atomic nitrogen, formed after the catalytic reaction, as a result of which the metal nitrides MeN are formed, occurs to the metal surface. Moreover, on the surface of metals or alloys, higher metal nitrides first develop in the order of decreasing nitrogen concentration along the depth of the saturated surface.

Equilibrium constants (K_a) can be used to estimate the ratio of the partial pressure of ammonia to hydrogen:

$$K_a = \frac{P_{NH_3}}{P_{H_2}^{3/2}} \cdot \frac{1}{a_N} \qquad (2)$$

Where: P_{NH_3} - partial pressure of ammonia;

$P_{H_2}^{3/2}$ - Partial pressure of hydrogen;

a_N - nitrogen activity or nitrogen potential.

During nitriding, a solid solution of nitrogen is formed in the α-Fe, γ′ and □ε--phases. At constant temperature and pressure, the equilibrium constant will be constant, therefore, equation (2) can be written in the following form:

$$a_N = \frac{P_{NH_3}}{P_{H_2}^{3/2}} \qquad (3)$$

To ensure the diffusion of nitrogen into the material, it is necessary that the nitrogen potential of the saturating medium be greater than the nitrogen content in the metal:

$$a_N^{\Gamma C} > a_N^{Me} \quad (4)$$

Equation (4) characterizes the initial stage of diffusion, since with the formation of a nitride layer (γ′- and □ε- phases), respectively, the value of the nitrogen potential must satisfy the condition:

$$a_N^{\Gamma C} > a_N^{\gamma'} > a_N^{\varepsilon} \quad (5)$$

During short-term nitrooxidation, the nitriding process first occurs with the formation of a nitride layer. In all cases, the formation of a nitride layer and a zone of internal nitriding in pure iron occurs in accordance with the “Fe-N” diagram [2].

Upon oxidation of the nitride layer, the ratio of the partial pressures NH_3:H_2 changes. The denitrogenation of the nitride layer begins with the formation of a thin surface oxide layer, which, after obtaining a certain thickness, prevents denitrogenation and forces the diffusion of nitrogen into the depth of the metal. As a result, during oxidation, the thickness of the low-nitrogen nitride layer and the zone of internal nitriding increase.

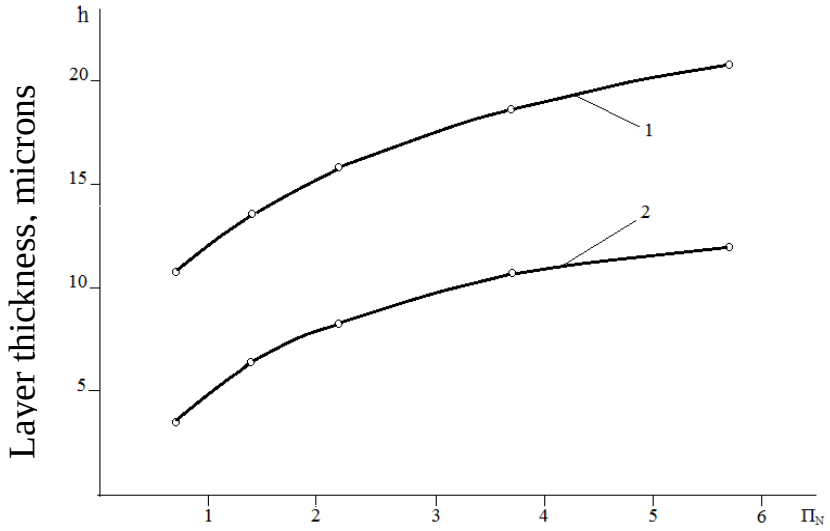
To develop the technology of the process and the theoretical foundations of the technology of nitrooxidation of low-alloy carbon steel, the dependences of the composition and structure of the nitrided and oxide layers on the chemical composition of steels and technological parameters of the process were studied. Technical iron and Steel 45 were used as an alloy.

For further oxidation in water vapor, it is necessary to obtain a given structure, phase composition and properties that best meet the requirements of the characteristics of the nitride

layer during nitriding. This circumstance poses the problem of choosing the nitrogen potential of the saturating atmosphere during nitriding in dissociated ammonia.

According to the theory of nitriding, regulation of the phase composition of the nitrided layer is achieved by changing the nitrogen potential of the saturating atmosphere [3]. By maintaining the nitrogen potential at the level of nitrogen solubility in one or another phase, it is possible to obtain a layer consisting of an α-solid solution, iron nitrides and alloying elements, to form a γ'-phase (low nitride) or ε'-phase with a low nitrogen content on the surface.

We studied the dependences of the change in the thickness of the surface diffusion layer depending on the change in the nitrogen potential of the saturating medium at a temperature of 5800C (Figure 1). The duration of the saturation process in all cases was 3 hours. Gas saturation was carried out with a change in the nitrogen potential in pure ammonia and the addition of partially dissociated ammonia, with the establishment of the required nitrogen potential in the furnace atmosphere.



1 — total thickness of the nitride layer; 2 - the thickness of the high-nitrogen ε-phase.

Figure 1. Changes in the total thickness of the nitride layer depending on the nitrogen potential of the atmosphere during nitriding in ammonia. Saturation temperature 580^0C, duration 3 hours.

With an increase in the value of the nitrogen potential, the thickness of the resulting diffusion nitride layer increases. Under the same conditions obtained, the samples were examined by X-ray diffraction analysis (Figure 2).

Analysis of the change in the diffraction maxima of the reflection of the phases shows that with an increase in the nitrogen potential in the nitride layer, the proportion of the ε-phase increases, and the fraction of the low-nitrogen γ'-phase and α-phase (internal nitriding zone) decreases. The optimal nitride layer in terms of the phase composition can be obtained at the values of the nitrogen potential: $2< \pi_N < 3$.

With an increase in the nitrogen potential $\pi_N >1$, a well-developed nitride layer is obtained on the surface, consisting of the ε'- and ε'+γ'–phases, with an increase in the nitrogen potential to $\pi_N <6$, the fraction of the γ'–phase in the nitride layer decreases, and ε'- phase increases.

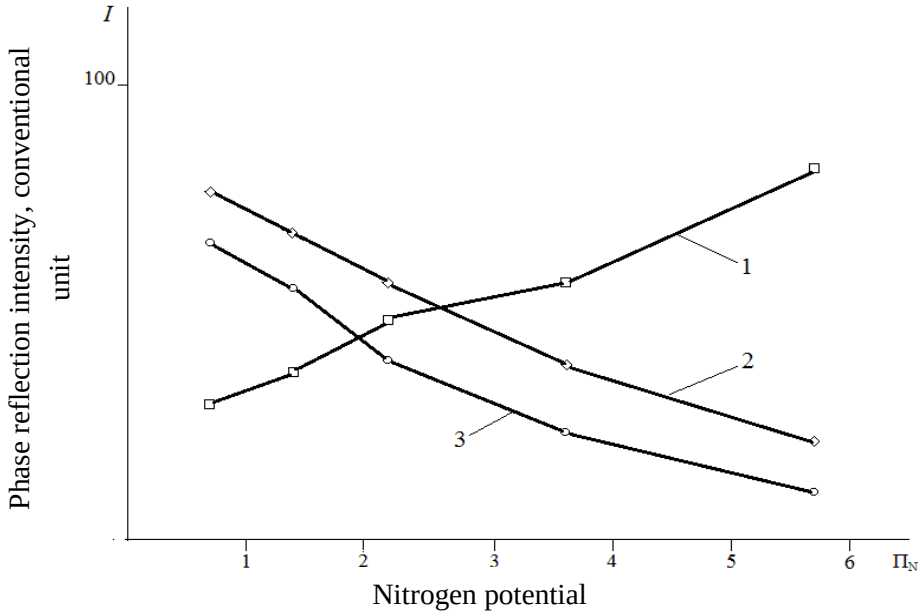


Figure 2 - Change in diffraction maxima depending on the nitrogen potential of the atmosphere during nitriding. Saturation temperature 5800C, duration 3 hours. 1- ε-phase (101); 2- γ'-phase (200); and 3 - ε'-phase (101). Radiation FeK$_\alpha$.

An increase in the thickness of the nitride layer prevents the diffusion of nitrogen through the nitride layer if the duration of nitriding is to be increased, as well as with an increase in the nitrogen potential π_N >5 due to an increase in the proportion of the high-nitrogen nitride layer, the brittleness of the layer and the porosity of the ε-phase are revealed.

In order to obtain a pore-free low-nitrogen diffusion nitride layer for further oxidation, it is desirable to obtain a low-nitrogen nitride layer consisting of a low-nitrogen ε-phase or a mixture of (ε+γ') - phases. The nitride layer formed upon saturation of the surface with nitrogen during the active period has a high concentration of nitrogen; at the second stage of saturation under conditions of a low nitrogen potential, until equilibrium is reached, it can dissociate in two directions: the process of nitrogen diffusion from the nitride layer into the metal and returned back to the external environment (surface denitrogenation process).

In the process of nitrogen diffusion from the nitride layer deep into the metal, the atmosphere in the furnace has no direct effect; in this case, the determining factors are the temperature and composition of the processed material (the presence of carbon in the matrix).

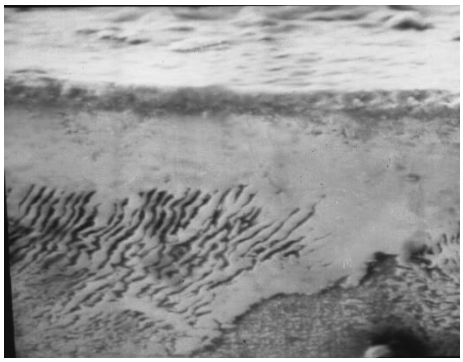
The process of returning atomic nitrogen from the nitride layer back to the external environment (into the furnace atmosphere) can be stopped by establishing in the furnace atmosphere by creating the necessary condition for equilibrium of the nitrogen potential with a decrease in the volume of ammonia supplied to the furnace or by creating a barrier surface layer preventing the denitrogenation process.

In connection with the above, the composition of the saturating atmosphere and the diffusion period can be varied within wide limits, which is determined only by the conditions for maintaining a high nitrogen concentration in the nitride layer, which does not require a large number of active atoms in the saturating atmosphere.

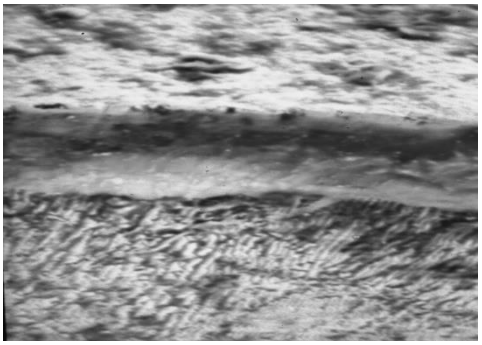
The formation of the ε'-phase occurs only during nitriding of steel and alloys in the presence of carbon in their matrix and has a carbonitride character. Therefore, a noticeable formation of this type of nitride is characteristic only during nitriding of carbon steel and alloys [4].

In order to obtain a complete picture of the change in the nitride layer during oxidation, samples of steel 45 were studied. The samples were processed in an atmosphere of pure ammonia at nitrogen potential values in the range $2< \pi_N < 3$, at a temperature of 5800C - below the temperature of the eutectoid for the "Fe-N" system and part The samples, without being removed from the furnace, were subjected to oxidation in water vapor at a temperature of 550^0C, below the temperature of the eutectoid for the “Fe-O” system. Micro-sections were made from the processed samples, and the distribution of elements along the depth of the oxide and nitride layers was studied.

Surface microstructures with a nitride-oxide layer of steel 45 after nitriding at the first stage at temperatures below the eutectoid for the “Fe-N” system (591^0C) and subsequent oxidation in complex-containing water vapor at a temperature below the eutectoid for the “Fe-O” system are shown in Figure 3.



a) x1000



b) x1000

Figure 3. Microstructure of the nitrooxidized layer on steel 45. Nitriding - 580 ° C, 3 hours: a - oxidation - 550 ° C, 1 hour; b - oxidation 2.5 hours.

During oxidation, the introduction of oxygen-containing complexones (film-forming agents) into the composition of the saturating medium, although in small amounts, favorably affects the formation of a surface oxide layer above the nitride layer, forming a uniform dense thin barrier oxide layer. The surface oxide layer, in turn, enters as a barrier layer prevents the denitriding process, while the higher nitride phases dissociate towards the internal nitriding zone with an increase in the thickness of the low-nitrogen nitride phase due to the high nitrogen concentration in the nitride layer (Figure 3, a). Dissociation of the nitride phase is especially noticeable with an increase in the holding time during oxidation (Figure 3, b).

X-ray diffraction analysis of the treated samples was carried out, which confirmed the presence of a developed γ'-phase, ε'-phase of a carbonitride nature, ε"-an oxycarbonitride phase, and at an oxidation temperature of 5500C the oxide layer consists of one Fe_3O_4.

After oxidation, due to denitrogenation of the samples, up to a certain depth, the nitrogen content is absent and an increase in nitrogen along the nitride depth is detected, due to the diffusion of nitrogen in the nitride zone.

During oxidation due to oxygen diffusion, denitrogenation and decarburization occur simultaneously in a part of the lower nitride zone. A layer of oxycarbonitride character forms on the surface (Figure 4).

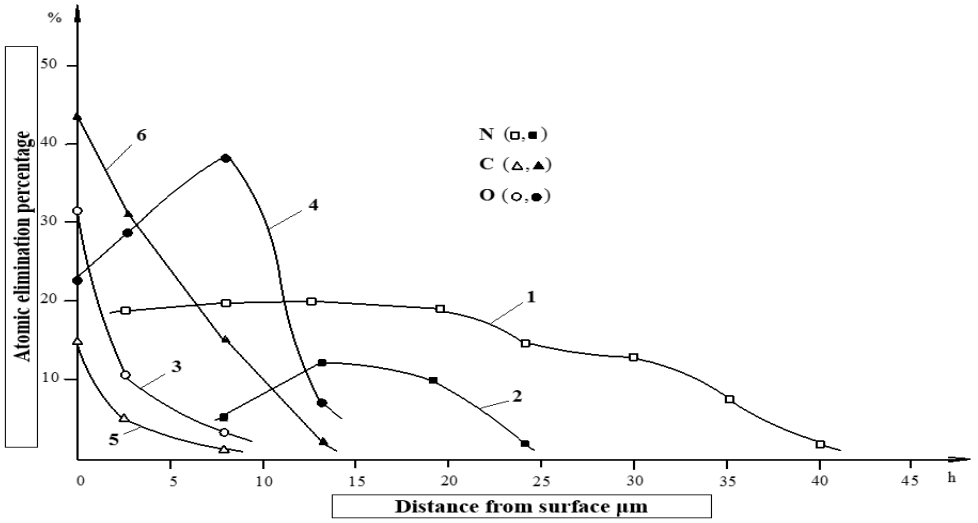


Figure 4. Distribution of elements in the nitride-oxide layer after nitriding: t=580^{0}C, τ=3 hours and oxidation t=550^{0}C, τ=1 hour (lines 1,3,5) and τ=2,5 hours (lines 2, 4.6).

CONCLUSION

Based on the results obtained, the following conclusions can be drawn:

- Nitride layer, for its further oxidation can be obtained at below eutectoid temperatures (below 591^{0}C) at nitrogen potential: $2<\pi_N<3$;

- During oxidation of the nitride layer, a dense oxide layer forms on the surface, which prevents denitrogenation;

- In the process of oxidation of the nitride layer, the thickness increases with the formation of lower nitride phases;

- In the process of nitrooxidation of structural and carbon steels, it is possible to obtain adjustable dense nitride-oxide layers, which are responsible for certain operating conditions.

ABSTRACT

This article is edicated to the mechanization of agriculture and aims to help farmers by softening the muddy crust formed after rainfall in field farming by using an energy andresource_saving aggregate softener. Structural soil crusts are relatively thin, dense, somewhat continuous layers of non-aggregated soil particles on the surface of tilled and exposed soils. Structural crusts develop when a sealed-over soil surface dries out after rainfall or irrigation. Water droplets striking soil aggregates and water flowing across soil breaks aggregates into individual soil particles. Fine soil particles wash, settle into and block surface pores causing the soil surface to

seal over and preventing water from soaking into the soil. As the muddy soil surface dries out, it crusts over.

KEYWORDS: *Mechanization, Aggregates, Preventing, Especially, Germination, Seedling Emergence.*

1. INTRODUCTION

Structural soil crusts are relatively thin, dense, somewhat continuous layers of non-aggregated soil particles on the surface of tilled and exposed soils. Structural crusts develop when a sealed-over soil surface dries out after rainfall or irrigation. Water droplets striking soil aggregates and water flowing across soil breaks aggregates into individual soil particles. Fine soil particles wash, settle into and block surface pores causing the soil surface to seal over and preventing water from soaking into the soil. As the muddy soil surface dries out, it crusts over.

Structural crusts range from a few tenths to as thick as two inches. A surface crust is much more compact, hard and brittle when dry than the soil immediately beneath it, which may be loose and friable. Crusts can be described by their strength, or air-dry rupture resistance.

Recent rain brings another challenge for farmers, especially in fields conventionally tilled last fall or early this spring. In addition to potential soil erosion and damages to soil structure rainfall can cause, there are after effects of the rain when the soil surface starts to dry. The potential problem is soil crust. Soil crust is a product of a weak soil structure and the absence of residue or cover crop to protect soil surface from the intensity of rainfall.

This could occur especially in intensively tilled fields where residue cover is not adequate, as well as with fine texture soils and soils with low organic matter content. These conditions could increase the potential for soil crust formation. Residue cover plays a significant role in reducing soil crust by absorbing the impact of rain drops that destroy soil surface structure. The destruction of soil structure impacts plant germination and seedling emergence for both cotton and soybean.

Soil crusting can also result in poor growing conditions and reduced water infiltration. Cotton seedling emergence can be a problem if a dense surface crust forms. In this situation, hypocotyl is broken when pushing up against a solid crust. Monitor high-risk fields for soil crusting, especially where plant emergence has not yet occurred, in order to avoid damage to seedlings.

This crust will be broken up just before planting time. When seed is placed into the ground, the surface of the soil is generally thoroughly tilled using various pieces of equipment so that the seedlings can have the best possible start. Just when the seeds are about to emerge, the crust over the top of the seed bed is again broken up so that the new seedlings can pop through the surface of the soil to the sunlight and air so valuable to the new plant. Then, just before the first irrigation which comes later in the season, a tractor will again pass through the field dragging some type of implement to break up the crust down in the furrows. If these key management functions are not carried out, the seedlings could suffer. A reduced payday at the end of the season could be the result.

Figure 1: Soil crusting in heavy clay soils will often crack open as the soil dries.

Crust is a hard layer that forms on the soil surface after heavy rains and irrigation. In Central Asia, almost all soils in irrigated farming areas are prone to hardening. The main reason for this is the extremely low granularity of these soils and the fact, that the soil aggregates are very resistant to water. After rain or irrigation, the top layer of soil thaws, hardens when it dries, and the surface cracks. Hardening has a negative effect on soil properties and the development of agricultural crops, slows down water permeability and air exchange in the soil, as well as accelerates the evaporation of soil moisture (up to 20-30%). In fields with very thick loam, the germination of grass is delayed for 3-5 days and the number of seedlings decreases.

The process of sediment formation depends on the mechanical composition, type, cultural condition, salinity, and so on. The sediment is mostly formed in irrigated gray and desert soils. Its thickness and hardness depend on the severity of the mechanical composition of the soil. Particularly in heavy sandy, loamy, salty brown soils and bald soils with a mechanical composition, the layer is thick and very hard. Salinization and salinization increase the tendency to form crusts. The thickness of the layer is 0.3-0.5 cm in light gray soils with light sand and loam, 0.8-1.5 cm in light and dark gray soils, 2.4-4.5 cm in weakly saline sandy and loamy soils; the weight of a layer of soil on one m2 reaches 50-70 kg. Applying organic fertilizers to crops, sowing of siderite crops, chemical reclamation, crop rotation, granulation of soils, use of artificial polymers and mulching materials, etc. Implement measures to improve the physicochemical properties of soil, prevent stratification. Takesbefore the seedlings emerge, the field is softened with the help of light storms or rotary mowers. To minimize the effect of tillage, the crop should be treated (mowing or cultivating) with soil compaction between rows.

2. Procedure of research

Research work is being carried out around the world to develop new scientific and technical bases of resource-saving technologies and technical means for softening the crust in the fields planted with agricultural crops. One of the important tasks in this direction is the development of a constructive scheme of working bodies and substantiation of technological processes, quality of work and development of resource-saving working bodies in the process of interaction with the soil. At the same time, it is necessary for the cotton cultivator to develop disk working bodies that soften the layer at the required level without damaging the cotton seedlings. Extensive measures are being taken in the agricultural production of the Republic to save resources, cultivate agricultural crops on the basis of advanced technologies and develop high-efficiency agricultural machinery [1,2]. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021 includes, among other things, “Modernization and accelerated development of agriculture, further improvement of the reclamation of irrigated lands, development of reclamation and irrigation networks, intensive methods of agricultural production, especially water and resources. Introduction of modern saving agro-technologies, use of high-yielding agricultural machinery,one of the important tasks in the implementation of these tasks.In particular, the maintenance of agricultural crops and the technical and technological renewal of mitigation equipment after rainfall is a topical issue today. [3].

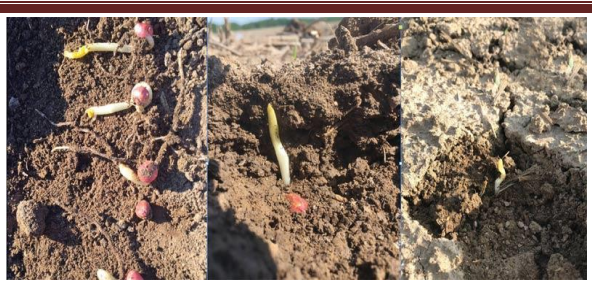

Figure 2: Sprouting of cotton in a stagnant field

Irrigated lands in cotton-growing areas are focused on natural-climatic and soil conditions, mechanical composition of soil, tillage technology, machine types and agro-technical requirements. In the early development of agricultural crops should be provided with soil, air, heat environment for the growth of young seedlings. The onset of spring rains prevents the young seedlings from growing, developing, and sprouting, that is, the rain turns the soil into a muddy layer and prevents the sprouting seedlings from developing by squeezing the roots. Our farmers try to create a comfortable environment by mowing the lawn, but it takes a lot of time and physical effort. Mechanized complex cultivation, on the other hand, takes a long time and prevents the fine compaction of the resulting hard soil, as well as the formation of lumps.

3. Results of research

The proposed utility model applies to the field of agricultural mechanization, in particular the process of primary processing between rows. The structure of the new device will consist of the following. A metal profile with a total length of 3.5 meters (1), 4 handles (2) are welded, one (3) working body is mounted on each handle. This means that when each working body processes cotton seedlings sprouted from one row, it is possible to further increase the number of rows with a total processing capacity of up to 5 rows. We determine the width of the unit depending on the power of the tractor. Tractors with 80-100 horsepower can handle up to 8 rows. The main part of the working body is mounted on small frames prepared by welding (4) with soil softening fingers (5). The softening fingers are attached to the small frame by means of rotating hinges or bearings. From the forward motion of the traction tractor, the softening fingers rotate and rub the fold (Figure2).

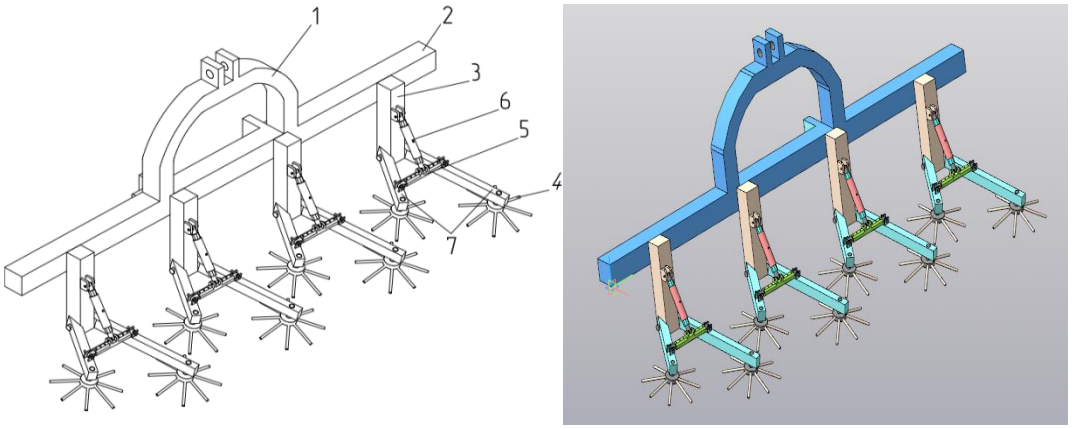

Figure3: Schematic diagram of the solidification device

As for the technology of operation of the unit, the device aggregated on the tractor TTZ-80 is adjusted for processing the grids by means of adjustable traction. It is necessary to ensure that the working body is parallel to the grid and lies flat on the ground, otherwise the quality of the processed field will not be good.

a)

b)

Figure 4: The appearance of the working bodies of the hardening device in the process of work.

It should be noted that the range of 0.18-0.48% damage to cotton seedlings meets the initial requirements. Therefore, on the basis of the above data, it can be said that the diameter of the toes should be in the range of 200-250 mm for quality softening of the layer at the required level with minimal damage to cotton seedlings. (Figure 3)

4. CONCLUSION

By using this device, the quality of work can be improved by reducing the consumption of metal, energy and fuel consumed in the process of softening the coating.

ON SOME CHARACTERISTICS OF REPEATING UNITS

Zukhra Yuldasheva*

*Researcher,
Institute of Language and Literature named after Alisher Navoi,
Academy of Sciences of UZBEKISTAN

ABSTRACT

The repetition concept is used to refer to the reuse of certain words and elements in order to reinforce, emphasize, or increase the language meaning. In repetition research it is suggested that research on these units dates back to the 5th century BC. In modern linguistics, repetitive units are mentioned as a means of forming a text. Some scholars consider repetitive units assesses as waste words, redundancy. Most educators, however, they put forward different views. They see repetition in education as a basis for learning and a means of communication. A unit that is repeated in a text or verbal thought communicates with the same elements in the brain and and try to justify the idea that it facilitates the understanding process. Especially, the poem's chorus, rhyme, and rediff repetition emphasizes that they are important units in ensuring that the text is remembered. The article discusses the repetition role in the environment, in our lives, in literary texts, and its importance in our communication.

KEYWORDS: *"Kholdorkhan" Epic, Repetitive Units, Epics, Lingvofolkloristic Approach.*

INTRODUCTION

The repetition concept is used to mention the reuse of certain words and elements in order to reinforce, emphasize, or increase the language meaning. Repetition and repetitive literature exist not only outside the text but also in the inter-body relations in the world around us. Even in every aspect of our lives we encounter it as a rewarding tool that provides consistency and eliminates complexity. İf we don't take into account the universe, we can always find the beauty around us. In textiles, both the lining and the pattern are the result of repetitive activities and procedures. Repetitive motifs in jewelry represent unique art works. Repetitive forms and rules makes the life complexities easy. Repetitive forms and concepts are quickly remembered. In short, more broadly, the sublime order that underlies the universe is based on repetition. From this point of view, it is clear that the repetition concept is not just a word repetition. İn a broad sense repetition is the the concept name and man and the universe existence.

The variety of types and functions of linguistic repetitions has recently attracted the attention of many leading Russian researchers I.V.Arnold, M.Y.Blokh, O.A.Dobizha, E.A.Ivanchikova, R.A.Vafeeva and others. Repetition as a reality of a functioning language system is considered by scientists from different positions. As a grammatical means of the language E.I. Ivanchikova,

L.V.Lisochenko and others, as a means of expressive-stylistic A.N.Kozhin, G.G.Khazagerov and others, as a violation of the language norm of I.V.Formanovskaya.

Repetition research suggests that the first known source about these units belongs to the Lithuanian Gorgias, who lived in the 5th century BC. (Tannen, 1989: 128) In modern linguistics, repetitive units are mentioned as a means of text forming. But not everyone agrees with this concept. Some scholars consider repetitive units to be words waste (Sienkiewicz 1984: 205) and redundancy (Casares 1959: 350). Many educators, however, take a different view. They see repetition in education as a basis for learning and a means of communication. They try to justify the idea that the unit repeated in the text or in the spoken word communicates with the same elements in the brain and facilitates the comprehension process. In particular, the poem's chorus, rhyme and rediffrepetition emphasizes that they are important units in ensuring that the text is remembered. In fact, such units are not wasteful or redundant units, but elements that ensure the text integrity.Repetitive units play a special role in overcoming so-called “background noise” inconvenience in pedagogy.That's why K. Weils emphasizes that duplicate units should not be taken from bad side. Here, the "background noise" concept refers to a situation that can be explained in a few words and phrases. It emphasizes the appropriateness of using a unit repetition known to the student or listener to get out of this situation. In this sense, the English linguist K. Weils argues that repetitive means can be a successful means of communication and a motivation element in communication. At the same time, he notes that the literature serves to demonstrate live speech style. (Weils 1997: 395)

Like other researchers, she considers the most common repetition to be a reprise, by which she understands a simple repetition of a word or a group of words immediately following each other. For example: *coeur battait battait tres fort a sa parole*. Repetition couples occupy important positions in a poem or phrase and combine two or more syntactic unity. These include: anaphora, epiphora, chain, cases of their combination, as well as a refrain.

The chain is a repetition, the first element of which ends the sentence, and the second begins the next, etc. For example:

Le ciel etait de nuit La nuit etait de plainte La plainte etait d'espoir.

British researcher D. Tannen noted that repetition in communication is a "convenient means of obtaining information": “Repetitive words are important tools for learning and remembering information.” D. Tannen also noted that repetition is an indispensable means of folklore. (Tannen, 1989: 137) There is an isotope term in chemistry. In recent years, the term isotope has also been used in research in textual linguistics. It is used to describe two or more similar elements relationship that form a common semantic center.

The units repeated in the following passages appear in different text parts, emphasizing the spatial “wedding invitation” breadth that is the text purpose, while enhancing the isotopic text nature:

I sent an application to the Turkmen people,

Listen to Holdorkhon's language,

Let the hatim go straight to the people of Chambil,

Let Beck Gurugli come to Holdor's wedding.

When a horse gallops,

Our people have the love of the state,

I told the people of Taka-Yovmit,

Holdorkhon has a big wedding.

Heard the cry of Holdorkhon,

I told everyone about the wedding, Yovmit-Taka,

Don't come to the big wedding with a handkerchief,

Gurugli crowned as the head.

The poor, the poor, the poor,

Anyway, that's it: I told the guys,

Crowds, don't drink beer,

Taka-Yovmitelni is a young man.[1]

The number of lexical repetitions used in the passage from the epic "Kholdorkhon" in Ergash Jumanbulbul oglu repertoire, a great representative of the Uzbek thought school, is as follows:

Nation (5), *Kholdorkhon* (4), *wedding* (4), *do not stay* (4), *have* (3), *Gulugli* (2), *horse* (2), *Taka-Yovmit* (2), *large* (2).

It is obvious that the repeated words serve to keep the rhythmic-intonational text aspect as a whole, while semantically emphasizing certain values and traditions. For example, the fact that the word nation is used the most in the passage indicates that in a sense, large-scale events have long been held as a group and held together. We believe that, the fact that the largest event in the region is a wedding, the proposals repetition and various assertions, in a sense, also reflects the national mentality associated with holding similar ceremonies.

In the text formation, repetitive units also serve to ensure syntactic parallelism and semantic coherence. (Korobeinikova, 1996: 32) One of the most important repetitions features is the ability to easily connect different points, to build a strong connection. Researchers also say that repetition is a means of maintaining the internal text harmony: “Perhaps the most notable aspect of repetition is to ensure that the tone within the text is consistent.” (J. Sülük, 1981: 323) when talking about the important repetition aspects, researchers often mention that repetitive units serve to draw the reader's attention to a particular text part.

Repetition in the literary text is always seen as a means of shaping the text, as a unit that enhances the expression effectiveness and completes the melody. What you need to pay attention to is the distance between the repeating units. The more orderly the repetitive elements, the more rhythmic and intonational the text. Usually, repeated words and other elements fill a rhythmically-semantically "empty" space. Close-up repetitions are designed to keep the text rhythmically active. Long-distance repetitions serve to clear, refresh, and strengthen the reader or listener memory. In addition, long-distance repetitions serve as a guide for the reader in the complex text. In this sense, long-distance repetitions form the text semantic and structural core.

The concept of repetition is used to refer to the re-use of certain words and elements in order to reinforce, emphasize, or increase the meaning of a language. Repetition and repetition exist not only in the literary text, but also in the inter-body relations in the world around us. We even encounter it in every aspect of our lives as a rewarding tool that provides consistency and eliminates complexity. Even if we don't take into account the universe, we can always find the beauty that is created around us. In textiles, whether you say fabric lining or pattern, it is all the result of repetitive activities and procedures. Repetitive motifs in jewelry represent unique works of art. Repetitive forms and rules ease the complexities of life. Repetitive forms and concepts are quickly remembered. In short, the broader order that underlies the universe is based on repetition. From this point of view, it is clear that the concept of repetition is not just the

repetition of a word. Repetition, in the broadest sense, is the name of the concept and existence of man and the universe.

Repetition in the literary text is always seen as a means of shaping the text, as a unit that enhances the effectiveness of expression and completes the melody. What you need to pay attention to is the distance between the repeating units. The more orderly the repetitive elements, the more rhythmic and intonational the text. Typically, repeated words and other elements fill a rhythmically-semantically "empty" space. Short-distance repetitions are intended to ensure the rhythmic activity of the text. Long-distance repetitions serve to clear, refresh, and strengthen the memory of the reader or listener. Long-distance repetitions also serve as a guide for the reader in the complex text of the text. In this sense, long-distance repetitions form the semantic and structural core of the text.

In a word, the role of repetition in the language of the epic is incomparable. According to observations, in the style of artistic speech and in the oratorical style, some types of repetitions appear in conjunction with other types of repetitions and with other stylistic devices. An example of syntactic repetition followed by lexical repetition has already been given above. The most common combination of various structural types of lexical repetitions. Anaphora is often combined with an epiphora, thus forming a ring. The pickup is often accompanied by a simple reinforcing repetition. Multi-union almost always entails syntactic repetition.

IMPACT OF SPORTS AND ENERGY DRINKS IN ATHLETES FOR PERFORMANCE BASED ACTIVITIES

Dr. Anjana Lohan*

*Associate Professor,
Head, Deptt. Of Physical Education,
S.D. Mahila Mahavidyalaya,
Narwana, Jind, Haryana, INDIA

ABSTRACT

Athletes use sports drinks, also known as electrolyte drinks, as a functional beverage that helps them replenish lost fluids, electrolytes and energy before, during and after a workout or competition. However, the effectiveness of sports drinks in improving athletic performance has been called into question. When taken excessively or incorrectly (as with the majority of nutritional supplements), they may be harmful to one's health or performance. Certain people may be allergic to the beverages or some of the components, so they should avoid them. Sports drinks are a great method to stay hydrated while also satisfying your thirst. The electrolytes and carbs in sports drinks help you recover faster after an exercise than ordinary tap water. Additionally, they may include stimulants such as caffeine or even protein to help you perform better throughout your workouts. Exercise and high-energy activities such as sports enhance endurance and performance when sports drinks are consumed. You'll recover more quickly and have more energy the rest of the day if you drink a sports drink after your exercise.

KEYWORDS: *Sports Drink, Sports Aqua, Sports Activities.*

INTRODUCTION

Sports drinks, on average, have a sugar content that is two-thirds that of a soda. Even with the added sugar in sports drinks, the daily sugar allowance for children is still too high. The electrolytes in sports drinks are touted, but they are of little use if the body is already getting them through proper diet. Electrolytes are used to replenish the body's supply of ions, which are used in muscle contractions and nerve impulses throughout the body. Water is a better transporter for salts than any other beverage, thus the efficacy that sports drinks claim is unneeded for normal physiological functioning and may damage owing to the high sugar content. Electrolytes are also known as "salts" in the scientific community.

The salt and sugar contents in isotonic sports drinks are comparable to those found in the human body. The salt and sugar content in hypertonic sports drinks is greater than in human blood. Unlike human blood, hypotonic sports drinks don't have as much sodium or sugar as normal.

Most sports drinks include between 4 and 5 heaped teaspoons of sugar per eight-ounce portion (13 to 19 grammes per 250 ml) and are thus roughly isotonic.

There aren't enough sources in this area to support what you're saying. This article may be improved with citations from trustworthy sources. It is possible to delete questionable content by citing the source.

Figure 1 : Sports Drinks and Water

Sweating and spending energy cause athletes who are actively training and competing to lose water and electrolytes. However, according to University of New Mexico exercise physiologist Robert Robergs, who researched Gatorade, unless someone is exercising or participating in a sports event for more than 90 minutes, there is no need to drink anything with too much sugar and electrolytes. Robergs says. This may create "gastrointestinal issues or additional disruption of fluid balance," according to the Australian Institute of Sport, and can also lead to salt-induced cramps.

Hong Kong shoppers bought Lucozade (on the left). It was first promoted as a sick person's energy drink in the UK in 1927, according to pharmacist William Walker Hunter. For athletes who have been active for more than four hours, a sports drink containing sodium may be suitable to aid recovery after an intensive and extended period of training or competition to prevent hyponatraemia (low sodium).

Sports drinks, which offer a significant amount of energy from sugars in the form of calories, claim to help athletes perform better and last longer. Most of the 431 marketing claims of performance improvement that were examined by Matthew Thompson and colleagues from the University of Oxford's Centre for Proof-Based Medicine provided no evidence. In the case of GlaxoSmithKline's Lucozade, 174 sources were mentioned, but only three studies were judged to be of good quality and low bias risk by Thompson's team. Those rigorous trials that did indicate an increase in endurance were "of limited significance to most individuals since the assessments were on top athletes," according to the authors. According to Thompson, consuming these drinks "may totally offset exercising more, playing football more, going to the gym more" for the overwhelming majority of individuals.

Drinks advertised as "soft drinks" are what they are: soft drinks. According to the soft drink industry's reaction to the Oxford study, "Sports drinks can encourage individuals to exercise more by enabling those engaging in sport to perform better and recover more rapidly.

Weight gain may occur if you consume sports drinks containing carbs without engaging in strenuous activity. According to research presented at the Obesity 2012 scientific conference by the Obesity Society, adolescents gained an average of 3.5 pounds (1.6 kg) over the course of two years for every bottle of sports drink they drank on average. Scientist Alison Field of Harvard Medical School was startled to discover that "Sports drinks had an even greater connection with weight gain than sugared sodas," according to the study's main author. According to a University

College London research published in August 2019, the high sugar content in sports beverages was contributing to elite athletes' increased risk of tooth decay.

Caffeine is an ingredient in several of these beverages, and large doses may be hazardous. Caffeine, on the other hand, may be helpful if taken in moderation (but other negative effects may still arise).

Traditional Use of Sports Drinks

Athletes drank low-alcohol beer to replace their bodies' water, minerals, and vitality in the 19th and early 20th centuries. The beer was a better choice since it was made using 780anitized water that was boiled throughout the brewing process. However, research shows that even a little amount of ethanol affects endurance performance by inhibiting hepatic glucose production and impairing psychomotor abilities including response speed, hand-eye coordination, and balance.

Energy drink

Figure 2 : Energy Drinks

Caffeine, the primary stimulant in energy drinks, is promoted as offering both mental and physical benefits (marketed as "energy", but distinct from food energy). They may be carbonated or not, and sugar, other sweeteners, herbal extracts, taurine, and amino acids can all be included. They can also be left unflavored. As a class, they fall under the umbrella term "energy foods," but they are different from the broader term "sports drinks," which are marketed to improve athletic performance. This beverage category has a large number of manufacturers and variations.

Natural caffeinated beverages such as coffee, tea, and others are not often categorised as energy drinks. Coke and other soft drinks with caffeine aren't energy drinks either. Caffeine and other stimulants may be found in alcoholic beverages like Buckfast Tonic Wine. The Mayo Clinic says that a daily intake of 400 mg of caffeine is safe for a healthy adult. These findings were backed up by a panel of the European Food Safety Authority, which likewise found no safety issues with people consuming up to 400 mg of caffeine daily. It's the same as 4 cups of coffee (90 mg each) or 2 1/2 standard cans of energy drink (160 mg each/80 mg per serving), according to the ESFA's calculations.

Caffeine and sugar are the primary components in energy drinks, but there is little or no evidence to support the claims made for the other ingredients. Caffeine is mainly responsible for most of the benefits of energy drinks on cognitive function, such as enhanced attention and response time. According to other research, these gains in performance are due to the synergistic effects of the active substances. The most common claims made in energy drink advertising are about enhanced muscular strength and endurance, however they are unsupported by scientific evidence. Many health concerns have been linked to energy drinks, including higher injury rates when coupled with alcohol and cardiac and mental problems if used excessively or repeatedly. Youth, caffeine-nave or caffeine-sensitive individuals, pregnant women, competitive athletes, and those with underlying cardiovascular disease are at risk of problems from energy drink use.

Caffeine and other chemicals in energy drinks are promoted to youngsters. These beverages offer health advantages in addition to the caffeine's effects. The majority of medical professionals believe that caffeinated energy drinks enhance alertness. Many students in high school and college mix alcoholic beverages with energy drinks to get the party started. Recently, the alcohol industry has come under fire for its promotion of alcohol and energy drinks as a unitary product. When these two factors are present in college students, it increases their chance of developing alcohol use disorders and other health problems.

Even while energy drinks are often marketed as having distinct advantages, there is no solid evidence to support the claim that other components offer additional benefits. Supplements in energy drinks may claim to offer health advantages like vitamin B12, however no scientific evidence has been found to support the idea that supplements may improve health in otherwise healthy individuals. For example, Red Bull and Monster have marketed their energy drinks by claiming that they "give you wings," are "scientifically designed," or are a "killer energy blend." With manufacturers sponsoring or advertising at extreme sports events and music festivals and targeting a young audience via social media platforms, the marketing of energy drinks has been especially aimed towards adolescents.

Energy drinks are often combined with alcohol and enjoyed in social situations as a prepackaged caffeinated alcoholic drink, a mixed cocktail, or simply as a drink drunk with alcohol.

Austrian Power Horse energy drink packaging includes a warning about caffeine. Caffeine and sugar are the primary components in energy drinks, but there is little or no evidence to support the claims made for the other ingredients. Caffeine is mainly responsible for most of the benefits of energy drinks on cognitive function, such as enhanced attention and response time. There is minimal scientific evidence to back up claims of enhanced muscular strength and endurance in energy drink advertising.

The European Food Safety Authority deems a caffeine consumption of 400 mg per day (for an adult) to be safe (EFSA). Nervousness, irritability, insomnia, increased urine, irregular heart rhythms (arrhythmia), and dyspepsia are all side effects of caffeine intake higher than 400 mg. Pupil dilatation has also been linked to heavy drinking. [a reference is required] For food, unlike medicines, the caffeine dose is not needed to be listed on the product label. Nevertheless, the caffeine level of most beverages is included on the label regardless of this, and some activists are asking the FDA to alter this practise.

Increased alcohol-related damage is possible when caffeine and alcohol are consumed together. Alcohol may be disguised by energy drinks, leading a drinker to overestimate their degree of drunkenness. The combination of a stimulant (caffeine) and a depressant (alcohol) delivers conflicting signals to the neurological system and may lead to increased heart rate and palpitations since both substances are diuretics. Despite the fact that many individuals choose to consume alcoholic energy drinks in order to combat alcohol intoxication, others do so in order to mask the taste of alcohol in their mouths. But the EFSA determined in 2015 that "Consumption of additional components of energy drinks at amounts typically seen in such beverages would not alter the safety of single doses of caffeine up to 200 mg." In addition, the EFSA says that drinking alcohol, which results in a blood alcohol level of approximately 0.08 percent, will not impact the safety of caffeine dosages up to 200 mg. Even at this doses, caffeine will not be able to conceal the subjective feeling of drunkenness.

High caffeine and sugar intakes from energy drinks, especially in children, adolescents, and young adults, may have negative health consequences. Teens' sleep habits may be disrupted and their risk-taking behaviour may rise if they consume too much energy drinks. If you consume too many energy drinks, you run the risk of developing cardiac issues like arrhythmias and heart attacks and mental health problems like anxiety and phobias. Sugar and caffeine-containing

sports beverages have been linked to athlete fatalities in Europe. More study and government control are required, according to studies that show caffeine concentration is not the sole issue and that the combination of additional chemicals in energy drinks makes them more hazardous than beverages that simply include caffeine as a stimulant.

Visits to the emergency department (ED) may be on the rise, according to recent data. Energy drink use was associated with 1,494 emergency department visits in the United States in 2005; however, by 2011, energy drink use was connected to 20,783 trips to the hospital. This spike in emergency room visits was driven mostly by males, who were more likely than women to seek medical attention. According to current research, unpleasant responses to alcoholic beverages are the leading cause of visits to the emergency room. There were 14,042 hospitalizations in 2011 as a result of energy drink use. These caffeinated beverages, when abused, lead to a large number of trips to the emergency room. A total of 6,090 trips to the ED were made because to the beverages' overuse or abuse by 2011. The researchers found that 42 percent of patients had combined energy drinks with another stimulant, whereas the remaining 58 percent had just taken the energy drink. Energy drinks, according to some research, may serve as a gateway drug.

Caffeinated energy drinks are not recommended for children by the American Academy of Pediatrics.

Variants

In the world of energy drinks, energy shots are a specific subcategory. Energy shots are offered in smaller 50ml bottles, as opposed to the larger cans or bottles that most energy beverages come in. Caffeine, vitamins, and other useful components included in energy drinks may be found in concentrated form in energy shots, making them comparable to their larger-sized counterparts. Instead of encouraging consumers to drink a full can of high-calorie energy drinks, the promotion of single-serve energy shots emphasises the convenience and availability of the low-calorie "instant" drink in one swallow (or "shot"). 5-hour Energy, a popular energy shot, combines B vitamins and caffeine at a dosage equivalent to that of a cup of coffee.

Red Bull and other caffeinated beverages such as rum and coke are frequently combined with energy drinks like Red Bull to create Vodka Red Bull, which has a higher caffeine content than rum and coke. The Jägerbomb or the F-Bomb – Fireball Cinnamon Whisky and Red Bull — are two examples of this shot's bomb configuration. Some nations also sell a broad range of caffeinated alcoholic beverages. Products made in the United States Before the U.S. outlawed caffeinated alcoholic beverages in 2010, Four Loko and Joose were the first to mix caffeine with alcohol.

TABLE 1 : KEY PARAMETERS AND FACTORS

	Gatorade	**Staminade**	**Powerade**	**Gatorade Endurance**	**Powerade Zero**	**Maximus**
Energy	1030kJ	1060kJ	1290kJ	1080kJ	68kJ	1300kJ

Potassium	225mg	186mg	141mg	392mg	n/a	300mg
Magnesium	n/a	29mg	n/a	14mg	n/a	40mg
Calcium	n/a	–	n/a	27mg	n/a	20mg

Caffeine, B vitamins, carbonated water, and high-fructose corn syrup or sugar are common ingredients in energy drinks (for non-diet versions). There are also a variety of ginseng, maltodextrins, inositols, carnitines, creatines, glucuronolactones, sucraloses, and other supplements including guarana, yerba mate and açа as well as taurine and ginkgo biloba. Non-diet energy drinks include sugar, which is a source of dietary energy; however, there is no evidence to suggest that the inclusion of additional components has any negative health effects.

Caffeine levels in energy drinks in the United States vary from 40 to 250 milligrammes (mg) per 8 fluid ounce (237 ml) serving. According to the FDA, the safe daily dose for adults is 400 mg, while the hazardous daily dose is 1200 mg.

Energy drinks are popular among teenagers and young adults all around the world. According to one research, young people aged 20 to 39 take 227 milligrammes of caffeine daily, compared to their non-consumer peers who only consume 52.1 milligrammes of caffeine daily.

Trends in Market Reports

Global sales of energy drinks amounted to about 44 billion euros in 2017. By 2021, it is expected that the US energy drink industry will be worth $19 billion. Hispanics and 18–35-year-old men fueled the category's expansion through 2016. While energy drink formulas continued to be refined in 2017, producers lowered the sugar level and caloric content, while adding "clean" labels to indicate the usage of all-natural or organic components, as well as flavours and additives that may influence mood.

Regulations

A case against the ban was filed in 2004 and won by the European Court of Justice. For a while, Red Bull was prohibited in Norway, however this ban has since been lifted. Selling in Norway was made legal in May of that year. The vitamin B6 content has been decreased in the Norwegian version. The drink was studied in the UK, but only pregnant women and children should consume it.

Colombia banned the sale and marketing of energy drinks to children under the age of 14 in 2009 under the Ministry of Social Protection. Energy drinks were declared "inappropriate in a Muslim culture" by Chechnya's President Ramzan Kadyrov in November 2012, who ordered his administration to draught legislation prohibiting their distribution as a kind of "intoxicating substance." In 2012, one person died and 530 others were admitted to the hospital as a result of "poisoning" from the drinking of such beverages, according to Kadyrov's claims. Gennady Onishchenko, Russia's Chief Sanitary Inspector, had a same opinion.

A school in Hove, England asked local businesses not to offer pupils energy drinks in 2009. "This was a preventive step," said headteacher Malvina Sanders, "since all research indicates that drinking high-energy beverages may have a negative effect on young people's ability to focus in class." A deal was worked out by the school and signs were put up at their neighbourhood Tesco urging kids not to buy the items they were selling. A school in Oxted, England, took similar steps, banning pupils from drinking alcoholic beverages and sending letters home to parents.

Energy drinks may only be sold and manufactured in specific countries. 'Formed caffeinated beverages' (energy drinks) in Australia and New Zealand are controlled by the Australia New

Zealand Food Standards Code, which sets the caffeine content limit at 320 mg/L (9.46 mg/oz) and the caffeine level in soft drinks at 145 mg/L (4.29 mg/oz). Caffeine labelling is required for all guarana-containing foods in Australia, and the labels on energy drinks there advise people not to drink more than two cans a day of the product.

Some energy drinks, such as Monster and Rockstar, have reportedly rebranded their goods as beverages rather than dietary supplements as of 2013, according to reports in the United States. Food stamps may be used to buy certain beverages, which are exempt from F.D.A. reporting rules for fatalities and injuries and can be bought with them, although the cans must identify the contents.

By banning the sale of energy drinks under the age of 18, Lithuania became the first EU nation to do so. An investigation into the popularity of energy drinks among teenagers prompted the Baltic state to impose the ban. The AFP estimates that 10% of school-aged Lithuanians use energy drinks on a weekly basis.

In June 2016, Latvia prohibited the sale to minors of caffeine- or stimulant-containing energy drinks, such as taurine and guarana. Many British shops began banning the sale of energy drinks with more than 150 milligrammes of caffeine per litre to those under the age of sixteen in January of this year.

Alcoholic energy drinks (also known as caffeinated alcoholic beverages) are illegal to sell in certain areas because of the prepackaged nature of the drinks. Marketers may alter their goods' formulas in reaction to restrictions.

Prominent Sports Drinks

- Commercially available sports drinks include:
- 100plus
- 10-K Thirst Quencher
- Accelerade
- All Sport
- Aquarius
- Bodyarmor
- Herbalife H3O Pro
- Isostar
- Lucozade Sport
- Muscle Milk
- Pocari Sweat
- Powerade
- Sqwincher
- Gatorade
- Vemma Thirst
- Vitamin Water

CONCLUSION

All athletes must be well hydrated in order to perform at their best. Athletes who establish a regular routine for staying hydrated recover faster and have more energy. An athlete's body can transfer nutrients and oxygen to active muscles, reduce lactic acid buildup, eliminate nitrogenous waste, and regulate body temperature better if they're well hydrated. Slight sweat weight loss may have a negative impact on an athlete's performance because of the reduced blood volume and less-than-optimal use of nutrients and oxygen that results. Sports drinks have undergone considerable testing and are usually considered superior to plain water for physically demanding individuals. Due to the efficiency with which energy is transferred to tired muscles during intense aerobic activity, carbohydrate is the body's preferred fuel source (rather than protein or fat). In order to reduce stomach discomfort and increase intestine absorption for the supply of energy to muscles, most sports drinks are designed to provide carbs, electrolytes, and water.

ABSTRACT

The World Wide Web Consortium (W3C), an international standards organization for the web, promotes Semantic Web. It's a more advanced version of the existing web that makes it simpler to find, reuse, combine, and distribute data. As a result, the Semantic Web is seen as a cross-platform integrator of information, data applications, and frameworks. Today's big data is often referred to as having three Vs: volume, variety, and velocity. The term "variety of data" refers to how to cope with diverse data formats and a large number of distinct data sources. As a result, large data variety challenges are critical for resolving a wide range of real-world issues. The semantic web is used as an integrator to combine data from multiple sources and formats, such as online services, relational databases, and spreadsheets. Because of the variety of the data, this task poses a number of challenges that may not be completely resolved with the current approach. This article attempts to concentrate on the many difficulties that come with integrating data from various kinds of sources, as well as how various semantic web technologies and tools are utilized to bring disparate data together.

KEYWORDS: *Big Data, Disparate Data, Information Extraction, Semantic Web, World Wide Web.*

42. INTRODUCTION

Big data is described as having three key characteristics: volume, diversity, and velocity, as shown in Fig. 1. The term "volume" refers to the problem of managing large data sets, which usually necessitates the use of a cloud-based platform. Velocity refers to handling continual gushing information, such as video feeds, when storing all information for later preparation may be challenging. Variety refers to the ability to manage a wide variety of sources, as well as different information layouts and large numbers of sources. A major portion of the work on

massive data has focused on volume and speed; nevertheless, concerns of diversity are as important in dealing with a range of real-world problems.

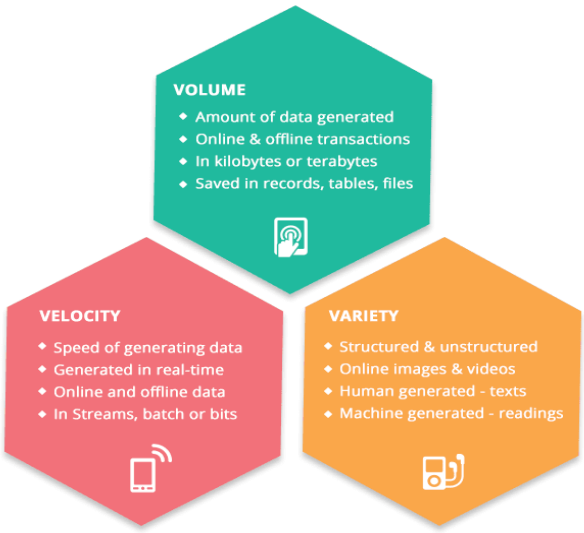

Fig. 1: Illustrates the 3Vs of Big Data[1].

Data integration is complicated by the diversity associated with large amounts of data. Huge amounts of data come from a number of sources, including social media streams, employee-created records, email systems, and business apps. Combining all of that data and organizing it so that it can be used to create reports may be very difficult. Although vendors provide a variety of ETL and data integration solutions to make the process easier, many businesses claim they have not yet addressed the data integration problem. Fig. 2 depicts a general data integration process.

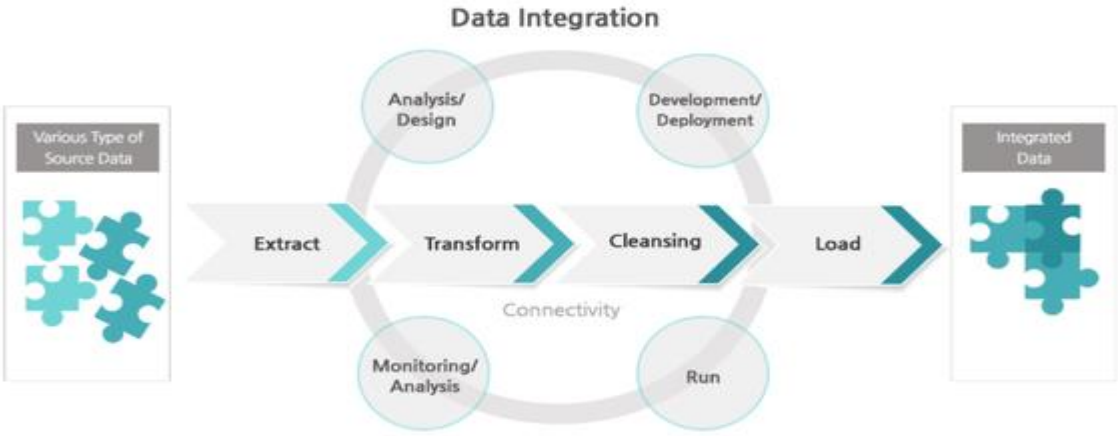

Fig. 2: Illustrates a general Data Integration Process[2].

Data integration is the process of enabling users to access, distribute, and utilise data across whole companies while maintaining its integrity and quality. It also allows changes to information stored in one source to be mirrored in many sources in real time. Big Data may be collected from a variety of sources, including spreadsheets, online services, relational databases, and more, and it can be in a variety of formats, including logical and hierarchical data.

Data integration allows big data to be realized. Data integration enables businesses to gather and clean large amounts of data originating from various frameworks for analysis by allowing access to information stored in various information stockrooms, mapping changes from one endeavor application to the next, and delivering real-time data to prospective clients.

Aside from big data analysis, data joining enables a variety of business advantages, including a 360-degree view of datasets, faster coordinated effort across entire organizations, and greater adaptability in selecting project applications and frameworks, as well as streamlining and automating business functions.

43. LITERATURE REVIEW

D'Aquin and Noy examined the features, content, volume, search techniques, potential application exploitation, and technological infrastructures of eleven ontology libraries [3].

A great deal of research has been done in the subject of ontologies. As part of their research, Noy and Hafner looked at a framework for comparing ontologies [4]. In order to determine the necessity for reusability, they looked at aspects such as design process, taxonomy, concept structure, axioms, inference techniques, applications, and contributions across a number of ontologies.

Ahmed et al. want to focus on the outcomes of integrating Big Data and Semantic Web, how Semantic Web makes Big Data smarter, the difficulties and potential of Big Data and Semantic Web, and the relationship between them, before ending with the integration's future route [5]. In recent years, large and complex amounts of data have been created, making traditional data processing systems difficult to handle. With the emergence of the Internet, the volume of information generated and made available skyrocketed. The World Wide Online Consortium W3C, an international web standards organization, popularized the Semantic Web. It's a more advanced version of the existing web that enables finding, reusing, combining, and disseminating information more easier.

Pasquier utilized a test example of biological data integration to show that when Semantic Web Technologies mature, they may be leveraged to build large applications [6]. Semantics has played a key part in Big Data integration. For example, Knoblock and Szekely translated a variety of data sources (represented in XML, KML, JSON structured text files, or databases) into a shared domain ontology that allowed for data integration, reasoning, and processing [7].

Flouris et al. addressed the need for a uniform nomenclature in the ontology community. They studied ontology change and came up with a consistent nomenclature [8].

Brank et al. looked at current ontology assessment methods, dividing them into layers such as lexical, syntactic, and structural [9].

44. DISCUSSION

44.1. Challenges of Integrating Big Data:

Big Data is a broad phrase that refers to large, complicated data volumes for which traditional data planning tools are insufficient. The integration of this massive informative index is very complex. Information creation, analysis, capture, search, sharing, representation, data storage, and privacy are some of the issues that may arise throughout this reconciliation.

44.1.1. Data Management:

One of the most essential aspects of integrating big data is data management. Data management becomes challenging when there is a large amount of data. NoSQL databases may be utilized to circumvent these issues. These databases are modern alternatives to conventional relational databases, and they provide excellent performance for a variety of large data applications. These databases are based on the key-value pair idea, allowing them to cope with large amounts of data in a short period of time.

44.1.2. Bad Data:

Data quality is the most important concern in any data integration solution. Organizations must clean up inheritance data prior to the change and joining, or they will almost certainly face honest-to-goodness data issues later. Legacy information pollutions exacerbate the problem since they are designed to target high-volume information customers. If this data is degenerate, it will make decisions along these lines as well. During the time spent cleaning data for usage by the integrated framework, it's not uncommon for new information quality problems to arise.

44.1.3. Lack of Skills:

Customers are migrating from conventional relational databases to new information processing systems such as NoSQL databases, in-memory analytics, and Hadoop as a result of the introduction of new technologies in the market. In fact, there is a scarcity of necessary talents for big data breakthroughs on the market. In the marketplaces, there are an average number of masters accessible to work on these systems that handle massive amounts of data.

44.1.4. Transmission of Data into Big Data Structure:

Various individuals have shown an interest in separating massive data accumulations for a notable data platform. They may also overlook the adaptability of data and information entry, transfer, and movement from a wide range of sources, as well as the subsequent stacking of this data in a large data stage. The wonderful aspects of data transfer, such as getting there and stacking, are only pieces of the exam.

44.1.5. Extracting Information:

The most practical use cases for big data include data availability, increasing current data accumulating, and also enabling access to end-clients via business knowledge instruments with the actual goal of data disclosure. It becomes a test in massive data coordination to assure data availability to data clients at the correct moment.

44.1.6. Synchronization Data Sources:

When data is imported into large data stages, we should be aware that information copied from a variety of sources at various rates and schedules might quickly deviate from the beginning structure. This ensures that data gathered from one source does not become outdated when compared to data gathered from another source. It also deduces the interdependence of data definitions, ideas, and metadata. The typical data administration and data circulation emphasis, as well as the collecting of data change, extraction, and motions, all contribute to the risk of data being unsynchronized.

44.1.7. Other Challenges:

Other challenges that may arise during data integration include the large volume of data, the cost of arrangement, the dependability of information, and the pace of change of data. Actually, it's more of a test to practice handling a large volume of data with practical speed, with the essential goal of getting the info to the right client at the right time. The approval of data collection is also completed when trading data from one source to the next or to buyers.

44.2. Semantic Web:

Today's data frameworks must identify the heterogeneity of information stored in many self-ruling information sources. The use of the World Wide Web as an all-encompassing platform for exchanging data, in particular, has profoundly altered our perceptions of information access and control. We believe that the unambiguous introduction of information semantics will stimulate information interoperation in a range of information control activities, based on the semantic web's perspective.

The semantic web aims to provide machine-understandable information on the internet. It's made up of two standout components: web ontologies and data annotation. Despite the fact that the development of an ontology, inference engine, and various segments is required for the recognition of the semantic web, the rule of the semantic web advises us that information semantics is to set up and maintain the correspondence from information to the subject is planned.

44.2.1. Semantic Data Integration:

Semantic information integration, on the other hand, is a method of combining data from disparate sources and integrating it into essential and meaningful data through the use of semantic technology. As a business grows in size, so does its data. Intradepartmental or application-specific information storehouses quickly arise without the proper information management system, obstructing efficiency and participation.

Semantic Data Integration is a solution that goes beyond traditional enterprise application integration solutions. It makes use of information-driven engineering, which is based on a well-established paradigm for information distribution and sharing, the Resource Description Framework (RDF). This system communicates, stores, and distributes heterogeneous information from an organization, such as structured, semi-structured, and unstructured data. Because the information structure is transmitted through links within the material, it is not bound by the database's structure and does not go out of date as the content evolves. The following are some crucial phases in the semantic data integration process.

i. Creating an Application Profile (RDF Shape) that reflects the last dataset's desired kind.

ii. Repurposing current ontologies and creating new ones when needed.

iii. Making full use of the available Linked Open Datasets in the area.

iv. Creating a simple, reasonable, and useful URL approach.

v. Performing the integration using a variety of transformation and ETL technologies that are available.

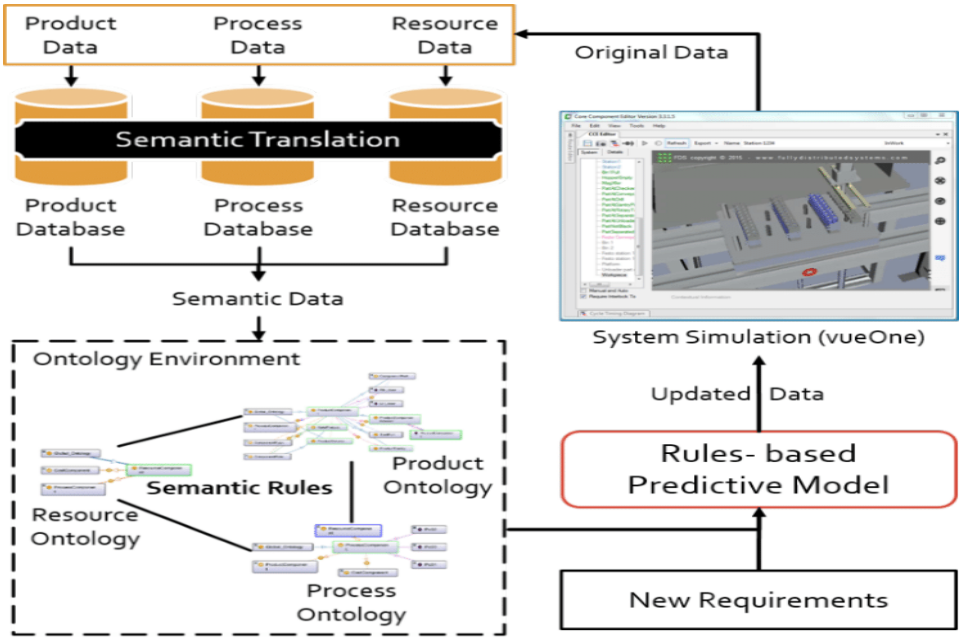

Fig. 3: Illustrates Ontology-based Semantic Data Integration Framework[10]**.**

Organizations require a set of easy-to-use semantic integration devices to go through the entire semantic information integration lifecycle. Clients may quickly design information handling activities and integrate a massive volume of data using semantic integration tools. Fig. 3illustrates ontology-based semantic data integration framework.

There are two main tasks involved in data integration. The first is homogenizing contrasts in diagrams and classifications used to communicate information at the schema level. The second method, information-level integration, entails identifying data in multiple informational collections that allude to a same certifiable material. Several writers investigate the topic of structural and semantic heterogeneity in the big data integration process. To tackle various research difficulties in the integration process, they suggested a large data semantic model based on ontology, which they developed by integrating semantic web technologies and creating ontologies amongst semantic models to solve the problem of incomprehensible data. They built a Key/Value storage model based on ontology to tackle the challenge of heterogeneous data storage. In a case study, Knoblock et al. developed a novel system named Karma that tries to tackle the variety problem by utilizing semantic technology to combine many types of Big Data sources[11].

Starting with the importation of various types of data sources, cleaning, modeling, and its issues, and ending with the integration process, a thorough description of the many processes has been provided. To overcome integration problems, the suggested system employs semantic RDF technology. For example, at the schema level, recognizing the same things in various datasets. Only certain types of structural and semi-structural data sources are validated by the system. According to Torres et al., emotional and sentimental analysis of social networks in the financial domain using a combination of social networks (Twitter), semantic financial ontologies (FIBO), and other assets that provide uniform vocabulary to express emotions and sentiments in a proper format[12]. Different data from Twitter, such as emotions, views, and actions, combined with FIBO and other data assets give a deeper knowledge of various groups, which might be useful in the financial arena. The job is completed in a legal and orderly manner, and the suggested framework is thoroughly explained. There is no evaluation or approval of the recommended techniques, and the conclusion is broad and does not clearly reflect the benefits of the proposed strategy. Consider a patient in the medical profession who requires a tailored health-care service design. To meet this need, a medical services framework must establish a new basis that allows for the direct distribution of patient information under the supervision of an expert. On the other hand, the condition would allow health-care delivery systems to make better judgments regarding their patients based on information from all of them. The study presents and investigates a Big Data and Semantic Web-based approach to Personalized Medicine. As part of smart data, Big Data can access and process a large quantity of homogenous and heterogeneous information on each individual patient. Because information is frequently unorganized, Semantic Web Technologies become maybe the most significant component and are used to explain various concepts.

45. CONCLUSION

Big Data nowadays is extremely varied, originating from a variety of sources that include organized, semi-structured, and unstructured data. Many companies want to combine this disparate data in order to conduct critical operational and analytical tasks on it. However, it is important to keep in mind that this integration may confront several hurdles during the process. This review article examines some of these difficulties and the role of the semantic web in addressing them through semantic data integration. This paper's future work will provide a new paradigm for integrating heterogeneous huge data sets utilizing semantic web technologies.

Email Id- drvarun.engineering@tmu.ac.in

ABSTRACT

Water electrolysis is a relatively new technique for hydrogen generation, having been developed about two centuries ago. This paper examined the incident, situation, and importance, as well as the history, present, and future of different water electrolysis methods. Thermodynamics, energy requirements, and efficiency of electrolysis processes are discussed in this paper. The effects of alkaline water electrolysis, polymer electrolysis membranes, and high temperature electrolysis are discussed and contrasted. Water electrolysis has a limited proportion of the hydrogen generation market because to its high cost, extensive maintenance, poor durability and stability, and low efficiency when compared to other existing technologies. Current water electrolysis technology and expertise are examined and evaluated to see where changes and development are needed for hydrogen generation. The energy requirements, practical cell voltage, process efficiency, temperature and pressure effects on potential kinetics of hydrogen production, and the effect of electrode materials on traditional water electrolysis for Alkaline electrolysis, PEM electrolysis, and heat electrolysis are all examined in this review paper.

KEYWORDS:*Electrolyte, Electrode, Electro Catalyst, Hydrogen Production, PEM, Water Electrolysis.*

INTRODUCTION

Many greenhouse gases, such as SOx, NOx, CO2, and CO2, are released into the atmosphere as a result of hydrogen generation by hydrocarbon fuel sources, which may have severe consequences for the environment. As a result, clean technology is needed for hydrogen generation, which will be accomplished if hydrogen is generated from renewable sources such as water electrolysis, with no emissions of SOx, NOx, CO2, or CO, as well as the realization of a "hydrogen economy." In reality, several significant non-fossil fuel based technologies such as water electrolysis, photo catalysis, and thermochemical cycles are used to produce hydrogen. Solar and wind energy are also viable options for producing hydrogen via water electrolysis, which is a low-cost, high-purity, and environmentally friendly technique[1].

Concerning environmental effects of various hydrogen generation methods, no clear conclusion on the optimal technique can be made based on these single score findings. Such comparisons

are only possible if the weighting factors and single score computation assumptions are same. For all of the technologies under study, techniques are used. Aside from that, comparing specific effect categories (e.g., Individual environmental emissions (as defined by CML) or Compared to comparing single score values, this method is more accurate[2].

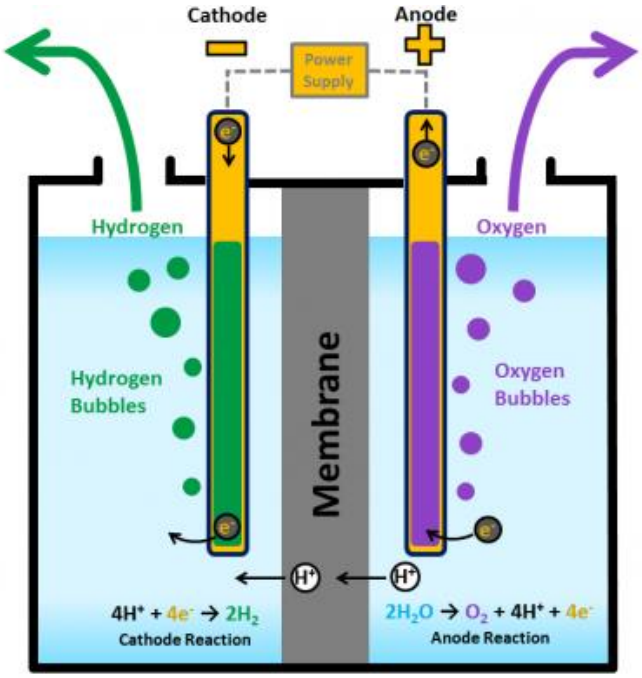

Figure 1: Illustrate the diagram showing the water Electrolysis

A DC electrical force producer is connected to two anodes, or plates, which are submerged in water and made of an inert metal, such as platinum or iridium. At the cathode (where electrons enter the water), hydrogen will appear, whereas oxygen will appear at the anode. If faradaic productivity is perfect, the amount of hydrogen produced is twice that of oxygen, and both are proportional to the total electrical charge directed by the solution. However, competing side reactions occur in many cells, resulting in a variety of items and less-than-ideal faradaic efficacy.

Electrolysis of pure water requires a large amount of energy as well as a high potential to overcome various starting barriers. Without an excess of energy, electrolysis of pure water takes place slowly or not at all[3]. This is due in part to the fact that water's self-ionization is limited. The electrical conductivity of pure water is about one-millionth that of saltwater. Many electrolytic cells may also be lacking in the necessary electro catalysts. The expansion of an electrolyte (for example, a salt, a corrosive, or a base) and the use of electro catalysts increase the productivity of electrolysis.

Because hydrogen can now be supplied more affordably from petroleum products, the electrolytic cycle is now sometimes used in mechanical applications. Water electrolysis offers a number of advantages for hydrogen generation, including being a pollution-free method if renewable energy sources have a high degree of purity, being a relatively simple process, and having a large number of resources. Water electrolysis is a nearly 200-year-old technique, with J. W. Ritter in Germany demonstrating the concept in an experiment about 1800 AD. William Nicholson and Anthony Carlise decompose water into hydrogen and oxygen in England the same year. After tens of years, this technology's use began[4]. In 1890 AD, the French military built a water electrolysis machine to produce hydrogen for Charles Reynard's airships. Around 1900 AD, there were about 400 industrial electrolyzes in operation all over the globe. Different types of alkaline electrolyze were created about 1930 AD. The introduction of PEM electrolyzes in the 1970s AD provided many benefits over alkaline electrolyzes, which were restricted to modest

hydrogen and oxygen generation capabilities due to costly materials and a short lifespan. Water electrolysis technology progressed slowly because steam reforming could generate hydrogen at a cheaper cost.

In all, approximately 500 billion Nm3/year of hydrogen is produced throughout the globe, mainly via steam reforming. Hydrogen generation through water electrolysis is currently too inefficient to be commercially viable. Water electrolysis has significant difficulties with poor gas evolution rates and excessive energy usage. For typical industrial electrolysis, an average amount of energy is required. The efficiency of water electrolysis for hydrogen generation processes is a critical metric. Many academics have examined the energy consumption and efficiency of hydrogen generating systems as part of their study[5]. The authors defined energy, energy analysis, energy efficiencies, various driving energy inputs, definition of efficiency, thermodynamic analysis, thermodynamic electrochemical features, thermodynamic losses, system boundaries, and warmth fluxes in various electrolyze plants. The energy requirement, practical cell voltage, process efficiency, temperature effects on potential, bubble mechanics and effects, kinetics of hydrogen production, and effect of electrode materials on traditional water electrolysis for Alkaline electrolysis, PEM water electrolysis, and heat electrolysis are all investigated in this review paper.

Alkaline water electrolysis is the most straightforward and straightforward technique for producing hydrogen. One of the major drawbacks to broad adoption of this method is its inefficiency. Efforts in development and research are required to overcome drawbacks such as energy consumption, maintenance costs, durability, dependability, and safety. The thermodynamic analysis depicts the theoretical and real energy needs, system resistances, and various efficiencies; these characteristics will aid in identifying the main issues that need to be addressed. The kinetic study shows the rate of reaction in alkaline solution, the surface activity of the ion transfer electrode, and the impact of different electrolytes and additions on production[6]. In order to improve this application, researchers must think about ways to reduce electrochemical reaction resistance, low-cost electrodes, electro catalysts, electrolytes and their additives to improve ionic mass transfer, corrosive resistive electrolytes and electrodes for electrode durability to reduce electrode physical phenomena, and electrode suction. Improve HER and OER catalytic activity by utilizing advanced binary, ternary, or quaternary alloys, increasing electrochemical active surface area, catalyst utilization, and corrosion resistance, and developing highly conductive supporting catalyst. Improve proton transport through the catalytic layer and water transport over the triple-phase boundary by understanding and improving the triple-phase boundary[7].

Finding catalyst alternatives to substitute limited iridium or unstable ruthenium for the anode will be regarded as a major accomplishment. New catalyst designs or tailored structures may be able to offer the required conditions for reducing iridium levels or stabilizing ruthenium dissolution over time. Improve catalyst stability, look at other supports other than carbon, and look into metal-free N-CNTs catalysts for the cathode. Exploring the utilization of high surface area carbon materials with modified pore size, functional groups, grafted polymers, and electrical conductivities to achieve greater activity and stability is also essential. To provide new support materials, catalysts, and electrode systems, use novel production techniques.

Although hydrogen is usually regarded as a clean fuel when used (direct combustion or use in fuel cells), its manufacture has severe environmental consequences. A comprehensive picture of the environmental costs associated with hydrogen generation may be obtained by looking at resource consumptions, energy needs, and emissions from a life cycle perspective. Plant manufacture and installation (hardware), plant operation (energy required to run the plant as well as feedstock for hydrogen production), and storage and/or distribution of the generated hydrogen are the three stages of hydrogen production (use phase could also be included as the fourth

phase). The majority of the environmental effects involved with hydrogen generation, ranging from steam methane reforming through electrolysis, occur during the plant operating phase. It is owing to the use of natural gas as a feedstock in steam methane reforming, and it is due to the use of fossil fuel dominated grid power to run the electrolyze in electrolysis[8]. These effects may be reduced in the electrolysis process when hydrogen is generated using renewable energy power (a schematic process flow diagram for electrolysis based on renewable energy electricity is shown in Fig. 2). Direct emissions are virtually non-existent or minimal during the operation of such systems. The production and construction of renewable energy power plants, on the other hand, cause environmental harm. The life cycle assessment (LCA) method aids in the understanding of such effects at various stages of the production chain[9].

LCA is a well-established and widely recognized technique, as specified by ISO 14040 and ISO 14044 standards. The life cycle of a product refers to all actions that occur throughout its lifespan, from its production to its use and maintenance to its ultimate disposal, including the purchase of raw materials needed to produce the product. There are many impact assessment techniques in use for evaluating environmental impacts. CML 2001 and eco-indicator 95 are the most often utilized techniques in the research evaluated in this article. The European Union has created and approved a guideline for conducting life-cycle assessments of hydrogen generating systems. This technique also meets the requirements of ISO 14040 and 14044. Because this guideline was just recently established, its use in LCA analysis has yet to be documented in the literature. The goal of this study is to use LCA to examine the environmental impacts of various hydrogen generation methods utilizing existing literature in the area. An extensive literature search was conducted for this aim. The review focused on LCA-related publications and reports on hydrogen generation technology. A total of 17 peer-reviewed articles and 4 reports or pre-prints were chosen for a comprehensive examination. Articles from all around the globe were examined regionally. Articles and reports published between 2000 and 2012 were evaluated in terms of publication dates. A comprehensive study presents the most up-to-date information on the life-cycle assessment of existing hydrogen generation methods. Although the paper's primary emphasis is on electrolytic hydrogen generation methods, it also includes non-electrolytic alternatives for data/results comparison[10].

Electrolysis Is Used To Produce Hydrogen.

Hydrogen may be made from a number of different sources. These include fossil fuels like natural gas and coal, as well as renewable resources like biomass, which may be turned to hydrogen directly via gasification and reformation. Water is used as a feedstock in electrolytic technologies, with energy produced from renewable (solar, wind, hydropower, etc.) or non-renewable resources. Because of the variety of these resources, hydrogen is a potential future energy carrier. Chemical, biological, electrolytic, photolytic, and other processes/technologies may all be employed to make it. Each technology has its own set of advantages and disadvantages. Local feedstock availability, technological maturity, market applications and demand, regulatory problems, and prices all affect the selection of appropriate hydrogen production alternatives.

The electrolyze module is made up of cells that are linked in parallel or series. The electrolysis-generated hydrogen and oxygen are cooled, filtered, compressed, and stored. The oxygen is not kept at many installations; instead, it is released to the environment. There are other electrolyzes that generate hydrogen at high pressure, eliminating the compression step and its accompanying expenses in terms of both money and energy. The water that enters the unit is cleaned beforehand to prevent mineral buildup and unwanted electrochemical reactions in the cells. Electrolyzes, in general, do not need ongoing maintenance since they have few moving components. They are quiet and modular, making them ideal for dispersed applications in residential, commercial, and industrial environments. Despite the fact that electrolyzes have been

in use for decades, there is still room for improvement in many areas, such as manufacturing, distribution, and installation costs; electrolyze module, power supply, control system, and other efficiency improvements; operation under variable electricity supply profiles; increase of operating temperature and pressure, and so on. Alkaline, polymer electrolyte membrane, and high temperature solid oxide electrolyzes are the three kinds of electrolyzes accessible. In the following sub-sections, they are briefly discussed.

Environmental Performance Of Electrolysis

Throughout this system process, fossil fuels, metals, and minerals are utilized as significant inputs. Iron contributes for 37.4 percent of the resources utilized, and is mostly employed in the manufacture of wind turbines and hydrogen storage tanks. For the concrete foundations of the turbines, a significant quantity of limestone is required, accounting for 35.5 percent of the main resources. Coal contributes for 20.8 percent of all resources utilized, mainly for the production of steel, iron, and concrete.

The best technique is wind-based electrolysis, followed by hydro. Although these figures for hydro were given in three literatures, none of them specified the process chain or the system boundary. As a result, based on the examined literatures, it is impossible to explain why hydro performed worse than wind. Emissions from major civil works during the hydropower plant building period may be one of the causes (deforestation for dam, channel, powerhouse, etc. construction). Emissions may also be caused by long-term biomass breakdown in big water dams. Solar PV, solar thermal, and biomass-based electrolytic methods have somewhat higher GWPs than hydro or wind electrolysis. Higher PV values are attributed to emissions associated with the module manufacturing process. Despite the fact that the biomass-gasification-electrolysis method has a lengthy process chain, the GWP is very low, just slightly higher than solar thermal.

DISCUSSION

It is necessary to develop membrane alternatives to Nation using improved membrane manufacturing techniques, leading in electrolytes with better proton transport but reduced gas crossover and greater durability. This may be accomplished via the use of membrane composites or blends, the addition of inorganic or organic fillers, or the introduction of molecular barriers to the electrolyte. Much of the varied jargon that has been used from the beginning to now has been collected and documented from one place through this examination. Finally, we presented our vision for future study in order to obtain PEM electrolyzes as a dependable, cost-effective option to assist in the resolution of renewable energy problems. Pressurized electrolysis requires lower work and total (work and heat) energy inputs on a continuous basis. Furthermore, for pressurized electrolysis, the proportion of labor composing total energy is higher, implying that the possibilities of integrating an electrolysis system with external heat sources must include both operating temperature and product pressurization.

CONCLUSION

The performance of high-temperature alkaline electrolysis cells is compared at different current densities, a broad range of pressure and temperature, and with various anode and cathode materials, and it shows a significant improvement. Although the findings are promising, further research is needed to fully understand the reasons for the observed significant reduction in terminal potential, as well as the probable impacts of product mixing and/or electrode degradation. The use of superheated steam to replace the water in the cell, as well as other modifications needed for long-term cell characterization. In conclusion, this study may serve as a foundation for the creation of a new generation of alkaline electrolysis systems that operate at very high temperatures and pressures. HT steam electrolysis may be a possibility in the future,

but only in the long term, due to the high efficiency of water breakdown at higher temperatures. This technique would be ideal for centralized and large-scale hydrogen production facilities since it requires HT heat and base-load operation. At the moment, research and development efforts are primarily focused on the creation of long-lasting materials that will increase the lifespan and performance of electrolysis stacks. Reduced system complexity is also a significant issue.

THE RING AND ITS ARTISTIC INTERPRETATION IN UZBEK FOLK MAGIC TALES

Zebiniso Rasulova*

*Candidate of Philological Sciences,
Uzbek Language, Literature and Folklore Institute,
Academy of Sciences of UZBEKISTAN

ABSTRACT

In the epic works plot, the ring plays an important role in connecting the ideas expressed in the events development. In the events depiction, it is observed that the ring is interpreted in a single or in several artistic tasks at once. The article deals with the artistic functions of the ring in Uzbek folk tales, the mythopoetic interpretation of the ring in the examples of folklore.

KEYWORDS:*Ring, Uzbek Folklore, Folklore, Fairy Tales, Epics.*

INTRODUCTION

The ring is one of the riddles often used in fairy tales and one of the details that has acquired a traditional meaning in the epic text.He often appears in fairy tales, legends and epics as a wonderful assistant to the epic hero in overcoming a hostile force or achieving a noble goal. Throughout the play, when the protagonist is faced with new, more difficult problems, the ring helps him overcome these weights. It collaborates and helps the hero. A ring is a simple piece of jewelry, but priceless.In fairy tales, its pricelessness is further exaggerated.

The first samples of rings were made from the animals skin and bones and were considered totems, and later from various metals (bronze, copper, silver, gold, brass).

Usually the rings were with or without eyes. The rings with eyes called “niginshininand”, “niginchnok”, “nigindor” [1]. The rings without eyes are “nigin”. Also, the names of the rings with and without eyes are different in other nations. In particular, Russians call a ring with an eye a "ring", and without eyes - a "circlet".

The “eye” of the rings is often made from stones such as turquoise, ruby, and sapphire. They are made to resemble the eyes of animals such as oxen, camels, or birds such as crows and nightingales [2]. It was believed that the eye of the ring protects the ring owner from the evil eye, kinna, envy.

Legend said that the first person to wear the ring was Jamshid. After that, it was habitual for all men and women to wear rings. The ring is valued as one of the priceless cultural artifacts created by the intellect, craftsmanship, and handwork of mankind. That is why it has become so firmly established in our way of life. By them it was even possible to determine the social and material status of people. While women from a wealthy family often wore silver, gold and ruby rings in

their hands, poor, helpless women wore only one or two brass, copper rings. That is why fairy tales show in a unique way that having a ring is not for everyone and is not easy.

Fairy-tale characters are usually told to reach the ring in five different ways:

а) presents the ring to the hero for any good and noble help made by his owner, the generous magician;

б) The hero fights or bets on an evil force (giant, dragon, witch), defeats him and pulls the ring;

в) Because the heroine has won the love of the fairy, the fairy girl presents him with a ring on her hand as a symbol of love;

г) The protagonist steals a ring from the space of mythological characters;

д) The protagonist finds the ring inside the inherited mysterious box.

In the fairy tale, the magic ring is used for good, creativity when it falls into the hands of good, open-hearted, pure-minded, hard-working, brave and generous people, and used for evil in the hands of selfish, ruthless, evil, greedy and covetous people. That is why the well-meaning fairy-tale hero tries to keep his ring like the apple of his eye, not to reveal the magic associated with it to anyone.

In the epic works plot, the ring plays an important role in the events development, connecting the narrated idea. In the events depiction, it is observed that the ring is interpreted in a single task or in several artistic tasks at once. In Uzbek folk magic tales, the artistic functions of the ring can be grouped as follows:

1) A means of bestowing happiness on the epic hero;

2) Change, i.e., a means of transforming a fairy-tale protagonist from one form to another;

3) A means of transporting from one place to another, i.e., a long-distance approaching vehicle;

4) A magical object that informs, warns, or has the power to reflect distant events;

5) Generous material supplier;

6) A companion and miraculous helper to those who set out on a journey in search of happiness;

7) Creative, builder and creator;

8) Means of enchanting and liberating from magic;

9) A deadly magic weapon.

In Uzbek folk tale "Oypari" it was interpreted some of these artistic functions, typical of the "magic ring". [3]. Therefore, the "magic ring" played an important role in the fairy tales development.

According to the tale, the protagonist inherits the magic ring from his father. This ring is also inherited from his father. He was left to his father by his grandfather, who said, "Use it when you have a hard time." Therefore, because of his father’s poverty, the rich man discouraged him from returning his suitor and advised his son (the protagonist) Orzimbek to use the inherited ring in order to support his oppressed son. The ring comes out of the ninth drawer in a box buried under an old walnut tree in the courtyard. In the details of where the ring was found and kept, there is a hint of its secret.

Orzimbek looked at the ring and saw a gold ring with a ruby eye. It was wtitten “Put this ring on the middle finger of right hand, say 3 times your desire and say will it will”. These words, written on the eye of the ring, add mystery to it. Thus, a magic ring appears in the fairy tale plot, which stimulates the subsequent events development.

The fact that there is a mysterious inscription on the ring and that it is inherited was not accidentally included in the tale plot. This is a unique household item in a fairy tale.

It is known that both in the past and today, parents tries to pass this or that on to his children, thereby laying the material foundation for their future and in doing so they often seek to inherit gold items, housing, arable land, and so on. It is at this point that fairy tales hint at the same social reality. Indeed, children with an inheritance are able to balance themselves financially quickly and easily in marriage. Therefore, the issue of "heritage" is interpreted separately in folk tales. However, it is also emphasized that only children who have more or less effectively used the inheritance left by their parents can achieve true prosperity and happiness. Inheritance reflects the parents' hard work, their love and care for their children, their concern for their future. In fairy tales, a child has a different attitude to inheritance, someone uses his inheritance wisely and wisely, multiplies it, and someone, on the contrary, squanders the inheritance left by his parents without calculation or planning. In the fairy tale "Oypari" the hero's intelligence is glorified in this respect. The "magic ring" demonstrates the inheritance power from parents.

Orzimbek also inherited a gold ring with ruby eyes. The price of such rings has always been high in the market. When financial hardship befalls him, if it is sold, one is much more relieved of financial hardship. So, these kinds of rings, which are small but have a great price, can be a real material inheritance for children. But such an inheritance can only be sold when there is a very severe financial hardship on the head, as used in the tale. At other times, it should be honored as a souvenir from the parents. This, in turn, is tantamount to honoring the memory of the parents. In folk tales, this idea is interpreted in an artistic way as above. The interpretations associated with the written ring inheritance in a fairy tale have a certain vital ground. According to reports, in the past, the ring served as a personal seal for people. According to sources, until XVIII-XIX centuries emir, khan, kaziy, kushbegi (title of first minister at the khan's court), biy (head of a tribe or union of tribes), volost ruler; persons holding public office, such as the centurion (official, higher than ellikbashi), and religious figures such as ishan, mufti, sheikh, had their own ring-shaped seals and such ring-seals are usually worn on the pinch (little finger) of the hand.

They were engraved with the name of the ring owner, his position, and excerpts from Qur'an verses. Some professionals also had their own symbolic rings [2.– p.159]. For example, dead washers, shaman- healers and etc.

The fact that government officials had seal rings also confirmed by the story "Amir Temur's Turquoise Ring"[4]. "Written ring" is also found in the plot of the epic "Ravshan", which belongs to the series "Gurogli". Ravshan found out about his future wife Zulkhumor from the inscription on the ring eye that his grandmother Yunus gave him. There is a name of Zulkhumor name written on it. After that, Ravshan sets out in search of Zulkhumor.

In general, the motive roots that the ring has a mysterious inscription and that this inscription serves as a guide to the epic protagonist are genetically related to the life reality and are expressed in the works epic plot as artistic re-perception of real vocabulary.

In the fairy tale "Oypari", Orzimbek, who has a ring, at his father urging, puts the ring next to him and goes on a journey in happiness search. At this point, we can see the artistic role of the "Magic ring" as a companion to the protagonist.

On his way, Orzimbek encounters a young man who has been magically turned into a snake and saves the young man from witchcraft by helping him with his ring. The young man returns to the human form again from the appearance of a snake with the help of a ring. Throughout the tale, Orzimbek uses this power of the ring several times. With the help of the ring, the hero turns into the wind. He transforms the wicked from the appearance of a man to the appearance of a donkey,

a mule, a dog. So, the magic ring is interpreted in the fairy tale as an evocative, enchanting and magical deliverer.

The secret of the magic ring is that, first, it reads a sentence like a human, can speak, does the task with a vengeance, gives advice to the protagonist and guides him. It is no coincidence that the ring is revived in such a way in fairy tales. In ancient times, Arab and Iranian jewelers made rings that made a sound when the hand moved. They believed that their voices drive away evil spirits, death. [2.– p.160-161.]. The beliefs that emerged about sound rings were undoubtedly the basis for the creation of the magic ring image that spoke aloud in fairy tales. Another unusual feature of the magic ring in fairy tales is that it can do things that cannot be done with human power. In order to accomplish such strange deeds, it is necessary to repeat the intention three times. After that, the ring starts working. This exaggerates its inherent mystery. In magical tales, the ring is interpreted not only as an evolutionary, but also as a "magic mirror" that reflects and informs the distant person. In particular, in the fairy tale "Oypari" its role is observed. Orzimbek remembers the ring and repeats it three times, asking to be shown so that we now know where Oypari is. He looked at the ring and saw that Oypari was sitting sadly somewhere in the house.

Apparently, in a fairy tale, a magic ring can, at the protagonist request, inform about the person who is far away from him, his behavior, and his mental state. This emphasizes its truly strange and magical nature.

In fairy tales, another artistic function of the ring is that it delivers the protagonist from one place to another without a horse, in the blink of an eye.

Thus, the *magic ring* is also a tool that brings a long distance closer in fantasy tales. In this respect it deals with mysterious objects such as flying carpets, flying boots, flying wineskin, flying brooms.

The magic ring also provides the protagonist and his companion with magical costumes and mysterious weapons as a generous material supplier in the fairy tale “Oypari”. He does this in a second: when he closes and opens his eyes, in front of him was a sword and shield, and on his saddle hung a garment that did not burn, did not sink in water, and was fireproof. Then the ring looked at them and said: “Do not be afraid, put on these clothes, ride the horses, and go on your way. If you encounter giants, dragons, wild beasts, or creatures on your way, use your sword, if you take it out of the vagina, it stretches forty arshin”[3. 77-105 pp]. In general, these same things, which are created with the help of the magic ring power, are also distinguished by their mystery, power.

There are fairy tales in many nations where a magic ring is found in the plot.In them, the magic ring is interpreted almost the same. For example, in Rumo's fairy tale "The Magic Ring", the boy gets a ring for his help to the old woman. The old woman told him to use the ring only when he is tired of something.To use it, it is worn on the finger and applied, or the ring on the finger is twisted back and forth.Then the ring begins to perform the assigned task. Only the hero should not lose the ring. If he loses, disaster will fall on him. In the fairy tale, the young man achieves a table full of various treats equal to the open table with the ring power.He builds a very beautiful tower.

In the Russian folk tale "Dead Princess", the princess dies when she wears a ring given to her by an old woman.This highlights the artistic function of the ring as a deadly, magical weapon.

In the Uzbek folk tales “Flower ring”, “Base ring” a young man rescues the son of the king of snakes. He then advises the young man to ask his father, who is the king of snakes, for the ring on his hand.This ring will symbolize the snakes dominion. It is known in life that the ring was used as a state symbol, a state seal. So, in the fairy tale, this vital reality is used in its own artistic

form.In this tale, the young man resurrects his dead mother using the magic ring of the snakes king.He builds a golden house for himself.

People have had a religious attitude towards the ring since time immemorial. It is valued as a preservative amulet. It was believed that a person with a ring would not be harmed. These notions led to the ring image interpretation as a magical object in fairy tales. Certain beliefs were also followed in choosing a stone for its eye. What kind of metal the ring was made of - gold, silver or copper - had certain symbolic meanings.

From the language of the ring in the fairy tale "Oypari": "As long as I am with you, I will not harm you", - it is not in vain. These sentences describe the nation's fetishistic belief in the ring.

In the "Oypari" story there is another case.It is also the fact that the fairy tale protagonist carries the ring with him without wearing it.Only when the protagonist uses the ring does he take it from him, put it on his middle finger, and tell him his intention three times. Such a fairy tale interpretation was not in vain. Because, in ancient times it was forbidden to wear a ring [5].

The ring also served as an amulet against evil spirits. Therefore, in fairy tales, it is shown to be a miraculous helper to the hero in overcoming evil forces, fighting them and winning.

The ancient magical-mythological, fetishistic views that the ring could fight evil spirits or hinder the death path were the basis for its further socio-magical function exaggeration. After that, instead of wearing the ring, the idea of wearing it regularly became more and more popular. Even at a certain period, women wearing rings were especially compulsory. That is why the girls were presented with a wedding ring by the groom on their wedding day.

Nowadays, men and women wear the ring equally. However, women's rings are distinguished from men's rings by their elegance, often by the fact that they have an eye selected from colored stones.

According to Lapland tradition, when a person dies, the person who puts him in the grave takes a copper ring from the deceased's husband, wife or child and puts it on his right hand [5– C.235]. (Probably because of this, in fairy tales, the focus is on which hand the protagonist wears the magic ring). It was as if this ring was acting as a tumor that protected him from various evil deceased soul influences. It is noteworthy that even among our people it is known that dead washers, that is, those who are engaged in the ghassal profession, wear a silver ring on the right, middle finger. So the ring also served to define the people profession.

The socio-magical function of the ring can be further substantiated by some traditions example and ceremonial elements that exist among the people.

The ring also served as a target for rifleman in ancient times.[6] To do this, the ring is worn on the index finger of the left hand. When shooting a bow, the arrow tip was placed on this ring and the target was taken. Even in competitions to determine the best riflemen, the condition is to pass the bow axis through the ring eye.

Ancient rings depict this or that goddess. For example, a gold seal ring made in Bactria at the end of the IV century and the beginning of the III century BC depicts the goddess of water and fertility Anahita [2. 191 p.]. In this way, Anahita was supposed to sponsor the ring owner and protect him.

The magic ring image is also found in works created in the written literature. This example is AlisherNavoi's epic "Farkhod and Shirin". The magic ring interpretation in this epic is based on popular opinion about it. This shows how popular the public opinion about the magic ring is. At the end of Rumo's fairy tale "Magic ring," the young man occasionally uses the ring, thinking, "it is not fair that everyone should work hard for what they want." In fact, these thoughts, which are emphasized as the young man thoughts, embody the noble people view.

Thus, the "magic ring" idea is based on the magical, fetishistic ideas of the ancients, and is interpreted in folk art fairy tales in a unique artistic way. Through it, people's dreams of a good and prosperous life, a peaceful and prosperous life are artistically expressed.

ABSTRACT

In this article, the biological characteristics of winter wheat, the conditions under which it grows and develops, the options for the amount of fertilizers, tubers, flowering, ripening varieties, the effect of ambient temperature, soil moisture and its structure on the height of normal growth.

KEYWORDS: *Autumn Wheat, Straw, Threshing, Flowering, Grain, Seedlings, Straw.*

INTRODUCTION

Agricultural crops, including wheat root, need to grow, develop, and absorb nutrients in order to make effective use of fertilizers.

In this section we need to determine what changes occur in the growth, development and absorption characteristics of the root system of winter wheat variety "Polovchanka", the number of seedlings when creating a different number of seedlings was.

First of all, the roots of plants are selective, not the main base in their lives, they absorb dissolved substances in the soil with water under different conditions.

It depends on many factors, such as ambient temperature, soil moisture and its structure, air regime, the amount of nutrients in it, the number of seedlings, the level of light. Changes in any root process depend on all the characteristics of the plant on the surface.

Typically, 60-80% of the winter wheat accumulation phase is completed before the cold snap in the fall. a nodular tumor is formed, which is called a nodule. Lack of moisture in the soil layer for the accumulation joint reduces or stops the formation of most stems. In field conditions, 5-7-10 or more stems per plant. Stems can also be formed from dormant buds and coleoptile buds.

With the formation and growth of the lateral stems of the accumulation joint, a secondary system of joint roots is formed. They develop from a secondary root node, unlike primary (apical) roots.

Adequate humidity and temperature during the accumulation phase allow the root to penetrate to a depth of 4-5 cm or more. This leads to more branches and more roots. In our experiment, we would like to note that the Polovchanka variety has a wide range of accumulation properties, because in the smaller number of seedlings the root buds formed a fast and strong stems.

In the experiment, we dug up the roots in some variants and separated them from the soil by washing them in clean water. As can be seen from the data in Table (3.4.4.1), 1.5 mln. In the single-seeded variant, the roots formed from the primary bud weigh 48.3 mg; 3 mln. in variant 44.2; 4.5 mln. 38.3 mg per plant left. And 29.4 mg in 6 million bushels of wheat. He formed. Or when the number of seedlings was quadrupled, the number of roots decreased by 19.1 milligrams. The increase in the number of seedlings negatively affected root growth from a young age.

Nitrogen, phosphorus, and potassium fertilizers were doubled, and root weight was observed in all four variants when seedling numbers were varied. For example, 1.5 mln. while the 3 roots formed from the bud when the seedlings were left were 54.3 mg, the root of the 6.0 million-seed variant variant was 34.2 mg or 20.1 mg less. However, the amount of fertilizer is reduced by 5-10 mg from the above options. This was also observed in the weight of other types of roots. For example; we see that the roots from the accumulation joint grow 10.8 mg or twice less when the weight is N200P140K100 kg \, and 20.2 mg when N100P70K50 kg.

An analysis of the data shows that while the number of seedlings negatively affects the root development of winter wheat, that is, from the beginning of ontogeny, the struggle for inter-vegetative space for the nutrient medium begins. The more roots a plant can produce, the faster it will grow. It was found that 1.5 million to 3 million roots of plants have the fastest growth, 4.5 million seedlings have average growth and 6 million seedlings have slow root growth.

TABLE 3.4.4.1. DEPENDING ON THE SOWING RATE OF DRY ROOT MASS AND THE AMOUNT OF FERTILIZER CHANGE 1 M^2

Options	Air-dried dry weight, in mg			
	Henna leaf roots	Secondary pairs	Primary 3 buds	Collection node roots.
$N_{100}P_{70}K_{50}$				
1. 1,5 mln	5,4	24,2	48,3	10,8
3. 3,0 mln	3,4	11,2	44,2	8,4
5. 4,5 mln	2,8	10,6	38,3	5,6

If, in the early stages of development, each plant grows its roots more rapidly to obtain water and dissolved nutrients from the soil, it will lay the groundwork for future growth. As A. Maksimov wrote in 1952, "The root of a plant moves to find water." This means that the roots of the plant must be able to find it from a young age. To do this, the roots need to grow rapidly from seed germination.

Some scientific studies have recognized the rapid growth of the surface of a plant based on the amount of sap (Pasoki) absorbed by the plant's roots. It is believed that all factors are present in the soil only when they are sufficient, especially in temperate conditions, when the amount is higher than in dry lands. In any case, NS Avdonin, EG Minina, OM Trubetskova (3.1) believe that the amount and speed of sap from the roots is an indicator of their rapid growth. They paid close attention to the overall root size and active suction root surface. The study of root size of experimental plants showed that, although it is a quantitative indicator, it shows that the root of wheat is inextricably linked to the number of seedlings.

Influence of NPK content on wheat root size and number of seedlings on suction surface.

№	Options	Root volume is cm^3			Suction surface m^2

8	6,0mln$N_{200}P_{140}K_{100}$	0,32	11,20	8,30	0,44	2,10	1,840

During the tubing phase, the volume of one plant root was 12.4-12.6 cm3 in 1-2 variants. But when the seedlings doubled to 3 million, it was a little less. (11.4-12.4 cm3) When the number of tubes increased by 3 and 4 times, the values decreased by 2-3 cm3 compared to options 1 and 2, and by 10.1-11.2 cm3 in 6 million variants. At the same time, the doubling of mineral fertilizers has led to an increase in this figure, albeit slightly. An increase in root size significantly increases the plant's nutrient uptake.

During the flowering phase of wheat, root development is more pronounced, especially in variants 1,2,3,4, as well as in variants 5 and 6, with a slight decrease in average growth. For example, in option 1-2, the minimum seedling size was 12.84-14.20 cm3, while in option 7-8 it was 8.10-3.30 ms3. This means that when the number of seedlings increases, there are some unfavorable conditions for root development during the flowering phase.

This is because when the seedlings were thick, the light level of the soil decreased from the tube wrapping phase (30-42%) and the roots grew poorly in the unlit soil conditions.

The suction surface of the root is usually taken in m3 to indicate how well the root is working. According to the table, the absorption surface was accelerated in all variants when the amount of NPK doubled.

An increase in the amount of seedling oil was observed during the accumulation phase, which negatively affected this indicator. For example, in the first case, the accumulation phase is 0.054 m3, while in the 7th variant it is 0.041 m3. In the same variant, when the NPK was used twice as much, the suction surface of the root was 0.100 m3 and 0.44 m3. This means that when the rootstock is left with a thick layer of seedlings, even if the amount of fertilizer increases, it remains low. The table shows the numbers 0.41 m3 and 0.044 m3 in options 7 and 8. The data obtained during the germination and flowering phases of wheat show that the number of seedlings, when the amount of NPK is two different, this figure is slightly higher than the growth surface in the root of a plant with a high amount of fertilizer. 'ladi. (2.11 m2 or 0.27 m2 more than 1.84). In the flowering phase, the root absorption phase is significantly increased, especially when the number of seedlings is 1.5 million, when the rate of mineral fertilizers is increased. For example, in Option 1, the figure was 2.28 m3, while in Option 2, it was 3,480 m3 or 1 m3 more. The same thing happened with options 3 and 4. But the number of seedlings is 3 million. At the time, the figure was slightly lower, at 2,270-3,244 m2. The number of seedlings increased from 4.5 million to 6 million, the lowest level (2.46-1.82 m2). An increase in fertilizer application has led to a reduction in absorbent surface area. For example, in option 7, the NPK was 2.480m2 for 100-70-50 kg, while the amount of fertilizer was doubled to 1.840m2. This is the lowest of the experimental options. This is due to the fact that the roots of plants do not have enough space to grow, and their location in the top layer of soil does not provide enough nutrients to the roots.

In the experiment, we also determined during the flowering phase to find out how much substance they can absorb by soaking the roots in methyl blue dye (1.5-2 minutes). Table 3.4.4.3 shows that when methyl dye was immersed for the first 2 times, 6.235mg in 1.5 million seedlings. of fertilizer doubled to 7,833 mg. However, 4.25-4.312 mg of 6 million seedlings, or 2-3.5 mg less than in options 1-2, or 72.66% of methyl blue dye in the container, was doubled. If the fertilizer is increased, it will increase by 78.81% when the fertilizer is doubled. This represents a 6% increase in root utilization. When the number of seedlings was quadrupled (6 million), the absorption of the dye was 4,250-4,314 mg, reaching 1.5 million. absorbed 2.3 mg less than the variant, or only 39.65-33.71% of the dye in the container. At the third time, the mastery decreased slightly and was 52.17-61.20%. But the number of seedlings has grown to 6 million. was 33.90-26-91%, which means that the absorption of the solution is reduced. This indicates that the roots are not very developed. Table 3.4.4.3 shows that the increase in the number of fertilizers and seedlings also has a negative impact on this indicator. (0.612-0.814 m2 to 0.420-0.380 m2) and decreased from 33.1-39.6% of total adsorption to 30.2-26.3%. This means that an increase in the number of seedlings slows down the root activity more than when a rare seedling is left. When the normal number of seedlings per plant is between 3-4.5 million per hectare, the suction surface of the roots is at the normal level or between 50-60%.

RESEARCH AND VERIFICATION OF URBAN PUBLIC TRANSPORT ROUTES USING MATHEMATICAL METHODS (On the example of the city of Termez)

Komilov A.L*

*Termez State University, UZBEKISTAN
Email id: azamjon.komilov88@mail.ru

ABSTRACT

Demand for public transport is also growing due to the growth of the city's population and the establishment of new manufacturing enterprises and educational institutions. Effective organization of urban public transport services plays an important role in the effective operation of other industrial enterprises, organizations and educational institutions in the region. The article analyzes the demand of the bus transport network and routes in the study area and makes recommendations for its improvement.

KEYWORDS: *Passenger Traffic; Public Transport; Passenger Traffic Quality; Meet The Route Line On Demand, Re-Switch To Another Vehicle, Get On And Off Another Bus Between Neighborhoods.*

INTRODUCTION

The quality of transport services in cities around the world, including the timely and comfortable delivery of passengers to their destinations without excessive traffic jams, modern solutions to existing problems and improving the quality of services are important. Particular attention is paid to the development of new scientific and technical solutions to improve the quality of bus services in developed countries, including major cities such as the United States, Britain, Germany, France, Singapore, Japan and South Korea [1]. Scientific research is being conducted to improve the work of urban public transport based on integrated approaches.

Today, the issues of public transport services depend on many factors, each of which requires a separate approach and a comprehensive solution. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021 highlights the issues of "… Radical improvement of transport services to the population, increase of safety of passenger transport and reduction of emissions of harmful substances into the environment, purchase of new comfortable buses, construction and reconstruction of bus stations and bus stations". One of the most pressing issues facing urban bus transport today is the timely delivery of passengers to their destinations.

LITERATURE REVIEW

Many prominent scientists of foreign countries and our country, including E.Ingrid, M.Mistretta, A.Monzon, Bashir Shalaik, Richard Anderson, A.Bristow, M.E.Antoshvili, I.V.Spirin, A.V.Shabanov, V.A.Gudkov, A.M. Bolshakov, L.B.Mirotin, A.V.Velmojin, G.A.Varelopulo, B.A.Xodjaev, G.A.Samatov, S.A.Salimov, Sh.A.Butaev, K.B.Nasretdinov, L.A.Axmetov, V.S.Mun, K.M.Nazarov, A.A.Nazarov, B.I. Abdullayev and others, have focused on improving the technology of passenger transport in city buses, creating a scientific basis for improving the quality of service.

In this regard, it is necessary to optimize the route network, taking into account the strict requirements, given the current level of urban development.

The route network refers to the aggregation of all passenger routes in a city, county, and so on. The route, in turn, represents the path of the vehicle between the start and end stops according to the schedule [2, 3].

The main indicator for assessing the quality of service in buses is the capacity utilization factor, the criteria for its integrated assessment have been improved (B.I.Abdullaev, 2019) [4].

The focus of many researchers is on shaping the set of requirements for route schemes. Researchers [5, 6, 7,] have now formulated criteria for optimizing route networks, including the shortest path between the start and end points of the route, the minimum time spent by all passengers, and so on.

To select the optimal route network, the researchers suggested the use of combinatorial analysis methods (comparing all possible route network options according to different criteria). However, given that for a large city, the number of routes between the studied locations can reach large values, it is almost impossible to compare all the options. Therefore, B.L. Geronimus used the method of combinatorial analysis with oriented selection of options in the formation of variants of route schemes [8].

MV Khrushchev proposed to divide the methods of guidance into two groups depending on the level of tasks to be solved [9]. The first group is designed to build route diagrams for the entire city and is called general routing methods. The local routing methods that make up the second group are designed to fix individual routes.

In many developed countries, urban mobility is one of the major challenges faced by the world's population living in urban environments. This problem has been shown to be a good alternative to a well-organized public transport system to ensure the mobility of a large population (V. H. M. Bins Ely, J. M. Oliveira, L. Logsdon, 2012) [10].

Methods of optimization of individual transport routes are reflected in the work of V.G.Bolonenkov, S. Liberman, Yu. Loginov, I.V.Spirin and others. [11] The authors consider the options of different forms of organization of city routes - regular, Express, semi-Express, high-speed, shortened, combined.

RESEARCH METHODOLOGY

The most common modes of transport in the country are land and road transport. In our country, road transport plays a leading role in urban and suburban transport.

The city of Termez reflects the infrastructure of public transport, the level of public transport, the number of routes, the number of buses (Table 1).

Table 1

Termez city

Level of public transport use (mobility)		
Population of the region:	182.1 thousand. person	
Number of settlements	37	
Number of neighborhood citizen meetings	37	
Bus transportation%	25.4 %	
Population mobility:	1 person uses transport 316 times a year	
Infrastructure		
Lengthofhighways:	313.9 km.	
Numberofroutes:	12	
	hence:	
	bus	10 (83%)
	directional taxi	2 (22%)
Locationofroutes:	city	12 (7,8%)
	aroundtown	15 (9,9%)
	intercity	5 (3,2%)
Number of pick-up and drop-off points:	Bus station and bus station:	2
	Stations:	78
Level of station supply:	- 1 stop every 500 meters. (Required 55 pieces)	

The methodology of writing the article is the Decree of the President of the Republic of Uzbekistan on the quality indicators of passenger service and routes in public transport in the region and their improvement, the works of local and foreign scientists on the development of this area. The research process is based on the extensive use of methods such as economic statistics, expert evaluation, statistical grouping, monographs, and scientific observations.

4. Analysis and discussion of results.

Figure 1 Map of routes of Termez city

Evaluation of the regional route network.Convenient movement of passengers in different modes of transport will depend on the improvement of the system of urban routes.

The main requirement for the urban route system is to ensure that the number of transfers of passengers on one route and another transport within the city area and the time spent on one flight in any direction of the city is minimal. The higher the density of the urban passenger transport network, the greater the chances of passengers reaching their destination without switching to other modes of transport.

Figure 1 Map of routes of Termez city

Cartographic view of Termez city area (***Google Earth***). (Figure 1)

The problem of choosing a bus route scheme in cities and the following basic information is needed to solve it.

• You will need a city map with a transport network that connects these points where buses can move and consists of exit and return points from the streets.

The points of origin and return of passenger traffic are generally understood as the transport districts of the city. Natural and artificial boundaries (rivers, railway lines, etc.) are used primarily when dividing a city into neighborhoods. Transport trunks should, if possible, have axes of symmetry in the neighborhood. Therefore, in solving this problem, it is assumed that it depends on the network of transport, not on the pedestrian crossings and the route scheme from the stop. In this regard, the total time spent by passengers is assumed to be constant, independent of the route scheme and therefore not taken into account in the route selection calculations. The transport network shows the length of each part of it and the time of bus travel through these sections.

The methodology for calculating the scheme of bus routes in cities is considered in a conditional, somewhat simplified example. The exception, for example, does not take into account all the limitations that may exist in the real conditions of a particular city, but in this example the basics are outlined. The considered example is represented by the transport network.

The numbers in the circles indicate the numbers of the dots (microcenter centers); the numbers in the middle of the network sections indicate the travel time of the buses in that section in minutes, and the numbers in parentheses indicate the section length in kilometers. This example shows the adequacy of passenger transport in the estimated period of “high” assumed to be equal to 1 hour (Table 2). This is based on the table. In describing the initial data needed to solve the problem under consideration (PTV Vissim https://www.ptvgroup.com/en/solutions/products/ptv-vissim/), the passenger traffic data was obtained on the basis of a data processing program (gadget).

The first column of the table shows where the points are, and the first row shows the address of the destination. (Table 1)

The proposed route scheme for the division of the study area into quarters is given. Circles represent quarters, and rectangles represent the distance of intermediate routes.

All routes serve one type of bus, each with a capacity of 40 people, taking into account the filling factor. Set for the maximum interval between bus departures Imax-12 min The travel time

between points in both directions is assumed to be equal, although it may be completely different.

The time taken for a passenger to pass at each point is as follows:

№ Breakpoints. 1 2 3 4 5 6 7 8

***t*$_{nep}$.....2 5 5 4 5 5 4 5** Indicator. Identify the shortest paths.

The development of a route scheme consists of several stages. Identify the shortest (in time) paths between points (neighborhoods). Among the many algorithms for solving the shortest path problem, the most accurate are the following, which consists of two steps.

Phase 1. Let 0 be loaded on the starting node of the network.

Indicator. Identify the shortest paths

Phase 2. In our example, the first nodes have potential and the last ones do not. We define the potentials of the last nodes as the sum of the potentials of the initial nodes and the time of bus movement along the link connecting the initial and final nodes. We select the end and write the node with the lowest potential next to the node and mark the link with an arrow.

All nodes that are repeated until step 2 are assigned potentials. In our example, the first starting node is 1. We assign this to the potential of 0.

Step 2 . You need to compare the two values 0 + 3.4 = 3.4 and 0 + 3.8 = 3.8 We choose the end node with the minimum potential. This is 2 points. We write a potential 2 close to this point and mark the link with a 1-2 sign.

Where from	**Where to**							
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**
1	-	90	180	110	190	110	120	140
2	110	-	120	170	150	80	120	80
3	100	110	-	190	110	110	90	75
4	90	100	90	-	210	70	82	70
5	150	125	104	80	-	100	100	65
6	95	90	97	90	210	-	98	80
7	110	120	100	120	130	110	-	78
8	120	100	122	110	125	118	80	-

Wher from	Where to							
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**
1	-	2	2 2,7	3 5,5	3,4 8	3,4,5 9.7	2,8 8.9	2 6,5
2	2	-	2,7	3 3.6	3,4 7, 1	3,4,5 8,8	8 8,9	4,5
3	2,7	1,8	-	2,8	4 5, 3	4,5 7	8 7	4,6
4	3 5,5	3 4,6	2,8	-	2, 5	5 4,2	5,6 5,8	5,1
5	4,3 8	3 7,1	4 5,3	2,5	-	1,7	6 3,3	6,7 5,7
6	5,4,3 9,7	5,4,3 8,8	5,4 7	5 4,2	1, 7	-	1,7	7 4
7	8,2 8,9	8 6,9	8 7	6,5 5,8	6 3, 3	1,6	-	2,4
8	6,5	4,5	4,6	5,1	7,6 5, 7	7 4	2,4	-

Repetition Step 2. The comparison results are 0 + 3.4 = 3.4, 34 + 3.8 = 7.2. The choice is the smallest of these potentials, which point means 2. We write it closer to this point and mark 1-2 with the reference arrow. If we continue this process, we get all the potential to the point.

Arrows with signs indicate the shortest path from point 1 to all other points. The results of these calculations are recorded in Table 3, where the corresponding cells in the upper left corner are the points with the shortest path and the lower-right corner is the time of movement between the start and end. For example, Table 2 shows that the shortest path from point 1 is through point 2 and point 3, and the time limit for the route (excluding transfer time) is 12 minutes. Similarly, calculations are performed for all points, each of which is taken sequentially as a starting point, and the results are entered in Table 3, which identifies all the shortest routes between all points on the transport network. [12]

II. Stage. Create an original route diagram. The scheme was adopted as the initial route scheme, which included continuously sufficient, minimal, purposeful routes through the routes, as well as partial routes that did not coincide with the route. As a route, we consider the route connecting the centers of three or more neighborhoods along the shortest route based on the time taken to cross the road.

A sufficient condition for an appointment by route is that the waiting time of the bus passenger at the starting point of the route is less than or equal to the time he has to spend at the transfer point to meet the natural requirement.

$$\frac{cqT_P}{\rho} * \frac{1}{P_{ij}} \leq t_{n_l}$$

c is the coefficient of roughness of the approach of passengers to the stop (assumed to be 0.5);

q is the capacity of the bus used (in our example, 40 people are accepted);

$\boldsymbol{Tp}$ is the duration of the period, min (60 min in our example);

$\boldsymbol{\rho}$ is the hourly coefficient of passenger flow inequality (assumed to be 1.1);

$\boldsymbol{P_{ij}}$ −is the maximum number of passengers traveling between the endpoints of the desired route on the route of maximum passenger traffic;

$\boldsymbol{t_{n_l}}$ is the time l spent by a passenger to travel to the destination, the point marked by the route i in the direction j and the end users j with the minimum duration of the transfer relative to other intermediate points on the road between the starting point, maximum passenger traffic.

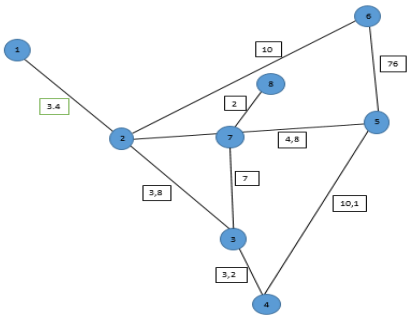
Routes that meet this condition are included in the original bus route scheme. In the example under consideration, we analyze the observance of a possible sufficient condition through the routes. The ratio of 1-3 above in the direction is as follows:

$$\frac{0.5 * 40 * 60}{1.1} * \frac{1}{180} < 5$$

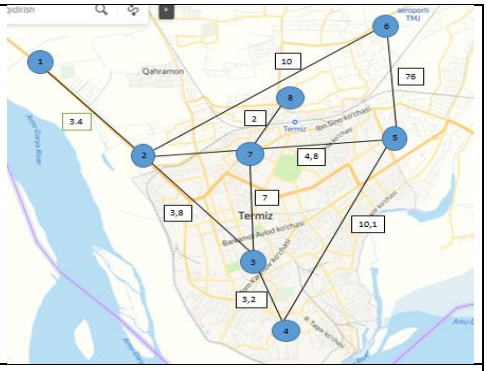
Since the left side of the inequality is larger than the head, i.e., the waiting time is longer than the transfer time, route 1-3 is not assigned. The same is true in lines **1-4**:

$$\frac{0{,}5 * 40 * 60}{1{,}1} * \frac{1}{110} > 3$$

All other routes are checked in the same way. However, it is given by the directions 1-8, 5-5, 6-7, 2-4 considered in the example.



Route scheme of Termez city



Route scheme on the map of Termez city

The proposed route scheme for the division of the territory of the city of Termez into districts is given (Figure 2).

Plot routes do not match these routes 1-8, 7-8. These routes should also include the bus route diagram in the original version. Thus, in this example, the original route diagram is shown in six directions 1-8.2-4.6-7.7-8.6-4, Indicator (**Figure 2**).

CONCLUSIONS AND SUGGESTIONS

Today, we can observe that the concentration of routes on the city's central highways generally leads to a decrease in the efficiency of the main network. Therefore, in the current situation there is a need to adapt the existing algorithms for the formation of route networks in the city of Termez to the modern conditions of urban planning.

Based on the above analysis, it is recommended that bus routes with urban routes be selected correctly, i.e., that new routes be opened, and that this measure improve the following indicators:

• Saves time for passengers to get to the station;

• The number of re-entry of passengers to other destinations will be reduced;

• Saves time for passengers to travel to their destinations by public transport;

• The level of branching of the network of routes in the region will increase;

• The quality of transport services will be improved.

• Saves time by improving bus route schemes;

• choosing the optimal route and adhering to and improving walking time intervals;

These analyzes serve as an aid to the development of a master plan for public transport in Termez [14]. In the next scientific articles, the selection of the route scheme and finding the optimal route line by mathematical methods will be continued in the next 3-4 steps in the next scientific articles.

ABSTRACT

This paper shows how to classify faults on a hybrid transmission line. The coefficients of discrete wavelet transform were used to evaluate current signals (DWT). To decompose high frequency components from fault signals, Daubechies4 (db4) is used as the mother wavelet. ATP/EMTP is utilized to mimic fault signals from current signals in this study. In the instance of single circuit single conductor with overhead and underground, a hybrid system between overhead line and subterranean cable of 115 kV from Provincial Electricity Authority (PEA-Thailand) was utilized as a simulated case study. The location of the fault, the kind of fault, and the angle of the fault has all been considered. Using MATLAB software, DWT is then applied to phase current and zero sequence signals in order to produce a coefficient in scale 1 for further analysis. This value is mostly utilized in the development of fault classification algorithms. The research's findings are satisfactory.

KEYWORDS:*Wavelet Transform; Overhead Line; Underground Cable; Fault Classification.*

1. INTRODUCTION

Transmission is divided into two types of installations: overhead transmission lines and subterranean transmission lines, each with its own set of applications. Because overhead transmission lines are easy to construct and cost less to install, they are widely used. However, it has certain drawbacks, such as poor dependability and the ease with which faults may arise. Underground transmission lines are often found in high-traffic regions or tourist destinations. When compared to overhead transmission lines, this kind of installation is quickly growing due to its excellent dependability and scenic attractiveness. As a consequence, the number of connecting points between the overhead line and the subterranean cable increases. Furthermore, the characteristics of both kinds of transmission lines are different. This may impair the protection system's ability to detect and diagnose faults, posing a risk to the power system. The categorization of faults in power transmission networks is complicated. For fault classification, the article employs a Decision-Tree Based Method.[1] Full-cycle discrete Fourier transform (FCDFT) and half-cycle discrete Fourier transform (HCDFT) are used to analyze voltage and

current (HCDFT).The accuracy of HCDFT is higher than that of FCDFT. A Distance Relay-Prevention Classification Approach Using Support Vector Machines was proposed. Two SVM-based classifiers have been suggested to be utilized in this study. SVM-1 is used to quickly identify problems in the system, whereas SVM-2 is used to differentiate between power fluctuations and voltage instability occurrences. Fault Detection and Classification Approaches in Transmission Lines Using Artificial Neural Networks was shown in the article. This method is based on treating each phase's current and voltage separately. In a relatively short period, the ANN outputs are utilized to identify the problem kind. Investigated Fault Detection and Classification for Compensating Networks Using Combination Relay and ANN. Data collected using Digital Signal Processing (DSP) and Artificial Neural Network (ANN) based on various methods is used to classify the issue. The RMS values of phase voltage, phase current, and phase voltage angle are used as inputs, and the results are compared. For fault classification,[2] the wavelet transform will be used in the majority of the studies . The Discrete Wavelet Transform was used to classify faults in Thailand's transmission lines. This utilized spectral energy extracted from detail coefficients (level-4) of fault currents using the discrete wavelet transform (DWT). For all kinds of defects, the suggested approach performs well. In the publications, the wavelet singular is used. The application of maximum singular value energy for defect detection and classification is discussed in the article. For the identification and categorization of defects in transmission lines, a method based on the wavelet singular entropy (WSE) approach is given. For fault analysis, the articles utilized the Discrete Wavelet Transform (DWT). The Wavelet Based Alienation[3] Algorithm was used to detect and classify faults in transmission lines . Alienation coefficients based on approximate breakdown of three phase currents from both ends may be used to assess fault detection and classification. Wavelet transform and Artificial Intelligence were used to evaluate fault in the articles. With the assistance of the wavelet transform, reported an application of a particle swarm optimization (PSO)-based multi-layer perceptron neural network in identifying defects in transmission lines. The results indicate that the suggested method achieves a very high level of accuracy. With acceptable results, the wavelet transform may be used to evaluate and categorize faults. As a result, this study suggests using the wavelet transform to analyze faults on a hybrid transmission line. The behavior of the wavelet transform coefficients will be investigated in order to develop fault classification methods. The simulated system is Thailand's Province Electricity Authority (PEA) 115 kV transmission line. On overhead lines and subterranean cable, the transmission model using Single Circuit Single Conductor is considered[4]. Figure 1 depicts the arrangement structures. Overhead wires placed on a 22-meter concrete pole and subterranean cables installed in a duct bank and 1.5 meters deep in the earth are seen. In the simulation, the EMTP/AT Draw program was utilized. The simulation system consists of a 40-kilometer transmission line connecting two substations. At the half-way point of the transmission line, there is a changeover between overhead and subterranean cable (20 km). Figure 2 depicts a transmission system diagram. Simulations were run with different modifications in system settings to assess the effectiveness of the proposed categorization algorithm: For the instants of fault initiation, the angles on phase A voltage waveform were 0-330 .There are four types of faults: single line to ground, double line to ground, line to line, and three phase fault.10 percent, 20 percent, 30 percent, 40 percent, 50 percent, 60 percent, 70 percent, 80 percent, and 90 percent of the length of the transmission line measured from the sending end to the receiving end are identified as fault locations on any phases of the transmission line. The EMTP/AT Draw program generated a signal with a sample rate of 100 kHz and switch responses for format and time that the fault would occur. The problem occurred at t=0.04 s and was simulated for 5 cycles (0-0.1 s) without clearing[5] the fault. Depicts a single line to ground fault in phase A situated 12 kilometers from the sending side, whereas Figure 4 depicts a line to line fault in phases B and C located 12 kilometers from the sending side. When a defect develops in a transmission line, as shown in Figures 3 and 4,

current on the fault phase increases substantially in both ends and on the load side. The high frequency component [6]dominates the fault characteristics. The Wavelet transform may be used to extract and evaluate this component. The Discrete wavelet transform (DWT) was used to examine a fault signal by extracting the high frequency component (Detail) in order to assess changes in different scales and frequency ranges. These data will be examined in order to develop fault classification by studying the features and behavior of coefficients. Fault signal analysis has been performed on both sides of the transmission line by collecting fault signals from the EMTP/AT Draw program and transforming them into different network sequences. Figure 1 discloses. The structure of transmission lines between overhead line and underground cable

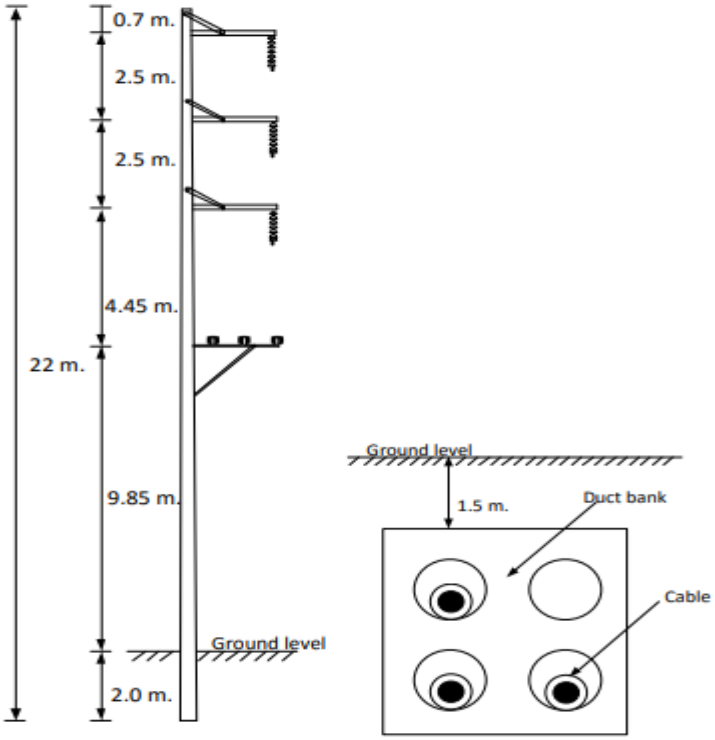

Figure 1: The structure of transmission lines between overhead line and underground cable.

2. DISCUSSION

An iterative method may be used to concentrate energy on a passive source, such as a kind of isolated reflector. The TRM sends off a plane wave that moves toward and is reflected by the target. The reflected wave reaches the TRM, giving the impression that the target has sent out a (weak) signal. As is customary, the TRM reverses and retransmits the signal, sending a more concentrated wave toward the target. The waves get more concentrated on the target as the procedure is repeated. Another option is to utilize a single transducer in conjunction with an ergodic cavity. An ergodic cavity, by definition, is one that allows a wave to originate at any place and travel to any other point. An unevenly shaped swimming pool is an example of an ergodic cavity: if someone jumps in, the whole surface will eventually ripple with no apparent pattern. A wave beginning at any place will reach all other locations an unlimited number of times if the propagation medium is lossless and the borders are perfect reflectors. This feature may be taken advantage of by recording for a long period with a single transducer to capture as many reflections as feasible. The time reversal method is based on a property of the wave equation known as reciprocity: if a wave equation solution exists, then its time reverse (with a

negative time) is also a solution. Because the conventional wave equation only has even order derivatives, this happens. Although certain media are not reciprocal (for example, extremely lossy or noisy media), many others, such as sound waves in water or air, ultrasonic waves in human bodies, and electromagnetic waves in free space, are. In addition, the medium must be somewhat linear[7]. A matching filter may be used to simulate time reversal methods. If the original signal is a delta function, the received signal at the TRM is the channel's impulse response. The TRM effectively auto correlates the impulse response by sending the reversed version back via the same channel. The origin, where the original source was, has a peak in this autocorrelation function. It's crucial to understand that the signal is focused both in space and time (in many applications, autocorrelation functions are functions of time only).The TRM may also be thought of as a "channel sampler" in a time reversal experiment. The TRM monitors the channel during the recording phase and utilizes that information to focus the wave back to the source ideally for transmission.Mathias Fink of the ÉcoleSupérieure de Physique et de ChimieIndustrielles de la Ville de Paris is a renowned researcher. His team has conducted many ultrasonic TRM tests. A single source transducer, a 96-element TRM, and 2000 thin steel rods placed between the source and the array were used in an intriguing experiment. Both with and without the steel scatterers, the source delivered a 1 s pulse. In the retransmission phase, the source point's temporal and spatial widths were measured. With the scatterers, the spatial breadth was approximately 6 times smaller than without. The spatial breadth was also smaller than the diffraction limit, which was defined by the size of the TRM with the scatterers. Because the scatterers improved the array's effective aperture, this is feasible. The focusing was still very excellent even after the scatterers were shifted slightly (on the order of a wavelength) between the receive and transmit stages, demonstrating that time reversal methods may be resilient in the face of a changing medium. Furthermore, José M. F. Moura of Carnegie Mellon University was heading a research team attempting to apply Time Reversal concepts to electromagnetic waves, and they were able to obtain resolution beyond the Rayleigh resolution limit, demonstrating the effectiveness of Time Reversal methods. Their research focuses on radar systems, with the goal of improving detection and imaging methods in extremely crowded settings, where Time Reversal techniques seem to be most useful.The beauty of time reversal signal processing is that no knowledge of the channel is required. The process of transmitting a wave across the channel essentially measures it, and the data is used to concentrate the wave during the retransmission phase. To optimize the system, one does not need to solve the wave equation; all one has to know is that the medium is reciprocal. As a result, time reversal is well suited to applications using inhomogeneous material. The fact that time reversal signal processing employs multipath propagation is an appealing feature. Multipath effects must be compensated for and corrected in many wireless communication systems. By using the energy from all routes, time reversal methods take use of multipath. Fink envisions a cryptography application based on ergodic cavity geometry. The key would be made up of two transducer sites. One plays the message, while the other captures the waves as they bounce about the cavity; this recording will appear as noise. There is only one place to launch the waves from in order for them to concentrate when the recorded message is time reversed and played again. Only one other place will show the focused message wave if the playback location is accurate; all other locations should seem noisy.

A geomagnetic reversal is a shift in the magnetic field of a planet in which the magnetic north and south poles are reversed (not to be confused with geographic north and geographic south). The Earth's field has cycled between times of normal polarity, in which the main direction of the field was the same as it is now, and periods of reverse polarity, in which the opposite was true. These intervals are referred to as chrons. The incidence of reversals is statistically random. Over the past 83 million years, there have been 183 reversals (one every 450,000 years on average). The most recent, the Brunhes–Matuyama reversal, occurred 780,000 years ago[1], with estimates of how fast it occurred varied considerably. According to some sources, the time it takes for a

reversal to complete is approximately 7,000 years on average for the four most recent reversals. According to Clement (2004), the length is influenced by latitude, with shorter durations at low latitudes and greater durations at mid and high latitudes. [2] The time it takes for a complete reversal to occur varies, but it usually takes between 2,000 and 12,000 years. Although there have been times when the field reversed worldwide for many hundred years (such as the Laschamp excursion), these occurrences are classed as excursions rather than complete geomagnetic reversals. Large, fast directional excursions, which occur more often than reversals and might be interpreted as unsuccessful reversals, are common in stable polarity chrons. The field in the liquid outer core reverses during such an excursion, but not in the solid inner core. Diffusion in the liquid outer core takes 500 years or less, while it takes 3,000 years or more in the solid inner core[8].

3. CONCLUSION

The wavelet coefficient analysis for faults was proposed in this paper. categorization based on a hybrid 115 kV system that includes both overhead and underground lines as well as subterranean portions The location, kinds, and severity of the defectIn order to assess all impacts, fault angles were changed. This may have an impact on the categorization of faults. The present situation There has been a signal on every phase and zero sequence signals. MATLAB software was used to apply the wavelet transform. The location, kinds, and angles of faults were discovered as a consequence of the investigation. Influenced the detection coefficient every case study, on the other hand, is unique. have a similar pattern in which the value of the coefficient is abruptly increasedwhen a problem arises This feature may be used to identify[9]faults. In the transmission line detection The data was then split in half (540 instances) and analyzed. in order to develop a defect classification method, it was discovered that for the initial peak value of the coefficient from the current signal's DWTAfter identifying flaws, phase X was utilized for comparison.Identification of the fault type The remaining half of the data (540 instances) will be analyzed.The accuracy is 81 percent when used in the circumstances indicated in Table I.This equates to 82.22 percent accuracy on the transmitting side and accuracy on the receiving side.In both cases, it may be identified with the maximum accuracy of 98.14 percent.both the transmitting and receiving sides Double line to has the least accuracy[3].

The transmitting side has a 55.55 percent ground fault rate, whereas the load side has a 48.76 percent ground fault rate Type of fault he number of lines toa fault in the earth From line to line,faultadd a second line toa fault in the earth three-phase processfaultIn transmission on hybrid, there is a transform on fault categorization. System of transmission (Overhead and underground). TheIn terms of results, the approach may provide acceptable results.accuracy. As a result, it may be developed further by incorporating to improve accuracy and rescue calculations, artificial intelligence is being used. Time to enhance the security system and boost the power dependability of the system[10].

AN OVERVIEW ON VIRTUAL POWER PLANT

Sarita Jangra*

Department of Pharmacy,
Teerthanker Mahaveer University, Moradabad,
Uttar Pradesh, INDIA

ABSTRACT

Controlling frameworks are still in use for a long time; they are the frameworks that control the flow and yield of the framework. The present examination paper discusses the virtual force plant, which is important in the construction of control frameworks. Many papers have been distributed with respect to the virtual force plant age of power, which is defined as the creation or age of power, followed by the transmission of power, which is virtual in light of the fact that there is an integrated associating gadget of all the components that connects all the force assets and structures a network that is ready to move power. When the supplied energy cannot meet the demand for electricity, virtual force plants become a viable option. The necessity for virtual force plants, their usage, and where all environmentally friendly power assets combine to provide power consistently are discussed in this article, as well as how a mixture of various virtual force plant mixes may solve power problems and increase proficiency.

KEYWORDS: *Controller, Control System, Gain, Virtual Power Plant, VPP, Open And Closed Loop.*

INTRODUCTION

In the electricity industry, virtual power plants are becoming a driving factor. This article describes how they let utilities and aggregators to pool output from various plants and dispersed sources, allowing them to participate and trade in the energy market with the flexibility and scale they need. The energy scene is shifting. Megatrends are causing global disruption in the energy and manufacturing sectors. Greater urbanization, a push for decarbonisation, and the rising impact of digitalization are altering how industrial products are manufactured across the globe, as well as how people use and generate energy. As a result, a power grid change is underway. It's altering the way electricity is produced, delivered, and used. Due to technology advancements, cost reductions, new business models, and supporting regulations, the transition from a conventional grid to a new smart, decentralized grid with bi-directional energy and information flow has quickened in recent years[1]. The worldwide shift toward renewable and distributed power production, which is significantly altering the energy environment, is one of the most important forces pushing change. Smaller, decentralized power generating units will dominate the market as the globe advances deeper into the energy transition toward a low-carbon future.

As a consequence, generation is moving from bulk, centrally managed power facilities to dispersed, weather-dependent sources, creating a complicated operating environment. Grid operators must now focus on controlling and optimizing those systems in a reliable and profitable manner. However, going beyond the fundamental needs has a distinct advantage, since changes in the energy environment offer a compelling chance to fully use the advantages of digitalization[2].

The framework utilized to manage the framework and its stream also yields and provides criticism to the information framework in accordance with the information framework's yield. Those items that establish themselves for humanity were developed with the help of designers and experts. In control framework design, a controllable framework is designed that also provides feedback to the framework so that it may improve its efficacy. Control framework engineers are focused on evaluating and managing pieces of their present situation, as well as control frameworks, to provide critical typical or precise value items for society and the environment. In view of the way that a superior frameworks control necessitates the frameworks to be sharp and visible, the goals of analysing and regulating are complementary. Control frameworks design is also used as a good way to control breakdown frameworks; compound cycle frameworks are an example of this kind of framework. Regulate engineers' current task is to show and control today's perplexing, interconnected frameworks, such as traffic signal frameworks, synthetic cycles, and automated frameworks. A few of the experts also have the ability and experience to operate contemporary robotization systems. The primary goal of control framework design is creating control frameworks according to the required yield that will benefit society[3].

Control frameworks design incorporates the concepts of organization hypothesis and correspondence hypothesis, as well as the development of framework criticism inquiry and direct framework examination. As a result, control framework design is not constrained by any standard or guideline, and it is suitable for aircraft design, compound design, structural design, and electrical design. Control framework design, for example, consists only of electrical, mechanical, and synthetic components[4]. A control framework is a collection of components that work together to create a framework architecture that produces the best possible response. The establishing provided by the direct framework hypothesis, which accepts a cause impact connection for the components of a framework, is the reason for examining it. As a result, a square may speak to a component or a cycle that has to be managed.

The info yield relationship refers to how the information sign is handled to produce a yield signal variable, which is often combined with a force intensification. An open-circle control framework is a framework without feedback that utilizes a regulator or control actuator to achieve the optimum response. This article provides information on the virtual force plant's display and activity. A virtual force plant is a framework made up of a variety of heterogeneous force assets that is used to fill or manage the power flow in metropolitan zones and provincial territories. A virtual force plant is a distributed computer architecture that is used to connect heterogeneous energy assets, also known as scattered energy assets[5]. Appropriate energy assets have a great potential to connect with all power markets and form connections between them. Virtual force plants are a collection of several heterogeneous energy assets that are linked together to form a matrix that attacks distributed computing. Virtual force plant proves to be productive, and it may extract data about the power market to assist and find methods to improve the efficiency of transmitted energy so that it can achieve maximum effectiveness or limit. It displays the VPP structure in a different way[6].

In recent years, the idea of integrating tiny producing units into the power grid has received a lot of interest. Furthermore, distributed generation (DG) is critical in bolstering the major producing

power plants to meet rising electricity demand. Unlike main power plants, DG may be readily linked and withdrawn from the network, allowing for more flexibility. Economic savings through reduced power losses, increased dependability, and better power quality are just a few of the advantages of properly designed and managed DG systems. However, increasing DG penetration without generating unit harmony may result in higher grid power losses, unattractive voltage profiles, unreliable protection device functioning, and a mismatch between actual use and output[7]. As a result, DER units should be visible to the system operator in order to ensure the most cost-effective operation of the main network. The negative consequences of increasing uncoordinated DG penetration are the driving force for the VPP concept's debut. VPP is the aggregation of DG units, controlled loads, and storage devices linked to a specific cluster into a single conceptual entity in charge of regulating the electrical energy flow inside the cluster as well as in exchange with the main network. With its framework, the VPP idea was suggested early on. Previously, DER were deployed in a “fit and forget” manner and were not visible to system operators. VPP combined all DERs into a single entity, giving DERs the same system visibility, controllability, and market effect as transmission-connected generators[8].

Various research looked at the VPP idea from three perspectives:

- The first direction is responsible for categorizing DGs within the VPP hierarchy according on their capacity as well as ownership. Domestic DG (DDG) and Public DG were the two categories reported (PDG). Another DG categorization was given based on whether they were stochastic or dispatch able in nature.
- The second approach concentrated on the technical and commercial structure of VPPs, including Technical VPP (TVPP) and Commercial VPP (CVPP), as well as their capabilities.
- The third path is geared at improving the VPP operation. Some of these research focused on optimizing the VPP structure by choosing the best size and placement for the VPP components. Other research, on the other hand, focused on the VPP's profit maximization.

A literature overview of VPP definitions, components, and framework is presented in this article. It also makes the relationships/correlations between VPP structure elements and their duties easier to understand. Finally, a review of the many methods that may be suggested to improve the functioning of the VPP is given[9].

1. Framework VP

Under a layer of Information and Communication Technologies, VPP is a big entity that includes a large number of DGs, controlled loads, and storage components (ICT). VPP is in charge of managing and regulating the flow of electrical energy not just inside its cluster, but also in exchange with the main grid. Auxiliary and power quality services are also available via VPP. VPP needs have the following tools in order to do these functions:

- Information and communication technology infrastructure.
- Applications for monitoring and control.
- At the customer's location, smart metering and control devices are installed.
- Software programs for predicting the VPP's electricity generation.

VPP is split into two categories for specialization: Technical Virtual Power Plant (TVPP) and Commercial Virtual Power Plant (CVPP) (CVPP). In order to accomplish the VPP functions, these two entities work together. The following are the functions and duties of TVPP and CVPP.

2. Virtual Power Plant (Technical) (TVPP)

TVPP is in charge of ensuring that the DER and ESSs are operating properly in order to control energy flow within the VPP cluster and to provide ancillary services. The CVPP provides TVPP with information on the contractual DGs and controllable loads, which must include the following:

- Each DG unit's maximum capacity and commitment.
- The prediction for production and consumption.
- Loads and DG units' locations.
- The capacity of energy storage systems and their locations.

According to the contractual requirements between the VPP and the loads, the available control strategy of the controllable loads at all times throughout the day. TVPP guarantees that the power system is managed in an efficient and secure manner, taking physical limitations and possible services provided by VPP into consideration, based on information received from the CVPP in addition to comprehensive information about the distribution network architecture.

The TVPP performs the following functions:

- For distribution system operators, managing the local system (DSO)
- Balancing, network management, and auxiliary service execution are all part of the job.
- Giving the transmission system operator (TSO) access into the distribution network's DERs, enabling DG and demand to participate in transmission system management operations.
- Managing the DER operation in accordance with the requirements derived from CVPP and system status data.
- Continuously monitoring the status of the equipment in order to get previous loadings.
- Asset management, which is backed up by statistics.

3. Virtual Power Plant For Commercial Use (CVPP)

CVPP views DERs as business entities that provide the price and quantity of energy that they can supply, allowing the VPP portfolio to be used more efficiently in the electricity market. Both the DG units and the consumers have bilateral contracts with CVPP. The information from these contracts is provided to the TVPP so that the quantity of contracted electricity may be taken into account during technical investigations. Individually, small-scale DG plants are unable to engage in the power market.

As a result, CVPP brings these units to the attention of the energy market. The following is a list of CVPP functionalities:

- Production scheduling based on anticipated customer requirements.
- Trading in the energy wholesale market
- Portfolio balancing and/or trading
- Assisting the system operator with his or her tasks
- Submitting the features, prices, and upkeep of DERs
- Forecasting production and consumption based on weather and demand characteristics.
- Demand management during outages

- Developing and submitting DER bids to the energy market.
- Generation scheduling and daily optimization
- In the electricity market, selling DER power.

CVPP works with the following entities in order to accomplish the above-mentioned goals:

3.1. DER:

Its primary goal is to close the imbalance between supply and demand. Its production must be planned, predicted, and the information transmitted to the TVPP.

3.2. • Balance Responsible Party (BRP):

A BRP is an energy trading business that has the ability to make its own production/consumption plan accessible for TVPP to utilize.

3.3. • Transmission System Operator (TSO):

This entity is responsible for maintaining the network's immediate supply and demand balance.

3.4. • TVPP:

It gets information from CVPP and considers it while optimizing the VPP's functioning and interaction with the main grid.

LITERATURE REVIEW

Several papers on power generation, appropriation, and transmission, as well as a few papers on virtual force plants, have been distributed, and among them is a paper titled "prologue to control foundations," which examines what a control framework is and how control framework design aids in the control of large force plants. There are two types of force plants: opened circle and closed circle control circuits. Examine the use of the input control framework and the criticism framework in control design. In charge framework design, regulators such as relative regulators, fundamental regulators, subordinate regulators, and matching vital differential regulators are used. Variable contribution of the framework offers variable yield, as well as controllability of various frameworks such as heat plants, wind power plants, and so on. It also provides information on the historical background of programmed control. The project's methodology is based on parallelization. When overflow power is available, it will verify the excess force rating and, if it is accurate, it will decrease the electrical force of the CHP and activate the kettle. If the overflow power is turned off, check whether there is a power shortage. If there is, purchase power from the lattice. If there is, check if the force shortfall is supplied by taking power from the network. If there is, end your advancement control. If not, stop the most un-beneficial modern app[10].

A complete definition is provided based on the definitions given. “A concourse of dispatch able and non-dispatch able DGs, energy storage elements, and grid connected supplemented by communication and information technology to form a single imaginary power plant which thus plans, monitors, and collaborates the power flows here between component to try and reduce generation costs, try and reduce greenhouse gas production, and maximize efficiency,” according to the VPP definition.

DISCUSSION

VPP is a relatively new yet appealing idea that requires much study in order to be implemented. This article provides a thorough assessment of the literature on various VPP definitions, components, and their relationships. For a better understanding of the VPP idea, the VPP

structure is described, as well as the capabilities of the TVPP and CVPP. A review of several optimization methods attempts to improve either the VPP structure or the VPP operation under consideration. The optimum size and placement of DG units and ESEs, the optimal load management, and the optimal measuring device location were all part of the VPP structure optimization. The necessary goal functions, as well as optimization methods, are emphasized for optimum VPP functioning. The survey results assist researchers in gaining a deeper knowledge of the VPP framework and functioning, as well as identifying the optimization tools and goals needed to fulfill the VPP idea.

CONCLUSION

The virtual force plant is essentially a distributed computer architecture that is used to combine heterogeneous energy assets, also known as circulating energy assets (DER). Appropriate energy assets offer a fantastic potential to connect with all power markets and form connections between them. Virtual force plants are a collection of several heterogeneous energy assets that are linked together to form a lattice for distributed computing. Virtual force plant demonstrates that it is capable of separating facts about the power market in order to assist and find methods for transmitted energy effectiveness, allowing it to achieve maximum productivity or limit. When we plant any framework, we have to look at the whole cost of the framework, thus the major practical advantage of virtual force plants for circulating energy asset (DER) owners is the most extreme profit from the power displays and reduced financial risk. The important segments of the virtual force plant (VPP) with dispatch competent force plants and discontinuous producing unit's adaptable loads and capacity units have been focused in a short time, according to this research. Also discussed were the main components of the virtual force plant (VPP), namely CVPP and TVPP, as well as virtual force plant-related demonstrations.

ABSTRACT

Signal processing methods may be used to identify faults in underground power lines by analyzing voltage and current data. We investigate the possibility of using sophisticated wavelet analysis to identify faults in this paper. We use continuous wavelet transform (CWT) to integrate complex wavelets and compute impedance from voltage and current data in the wavelet domain. The magnitude and phase distributions of the impedance are then investigated under different circumstances. We put our analytical method to the test using data from several kinds of cables. The findings demonstrate that a sophisticated wavelet analysis-based method may generate distinct fingerprints for distinguishing between different types of data.

KEYWORDS: *Power Cable, Impedance, Communication Cable, Wavelet Analysis, And Continuous Wavelet Transforms, Fault Detection.*

1. INTRODUCTION

Over time, underground power lines degrade. It is critical to identify faults and estimate the remaining life of cables in order to guarantee the stability of power delivery systems. The voltage and current signals obtained with the wires are typically used to identify faults .We looked at different signal processing methods for defect detection before. Fast Fourier transform (FFT) , short-time Fourier transform (STFT) , and discrete wavelet transform (DWT) were among them. All of them produced acceptable results, with the DWT-based detection seeming to be the most trustworthy. We investigate the possibility of using complex wavelet analysis for fault detection in this article. For the wavelet transform in complex wavelet analysis, a complex valued mother wavelet is used. The resultant wavelet coefficients are all complex valued, allowing for independent extraction of magnitude and phase information. The wavelets in the prior DWT-based detection were entirely real valued. As a result, it was unable to offer critical phase data for study.In this paper; we look at the continuous wavelet transform (CWT) in addition to complex wavelets. CWT, unlike DWT, produces coefficients on continuous scales rather than discrete scales. The much expanded number of scales allows for considerably more signal information to be analyzed. We compute the impedance using voltage and current data in the wavelet domain, as we did in our prior research.[1] We look at the magnitude and phase data

to see what features are linked with different cable kinds.The analytical method is then put to the test using data collected from three cables with various failure situations. Mother wavelets of complex values are used in complex wavelet analysis. As a consequence, the wavelet coefficients computed are also complex valued. Complex mother wavelets come in a variety of shapes and sizes. We use complicated Gaussian wavelets in this work. The p the derivative of the following complex Gaussian function yields a mother wavelet with parameter p. Cp is a normalizing factor that ensures the derivative has a unity norm. Figure 1 discloses the Time-scale plot of the impedance magnitude, generated from data set 1 of the normal cable.[2]

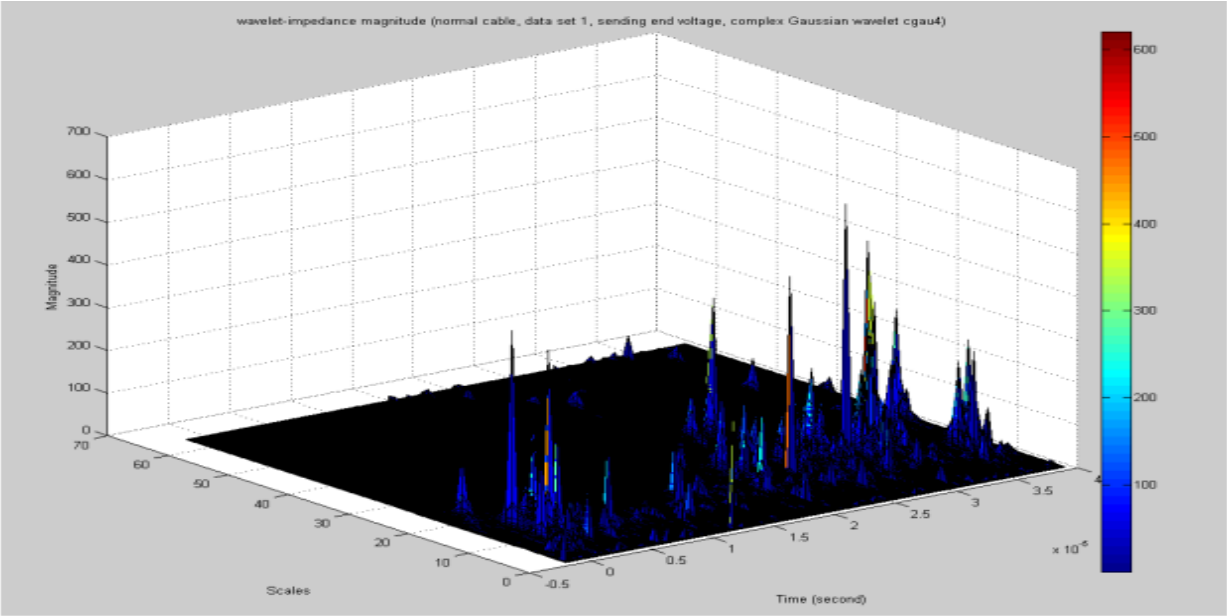

Figure 1: Time-Scale Plot Of The Impedance Magnitude, Generated From Data Set 1 Of The Normal Cable[3]**.**

The Continuous Wavelet Transform (CWT) is a kind of wavelet transform that is The scale parameter is a, the position (time) parameter is b, the signal being converted is f(t), the mother wavelet is (t), and the complex conjugate of (t) is *(t) (t).CWT compares the signal f(t) to wavelet functions that reflect various scales and temporal locations. C(amble(t),(t)) provides a multiresolution analysis of the signal in both the frequency (i.e. scale) domain and the time domain. The mother wavelet is scaled (using parameter a) and shifted (using parameter b) to produce the wavelet functions (t).The impedance is defined as impedance = FT(voltage) / FT(current) in the Fourier domain, where FT denotes the Fourier transform. In this research, we use the wavelet domain to do comparable calculations and designate the findings as wavelet-impedance, using the formula wavelet-impedance = WT (voltage) / WT(current) The wavelet transform, whether DWT or CWT, is denoted[4] by WT. However, we continue to refer to "impedance" rather than "wavelet-impedance" throughout the study for clarity. At the transmitting end of three cables, normal cable, cable with holes, and shorted cable, voltage and current signals are measured. Five sets of data are collected for each wire. The complex wavelet analysis uses a total of 5000 samples from each data set. The parameter p is set to 4 for the complex Gaussian wavelet. The CWT has a scale range of 164 points.3-D time-scale graphs of the magnitude and phase derived from the estimated impedance for each cable. Most major peaks occur at small to medium scales, according to the magnitude distributions. Along the time axis, the phase distributions seem chaotic, but along the scale axis, certain patterns emerge. Each cable has its own magnitude and phase distributions, which may be investigated further to produce fingerprints.

2. DISCUSSION

Power cable is extensively utilized, particularly in the metropolitan power system, due to its benefits. To maintain a dependable power supply, it is critical to locate power distribution line faults quickly and precisely. Figure 2 discloses the Time-scale plot of the impedance phase, generated from data set 1 of the normal cable

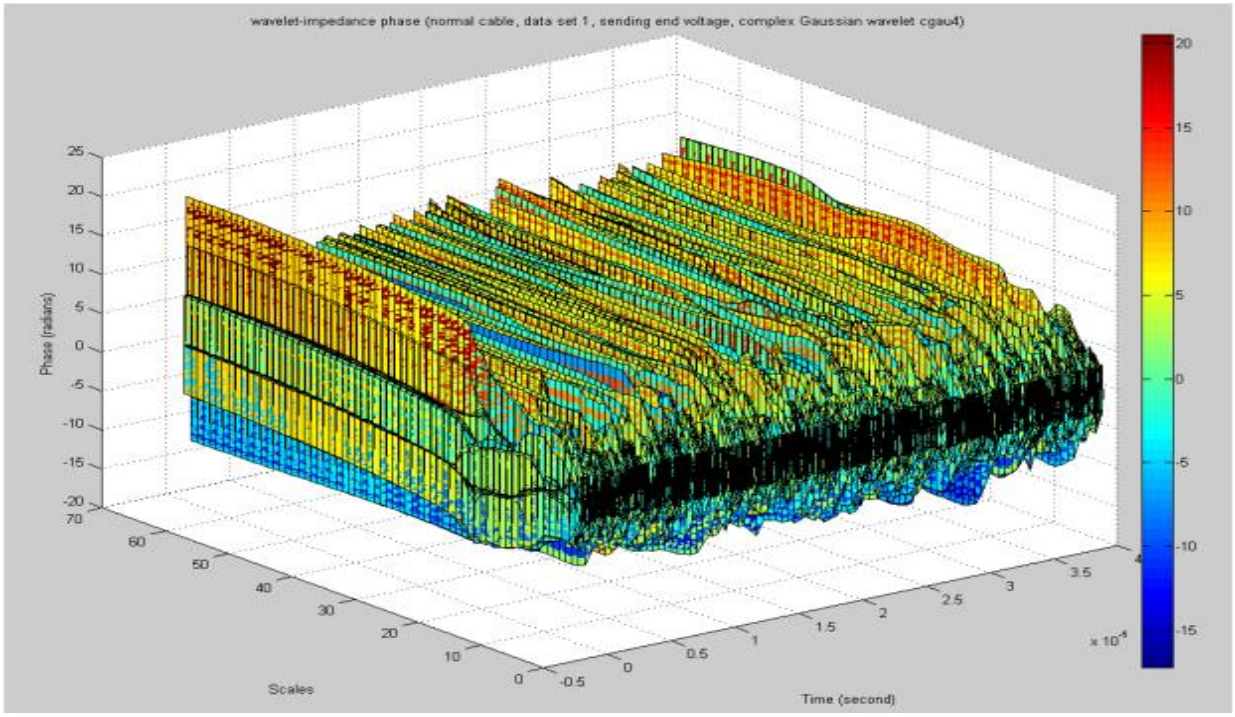

Figure 2: Time-scale plot of the impedance phase, generated from data set 1 of the normal cable[5]**.**

We must fmd find the problem spot and fix it after it has occurred. The first step is to see whether there is a problem, and then to figure out what sort of issue it is. On-line monitoring is primarily accomplished by tracking electric parameters and calculating insulation-related metrics in order to anticipate insulation damage. The purpose of this research is to provide a novel technique for monitoring cable problems and determining the kind of cable defects. The majority of urban electricity grids are tiny. Fault current is not a suitable way to fmd out a fault line when the power connection is damaged. However, measuring sheath grounding current may be a useful tool for detecting cable line faults. Previous grounding current research has mostly focused on steady state capacitance current. We analyze sheath grounding current in this article and provide a new technique of power cable fault monitoring in a 35kV power system that uses both steady state and transient capacity current..Sheth grounding mode and 35kV cable construction. Figure 3 discloses the Time-scale plot of the impedance magnitude, generated from data set 3 of the cable with holes.

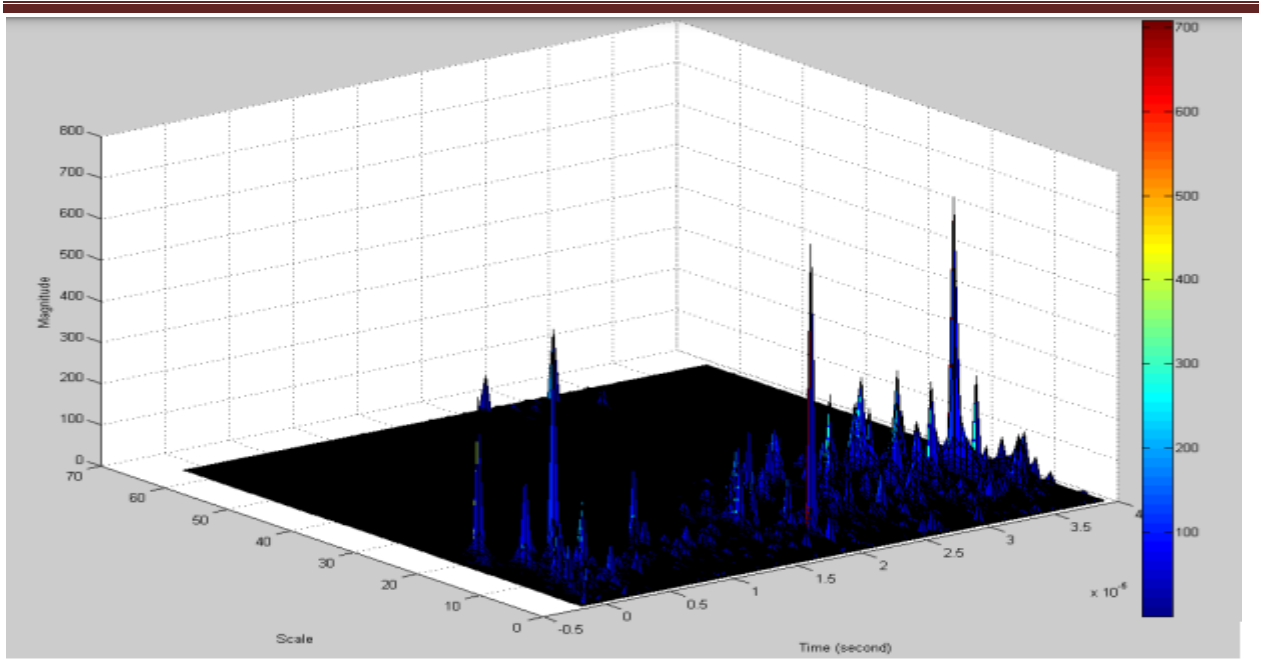

Figure 3: Time-Scale Plot Of The Impedance Magnitude, Generated From Data Set 3 Of The Cable With Holes[6]**.**

Conductor, insulation layer, copper shield, and Ann or layer is the four major components of. A simplified circuit is illustrated in Fig2 in the system where the neuter point does not ground. The metal sheath has one end that is grounded and the other end that is open. When alternating current passes through the cable core, an induced magnetic field forms surrounding it. It adds induced voltage to the equation. The circuit of the metal sheath is normally open. In the circuit, there is just capacitive current. The current flowing through sheath B. The power cable's steady-state fault characteristics The fault point is grounded when there is a circuit fault. Assume the grounding point is now in phase A.We know that phase A's voltage is zero. In phase A, the capacitive currents of the elements are zero. The total of capacitive 738 current in the other phase is the current through the fault site. In typical circumstances, the value is three times higher. In most systems, there are many lines. Other components' capacitive currents are included in the fault line current. Current in the shielding layer of the cable is interested in surrounding capacitance and line voltage level during normal operation. The following is the calculating technique for a capacitive current shielding layer: In the formulae, is the system's frequency[7]. The voltages in each phase are [7]referred to as Ui.In each phase, Ci stands for earth capacitance. Figure 4. Discloses the Time-scale plot of the impedance phase, generated from data set 3 of the cable with holes.

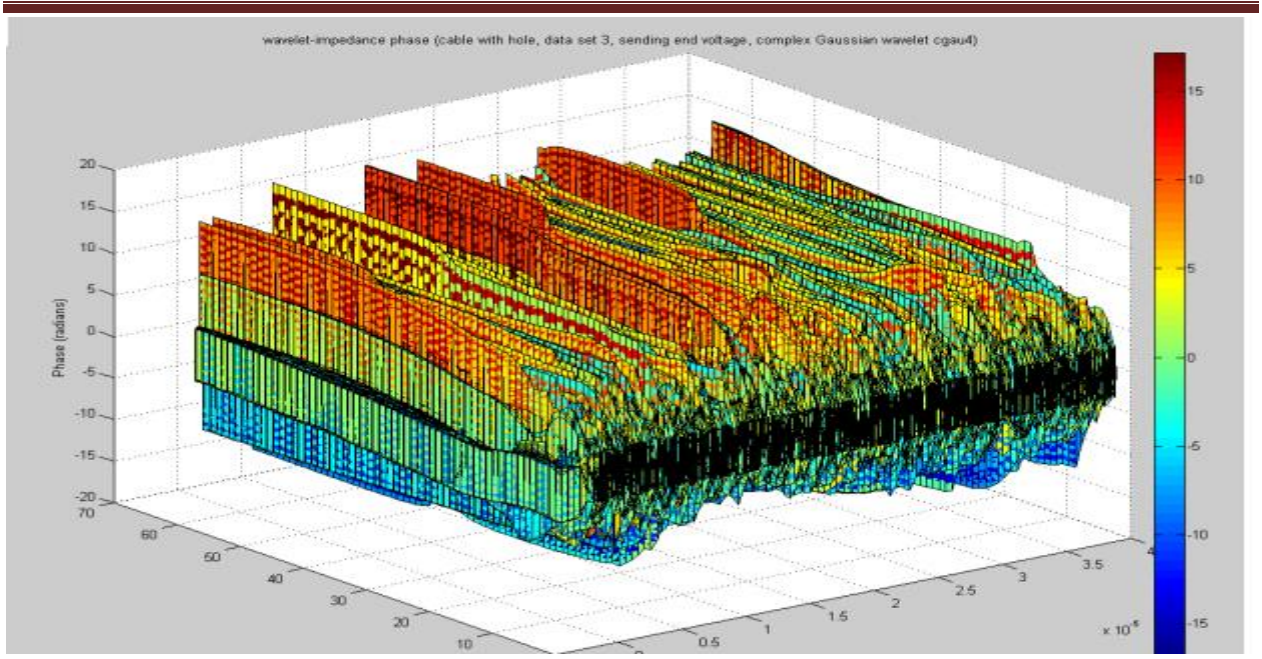

Figure 4: Time-Scale Plot Of The Impedance Phase, Generated From Data Set 3 Of The Cable With Holes[5]**.**

The cable's earth capacitance is: the dielectric constant in the formulae.The diameter of the conductor is 1 d.The outside diameter of the insulating layer is 2 d.To monitor the current in the cable's metal sheath, a current sensor is placed. The cable is made up of many sections. Each part's beginning is grounded.[8] The following are the openings at the conclusion of each part: Assume a fault occurred in the cable's first section. Before a grounding fault develops, current through the fault phase's sheath in the fault portion is equivalent to single-phase grounding capacitive current. When a grounding fault develops, it is three times larger than before. When there are several lines, the capacitive current in other phases is added to the current via the fault site. The current flowing through the sheath of the sound phase in the fault portion was three times greater than before. As a result of a voltage change. In the non-fault portion, current through the sheath is almost nil. Due to the fact that the voltage is zero. By comparing the differences in currents through the sheath of each phase in each part, we can determine which part and which phase is grounded. Obviously, the portion whose current through the sheath rises is grounded. The transient capacitive current is divided into two components after a grounding failure. Because the voltage is dropping, the discharge capacitance current of the grounded phase is increasing. The current has a high frequency and a rapid attenuation due to the voltage rising. Charging capacitance current of sound phase. The current is slower to attenuate and has a lower frequency.The amplitude of phase voltage is denoted by Um.The capacitive current's amplitude is measured in cm I. The angular frequency is 0 degrees.is the transient free oscillation component's attenuation coefficient. This is the first stage.is the angular frequency of the power frequency. The steady-state component is opposite the transient free oscillation component.The transient free oscillation component has the same polarity as the steady-state component at the start of the transient. Fault features are readily apparent[9].

3. CONCLUSION

We used complicated wavelet analysis to create a method for cable diagnostics in this study. It combines CWT and complex wavelets to compute impedance in the wavelet domain for analysis. The recovered magnitude and phase signatures have been confirmed to be useful for differentiating between different kinds of cables via tests using data collected from various cables. A technique based on sheath grounding current is given in this article to address the issue

of fault monitoring in cable lines. The fault phase and sound phase sheath grounding currents have distinct properties, according to the study. We can determine which component and phase is at issue based on these discrepancies. However, when fault resistance rises, the features of a grounding defect become less noticeable. When fault resistance is strong, it is difficult to determine the fault line[10].

ABSTRACT

This article explores the ideological and aesthetic transformation of the stories of the Persian Gulf at the beginning of the XXI century, the appearance of miniature and very short stories in the Arab story. At the turn of the 21st century, great changes and shifts have occurred in Gulf novelism, and these have occurred mainly in the traditional plot, which is an important element of the artistic form. The interconnected situations, the sequence of events have practically changed, the stories have acquired a more lyrical character, and the development of thoughts, feelings, emotions and experiences has intensified in them.

KEYWORDS: *Thoughts, Feelings, Emotions, KhudaNaimi, Qatar, Holy Quran, Bukhturi, Kuwait, United Arabic Emirates, Psychologism, Novelistics, Persian Gulf.*

INTRODUCTION

At the turn of the 21st century, great changes and shifts have occurred in Gulf novelism, and these have occurred mainly in the traditional plot, which is an important element of the artistic form. The interconnected situations, the sequence of events have practically changed, the stories have acquired a more lyrical character, and the development of thoughts, feelings, emotions and experiences has intensified in them.

THE MAIN FINDINGS AND RESULTS

Arab literary scholars call the external (traditional) movement of the plot - "at-tabir al-khorijiy" (**التبئير الخارجى**) and the internal movement "at-tabir ad-dakhiliy" (**التبئير الداخلى**). [1:68]

Qatari writer KhudaNaimi applied external plot movement (at-tabir ad-Dakhiliy) in her short stories "*At the Bottom"* (فى الحفرة), *"A Stain on the Wall of History"*(شخبطة على جدار التاريخ), *"Leila and I"* (ليلى و أنا), "*Acrobats*" (اكروباتا), "*Done for others*" (يحدث للاخرين).

In the story of the writer "*At the Bottom*" [2:13], the main character seems to fall into a deep hole. No one can save him or even try to save him.

In this story, the writer abandons the chronicle approach to plot organization and puts the effect before the cause. In a monologue addressed to the relatives of the protagonist of the novel, he

compares them with the people from the cave, mentioned in the surah al-Kahf of the Holy Quran, who have lagged behind their time, and pours out "curses" on their heads. Another feature of the work is that the situation in it requires a creative approach from the reader, the writer creates for the reader a state of seeking a solution along with the main character, she observes, analyzes events, and seeks a way out. But mainly because of the spiritual pit created by the protagonist himself, accustomed to slavish obedience, who never rebelled, he cannot find the strength and will to get out of this pit.

The story of the writer from Bahrain Fawziya Rashid "*Swimming*" (سباحة) [3: 7: 4] masterfully covers the story of overcoming the crisis between a man and a woman. In the story, the writer uses various methods to realize her creative intention: firstly, an ironic, satirical style: the main characters do not get tired of arguing with each other, even when they are drowning in the sea, the second sign is that the true image of the heroes manifests itself in a "borderline" situation characteristic existentialist literature, that is, in the struggle for the lives of drowning people. Disagreements arise when two strong personalities collide. A man was fascinated by a freedom-loving woman, but when the same traits of a woman became a burden to him, and he tried to put himself in the place of the "master" in family relationships, the woman's whole being rebelled against this, she could not get used to such a relationship. In the story, there is a new approach to the problem of women. This new approach appeared only in the late XX - early XXI centuries, mainly in the works of female writers. The main character in them is usually an enlightened, highly educated, self-aware, self-confident, equal to a man, sometimes superior to him, a woman of this category - the main character in Fawzia Rashid's story "*Swimming*". As a result of a constant quarrel between a man and a woman, they decide to divorce. The writer puts the heroes in a critical situation when they can drown. In danger, they unite, fight for life, support each other and survive. These dangerous moments cleanse them, as if they are being reborn with the universe. Before death, all their whims, ambitions will seem petty, futile and unnecessary.

The works of Sultan Amimi, a novelist from the United Arab Emirates, are written in various forms and styles, and in content most of them relate to rural life, which sets him apart from other writers. His stories "*The Long Guts*" *(السنطوانة)*, *"The Graves*" *(قبور)*, "*The Oath*" *(ثأر)* [4] portray rural landscapes, customs, lifestyles and attitudes with great skill. The presence of local colorful touches and national traditions gives a special charm to the writer's stories. Despite the socio-economic changes, it cannot be said that the villages of the emirates have completely abandoned the tribal structure. Among the population, there are still old rituals, interpretation of dreams, belief in magic, seeking salvation from witchcraft with the help of various rituals, and observance of customs. The writer laughs at these local heresies, and this mood permeates his stories. But sometimes adhering to old habits and customs takes a serious turn.

Especially if one of the tribesmen is killed, the obligatory blood feud has not lost its significance in the villages. The main character of the stories "The Oath" *(ثأر)* Khadiri lived for twenty years with a desire to take revenge on Bukhturi, the murderer of his father. He got married, he already had children, but the heavy burden that was placed on him did not leave him alone. He didn't want to kill a man. Bukhturi, who committed that murder quite by accident, always lived in fear, and tired of waiting for his end, he took the shroud in his hands and came to Khadiri to ask for a petition. He drove 20 camels, which he collected all his life, came with a large amount of money, surrendered to Khadiri and expressed his bitter regrets. They agreed, the owner slaughters the sheep.

For centuries, the society was ruled by the motto "blood for blood, eye for an eye". But the consciousness of the villagers is also changing. And the sensitive heart of the writer caught this change and he embodied it in his work. In addition to rural life, the author is interested in family relations in the Emirates ("*Soul*"*قلب* , "*Letters*" *رسالة*), family and life problems of Emirati men

married to Western women who have a different mentality (“*Door number 4 to call*” (4البوابة رقم)), unfair trial (“*Choice*”الاختيار), social indifference (“*Red*” حبر أحمر).

Some of the stories are written in the classic realistic style, that is, they are close to lifestyles, and some are written in the form of letters or are written by telegraph. The author makes extensive use of the stream of consciousness in psychoanalysis “*Waiting room*” (غرفة انتظار), *“Remember, my friend*” (للذكرى يا صديقي). Very short stories, that is, miniatures, occupy a large place in the work of Sultan Amimi.

By the beginning of the 21st century, three main types or types of story can be distinguished in the novelistics of the Arab countries of the Persian Gulf. In Arabic literary criticism, they are called: “issatuntawilatun” –**قصة طويلة**(long story), “issatunkasiratun” - **قصة قصيرة** (short story) and “issatunkasiratunyiddan” - –**قصة قصيرة جدا** (very short story). Very short stories are also found in other national literatures, for example, in Iranian literature they are called “dastanak”, in English literature – “drabble”, in Japanese literature – “syo: to - syo”: to”, and in Arabic literature “al-kissaqasiratunjiddan”. In the Persian Gulf at the beginning of the 21st century, Suraya Baksami (Kuwait), Sultan Amimi (United Arab Emirates) and Nasrin Abdullah Kaffa (Qatar) became famous for such very short stories.

SurayyaBaksami's very short stories are often one-page memoirs, and their order is not consistent in time and space. Based on the subject matter, these miniatures are divided by the author into categories such as “Sidewalk” ***(ارضفة)***, “Loyalty” ***(صداقة)***, “Roads” ***(مسارات)***, “Childhood” ***(طفولة)***, and “Pages” ***(أسفار)***.

By the 21st century, the volume of stories in the genre of "very short", which received significant development in the literature of the Persian Gulf, became even more compact: from 25-30 lines to even 5-6 lines. In Uzbek literature, the terms “mitti” are usually used for such stories.

The very short stories of Sultan Amimi mainly consist of 5-6 lines, less often there are stories of 7-8-9 lines. Most of his stories are written in the form of dialogues and reflect the attitude of lovers. In these 5-6 lines, the relationship between a young man and a young woman goes through various life experiences and trials in a short and concise form and, finally, has its own positive or negative result, allowing you to make an appropriate conclusion.

As usual, the names of the characters are not indicated. In many cases, the story begins with the verb “he said” or “she said” (**قال** masculine, **قالت** feminine). An example is the story “*Letter*” (**رسالة**):

رسالة

قالت أحب أن ترسل إلي رسالة بريدية. تحولت الى رسالة ، و نمت فى صندوق بريدها لأيام وحيدا.

ثم انتشلتني ذات صباح و قالت : نسيت أن أحبرك أني من هواة جمع الطوابع!

نزعت الطابع ، و طوحت بالرسالة بعيدا!

Letter

She (the girl) said: “I want you to send me a letter through the mail”.

I turned (with my whole being) into a letter, spending the night alone in her mailbox for several days. One morning she said to me: “I forgot to tell you that I am one of those who collect stamps!”

Then she tore the stamp off the letter and threw the letter away! [4:35]Letter

She (the girl) said: “I want you to send me a letter through the mail”.

I turned (with my whole being) into a letter, spending the night alone in her mailbox for several days. One morning she said to me: “I forgot to tell you that I am one of those who collect stamps!”

Then she tore the stamp off the letter and threw the letter away! [4:35]

This miniature story is a reflection of a bitter life experience, because the love of a young man met with indifference, indifference. The writer succinctly and expressively talks about strong love: the young man with his whole being turns into a letter. The answer was unexpected not only for him, but also for the reader, and created a situation for reflection.

Sultan Amimi's 5-6 line stories are certainly very different from the one-page stories of Suraya Baksami and NasrinKaffa. As the text narrows, the density of the content increases. The reader needs to strain his mind to comprehend the text. Sometimes the story is not fully revealed; it seems incomplete and requires a creative approach and conclusion from the reader. The instructive tone of the text can completely disappear and sometimes there is no open conclusion. There is a distortion of reality, inconsistency with reality; the layers of time can also shift.

Symbols and subtext distinguish them from the usual descriptive narrative speech and writing style based on traditional social realistic conflicts. For example, in the 6-line story “*Truth*” (**حقيقة**), we see the following picture:

حقيقة

انتشرت إشاعة قوية بأن عرافا يضضح الكذابين سيزور قريتنا يوم الاثنين...

و في صباح الاثنين...

خلت الأسواق ودور العبادة و المرافق الحكومية من الناس تماما...

و كان الأطفال يلهون و حدهم في القرية

True

The news of the fortune teller's arrival in our village on Monday, who exposes the liars, spread quickly...

Monday morning…

Markets, temples, government offices are completely empty...

In the village only children played merrily. [4:27]

Although the text is very short, it contains a poignant social critical eye.

There was not a single honest person left in the entire village, not only in the bazaar, in government offices, but also in churches, lies, intrigues and hypocrisy flourished. The miniature story has its own plot: the plot is the news of the fortune teller's arrival, the escape of people is the culmination of the story, the fact that the children were left alone in the village is the denouement.

In this article, we have investigated the changes in the novelistics of the Gulf countries at the end of the 20th and the beginning of the 21st centuries, such as the expansion of the range of topics and the emphasis on psychologism. In an artistic depiction of the reality of life, the writers of the Persian Gulf resort to various creative techniques, in their stories, along with scenes reflecting endless changes in the inner emotional world of a person, the vain attempts of a lonely hero to rise from the "depths" of a chaotic world (this style is characteristic of modernism), got the place of a page with realistic paintings that seek to faithfully portray life.

CONCLUSION

To conclude, we can say that the modernist principles of existentialism in the works of the studied authors form an artistic mixture with an excessive sensitivity of sentimentalism, with an open expression of the enlightenment concept of man, with an ironic approach and signs of intertextuality characteristic of postmodernism. To realize their creative ideas, writers widely use various methods, expressive and pictorial possibilities, word games and other techniques in their short stories when covering socio-political, educational, spiritual, moral and educational issues.

ABSTRACT

The article presents the optimal compositions and properties of backfill mixtures using waste rock sand, marble processing waste and copper smelting slag. The desire to increase the extraction of minerals from the subsoil, the creation of more favorable conditions for the separate extraction of multi-grade ores and the safety of underground mining predetermined the wide development of the development of deposits by systems with solidifying backfill of the mined-out space.

KEYWORDS: *Backfill Mixture, Optimal Compositions, Copper Smelting Slags, Marble Processing Waste, Additive, Waste Rock Sand.*

INTRODUCTION

The desire to increase the extraction of minerals from the subsoil, the creation of more favorable conditions for the separate extraction of multi-grade ores and the safety of underground mining predetermined the wide development of the development of deposits by systems with solidifying backfill of the mined-out space [1, 2, 3, 4 and 5].

In this regard, scientists and material scientists are conducting research to improve the quality of the product and reduce the cost of using local raw materials and various industrial wastes in the production of filling mixtures to fill the mined-out area. Analysis of domestic and foreign literature has shown that in recent years, a new leap has taken place at ore mining facilities with

backfill technologies. There is a tendency of increasing use for the preparation of hardening backfill as a binder and fillers of various wastes and by-products of the industry, primarily mining, fuel and energy and chemical.

The use of waste is beneficial from both economic and social points of view. Thus, compared with the use of natural raw materials, the costs of exploration, construction and operation of quarries are excluded, the costs of fuel, energy and transport are significantly reduced, the cost of mined ore and finished products is reduced, the land occupied for dumps is reduced, the raw material base of the building materials industry is expanding. , as well as the issues of environmental protection from pollution [6, 7, 13, 14].

Waste is generated in the production activities of the Almalyk Mining and Metallurgical Combine, which must be disposed of and create special dumps for storage.

Long-term scientific and technical cooperation of the AMMC with the Tashkent Institute of Architecture and Construction in solving the issue of rational use of the plant's waste and their use in filling mixtures for two decades has made it possible to significantly advance in solving this problem.

Earlier, for the plant, the compositions of filling mixtures were developed using fly ash from the Angren State District Power Plant, waste from the marble quarry "Kora-Khona", as well as mixtures based on a slag-alkaline binder, for which a patent of the Republic of Uzbekistan was obtained and regulatory documents were prepared [8, 9 and 10].

MATERIALANDMETHODS:

At present, in connection with the completion of the marble quarry, problems have arisen to provide the combine with raw materials for the preparation of filling mixtures. To develop new optimal compositions of filling mixtures, the following types of waste generated at the plant itself were selected and studied:

- Waste rock sand obtained at the crushing plant at the Kauldy mine after the extraction of minerals.The limiting sand size is 5 mm;

- Marble processing waste generated from the activities of the marble workshop of the combine.This additive is used as a plasticizer and reduces the abrasive properties of waste rock sand;

- Slags of copper-smelting production, in the form of finely ground powder. Of the variety of metallurgical slags, copper-smelting and nickel slags are of no less interest for construction and the production of building materials.The general view of copper smelting waste is shown in Figure 1.

Figure 1. General view of copper smelter waste

It should be noted that the above wastes do not require additional technological processing and are used in their natural form.

RESULTS:

The development of optimal compositions of filling mixtures was carried out using a mathematical method of planning an experiment, verified by a computational and experimental method, with further refinement in the manufacture of test mixes in laboratory conditions with testing the actual rheological and physical and mechanical characteristics of filling mixtures and solidified samples.

The test methodology for samples-cubes of filling mixtures based on waste with face sizes of 7 and 10 cm corresponded to the requirements of regulatory documents for conventional mortars. The test period for thecube samples was 28 days.

Waste of a marble quarry after processing on the classifier had a granulometric composition presented in table 1. The same table shows the grain size composition of rock sand.

TABLE 1 GRANULOMETRIC COMPOSITION OF WASTE FROM A MARBLE QUARRY AND ROCK SAND

Name	Private balanceson sieves,%						Passed through a sieve 0.14	The amount of clay and dust particles	Size module
	5	2,5	1,25	0,65	0,315	0,14			
Waste from a marble quarry	0,15	15	15	25	16,5	18,5	9,5	07-09	1,7-1,9
Mountain sand	1,5	12,0	9,0	19,5	15,5	14,0	28,5	1,5	1,0-1,2

DISCUSSION:

The results of the tests carried out for filling mixtures using waste rock sand, marble processing waste and copper smelting slags are shown in Tables 2 and 3.

TABLE 2 OPTIMAL COMPOSITION OF FILLING MIXTURES USING WASTE ROCK SAND FOR THE KAULDY MINE

Train numbers	Amount of materials per 1 m3 of mixture, kg			Mixture mobility, cm	Average compressive strength, MPa
	Portland cement grade 400	Wasteland sand 5mm or less	Water		
I	100	1400	280	14-16	2,5
II	150	1400	280	14-16	4,0
III	200	1400	280	14-16	8,8
IV	250	1400	280	14-16	9,7
V	300	1400	280	14-16	13,5

When developing the technology for laying filling mixtures into the goaf, two schemes for the construction of artificial massifs were selected and tested:
- Erection of artificial arrays using a homogeneous filling with a multi-strength (two-three-layer) filling mixture;
- Erection of artificial massifs using a combined (rock-hardening) bookmark.

TABLE-3 OPTIMAL COMPOSITIONS OF FILLING MIXTURES USING SLAGS FROM COPPER SMELTING PRODUCTION AND SAND OF WASTE ROCK

omponents	Initial materials for 1 m^3 of mixture, kg			
	Compositions:			
Portland cement	250	200	150	120
Copper smelting slag	0	30	60	90
Sand of empty rock	1400	1400	1400	1400
Water	280	280	280	280
Average compressive strength, MPa (28 days)	12,6	12,1	11,4	9,2
Average bending strength, MPa (28 days)	2,24	2,1	1,9	1,6

CONCLUSION

The essence of the technology for the construction of a multi-strength filling array is as follows. In the treatment chambers (the shaft of the mine), the lower part is initially laid to a height of 1.5 - 3.0 m with the composition of the filling mixture, which ensures the standard strength of up to 1.0 MPa, in the last turn (the third layer), the upper layer is initially laid at a height of at least 0, 5 m composition, providing standard strength 3-4.5 MPa. On average, the porosity of the filling mixtures is 18-21%. The density of the hardening fill was determined by weighing cubic standard specimens with face dimensions of 7 and 10 cm. It ranged from 1750 kg / m3 to 1830 kg / m3 [8, 11 and 12].

Analysis of the data obtained allows us to draw conclusions about the advisability of further research and use of the plant's waste for filling mixtures, since this expands the range of waste used, reduces the cost of mined ore and finished products, increases the strength indicators of filling mixtures, and also improves the environmental situation in the region by eliminating dumps.

ABSTRACT

In the 18th century with becoming the Khoqand Khanate as an independent state developed external and internal trade in Central Asia, being one of the important component of social-economical life of the country. New bazaars, shopping malls and caravanserais were built and existed ones were restored. In the 18th – 19th centuries the Khoqand Khanate led active trade relations with China. China exported tea, silk fabric, silver, ceramic products, herbal medicine and musk. In addition, it should be noticed that Khoqand Merchants played a vital role in developing close international trade relations. One of several key factors that contributed to these relations was being a provider (hub) in trade relations between China and other Central Asian countries, like the Bukharan and Khivan Khanates, as well as Afghanistan. Moreover the Khoqand Khanate used to provide with Chinese goods not only Central Asian countries, but also becoming international transit and trade zone for the Ottoman Empire, which allowed the Khanate to get economically sufficient profit from customs services. In order to set up tied diplomatic relations the Rulers of the Khoqand Khanate sent as presents different Chinese products, which were given by Kokand merchants, to Russia and The Ottomans and confirmed by data of archival documents.Dynamic of the activity of the Khoqand merchants and their role in trade relations between China and Central Asian countries have been reviewed.

KEYWORDS: *Khoqand merchants, Khoqand Khanate, China, Central Asian countries, trade relations.*

INTRODUCTION

The main purpose of my presentation is to highlight the intermediary role in trade relations that Khoqand tradersplayed between China and other Central Asian states, such as the Bukhara and Khiva khanates, Afghanistan.

Khoqand is an ancient city in the Ferghana Valley. At the beginning of the 18th century, it was the capital of a state that emerged as an independent state in Central Asia. The name of the state

is also named after that city. It is the Khoqand khanate, one of the Central Asian khanates that existed from 1709 till 1876. Khoqand is an ancient trade town. Information about this city is found in the geographical works of Arab authors of the 10th century. In particular, in the work of Mukhtar al-Istahri in "Kitab al-Masalik" and in "Hudud al-olam" (written in 983) about the city of Khoqand. This proves that Arab scholars had deep knowledge of Central Asia and Movarounnahr. In the following years, in the 18th and 19th centuries Khoqand traders became more active in international trade. One of the reasons is that Khoqand's location at the crossroads of trade.

In the 18th and 19th centuries Khoqand played a significant role in the socio-economic life of the country as a result of its becoming a major city and capital of the state. This, in turn, gave impetus to the development of domestic and foreign trade. As a result, new markets, trading centers, caravanserais were built and existing ones repaired. This led to the development of both domestic and foreign trade in the country's markets.The trade relations between China and other regions of Central Asia in the 19th century indicate that the Khoqand traders were active. This can be seen from sources and archives. Also, a number of articles and books on trade relations between China and Central Asia have been written by historians such as T. Saguchi, M. Kutlukov L. Nyubi, Sh. Qo'ldoshev[1]. However, these studies do not highlight the mediation of Khoqand traders in China and Central Asia. Or there was no such approach. By the 19th century, the Khoqand khanate had an international position and status. The city of Khoqand became an important transit city. As a result, Khoqand traders became more active in international trade, supplying Chinese goods to Central Asia. Moreover, Khoqand traders took the leading positions in mutual trade between China, Russia, Bukhara, Khiva, Afghanistan and India. Let me stop to the facts.The description given to Khoqand traders by Chinese historians. “The people of Khoqand were very good at trade”.

In the 18th and 19th centuries, the largest international trade centers in Central Asia were Khoqand, Samarkand and Bukhara. The main trade products from China to Central Asia were tea, raw silk and silk fabrics, porcelain, paper, silver bullion, musk, rhubarb and other products. These Chinese products were in great demand in Central Asian countries.The Russian military officer Velyaminov-Zernov, who was in Khoqand in the 1850s, wrote in his travel report that the Khoqand traders brought Chinese tea, porcelain, and silk fabrics to Bukhara market.

SALE OF TEA

The fact that Khoqand traders brought Chinese tea to the markets of Central Asia is also reflected in the studies of Japanese scientist Toru Saguchi and Uzbek scientist Sh. Qo'ldoshev.

Chinese tea was brought by Khoqand traders from the Inner China and Xinjiang markets. Khoqand traders acted as translators at that trade.

The tea species cultivated in Chinese Tebey, Yunan, An-Xou and other regions were brought to Khoqand Khanate.

The varieties of tea brought to Bukhara by the Khoqand traders were called *“To'qtachoy”* and *“Oqquyruq”.* These were green tea. According to *"Turkestanskie sborniki"*, the Chinese tea came from plantations along the Yantszi River.

According to the Chinese sources of Toru Saguchi "the annual trade turnover between Khoqand and China ranged from 100,000 to 300,000[2]*chings*"[3]. In the middle of the 19th century, the annual trade turnover of Khoqand with only one Kashgar amounted to 5 million rubles and the amount of tea to be brought to Khoqand amounted up to 30,000[4]*poods*[5].These figures were enormous for the 19th century.

Khoqand traders spread tea products from the Khanate to the Russian empire, Bukhara and Khiva khanates.

Like other Central Asian rulers, Khoqand rulers, who were active in international trade, had been profiting from selling tea from China to countries in the West.

The historian from Khoqand Tojir Khodjandi, in his work *"G'aroyibi sipoh"* left information about the features of Chinese tea[6].

A chronicler MuhammadAziz Margilani had mentioned in the *"TarikhiAziziy"* the fact that a large amount of tea was kept in the treasury of the khan[7]. Demand for tea was also mentioned in agreements between the Khoqand rulers and the Manchu government. This information even indicates that the Khoqand ruler Muhammad Ali Khan paid particular attention to international trade, especially in his control of tea sales. Some sources on the history of the Khoqand Khanate also include information about the types of Chinese tea. The widespread use of Chinese tea in Central Asia is said to have influenced the emergence of a "tea culture" for the region's population. In the 18th and 19th centuries, the *Choyxona*(Teahouse) was widespread in the Ferghana Valley, not only in cities but even in villages and small neighborhoods. Sources note that there were many *Choyxona*(Teahouse) in the markets. The *Choyxona*(Teahouse) was a place where men could sit and talk. There is such tradition today. But there is a difference between the "Teahouse" that existed 30-40 years ago. Unfortunately, this Uzbek tradition is currently undergoing transformation. It is not preserved as in the old tradition.Even 19th-century European tourists in Central Asia have left plenty of information about the culture of the Teahouse. In particular, the English Officer A. Burns describes the types of tea in the markets and the methods of its preparation. He also notes that "the day begins with tea". This is a very interesting description.

In the late Middle Ages, tea was an important trade pproduct in trade relations between Central Asia and China. Although Chinese tea had become a large consumer product among the population of this region, Khoqand tea traders also acted as translators in the trade relations between the West and the East.

SILK FABRIC TRADE

Khoqand traders sent only 1,000 camels of silk a year to Bukhara alone. It is estimated that it amounts to 12,000 poods. It is also noted that in 1860 the price of one pound of silk was equal to 22 Khoqand gold coins and 197 rubles in Russian currency. In fact, silk was cultivated in Khoqand and the entire Fergana Valley. However, the demand in the Central Asian markets could not meet the demand for silk produced in the Khoqand khanate. Therefore, much of this demand came from China. According to the data of 1870 one poodle of Kashgar silk of the first sort, brought for Bukhara by the Khoqand traders and was sold for 22 gold in Khoqand but sold in Bukhara for 20 gold. Here I must notice that at that time Bukhara's gold was rated higher than Khoqand's gold.

Chinese Paper Trade

Paper production in Central Asia was mainly concentrated in Samarkand and Khoqand. That is why Khoqand and Samarkand paper became popular. However, it was also known that Chinese paper was sold in Central Asian markets in the 19th century. Khoqand traders brought to Bukhara markets Khoqand paper "*Ishtarhoniy"* sort. In addition, a large amount of paper *"Abreshim"* was imported from China through Khoqand. L. Rempel noticed this in his study of Bukhara art and crafts. Due to the fact that paper was not produced in Bukhara, government documents, diplomatic letters, and books were written on Khoqand paper.

Silver Trade

Silver was imported from China to Central Asia. Almost all researchers mention this. According to the Russian travel documents the Khoqand khanate, the Bukhara and Khiva khanates didn't have silver therefore it was fully imported from Kashghar.

Chinese Products In Diplomatic Relations

The archival documents confirm that the Khoqand khans sent Russian goods to the rulers of the Ottoman Empire as a gift from the Chinese goods brought by the Khoqand merchants. As I studied the history of the Khoqand Khanate's diplomatic relations with the Ottoman Empire, the information in the documents caught my attention. Ambassadors sent from Khoqand to Istanbul accompanied with presents from the Khoqand ruler. This document is stored in the Hattie Humoyun (HAT) fund of the Ottoman Archives in Istanbul under the number 657/32100 D. This document was the second embassy sent by Muhammad Ali Khan in 1254/1838, led by Muhammad Zahid Khoja. It is revealed that part of the gifts presented in this document were Chinese goods.

According to documents from the National Archives of Uzbekistan, Chinese goods were transported through the Khoqand traders to the Ottoman Empire. The goods transported to the Ottomans were mainly Chinese tea and porcelain. In addition, Khoqand traders played an important role in Afghanistan's trade relations with China and Kashgar. Chinese goods were transported to Afghanistan via Bukhara. Chinese porcelain in Afghanistan “famous for Kashgar porcelain.” Russian traveler Yavorsky wrote in his writings. Khoqand had been actively pursuing diplomatic relations with China. According to the historian Kutlukov, this is based on information from Chinese historians. He writes that in 1809 the Chinese emperor Yun Yan completely abolished customs duties on Khoqand goods in China. This was a great privilege for the Khoqand traders.

CONCLUSION

As a result, Khoqand traders played a major role in the international trade of Central Asia with China. This, in turn, was an important factor for Khoqand traders' role in the Central Asian market.These facts in history show the importance of China's relationship with the Muslim world.

ABSTRACT

Bullying has developed as a habit having harmful consequences on young people; nevertheless, prevalence assessments differ depending on measuring methods. In order to get a better understanding of each approach, we carried out a systematic study and content analysis of bullying measures, including behavioral contents. Multiple internet resources have been examined for measures released between 1985 and 2012. Measuring methods included assessing the behaviour of bullying, were given to respondents aged 12 to 20 years, were delivered in English, and psychometric data were provided.In this chapter, we examine the concept of bullying and the related term of cyberbullying. We start by analyzing the word bullying and the defining characteristics usually associated with it, namely purpose (to hurt), repetition, and imbalance of power. We also examine the related notion of harassment. We then go on to the word cyberbullying and a related term cyber aggression. This includes a debate of how helpful the conventional bullying criteria are in the internet realm. We conclude with some suggestions about the meaning and usage of the term 'cyberbullying'.

KEYWORDS: *Aggression, Bullying, Cyberbullying, Victim, Violence.*

1. INTRODUCTION

Aggression is usually considered to be a deliberate behaviour in psychological literature that harms anybody (or some living creature) that doesn't want to be hurt. The 'someone' is typically someone else, even if some individuals do themselves damage, of course. The conduct should be deliberate since unintentional damage is not seen as hostile. For many decades, the aggressiveness literature concentrated on the direct and individual kind of aggression such as direct physical assaults such as striking, kicking, punching and direct verbal attacks, such as threats, bullying and insults.In the early 1990s, however, the emphasis was extended to other types of violence. Researchers have developed the notion of indirect violence, which is directed at someone but not personally committed. It is typically done via a third party, which spreads unpleasant stories about someone, for example. Indirect attacks may also include incident when a purposeful detrimental act was perpetrated, but the assault did not occur; it is often done to hide,

steal or damage property of someone while the victim is not there, and physical bullying can be regarded indirectly[1].

Researchers suggested the term relational aggression as an aggressive conduct designed to harm connections between people. This also involves the propagation of rumours and social isolation. Although relationship aggression is frequently indirect (e.g. spreading rumours aimed at one's relationships and reputation; never selecting a partner to work or to play, never talking to him or her), this may be blatant, face to face. Researchers used the same term social aggression, which refers to violence to harm the self-esteem or social standing of others. Some research indicates that the pain of relational violence may have a greater effect than that caused by physical assault.In addition to the obvious blows and insults researched in the past decades, it is now widely recognised that aggressiveness should take indirect and relational forms. Aggression may occur in the workplace in particular in adulthood, including more advanced ways, such as when someone sets completely unreasonable objectives and undermines the confidence and pleasure of others. And cyber aggression in this century encompasses mobile and internet assaults.

1.1 Bullying Definition:

While no generally accepted definition exists, there is growing agreement in the Western research tradition that bullying refers to repeated hostile actions against a particular target (the victim), who cannot readily defend themselves. A related definition is that bullying is "systematically misuse of authority," but with wider implications. In the majority of study material, bullying is therefore regarded as:

I. an act of aggression;

II. perpetuated via any kind of violence (e.g., physical, verbal, cyber; direct or indirect);

III. there is a power imbalance between the offender and the target (the victim finds it hard to defend him/her);

IV. It has some repeating element (these things can happen frequently).

Although the two criteria of power imbalance and repeatability are not recognised universally, they are now extensively utilised. The relative defencelessness of the victim in particular means that others are obliged to act. Researchers claimed that the freedom not to be intimidated is a basic democratic right. The growing worldwide concern about the use of bullying by schools in the last 25 years seems to mirror a growing concern for human rights problems that developed and continues to develop during the 20th century[2].

Bullying may occur in various settings, including in the business, the family, the military, and prisons. Themes like bullying in the workplace are really increasing in study fields. The main emphasis of bullying research to far has nonetheless been on in-school bullying. In schools, we may think about teacher-teachers, teachers-pupils, pupil-teachers and bullying, even if the latter has always been the main topic of attention.

1.2 Bullying in Many Languages:

Bullying is essentially an English or northern word in Europe. Words for bullying vary in various languages and have not precisely the same significance. Latin languages in Europe lack a word like bullying, although they have numerous names for aggressiveness and violence; yet the English term bullying appears easily understood. The word ilbullismo was introduced to the language in Italy. Harassment, which is more typical of direct and persistent violence, is the closest phrase in Spain, while maltratoporabuso de poder is used as an idiom in general; in addition to the word bullying, the word bullying is now occasionally sometimes used.

The word closest to bullying in Japan is ijime. This is more on group dynamics and the position of the victim in the social network, with more focus on social exclusion, like the Korean Wang Ta word. These variations seem to be associated more with bullying forms and procedures than with repeat and power imbalance criteria[3].There is thus an argument that bullying is somewhat normal, at least for adults. By a natural category, we mean that if a word extremely similar to bullying is absent in a lexicon, the idea is easily grasped according to the conventional definition nonetheless. The tendency seems to occur worldwide; indeed, some individuals are inclined to use others in a more disadvantaged position for their own gain in interpersonal interactions. The meaning of words is not precisely the same in other languages, although most of this variance relates to the kind of violence. Having said that, more study would definitely be desired on how key words vary in other languages and how well the common idea of bullying is recognised across cultures.Instead of definitions for each case, it is better to speak about probabilistic features or criteria. Better and less excellent examples of a category may exist, that is, some are more core or prototypical than others (for bullying - hitting vs ignoring someone). A category may have broad boundaries and fresh examples of the idea can be added (for bullying, social exclusion in the past, and cyberbullying more recently)[4].

1.3 Bullying Criterion:

We are now considering the three major bullying factors, namely harm intention (including violence), power imbalance and repetition. We don't take additional questions into account which are not essential to defining bullying even if they may be fascinating in certain instances or cross-cultural comparisons. Bullying, for example, may vary in intensity. There may be problems with how extreme bullying has to be regarded as harmful. These problems, however, are typically applicable to aggressiveness and many other notions, and need not be addressed in the definition. Furthermore, while cross-cultural bullying may differ in how much individual or group bullying is, we do not consider this a key element of the definition. Similarly, it is already implied that bullying is a question of relationships that are beneficial for practitioners and is intended to damage a particular target[5].

1.4 The Intent Criterion:

Aggression is an intention to hurt a person who is damaged (or at least threatened with harm). But how can we judge in real circumstances on intent? It is obviously essential that the behaviour, at least as far as damage is concerned, was not simply incidental. An essential criterion here is if the offender continues to behave harmfully, not to abandon and repair, even when it is told of the damage. But if the conduct itself was deliberate, how can we assess that it was really intended to harm? A frequent justification of an assailant or bullying person is that "it was only for fun" and no harm was meant.We believe three suggestive factors for the evaluation of the intention to hurt, which relate to the victim, offender and knowledgeable outsider's perspectives:

I. the victim had suffered injury; this is the criteria most apparent and utilized, although it is not ideal. Sometimes a victim may be paranoid, believing that he is threatening or attacking and reporting, even though no real danger or assault seems to be there or sufficiently apparent to warrant the so-called aggressiveness or intimidation.

II. When the culprit not only wanted to damage the conduct, but is sometimes obvious that the perpetrator was intended to harm someone. However, they could not succeed when the assault was inefficient or the target victim did not detect the attack as especially dangerous or dangerous. This criterion is thus not ideal either; is it an assault or bullying when the victim does not suffer harm? We must also remember that some victims are 'deniers,' unable to believe that anybody else is harmful to them.

III. Ultimately, we think that, although being influenced by the opinions of the victim and the offender, we feel the decision on the purpose to injure must rely on the question whether a reasonable person can assess that the conduct is likely to damage the intended beneficiary.

1.5 The Power Imbalance Criteria:

Power imbalance seems to be a key requirement of intimidation as distinguished from violence. For the victim, bullying makes it impossible to protect himself; thus, fighting equals (while violent) does not bully. How is 'power imbalance' to be defined? It is obviously multi-dimensional. However, suggestive criteria include:

I. physically weaker (for example for physical attacks)

II. being less proficient vocally (for example when teased)

III. lack of trust or self-esteem

IV. overwhelmed

V. lack of friends or support for society

VI. being in a poor position or rejected in the peer group

In an empirical study researchers examined questionnaires answering the aggressive behaviour and bullying behaviors of Scottish students 8-13 years old (where there was a perceived imbalance of power through physical strength, group size, and social popularity). Their research revealed that victims of bullying were less controlled and sadder than victims of peer aggressiveness in general[6].Another indication of power imbalance may be when the victim is in a marginalized group. Here, while individuals may be strong or confident on an individual level, the group eight they identify or believe to belong to is weaker or discriminated against. Of course, this differs from social to ethnic, racial, religious/faith, sexual, sexual or disabled contexts. In this field, the literature frequently utilizes the word harassment, for instance in racial or sexual harassment. If we consider harassment as an aggressiveness targeting someone from outside the marginalized group particularly, then power is imbalanced and this may be seen as a kind of bullying. Therefore, not all harassment is harassment, but all harassment is harassment[7].

It is not always a deficiency that puts the victim in a vulnerable or disadvantaged situation. Maybe it's neutral (new in a classroom), or a characteristic that is seen as good when observed from a third party viewpoint (e.g. more articular, having a certain skill), making it the target of peer assaults. The imbalance of power may be summed up quite frequently as being distinct from the majority of the group and thus less power within the social hierarchy. Sometimes the bullying towards immigrants is mostly social exclusion. In a 3,000 Spanish high school pupils study, researchers discovered that immigrant kids were twice as much neglected as their non-immigrant classmates. That is why bullying may be regarded as a situation phenomenon in the words of Bruner; the particular environment dictates which traits might make a person susceptible.

2. DISCUSSION

In short, 'bullying' seems to be a valid term as far as 'conventional' kinds of violence are concerned. It is characterized by a power imbalance as a core or key criteria; repeat is a secondary criterion that increases probability identification of bullying. In general, the difference between bullying and violence seems significant, both with regard to the effect on victims and for intervention approaches. More scientific explanation for the difference between bullying and violence would still be helpful, particularly when considering the view of the offenders.

Researchers have suggested that stronger empirical foundations are required in this field and that bullying is only a subcategory of a larger peer victim-ship structure[8].

Most cyberbullying research over the last six or seven years indicate a very substantial overlap between the participation of pupils in conventional bullying and cyberbullying, independent of the accuracy of measuring tools and terminology used. This overlap is one of the most well-replicated results in the relatively young cyberbullying field. As usual more students participate in conventional bullying than in cyberbullying, the clearest assertion is that the majority of the participants online also participate offline.Therefore, defining conventional bullying and applying it to the online realm is a very logical step. This leads to a very common description, that cyberbullying "is an aggressive, deliberate act performed by a group or person, utilizing electronic forms of communication, time and again, against a victim who cannot defend himself easily."

How helpful is this definition, however? First, there is a question of what "electronic forms of communication" means. Second, some writers have questioned without qualification the practice of carrying out the conventional cyber domain concept of bullying; these critiques take two similar forms. One is a criticism of the two basic characteristics characterizing bullying, namely power imbalance and repetition. The second associated objection is that a wider notion of cyber violence or techno-aggression cannot be distinguished from cyberbullying. In turn, we look at these problems in the following sections[9].

The first documented instances of cyberbullying were usually via text message or e-mail (on the Internet). Mobile and Internet-based technologies were thus regarded as 'electronic means of interaction.' In addition to texting, though, mobile phones can be used for unpleasant phone calls just like fixed phones. There was therefore already a problem whether wicked cellphone calls could be regarded as a kind of cyberbullying. Pragmatically, utilizing fixed phones seems to have been a relatively rare way of conventional bullying, while mobile phones have now become an almost essential element of the life of young people. On this premise, the inclusion of all mobile usage, including telephone calls, as potentially relevant for cyber-bullying may make sense[10].

Researchers distinguished between Internet or online bullying, bullying text messages, bullying telephones and bullying in person. There are two things to be noticed here. First, the emergence of smartphones has made an outdated difference between the usage of the Internet and mobile phones. The increasing opportunities to utilize the Internet through various technical devices may make it better to differentiate between different communications types than between different communication technologies (smart phones, computer, etc). Second, the term "in person" means face-to-face, while indirect bullying, such as rumors and social isolation, is not face-to-face and may be regarded more comparable in this respect to other types (online, text or telephone).

3. CONCLUSION

In conclusion, we believe that cyber aggression should relate to deliberate harmful behaviors towards a person utilizing electronics (computers, telephones, etc) (text, images). We also argue that cyberbullying is a notion that is different from cyber-attack. Naturally, many academics want to examine cyber aggressiveness, Internet security and other antisocial issues caused by electronic technology, but cyber bullying is a valid topic for study.We believes that the notion of cyberbullying encompasses three key elements. The first criterion is the intention to damage that is common to cyber-attack. The second requirement is the presence of a defined target for the deliberately damaging communication. The third criteria are that there is a power imbalance as a distinguishing feature of this cyber assault. Differences in technical skill between the offender and the victim, relative anonymity, social rank, the number of friends or marginalized group

positions may be evaluated in terms of power imbalances. The power imbalance should not be derived from the victim's response, but as much as possible should be evaluated from the 'outside' viewpoint.

Cyber-aggressive studies that do not contain a certain objective and power imbalance should be regarded as study rather than cyberbullying. These are key cyber bullying characteristics. Concepts are boring; therefore supplementary criteria may be useful. We show here that the recurrence is not a necessary requirement for the perpetrator. The subsidiary criteria for cyberbullying may be employed as a repetition in the wider sense, including distribution mechanisms. Similarly, the effect on the victim is a secondary criterion (e.g. if it is harmful). In both instances, their existence may judge that a cyberbullying incident is stronger.Finally, in many of the topics we have covered, additional study is required. The opinion that bullying is a natural category requires more research. Furthermore, the usefulness of different metrics to assess power imbalances in cyberbullying has not yet been explored. We now consider cyber bullying as a valid and defensible notion, but it may alter as research continues to grow and as technology is developing and new kinds of cyber bullying and cyber-aggression arise. However, we trust in our demand for more research attention and accuracy in these and related words.

ABSTRACT

The article examines contemporary cyber bullying research, which are presented with a policy perspective. It is evident that cyber-bullying problems to public policy involve conflicts between principles of freedom of expression, the best interests of the kid and the protection of parenthood and schools. The development of an effective plan includes all stakeholders, policy makers, school managers, parents and young people, in the sphere of the problem, as well as conflicting values. It must be emphasized that the literature which delineates the differences between conventional bullying and cyber bullying is extremely different, and that the two must be addressed and evaluated separately. The next parts thus lay forth cyber bullying ideas and frameworks for policymakers, who consider new and/or updated regulations, examine the problem and Internet harassment psychology, explain its physical and mental consequences and sum up results from current cyber bullying surveys. Finally, the paper concludes with recommendations for implementing acceptable usage rules at the school board and at the local school levels, as well as family contracts for home use.

KEYWORDS:*Bullying, Bullying Prevention, Cyber Bullying, Policy, Victims.*

1. INTRODUCTION

Victims of cyberbullying are often subjected to severe psychological and emotional distress. In a few of cases, this has resulted in terrible acts of physical violence. For many of the victims, loneliness, humiliation, and shame were all or a mix of the emotions they were experiencing at the time. Several horrifying instances of cyberbullying that have ended in suicide have also been reported in the media, according to the press. These results are concerning for worried parents and educators who are looking for explanations for their children's behaviour. This study was also carried out in order to offer teachers and parents with an overview of some of the most effective methods for establishing a cyberbullying prevention programme for their students. As a starting point for our study, we looked at the development of bullying and its relationship to cyberbullying.

Bullying is characterized by the exhibition of hostile actions that are adversarial and planned in their nature. Bullying occurs when "another person is subjected to physical or emotional harm."

Bullying that results in mental and bodily damage has led to the need for legal action by the general public. Bullying has progressed beyond a few harsh remarks spoken in person to multi-media interaction that may be sent via a variety of technological means. The development of electronic communication serves as the foundation for cyberbullying. Cell phones are used for cyberbullying, which takes place via text messages, Twitter, and the Internet[1].

A frequent feature of the media is the dissemination of "breaking news reports" and special programming warnings against cyberbullying. For openers, ABC News recently broadcast a two-hour 20/20 programme titled "Bullied to Death in Schools in America," which explored the issue of bullying in schools. According to the information presented in this video, at least 14 adolescents committed themselves in the previous year as a consequence of being bullied. Dilmac has done a number of studies that have shown that cyber bullying is not just a problem in North America, but is also a worldwide problem, according to the findings. As a means of defending themselves against such acts of violence, government agencies, schools, and other places of work have tried to establish regulations.

Dan Olweus, a researcher who is widely regarded as a pioneer in bullying research, has been mentioned in many studies that have been conducted as a result of his expertise in this area. The first book written by Olweus was named "Aggression on the Schools: Bullies and Whipping Boys" and was released in 1973. This marked the beginning of his more than four decades of investigation into bullying problems in the United States and other countries. 'Olweus claimed that bullying is a result of a power imbalance,' according to researchers, in his observations[2].

Olweus is credited as being the first to implement an anti-bullying programme. His anti-bullying design includes classroom activities as well as workplace techniques that may be utilized to assist disperse bullying operations in the workplace. Olweus started a campaign in the early 1980s to draught legislation to combat bullying in schools, which has subsequently been signed into law by the president of the United States. As a result of his work, some schools have experienced a 50 percent reduction in bullying. Administrators and other instructors have said that the work done by Olweus has unquestionably shown to be worthwhile and has improved student safety.

The United States Secret Service conducted a research to analyze the characteristics of pupils who had committed criminal offences, and the results revealed that intimidation was one of the main causes leading to criminal activity. In 12 of the 15 campus shootings that occurred throughout the 1990s, the shooters had a history of being harassed. Bullying in the past consisted of violence against the weaker opponent, compulsion, and physical abuse, among other things. Bullying was more prevalent in schools and throughout the day. The outcomes usually result in the stronger opponent winning the championship and, in certain cases, the seizure of someone's lunch money.The innate drive to survive is shared by all living things and is a universal human trait. Because of the large number of species on the globe and the limited number of natural resources available, survival is directly linked to competition. Throughout history, there has been a continuous desire to outperform others while also overcoming challenges. As the human race has progressed, this survival instinct, as well as a competitive environment, have stayed essentially unchanged[3].

Both of these forces have spilled over into the domains of education, social interaction, and economic activity. Despite the fact that this competitive hierarchy is widespread in most civilizations, it differs between cultures based on their ethical systems, customs, and the level of government control they have. Unfortunately, the capitalistic culture of the United States unintentionally promotes the notion that success and money are inextricably linked. As a result of this mentality, a society has been created in which bullying is inadvertently taught as a survival strategy from an early age.From the moment a kid enters elementary school in the

United States, he or she is encouraged to strive to be the greatest person possible. This apparently simple lesson may take on many meanings as a kid grows and develops during his or her educational career. Students often acquire dishonest methods of gaining an advantage in the highly competitive scholastic and social settings that grade school provides. Bullying methods may include pushing others for answers on assignments in order to get higher marks, which in turn leads to greater college prospects, or spreading social rumors about other students, among other things[4].

These strategies are hazardous because, once a student understands how successful they are, he or she may utilize them to build a life style around themselves. The development of a regular use of bullying techniques may have a detrimental impact on an untold number of individuals and can even result in corruption in the workplace.

1.1 Bullying Progression to Cyberbullying:

The incidence of schoolyard bullying has increased significantly in the United States over the last thirty years, which may be linked to an increase in the number of suicide and murder cases in certain areas. When concentrating on the cause for bullying, the reaction is often based on something about the victim that they are unable to change or improve. People who are self-conscious about their hair color, sexual orientation, physical size, or socioeconomic position are good examples. According to study conducted by 'Fight the Crime Teen,' some of the most common causes for cyber bullying include a person's interest in a male or female, their looks, their race or ethnicity, and their sexual orientation. The Deficiency Model of Social Skills is used by Safran, who theorizes that bullies victimize others in order to maintain their power and social position.

There is a contradiction between the differences of victimization from elementary, middle, and secondary schools in terms of physical, psychological, and behavioral aspects. Elementary children may engage in name-calling and name-hitting among themselves using simple names. Cell phones have been made available to middle school kids by their parents, who generally do so at the insistence of their children. Elementary kids' usage of computers in school may be limited to navigating through instructional programmes, while middle school and high school students utilize computers to create programmes, write papers, and have more flexibility to connect with various websites than elementary students. The disparity in grade levels demonstrates the necessity for each set of students to be informed of proper computer etiquette and how to avoid computer abuse[5].

Bullying may have an effect on children of all ages and grade levels, regardless of their chronological age. This fact has been the subject of investigation since the late 1960s. Due to the lack of access to technological gadgets in primary schools, these kids were confined to physical and verbal abuse of their classmates as a form of expression. Students in middle and high schools have access to technological gadgets, which they may use to initiate cyberbullying.

1.2 Bullying Prevention and Intervention:

A significant number of anti-bullying preventive efforts are required in order to completely eradicate this harmful behaviour. Policy initiatives have also been created to address this social problem at the municipal and state level by governmental entities. Mandatory reporting regulations place education professionals in positions of responsibility in order to safeguard children. In addition, the Anti-Bullying Act was passed in order to enforce strict restrictions against all forms of bullying, including cyberbullying. Strategies have been developed by the European Commission to assist in the protection of their websites. Their goal is to provide information to users. This safety precaution was put in place for the benefit of children,

instructors, and parents. Schools must ensure that teacher and student processes and teaching are followed, and they must offer advice to parents[6].

In Texas, school districts have adopted and implemented a "Zero Tolerance Bullying Policy," which means they will not tolerate bullying of any kind. The Fort Worth Independent School District in Texas has launched the "It's Not Okay Campaign" to raise awareness about bullying. The goal of this initiative was to provide assistance to victims while also encouraging others to speak up about improper actions they may have seen. The programme teaches kids how to identify sexting, cyberbullying, dating abuse, and other issues that are important to be aware of. Teaching appropriate student conduct is essential in the development of self-esteem, self-efficacy, and confidence in one's own abilities within a social context. Employee wellness programmes, which provide one-on-one counselling services for problems such as anger management, depression, domestic abuse, and workplace difficulties, are becoming more popular among companies.

1.3 Cyberbullying Culture:

This problem has grown so important that it has been adopted by popular culture. When one of the characters was harassed when it was discovered that he was gay, a recent episode of Glee, On My Way, brought the negative consequences of cyber bullying into the spotlight. Immediately after the programme aired, the Trevor Project Web Site, which is a nationwide organization that assists LGBT suicide prevention, experienced an unprecedented 300 percent spike in visitors. It was recorded in the ABC Family movie "Cyber Bully" how the character of a young girl suffered because of a miscommunication with her pals. The movie was a success. This demonstrated the negative consequences of cyberbullying on both the victim and the offender, as well as on other members of the community[7].

Everyone, even those who were not directly engaged, was adversely impacted. In school, the survivor saw a decrease in her social position, which she took personally. During this time period, her parents were in the process of getting divorced. The victim purposefully deceived her mother via a sequence of events and planned to meet up with new acquaintances she found on the Internet, according to the prosecution. Eventually, these pals turned on her and began cyberbullying her on the internet. Unfortunately, the victim believed that planning her own suicide was the only way to get away from her severe mental anguish. According to the CDC, victims of bullying are more prone than non-victims to have physical and mental health issues, as well as to consider taking their own lives[8].

2. DISCUSSION

Despite the fact that bullying was only initially characterized in the late 1970s, there is already a substantial body of scientific study on the issue that has been conducted. If we start with Olweus' definition of bullying and keep in mind later modifications to that description that took into account moral and practical considerations, bullying can be described as an essentially psychosocial problem involving the intentional, repetitive harming of another person and the creation of a power imbalance between the victim and the aggressor, with negative consequences for both the victim and the aggressor. It is important to note that the repercussions of a power imbalance created between the two are different for the victim and the aggressor since the impacts of the power imbalance are of a moral character.

Bullying has been proven to have negative consequences in the social circles of people who are bullied. For example, research has shown that when bullying occurs, the quality of peer network connections degrades. Bullying is, in reality, a complicated phenomenon that involves both the personality and history of individuals engaged as well as a variety of environmental variables. School climate has been characterized as either a factor of danger or a factor of protection,

depending on the quality of the environment. The improvement of the school environment, especially in the construction of norms, values, and expectations of support, is the foundation of bullying prevention and intervention programmes, which are designed to deal with this kind of issue. According to findings from evaluations of such bullying prevention and reduction programmes, levels of victimization and bullying have decreased significantly, although to a lower degree, compared to the baseline[9].

In terms of individual characteristics, empathy is regarded to be one of those that have the greatest impact on the prevention of participation in bullying in the aggressor position, according to research. Equally important in anti-bullying programmes are the abilities to perceive the moods of others, to develop both cognitive and affective awareness of others, to understand the victim's feelings, and to recognize the potential impact that an unjustified attack may have on the victim. These abilities appear to contribute to the reduction of problems of unjustified harassment and abuse.

Notably, the most intriguing bullying research has been conducted in the psycho-educational area, and many of the studies conducted have attempted to develop preventative and palliative methods to fight the issue. When it comes to identifying the essential components of effective action, bullying research has made significant strides. However, bullying as a phenomenon has evolved, due to the influence of information and communication technologies (ICTs) on interpersonal interactions, among other factors. As a consequence, academics are now concentrating their efforts on bullying that occurs in the context of social contact via digital devices, culminating in the creation of a totally new concept known as cyberbullying. Cyberbullying, which is considered an extension of conventional bullying, is described as hostile, deliberate actions carried out through information and communication technologies (ICTs) and resulting in a power imbalance. It seems to be gaining popularity as a form of violence among schoolchildren and young people in general.

Cyberbullying has many of the same risks as conventional bullying, but, possibly as a result of its unique character, it also carries additional risks that should not be ignored. One such factor is the lack of control over personal information, which may be the result of a lack of understanding of the risks associated with sharing personal information on the Internet, sharing passwords, communicating with strangers, and publicly displaying very personal information such as addresses and telephone numbers. This lack of control, along with the victim's resulting vulnerability, may be regarded a distinguishing trait of cyberbullying. The existence of a link between cyberbullying and Internet addiction has also been discovered, with the latter being defined as a constant desire or need to connect to the Internet that restricts forms of entertainment and social relationships, negatively impacts an individual's mood and irritability, induces violent, aggressive behaviour that makes it impossible to disconnect, and increases the user's own social isolation. Excessive usage of some technology foreshadowed the occurrence of cyberbullying[10]. The following factors were identified as having an impact on cyberbullying victimization in a large sample: gender, marital and socioeconomic status; purpose; frequency; location; time and type of Internet usage; and language ability. In another recent study, researchers looked at mental symptomatology as a predictor of cyberbullying among university students, and they discovered that it was true. Once again, there is no behavioral connection between this kind of scenario with victims or aggressors in conventional bullying situations.

3. CONCLUSION

Bullying has progressed from fist fights in the schoolyard to the assignment of virtual personas on the internet. The necessity for an increase in the protection of victims has also been related to proper electronic interaction etiquette. The necessity for students, parents, teachers, coworkers, and others to report harassment is a major element in reducing the prevalence of cyberbullying in

the United States and throughout the world. Because many parents and older people lack computer skills and knowledge, cyberbullying may be frightening for them. Therefore, increasing their learning as a form of empowerment is essential to reducing their fears. Bullying prevention methods are intended to detect and divert instances of innocent people being victimized by others.

The effectiveness of these policies is being evaluated on a continual basis. Through changes in law as well as increased public support, federal, state, and municipal governments have maintained their focus on the necessity of resolving social problems. These initiatives may be beneficial in the battle against bullying. As social networking platforms continue to expand and communication advances in other nations, it is critical that we stay vigilant in protecting our children from cyberbullying and other kinds of online harassment. The ramifications of cyberbullying include negative consequences for individuals, families, and society.

ABSTRACT

For decades, neurons were thought to be the brain's basic computational units, summarizing incoming signals and eliciting action potentials only in response to suprathreshold stimuli. Although modeling studies predicted that single neurons would be a much more powerful computational entity capable of performing a wide range of nonlinear calculations, this possibility was not tested experimentally until active mechanisms in the dendrites of most neuron types were discovered. We review a number of modeling studies that have looked at information processing in single neurons, starting with those that characterize the arithmetic of different dendritic components, moving on to those that look at neuronal integration at the cell body, and finally, those that look at the axon's computational abilities. We present model predictions alongside supporting experimental data in order to emphasize the importance of modeling work in furthering our understanding of single-neuron arithmetic.

KEYWORDS: *Brain Modelling, Dendrite, Nonlinear Computations, Single Neurons.*

INTRODUCTION

One of the most fascinating and difficult problems in modern biology is figuring out how the brain works. Despite the wealth of knowledge about the molecular and biophysical mechanisms that underpin neuronal activity that has accumulated over the years, similar advances have yet to be made in understanding the rules that govern learning and memory and the connection between the brain structure of a neuron.Computational models combine a theoretical framework with a technological platform to help us better understand how the nervous system works. Certain tools are better suited to analyzing and interpreting complex data sets, such as multi-channel recordings from hundreds of neurons, while others are better suited to simulating the activity of single cells, neural networks, or networks of networks at various levels of abstraction. Researchers can use interactive models of the systems under study to investigate several hypotheses quantitatively thanks to the development and application of such modeling tools. These models, when combined with experimental techniques, make hypothesis testing easier and aid in the identification of important follow-up experiments[1]–[4].

Computations by a Single Neuron:

Most neurons are made up of three main structural units: dendrites, soma (cell body), and axon. They can be as simple as bipolar cells in the retina or as complex as Purkinje cells in the cerebellum. Axons and dendrites have been thought of as simple transmitting devices that communicate signals to and from the soma, where threshold computations take place, for decades. As a result, neuronal cells were first depicted as spherical point neurons with only a cell body, and information transfer was assumed to be solely dependent on their average firing rates. However, computational and, more recently, physiological studies have shown that differences in the morphology and ionic conductance composition of different neurons provide the cell with far greater computational abilities than a point neuron. The structure of a neuron is shown in Figure 1.

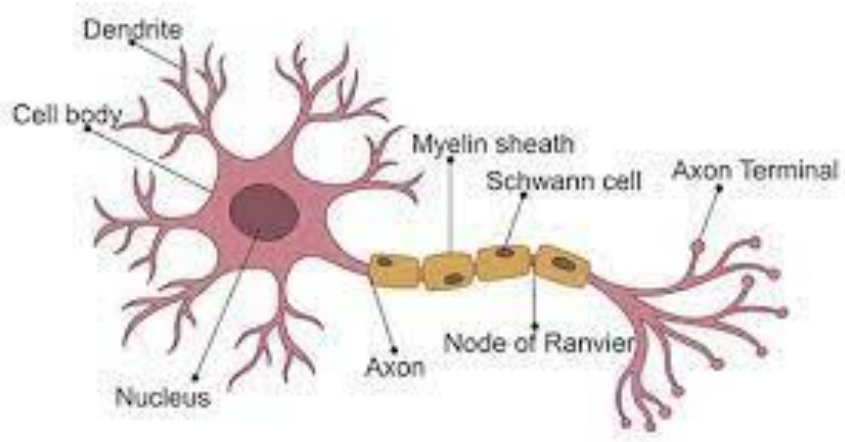

Figure 1: Illustrates the structure of Neuron[5].

Dendrite-Based Computing:

Old buildings are given new functions. Dendrites are no longer thought to be simply passive wires that transmit incoming impulses to the cell body. Dendrites seem to be capable of performing a range of computational tasks, including temporal integration, signal amplification and attenuation, and detection of concurrent incoming inputs, based on mounting evidence emphasizing their active involvement in signal integration. In this part, we concentrate on insights obtained mainly from modeling research and use a bottom-up approach, beginning with the smallest dendritic subunit—the spine—and working our way up to the impact of network activity on dendritic and, ultimately, neuronal function.

Excitable Spines do the following computations:

Ramon y Cajal anatomically discovered dendritic spines in 1911, naming them espinas because to their similarity to thorns on flower stalks. Theoretical results initially suggested that the anatomical features of spines, as well as the existence of voltage-gated ion channels, allow for compartmentalized gain modulation of synaptic inputs in spine heads—that is, information from two or more sources may be integrated nonlinearly. Strong inputs, according to the models, may trigger local dendritic spikes, which can then activate other adjacent spines, amplifying incoming signals locally. Individual spines may conduct nonlinear integration of incoming coincident signals, resulting in a spatially limited amplification of dendritic events as a consequence of their interaction. If synaptic input is scarce, the spine membrane's increased resistance and capacitance burden, along with the small spine neck, acts as a local filter, favoring linear integration. According to a recent compartmental modeling research, the effectiveness of somatic action potentials for penetrating apical dendrites in CA1 pyramids may be explained by spine shape and a high density of sodium ion (Na+) channels on spines. This suggests that these structures have a

function in back-propagating signal regulation and perhaps coincidence detection. These findings point to the intriguing potential that dendritic sections with tiny clusters of spines may function as independent computing units. Short (about 40 m) basal dendritic compartments of layer V pyramidal neurons were found to sum local signals as individually thresholded sigmoidal units in a recent experimental investigation, which supports this theory[6], [7].

Computations Dendritic:

Is it conceivable that various spatial arrangements of synaptic inputs are differently received by the cell if sparse and clustered synaptic inputs are variably detected by a dendritic section? Early neuron models that included passive dendritic characteristics and used the cable theory—that is, how voltage changes travel along dendritic segments—suggested that inputs arriving at different sections of the dendritic tree might be added linearly. This indicated that the place didn't matter. Closely spaced inputs, on the other hand, were believed to mix sublinearly as a result of the activation of a shunting current. Despite the early models' simplicity and the existence of a variety of active membrane processes that might theoretically allow supralinear dendritic integration, experimental data from different neuron types has largely backed up the linear or sublinear summing rule. However, strong thresholding events have been identified in the thin dendrites of neocortical and CA1 pyramidal cells in at least two investigations.

Effects of Normalization on Synaptic Integration:

While dendritic regeneration events allow for gain control of neuronal output, passive characteristics and K+ conductances in the dendrites work to spatially normalize and temporally integrate inputs, allowing the neuron to process information in a different way.Due to the ‘large voltage attenuation and significant temporal delay' of propagated signals, these passive properties (such as membrane time constant, input resistance, and dendritic length) allow for differential integration of synaptic inputs that arrive at distal or proximal parts of the dendritic tree. Simultaneously, the inclusion of a hyperpolarization-activated potassium ion (K+) conductance (I h) in a CA1 compartmental model was shown to account for the experimentally observed normalization of EPSPs originating from various parts of the dendritic tree, resulting in similar depolarizations at the cell body. Additional modeling studies revealed that I h is important in establishing the temporal window for input summation at subthreshold levels, allowing coincidence detection while reducing the efficacy of non-synchronized inputs. Other dendritic K+ conductances may either assist or oppose I h's temporal summation effect.

Finally, the long-standing but mostly ignored impact of network activity-induced background noise on neuronal information processing should be addressed. Background activity in a passive neuron model dampens the efficacy of asynchronous—but not synchronous—inputs in producing a somatic action potential, according to Bernander and colleagues (1991). As a result, it's easier to tell the difference between 'unimportant' and'meaningful' messages. In a more detailed cortical neuron model with active dendritic conductances, intense synaptic network activity increased membrane conductance, promoted the place effect of inputs having arrived onto different dendritic regions, and increased the probability of dendritic spike initiation and forward propagation to the axon. As a result, incoming background noise from network activity may have a significant impact on a neuron's integrative characteristics, such as altering the temporal window for dendrite nonlinear effects[8]–[11].

At The Cell Body, Information Is Processed:

Dendrites help with nonlinear summation of inputs, whereas the soma may help with a different type of information processing, such as enabling a persistent firing mode even when the brain is not stimulated. In addition to traditional network mechanisms, recent experimental and modeling studies have highlighted the importance of somatic intrinsic membrane mechanisms in

generating and maintaining persistent activity. In vitro work in the entorhinal cortex revealed that pharmacological stimulation of muscarinic acetylcholine receptors in response to somatic or synaptic stimulation activates a slow Ca2+-dependent mixed ionic (CAN) conductance, allowing a single neuron to generate graded persistent activity. The slow temporal decay of the EPSP, the CAN conductance, or the Ca2+-induced Ca2+ release mechanism may all play a role in the maintenance of a stable persistent state at low physiological frequencies (10–50 Hz), according to modeling work.

Using Axons to Compute:

Axons serve as a conduit for information to flow across neuronal assemblies in the form of action potentials. Several computational studies, including the seminal work of Hodgkin and Huxley, have shed light on the ionic mechanism for action-potential generation as well as the action-potential initiation site. Recent research focusing on the accuracy and reliability of action-potential generation and propagation suggests that changes in axonal geometry and ionic conductance composition can alter these properties, which are critical for normal information processing. Goldstein and Rall (1974) first implicated the above structural characteristics in modifying the action-potential curve and propagation speed in simulated axons with changing diameter and different branching patterns. Another computational study found that synaptic boutons in different terminals are activated asynchronously in a reconstructed axon of a layer V neuron in the somatosensory cortex after quantifying the effect of such morphological changes on action-potential propagation velocity. It's also been suggested that the density and type of ionic channels along the axon and branching points may be used to control action-potential propagation. In both simulations and experiments, activation of just a few clusters of A-type K^+ channels has been shown to gate axonal propagation of impulses in CA_3 neurons.

DISCUSSION

The neuron is the brain's fundamental working unit, a specialized cell that transmits information to other nerve cells, muscle cells, and gland cells. Neurons are nerve cells that transmit information to other nerve cells, muscle cells, and gland cells. A cell body, an axon, and dendrites are all present in most neurons. This isn't a simple issue to answer, at least for neurons in the brain. However, there are three kinds of neurons in the spinal cord: sensory, motor, and interneurons. Neurons are transmitters of information. They carry information between various regions of the brain and between the brain and the rest of the nervous system via electrical impulses and chemical signals. Neurons are made up of three fundamental components: a cell body, an axon, and a dendrite.

CONCLUSION

For many years, neuroscientists thought that the neuron, which receives and analyzes incoming impulses from neighboring cells, was the brain's transistor or basic processing unit. We propose in this study that the morphological and ionic characteristics of dendrites, soma, and axon equip these structures with a variety of computational skills that may allow them to contribute differently to neuronal activity.The ultimate challenge for future modeling and experimental research is to link computational characteristics to behavior. Recent studies in Drosophila and mice using modeling, physiological, molecular, genetic, and behavioral methods have shown the role of various voltage-dependent K+ conductances in light processing by photoreceptors and in correcting age-related learning and memory deficits, respectively. Such multidisciplinary approaches, in which designs have been used to formulate experimentally accurate hypotheses and experiments are used to verify and refine the predictions, will allow for a more in-depth investigation of how different neuronal elements as well as the nucleus as a whole make a contribution to processing capabilities as well as actions.

The following open issues may offer fertile ground for partnerships between molecular biologists, evolutionary biologists, physiologists, modelers, and behaviorists in furthering our understanding of the brain's mysteries. Do particular neural computational processes need certain behaviors? What elements of the brain circuit or the neuron are in charge of these tasks? What are the chemical processes that underpin the various neural integration working modes? Such integrative methods should bolster the emerging notion, backed up by this research, that something less than the cell is at the core of brain computing.

ABSTRACT

The main goal of studying the Russian language in the modern general educational Uzbek audience is the practical mastery of the Russian language by students. To achieve this goal, it is necessary to firmly and consciously master this language by students, which is carried out by solving a number of methodological problems. One of them is taking into account the peculiarities in the study of the Russian language. In the assimilation of the Russian language by Uzbek students, a number of difficulties are encountered, which are caused, on the one hand, by the specific features of its grammatical system, on the other hand, by the interfering influence of the Russian language of students on the studied Russian language.

KEYWORDS:*Comparative Analysis, Combinations, Khorezm Dialects.*

INTRODUCTION

To achieve this goal, it is necessary to firmly and consciously master this language by students, which is carried out by solving a number of methodological problems. One of them is taking into account the peculiarities in the study of the Russian language.

In the assimilation of the Russian language by Uzbek students, a number of difficulties are encountered, which are caused, on the one hand, by the specific features of its grammatical system, on the other hand, by the interfering influence of the Russian language of students on the studied Russian language.

The path to mastering the specifics of the Russian language and overcoming the interfering influence of the native language in students lies through a deep understanding of the features of the studied Russian and native languages by students. In the implementation of this task, an important place is occupied by the use of comparing the phenomena and facts of the Russian language with the phenomena and facts of the students' native language. Of great importance in

understanding the grammatical laws of the Russian language are students' knowledge of their native language, translation of terms, comparison of facts of both languages, etc.[1]

The need to take into account the facts of the native language when teaching the Russian language is caused by the fact that the process of mastering the Russian language differs from the process of mastering the native language.

If the assimilation of the native language proceeds simultaneously with the process of the development of thinking, then the Russian language, which Uzbek children usually begin to study from the age of seven / in the first grade /, is assimilated by students if they have already developed in varying degrees of thinking, formalized within the framework of native language systems.

As long as the assimilation of a non-native language has not reached active mastery of it, the native language system exerts quite strong pressure on the process of assimilation of a non-native language. Therefore, taking into account the peculiarities of the native language, it is possible to eliminate the possibility of its pressure on the process of mastering the Russian language.

Realizing the difference between the two languages, students, in the practice of Russian speech, will strive to avoid the pressure of the system of their language and thereby avoid possible mistakes.

This circumstance requires the development of a special methodology for teaching the Russian language to a non-Russian (language), based on the principle of strict consideration of the peculiarities of the students' native language.

The native language is the result of long-term language experience, therefore it is impossible to exclude it from the process of mastering the Russian language. The laws of the native language have become so entrenched in the consciousness of the student that he inevitably perceives new facts of the Russian language through the prism of the native language system. This system influences all the activities of the Uzbek student aimed at mastering the Russian language.

Academician L.V. Shcherba wrote that the native language can be expelled from the process of teaching a second language, but it is impossible to expel it from the heads of students in their environment, where Uzbek is spoken at every step.[2] Therefore, Shcherba proposed a path of conscious repulsion from the native language, when students must study every new phenomenon of a foreign language, comparing it with the corresponding phenomenon of their native language.

Comparisons play an important role in human mental activity. Comparison helps to see the characteristic features of objects and phenomena, to get to know them better. The importance of comparison (matching) is also great in the assimilation of educational material. Comparing the structure of a non-native language with the structure of their native language, students consciously assimilate the features of the language being studied and at the same time delve deeper into their native speech.

Comparisons are possible in all sections of the Russian language course: vocabulary, phonetics, grammar, spelling and punctuation.

In this article, the object and subject of research is - fully identify the similarities and differences between the Russian language, the Uzbek literary language and the Khorezm dialect, provide information about the Khorezm dialect subsystem of consonants between the Russian and Uzbek literary systems, about the acoustic-articulatory features of the Russian, Uzbek languages and Khorezm dialects.

In Uzbekistan, in addition to English, which came in second place after the native language, Russian continues to occupy one of the leading places. Therefore, it is very important, at present,

to study the classification of consonants of the Russian, Uzbek and Khorezm dialect in a comparative plan, in order to eliminate inaccuracies in the pronunciation of certain consonant sounds by Khorezm students.

For Uzbek and Khorezm students, special difficulties arise in the assimilation of the material, phonetic side of the Russian language - its phonetic-phonological system.

The relevance of the topic of the article is that the study of the phonetic aspects of the Russian and Uzbek languages, and the Khorezm dialect helps to master the Russian language perfectly.

The scientific and practical significance of the research lies in the scientific substantiation in Russian of an effective methodology that allows to eliminate phonetic interference in teaching Russian to the Uzbek (Khorezm) audience, as well as to lay the foundations for correct pronunciation.

The research results can be used in practical lessons, as well as in theoretical and experimental lessons in phonetics.

To achieve this goal, it is necessary to solve the following tasks:

1) To identify and describe the initial level of knowledge, skills and abilities in the pronunciation of Russian consonants in the speech of students of Russian-speaking groups for students speaking the Uzbek (Khorezm dialect) and the reasons for phonetic errors in speech;

2) To find phonetic problems of consonant sounds that appear in Russian pronunciation and work to overcome these problems when teaching Russian to Khorezm students and schoolchildren;

3) A comparative description of the phonetic systems of the Russian and Uzbek and the identification of lexical errors in the pronunciation of consonants, i.e. study of the consonantism of the Russian language in the Russian speech of Uzbek students and schoolchildren of the Khorezm region, taking into account the peculiarities of the Uzbek language and the Khorezm dialect;

4) Development and explanation of a set of phonetic exercises for teaching the correct pronunciation and spelling of Russian consonants in the Khorezm audience.

The problems of teaching the Russian language, which are based on the study of the phonetic structure and pronunciation norms of the Russian and Uzbek languages in our country, have been developed in the works of such prominent scholars as G.Kh. Bakieva, A.A. Freiman, A. Madrakhimov, G. A.Gleason, and Lebedeva Yu. G., Trubetskoy G.S., Shansky N.M., Barkhudarova E.L., Kasatkina R.F., Bondarko L.V., Verbitskaya L.A., Gordin M.V., Verbitskaya L.A., Ignatkina L.V., Vereshchagin E.M., Lyubimova N.A., Musatov V.N., Rozova O.G., Kissen I.A., Abdullaev F.A. A., Matusevich M.I., Polivanov E.D., Reshetov V.V. and etc.

The technique of eliminating phonetic interference when teaching Russian in the Uzbek (Khorezm) audience has also been previously studied by researchers. But in these studies, the main attention was paid to the pronunciation of the vowels of the Khorezm dialect - Allabergenov B.K., Urazova M.B.

This work will help to positively solve the problems in teaching the correct pronunciation of consonants in Russian, as well as in improving the educational process in non-linguistic universities.

The linguistic material is studied on the basis of the experience of the comparative-typological analysis of phonological units used in modern linguistics. The article examines the features of the phonetic interference of Russian speech, caused by discrepancies in the systems of consonantism of the native (Khorezm) and studied Russian languages. On the basis of the

comparison of “contacting” systems, methodological recommendations are proposed for teaching foreign language groups to Russian pronunciation, taking into account the dialect phonetics of consonants.

The main task is to systematize and generalize the theoretical base existing in science for the comparative-comparative study of the phonological systems of the Russian, Uzbek languages and the Khorezm dialect.

Too successfully master the norms of the Russian literary language, students need to take into account the existing similarities and differences in the phonetic systems of the studied languages.

In this case, the greatest attention should be paid to the functional aspect of phonetics, that is, a comparative analysis of the phonological systems of the Russian, Uzbek and the Khorezm dialect.

It should be emphasized that in recent decades, quite a lot of attention has been paid to the comparative analysis of the Russian, Uzbek and the Khorezm dialect.

Nevertheless, very few works devoted to the actual problem of comparative analysis of phonological systems of consonant sounds of Russian, Uzbek and Khorezm dialect have been created in recent years. Russian and Uzbek consonants and vowels are compared, however, most of the analysis is done, and the consonant letters and sounds of the Khorezm dialect are not studied so thoroughly, and often if you compare the structure of the Russian and Uzbek languages, you can find similar features in them. And the structure of Khorezm speaking differs markedly from the structure of the above-mentioned languaTo fully understand the similarities and differences between the Russian, Uzbek literary systems and the Khorezm dialect subsystem of consonants, it is necessary to refer to the data of acoustic-articulatory features of the phonemes of these language systems.

Each of these languages has a system of vowels and consonants.

Vowels are sounds that, unlike consonants, arise during the formation of a tone - without the participation of noise, i.e. when pronouncing vowels, no obstacles arise in the oral cavity and the sound passes directly without overcoming any obstacle.

Consonant sounds are sounds, when pronounced, obstacles arise in the path of the air jet in the oral cavity as a result of air friction against the walls, as a result of which a voice + noise or only noise appears.

There are 6 vowel phonemes in the Russian language, which do not differ in length and brevity, and 37 consonant phonemes.

The total number of phonemes in the Russian and Uzbek languages, with quantitative proximity, has a significant discrepancy in qualitative terms.

This is due to the fact that in Russian phonetics, hard and soft sounds are denoted by the same letter, for example: *сэр (сэр)* and *сер (сэ’р)*. And also the six main vowel sounds are indicated by ten vowel letters:

(и) – и (милый),

(ы) – ы (мыло),

(а) – а (май) и я (мойа),

(о) – о (мой) и ё (йолка),

(э) – э (это) и е (мел),

(у) – у (куст) и (йула).

Hence it can be seen that to denote the four vowel sounds (a), (o).(э).(y), there are two rows of letters, these are: 1) a, o, э, y ; and 2) я, ё. е, ю.

There are 37 consonant sounds in the Russian language.

Let's compare the phonetic structure of the Russian and Uzbek languages, and Khorezm speaking.

The main features of consonants are the place of formation, the method of formation and the participation of the vocal cords.

Depending on the place of formation in the Russian language, consonants are distinguished:

1) Labial,

2) Antero-lingual,

3) Middle-lingual,

4) Posterior-lingual.

According to the method of formation, sounds differ in:

1) Bowed,

2) Explosive,

3) Bowed-through,

4) Affricates,

5) Slit,

6) Trill consonants.

Depending on the participation of voice and noise, the following differ:

1) Sonorous

2) Noisy consonants.

Noisy, in turn, according to the participation of voice and noise are divided into:

1) Voiceless

2) Voiced

The specific signs of consonants of the Russian language are:

1. Soft

2. Hard[3]

And now let's characterize each consonant sound separately.

And now let's characterize each consonant sound separately.

(b - b') - Consonant, noisy, sonorous, bowed, labial, paired in deafness and softness, eg: robot (b) - child (b'),

(в – в')– Consonant, noisy, ringing, bowed, labial-dental, paired for deafness and softness, eg.: ворота (в) – ведро (в'),

(г – г') – Consonant, noisy, ringing, bowed, middle-lingual, paired for voiceless and softness, eg.: город (г) – герой (г')[1]

(д – д’) - Consonant, noisy, voiced, occlusive, front-lingual, dental, paired for voiceless and softness, eg.: лом(д) – (дед) (д’),

(ж – ж’) - Consonant, noisy, voiced, slit, front-lingual, dental, eg.:Жора (ж) – Женя (ж’),

(з – з’)- Consonant, noisy, voiced, slit, front-lingual, dental, paired for voiced and softness, eg.: роза (з) – зебра (з’),

(п – п’) - Consonant, noisy, voiceless, slit, labial, paired in sonority and softness, eg.: парад (п) – вперед (п’),

(ф – ф’)- Consonant, noisy, voiceless, slit, labiodental, paired in voicing and softness, eg..: фонтан (ф) – фиалка (ф’),

(к – к’) - Consonant, noisy, voiceless, slit, back-lingual, paired for voice and softness, eg.: рок (к) – километр (к’)

(т–т’) - Consonant, noisy, voiceless, occlusive, front-lingual, dental, paired in voicing and softness, eg.: рот(т) – тень (т’),

(с – с’)- Consonant, noisy, voiceless, slit, has pairs in voicing and softness, eg.: соль (с) – село (с’),

(ш – ш’) - Consonant, noisy, voiceless, slit, front-lingual, alveolar dental, has pairs in voicing and softness, eg.: шорох(ш) – шелест (ш’),

(х – х’) - Consonant, noisy, slit, back-lingual, has a pair of softness, eg.: хорек (х) – херес (х’),

(ц) - consonant, voiceless, affricate (occlusive-slit), front-lingual, dental, has no pair, eg.: цирк (ц),

(ч’) - Consonant, voiceless, affricate (occlusive-slit), anterolingual, palatal - dental, eg.: часы (ч’)

(л – л’) - Consonant, sonorous, occlusive-anadromous, lateral, has a pair of softness, eg.: лось(л) – лес (л’),

(м – м’) - Consonant, sonorous, occlusive - anadromous, nasal, labial, has a pair of softness, eg.: море (м) – мел (м’),

(н – н’) - Consonant, sonorous, occlusive-anadromous, nasal, front-lingual, dental, has a pair of softness, eg.: нора (н) – лестница (н’),

(р – р’) - Consonant, sonorous, trembling, front-lingual, palatine-dental, has a pair of softness, eg.: robot (b) - cutting (р’),

(й) - consonant, voiced, unpaired soft, sonorous, eg.: рой (й’).[4]

Combinations of consonants are pronounced differently.

In some combinations of consonants (*сш, зш, сж, зж, тч, дч, тц, дц*), the previous sound is completely similar to the previous one, as a result of which a double (long) sound occurs.

Other combinations *(тс, дс, тьс, жч, сч, зч*) are pronounced as one sound, and in the spelling not one of the letters corresponds to the spoken sound.

In the third combinations, double pronunciation is possible. So, the spelling combination *чн i*n most cases denotes the sound *[ч’н]*, for example: *вечный – ве[ч’н]ый, загадочный – загадо[ч’н]ый.*

In the following words, in place of the spelling combination *чн,* only *[шн]* is pronounced: *скучно – ску[шн]о, конечно – коне[шн]о, яичный – яи[шн]ый, яичница – яи[шн’]ица,*

пустячный – пустя[шн]ый, скворечник – скворе[шн’]ик, прачечная – праче[шн]ая, горчичный – горчи[шн]ый, подсвечник – подсве[шн’]ик, а также в женских отчествах типа Саввична – Савви[шн]а, Ильинична – Ильини[шн]а.

As a rule, the combination *[шн]* is also pronounced in words included in phraseological expressions. For example: *шапочное (шапо[шн]ое) знакомство, перечница – пере[шн]ица.* In some cases, in place of the spelling combination *чн*, pronunciation *[шн]* along with *[чн]* is acceptable,, for example: *двоечник – двое[ч’н’]ик, двое[шн’]ик, порядочный – порядо[ч’н]ый, порядо[шн]ый, сливочное – сливо[ч’н]ое, сливо[шн]ое.*

Pronunciation *[чн]* or [шн] can be a differentiating feature that distinguishes the meanings of words.Compare:*серде[ч’н]ые болезни – серде[шн]ый друг.*

A double consonant is usually pronounced in the middle of a word in a position after a stressed vowel: *гру[п]а, тра[с]а.* At the end of a word, double consonants, as a rule, are not pronounced *(криста[л], мета[л]).*

In the modern written literary Uzbek language, there are 6 vowels - (и), (э), (а), (о), (у), (ў) *and 25 consonants*, their composition is significantly different from the phonemes of the Russian language- [б], [д], [ф], [г], [х], [ж], [ж,], [к], [л], [м], [н], [п], [қ], [р], [с], [т], [в], [х], [й], [з], [ғ], [ш], [ч], (ц),[нг].

Depending on the place of foundation, consonants are distinguished in the Uzbek language:

1) Labial,

2) Lingual (front-lingual, middle-lingual, back-lingual, deep back-lingual).

By the way of foundation, the Uzbek language has explosive:

1) Clean explosive,

2) Compound explosive,

3) Slit,

4) Explosive-slit (nasal, lateral, trembling)

According to the participation of voice and noise, noisy ones are distinguished:

3) Voiced

4) Soundless

5) Sonorous (voiced)[5]

Characteristic of each consonant separately:

(б – б’) - Consonant, noisy, voiced, occlusive, labial, has pairs for voiceless and softness, eg: *бозор (б) – бадан (б’),*

(в – в’) - Consonant, noisy, voiced, slit, hard sound, labiodental and soft - labial, has pairs for voiceless and softness, eg: *вақт (в) – вакил (в’)*[6]

(г – г’) - Consonant, noisy, voiced, occlusive, back-lingual, paired in voiceless and softness, eg: *педагог (г) – гап (г’).*

(д – д’) - Consonant, noisy, voiced, occlusive, front-lingual, dental, paired for voiceless and softness, eg: *достон (д) – давлат (д’),*

(ж – ж’)- Consonant, noisy, voiced, affricate, slit, front-lingual, palatine-dental, eg: *журналист (ж) – жараён (ж’),*

(з – з’) - Consonant, noisy, voiced, slit, front-lingual, dental, paired for voiceless and softness, eg:*зўр (з) – зийрак (з’),*

(п – п’) - Consonant, noisy, voiceless, occlusive, labial, has a pair in voicing and softness, eg: *пойабзал (п) – панжа (п’),*

(ф – ф’) - Consonant, noisy, voiceless, slit, labial, has pairs in voicing and softness, eg: *фойда (ф) – фан (ф’),*

(к – к’)- Consonant, noisy, voiceless, occlusive, back-lingual, has pairs in voicing and softness, eg:*қўпол (қ) – китоб (к’),*

(т–т’) - Consonant, noisy, voiceless, occlusive, front-lingual, dental, paired in voicing and softness, eg: *тўқсон (т) – тарбия (т’),*

(с – с’)- Consonant, noisy, voiceless, slit, has pairs in voicing and softness, eg: сўроқ (с) – сўз (с’),

(ш – ш’)- Consonant, noisy, voiceless, slit, front-lingual, palatine-dental, has pairs in voicing and softness, eg: *шўрва (ш) – шанба (ш’),*

(ҳ – х’)- Consonant, voiceless, noisy, slit (fricative), back-lingual, has a pair of softness, eg: *ҳўроз (петух) (ҳ) – хал (мечта) (х’),*

(ц)- Consonant, voiceless, affricate (occlusive-slit), front-lingual, dental, has no pair, eg: *цирк, цензура (ц),*

(ч’) - Consonant, voiceless, affricate (occlusive-slit), anterolingual, palatine-dental, eg: *чилдирма (ч’),*

(л – л’) - Consonant, sonorous, occlusive-anadromous, lateral, has a pair of softness, eg:*луғат (л) – лайлак (л’)*[7]

(м – м’) - Consonant, sonorous, occlusive-passable, nasal, labial, has a pair of softness, eg: *пуфламоқ (м) – менда (м’),*

(н – н’) - Consonant, sonorous, voiced, occlusive-anadromous, nasal, front-lingual, dental, has a pair of softness, eg: *нусха (н) – навбат (н’),*
(р – р’) - consonant, sonorous, trembling, front-lingual, palatine-dental, has a pair of softness, eg: *рўмол (р) – разм (р’),*[8]
(нг) - consonant, noisy, voiced, unpaired soft, sonorous, middle-lingual, fricative, eg:*бодринг (нг) ,*

(ғ) - consonant, voiced, unpaired, noisy, fricative, deep-lingual, nasal, more posterior, eg: ғазаб, ғалла (ғ).[9]

The Russian language, to a greater extent than the Uzbek language, is characterized by the accumulation of consonants at the beginning of a syllable and at the end of a syllable.

Many active organs of speech: lips, lower jaw, tongue, palatine curtain, vocal cords - work more when speaking Uzbek than when speaking Russian.

Acoustic differences of consonants are generated by their articulation. The phonetics of one language, as a rule, are not similar to the phonetics of other languages. Therefore, the very sounding speech, as it were, separates one sound from another.

Uzbek consonants do not have a sign of softness and hardness. The loss of consonants in consonant groups is characteristic of colloquial speech and vernacular in the Uzbek language, as well as literary speech in Russian.

Phonetics of the Khorezm dialect

Let's consider the characteristics of each consonant sound of the Khorezm dialect.

There are 32 consonants in the Khorezm dialect.

[б - б’] - Consonant, voiced, noisy, occlusive, labial, paired on hardness and softness. And by voicedness - voisless,eg: *бол – (бал – асал); барак*

[в – в’] - Consonant, voiced, noisy, slit, labial - dental, paired in softness - hardness, eg:*вағырды – (вағырды–шовқин), важ (важ–буйум нарса)*[10]

[г’] - Consonant, voiced, noisy, plosive, back-lingual, unpaired in hardness, eg: *галди - (галди–келди).*

[д –д’] - Consonant, voiced, occlusive, front-lingual, dental, noisy, paired in voiced- and in hardness-softness, eg: *домбойин, дери- (дэри);*

[ж’] - Consonant, noisy, voiced, front-lingual, anterior palatal (apical) (the tip of the tongue, together with the back, rises to the upper teeth or alveoli), always soft (does not have a pair in hardness), eg: *жора , жаныққмоқ;*

[з – з’] - Consonant, noisy, voiced, noisy, slit (fricative), front-lingual, has a pair for voiceless and for softness-hardness, eg: зоволо (завала - зувала), (зар – захар);

[й’] - Consonant, voiced, sonorous, unpaired, always soft,eg: *йул – йўриқ* ;

[қ – к’] - Consonant, noisy, voiceless, occlusive, back-lingual, has a pair in voicing and softness, eg:*қазық (казык - қозиқ) ; кавап - (ковоп – кабоб);*

[л–л’]- Consonant, voiced, sonorous, occlusive-passable, lateral, front-lingual, dental; has a pair of hardness-softness,eg: *лотра, лаппик;*[11]

[м–м’] - Consonant, voiced, sonorous, occlusive-passable, nasal, paired in hardness and softness, eg:*манқа, масси, мейир ;*

[н–н’] - Consonant, sonorous, occlusive, nasal, has a pair of hardness-softness, front-lingual, dental,eg:*назвай, нера;*

[п–п’] - Consonant, sonorous, occlusive, nasal, has a pair of hardness-softness, front-lingual, dental,eg:пайыр, питта;

[р – р’] - Consonant, sonorous, trembling, front-lingual, palatine-dentsl, unpaired, eg: *ропак, ружжа;*

[с–с’] - Consonant, voiceless, slit, front lingual, dental, has pairs in voicing and hardness-softness eg: *сағат, сас;*

[т– т’]- Consonant, noisy, voiceless, occlusive, front-lingual, dental, has pairs in voicing and hardness - softness eg: *тавақ , тейип;*

[х–х’] - Consonant, noisy, voiceless, slit, back-lingual, has a pair in sonority and hardness-softness eg: *хавандар, хинжи;*[12]

[ч’] - Consonant, noisy, voiceless, affricate (occlusive-slit), front-lingual, palatine-dental, soft, unpaired, always soft, eg: *чолур;*

[ш – ш’] - Consonant, noisy, voisless, front-lingual, palatine-dentaleg: *шағал, шарава.*

The consonants [қ], [ғ], [ҳ] of both the Uzbek language and the Khorezm dialect have no analogues in Russian.

The sound [қ] is a voiceless, occlusive, posterior palate, formed by closing the very back of the back of the tongue with the soft palate: *қator - "row", qishloқ* .

Replacing the sounds [қ] and [k] can lead to distortion of the lexical meaning of the word.

The sound [ғ] is a voiced, slit, formed by bringing the very back of the tongue closer to the soft palate, eg: *ғайр, боғ, беғайрат*.

The sound [х] is a voiceless, slit, formed by the convergence of the walls of the pharynx in its lower part. The sound [х] for example *(ҳазатмоқ)*. The sound [х] differs from the Russian sound [х], since it is formed deeper (just like the sound [ғ], but without the participation of the voice).

The sound [л] by ear can be taken as an average between the Russian hard [л] and soft [л'], for example, *лақалақ, лаппик*. When the Khorezmian [л] is formed, the front part of the back of the tongue closes with the hard palate, and touches the front upper teeth eg: *ликув, ликки.*[13]

Voiced consonants *[б], [д],* unlike similar Russian consonants at the end of a word are stunned slightly, for example: (од), бод.

The rest of the consonants of the Khorezm dialect do not differ significantly from similar sounds of the Uzbek language.

Investigating the phonetic side of the Khorezm dialect on the basis of an explanatory dictionary, during the study, the following final consonant combinations at the end of a word, stunning voiced consonants were identified:

б-п-галиб (галип) ,

в-ф- ақлов (аклоф),

г-й – эг (эк)

д–т- ад (ат)

з-с – дуз - (дус)

ж–ч- авж – (авч)

з-с –аз-(ас)

Sounds remain unchanged in the following positions, for example:

с-с - палпис,

й-й - буғдой,

к - к –ак,

қ – қ - айақ,

л- л - ал,

н – н - э:ван,

р – р - жўвр,

с - с - камис,

т– т - тут,

х–х- гулмиҳ,

ҳ-ҳ – воҳ -воҳ,

ч–ч-каруҷ,

ш- ш - тырқыш;[14]

The phonetic differences between the consonant sounds of the Oghuz dialect and the literary Uzbek language are as follows:

a) at the beginning of the word, instead of the sounds "к", are pronounced"г"*(гал)* - *кел*, instead of *"т"* - *"д"(дил)* - *тил*, *instead тиш — диш*, *кел — гал (гел)*, *керак — гарак (гарак);*

b) *"қ", "ғ", "к", "г"* at the end of the word are omitted: *иссиқ — (исси)*, *тирик — (дири), гоҳо – (гавах).*

c) in the forms of local and original cases of words in the form of belonging to the third person, the sound*"н"* is added before the case affix: *ичинда*, *дишинда;*

d) The letter*"нг"* is pronounced in two forms, like "нг" and "ң": китопиңг, гийиминг;

e) Voicing of anlaut к, т: гу:з; да:л ; да’па ;

e) Falling away of the final *“к”, “қ”*: катты; аджы;[15]

In the Uzbek language, as a rule, consonants alternate with vowels. Therefore, the pronunciation of Russian words in which there are several consonants in a row can cause difficulties.

For example, Uzbek and Khorezm students make mistakes in reading, pronunciation and writing at the junction of two consonants eg: *на улицах - (на улитсах, на улитицах, на улитцах), листьями (лисиями, лисьсиями), осенний (осенни,осеньны, в осеньный).*

It is very important to learn how to pronounce such words correctly, without adding vowels both at the beginning of a word and between consonants.

Some Russian consonants like (ц) are read and written by doubling them, eg: *в центре - (в тсентре), спотыкаться (спотикаца).*

I would like to pay special attention to the**ь** and**ъ** signs of the Russian language instead the word*грязь*, the Uzbek-speaking audience writes - (грьяз, гряз), сильный – (силний), земля- (земьлья, земьля)

Foreign words, as they are mastered by the Russian language, lose the length of the consonants and are pronounced as sounds of ordinary longitude *(то[н]ель, те[р]аса, ко[р]ектор, ко[м]ерция).*

The pronunciation of each word can be checked in the book “Russian literary pronunciation and stress. Dictionary-reference book ", edited by R.I. Avanesov and S.I. Ozhegov. - M., 1959.

ABSTRACT

This article examines the specifics of the development of the service sector and its role and importance in the socio-economic development of the country. In the process of diversification of the economy and modernization of the most important sectors of the country, the sustainable economic development of service enterprises in the context of constantly changing market relations requires improving the organizational and economic mechanism to increase the efficiency of their economic activities. Because ensuring the intensity of services associated with the organizational and economic mechanism for improving the efficiency of service enterprises to achieve savings in the use of resources; increase the efficiency of employee use and quality of service and its efficiency; the issue of full satisfaction of consumer demand is one of the specific problems of the industry.

KEYWORDS: *Service, Service Economy, Economic Efficiency, Human Capital, Division Of Labor.*

INTRODUCTION

According to the essence and content of the service sector, it includes various forms and directions of human activity related to the creation of conditions for human capital development and the transition to a relatively high level of division of labor, related to ensuring modern quality of life.

In the process of diversification of the economy and modernization of the most important sectors of the country, the sustainable economic development of service enterprises in the context of constantly changing market relations requires improving the organizational and economic mechanism to increase the efficiency of their economic activities. Because ensuring the intensity of services associated with the organizational and economic mechanism for improving the efficiency of service enterprises to achieve savings in the use of resources; increase the efficiency of employee use and quality of service and its efficiency; the issue of full satisfaction of consumer demand is one of the specific problems of the industry. One of the main tasks today

is to increase the level and quality of services of local enterprises in the international market and increase exports of services on this basis.

In the current era of the spread of new information technologies, the development of the world community has reached such a stage that it is changing, showing its impact on all aspects of socio-economic life. Such changes in socio-economic life are recognized by economists in such a way that it is marked by the fact that the development of human civilization has entered a new stage. According to them, at this stage of civilization, the decisive factor is the knowledge and skills of people and information.

THE MAIN FINDINGS AND RESULTS

The development trend of modern society is mainly characterized by the transition from a raw materials and industrial economy to a service economy. The main focus is on the development of modern networks with a large capacity of science and information technology in the use of intellectual resources. Such a situation in the development of society requires a wider development of the service sector than other sectors of the economy.

The scientific and technological revolution of the 1950s led to a qualitative change in the productive forces, a radical renewal of the material and technical base of production and a deepening of the international division of labor. As a result, since the 1970s, the number of people employed in the service sector of the developed market economies has increased. In the service economy, knowledge and information are important as a key factor in production.

At the present time, the socio-economic development of the countries of the world differs sharply from the previous stages in terms of its meaning and content. New interpretations of economic growth require modern, conceptual approaches to the science of world economics. In particular, effective activity in the service economy has been studied more extensively than industrial activity, which is primarily explained by the fact that socially oriented activity is aimed at ensuring the living standards and quality of life in society.

In the context of effective activity, characterized by the establishment of a service economy, the following can be distinguished:

1. In the service economy, businesses focus primarily on increasing efficiency, ie more fully meeting the specific (special) needs of customers. In an industrial economy, the focus is more on maximizing the production of goods.

2. The concept of utility in the service economy is the same as the nature of the use of goods, which determines the degree of improvement of the system of material goods and services. In an industrial economy, only the material side of the product is taken into account.

3. In the service economy is understood the ability to constantly monitor and determine the attitude of the manufacturer to the maximum satisfaction of the consumer on the basis of quality. In an industrial economy, on the basis of quality, only the ability of the operator to “do his job well” is understood.

4. The management system in the service economy is also changing. While its main features are flexibility, quick decision-making, organization, freedom of movement and transparency, in industrial economics management is characterized by a “mechanical” nature, i.e. the hierarchy of structures and their excessive regulation.

5. In the service economy, the focus is on the efficiency of the service system, while in the industrial economy, the focus is on the transformation of raw materials into finished products.

From the above, it can be concluded that effective activity in the service economy differs from effective activity in the traditional (industrial) economy, and it is more socially oriented.

Therefore, the development of the service economy in countries based on developed market economies leads to a new understanding of socio-economic development. In particular, not only the rate of quantitative growth, but also social indicators, indicators of quality of life plays a key role in it. In such an environment, effective activity is defined as meeting the needs of members of society, primarily socially oriented goals. In an industrial economy, there are more quantitative, economic, and priority goals.

CONCLUSION

In general, considering the theoretical foundations of the service economy, it should be noted that the changes in economic conditions in developed market economies require a broader category of effective activities. A new approach to the category of efficiency is becoming increasingly popular in foreign economics. This approach emphasizes that results can be achieved qualitatively rather than purely quantitative in terms of the content of effective activities.

Economic efficiency reflects the results of the activities of entrepreneurs, while social efficiency reflects the social efficiency of economic entities, its impact on various aspects of society. At the same time, social and economic efficiency are to some extent interdependent. Achieving social efficiency is the improvement of people's social living conditions, which makes it possible to increase economic efficiency. As a result, it affects a person’s ability to work, leading to an increase in his or her labor productivity. At the same time, a material basis is needed for the implementation of social programs. This material basis is achieved by increasing the economic efficiency of enterprises. Hence, the new content of effective activity in the conditions of service economy can be expressed as follows: activity efficiency is not measured by the essence or content of the concept of efficiency, but by indicators that constitute social efficiency. These indicators have a broader meaning than the indicators that determine economic efficiency. Changes in the qualitative conditions that constitute efficiency make it necessary to assess the effectiveness of business entities. At the same time, it is generally accepted that social efficiency cannot be reduced to a precise quantitative measure. Thus, traditionally, efficiency can only reflect its economic nature, making it difficult to measure its social and socio-economic aspects by quantitative criteria. This view is widespread in the economic sciences today. At the same time, research related to the solution of the problem of performance appraisal in the service economy is becoming more relevant, and the demand for research in this area, in our opinion, is much higher.

THE IMPORTANCE OF USING PEDAGOGICAL TECHNOLOGIES IN THE CLASSROOM

Bahodir Sayfiddinovich Akhmedov*

*Teacher,
Namangan State University, UZBEKISTAN

ABSTRACT

The teacher uses pedagogical technologies, educational technology, teaching technology in the process of quality organization of teaching processes and attracting students to the lesson. "Advanced pedagogical technology", "modern educational technology" are still not standardized, not explained in encyclopedias, no single interpretation of its content has been developed, and therefore many different terms reefs are available.

KEYWORDS: *Technology, Educational Innovation, Pedagogical, New Pedagogical Technology, Modern Educational Technology, Advanced Pedagogical Technology.*

INTRODUCTION

All levels of the education system in the country are provided with new scientific literature. They are innovating in their work based on the requirements for educators. In the process of educating the younger generation, along with the use of science, technology and best practices, modern pedagogical technologies are effectively used. This process increases the responsibility of teachers. What is pedagogical technology? How and where can we use it effectively? To answer such questions, do we first need to study the teaching process, the teacher and the student? Lessons are the collaborative, productive work of a teacher and a student. Positive organization of the lesson, effective use of time, the right choice of lesson objectives, the ability to apply the methods in place, to create a positive-emotional environment in the classroom by cooperating with students is the main activity. Teaching students to read, to help students acquire knowledge independently from teaching, and to understand and apply modern pedagogical technologies in a variety of ways to achieve a positive outcome in the classroom requires skill on the part of the educator. The learning process consists of three parts.[1]

-Motivation;

-Cognitive activity;

-Management activities.

When these three components work together, results can be achieved in pedagogical technology. Classes based on pedagogical technology allow students to express their views on important life achievements and problems, to think, to justify their views. The most fundamental foundation of pedagogical technology depends on the technologies chosen by the teacher and the student to

achieve a systematic, collaborative approach based on a clear sequence of guaranteed results from the set goal. The main features of pedagogical technology are design, implementation and guaranteed results. The teacher is responsible for the development of the lesson plan, technological mapping, purposeful implementation and achievement of results. The role and importance of innovative methods in the use of pedagogical technologies is great. The main purpose of interactive methods is to motivate students to be active, to involve them in the lessons, to teach them to work together.[2]

Interactive or Interactive Methods

Relation of educational content to interactive methods. Thus, we have described a holistic approach that identifies the first important condition for improving the choice of teaching methods in relation to their systematization, their application in the practice of planning processes of the learning process. Criteria for the selection of traditional methods in pedagogy have been developed in large numbers, and in recent years in the works of didactic scholars more than twenty of them are cited.

The criterion for choosing interactive methods is that they are highly focused on solving problems in the development of education and upbringing. This criterion is introduced by assessing the ability of different methods to solve problems in one area or another, as their ability to master the elements of social experience varies. The next criterion for choosing interactive methods is their relevance to the nature of the content. The content of the method is also defined as part of the movement. There is no doubt that this criterion will be taken into account from this bus. One method reveals the content of the topic in more detail, while the other allows you to master it positively. Another criterion for choosing interactive methods is that they are fully compatible with the learning opportunities of students, that is, to ensure the unity of internal and external conditions for effective learning activities. The use of interactive teaching methods should be tailored to the individual capabilities of the educator. The next criterion for choosing interactive methods is their compatibility with the forms of organization of the learning process. By the way, general, group and individual forms of teaching require different methods. the participation of all students in the group will be required. Compliance with the principles of pedagogical technology of interactive methods is a generalizing criterion. Based on the general purpose of education, the allocated option is analyzed and evaluated, taking into account the need to address educational and developmental issues at the current stage of teaching. One of the important requirements for the organization of modern education is to achieve high results in a short time without excessive mental and physical effort. formation, as well as monitoring the activities of students, the assessment of the level of knowledge, skills, competencies acquired by them requires from the teacher high pedagogical skills and a new approach to the educational process. Pedagogical technology is inherently subjective, which means that every educator must organize the process of education and upbringing creatively, based on their abilities and professional skills. Regardless of the form, method and means of organization, pedagogical technologies:

-Increasing the effectiveness of pedagogical activities;

-Decision of interaction between teachers and students;

- Ensuring that students acquire a thorough knowledge of the subject;

-Development of independent, free and creative thinking skills in students;

-Create the necessary conditions for students to realize their potential;

The method of “intellectual attack” is to ensure the activity of students in the classroom, to encourage them to think freely and free them from the inertia of the same thinking, to collect a

variety of ideas on a particular topic, as well as to solve creative tasks. serves to teach them to overcome the ideas that arise in the early stages of the maturation process. The method of "brainstorming" was recommended by A.F.Osborn the main principle and condition of which is to strictly prohibit criticism of the idea expressed by each participant in the training, to encourage any bites and jokes. The aim is to ensure the free participation of students in the learning process. The effective and successful use of this method in the educational process depends on the pedagogical skills of the teacher and the breadth of thinking. When using the method of "brainstorming" it is advisable not to exceed 15 students. Classes based on this method can last up to an hour.[3]

Interactive methods are called collective thinking, that is, methods of pedagogical influence are an integral part of the content of education. The peculiarity of these methods is that they are carried out only through the joint work of teachers and students.

The benefits of a student-centered approach

The purpose of independent work of students is to organize a systematic study of disciplines during the semester, to strengthen and deepen the acquired knowledge and skills, to prepare for the next lessons, to form independence and a culture of intellectual labor in the search for new knowledge. The time allotted for it is determined by the working curriculum and can be 30-60% of the total number of study hours allocated to the student for the study of a particular subject. Each studied subject is divided into a number of thematic sections, and for each of them are identified all important types of classes, tasks for independent theoretical and practical work, educational and scientific literature, sources of statistical data, etc. The student reports in the prescribed manner on the completion of the tasks of each department. All the work done by the student is evaluated on the basis of criteria developed and approved by the department. A student who does not get enough points in each independent work is considered to have not mastered the relevant subject. Students' independent work, depending on their characteristics, can be as follows. Reproductive independent work - reading, summarizing textbooks, listening to lectures, narration, memorization, repetition of educational material, etc.

Self-seeking independent work in practical and seminar classes with presentations and lectures, selection of literature on the curriculum, writing course and control works, etc. Creative independent work - writing abstracts and scientific articles, participation in research work, preparation for graduate work, special creative assignments, etc. develop technological maps for the organization of training, which include independent work, their capacity, labor capacity, forms of control. Technological maps to be developed for each topic of the training course include the main questions of the report, practical and seminar classes, a list of necessary literature. Published documents, a set of visual aids (drawings, graphs, slides, etc.) are distributed in advance to the study groups and are an important organizational part of the learning process. Depending on the level of students' ability to work independently, from the first semester to increase the volume of independent work semester-semester, the transition from simple to more complex tasks (active participation in practical classes, essays, course work, graduate work), independent work It is advisable to expand the forms. The teacher must always increase the creative approach to the independent work of the student and actively add to the chosen form of independent work the general elements of research, practical experience. The main task here is to strengthen the independent learning of each student. The teacher must always lead the independent work, not to allow arbitrariness in its organization, to implement the established control system and to provide objective assistance to students at all stages of learning.

Technology (Greek: "techno" - profession, master and "logos" - science, education) - methods of converting raw materials into finished products on the basis of scientific practice. Technology (Greek techne - art, skill, learning and ... logy) - a system that regulates the methods of obtaining,

processing and processing products in industry, construction, transport, agriculture and other areas; a science that deals with the development, introduction, and improvement of these methods. Each industry has its own technology: mining technology, mechanical engineering, construction technology, agricultural technology, and more.

Methods of ensuring the continuity and continuity of communication techniques and strategies.

The main reason why a person is called a product of social relations is that he is always in the circle of people, in the sphere of interaction with them. This indicates that one of the most leading and influential activities of an individual is communication. The type and forms of communication vary. For example, this activity can be directly “face-to-face” or by one or another technical means (telephone, telegraph, etc.); be practical or friendly in the course of a professional activity; can be subject-subject type (dialogic, partnership) or subject-object (monologue). Human relationships are processes of interaction in which interpersonal relationships are formed and manifested. Such a process involves the exchange of thoughts, feelings, worries, and joys that initially occur between people. As people communicate, as they experience the relationship between them, they develop qualities such as commonality, similarity, and harmony that make them understand each other at a glance, or even “half-heartedly.” In some cases, the intensity of such communication leads to the opposite reactions - fatigue, lack of speech. For example, the family environment and the relationships within it are such close relationships. Only such a density can occur not only among all members of the family, but also among individual members (mother - child, mother-in-law - daughter-in-law and x-zo). The main goals of the parties to the relationship are to find common ground and understand each other. The complexity of this process, if necessary, the "charm", the uniqueness of which is that it is impossible to find common ground or think and speak exactly the same. If we imagine such a situation, such a dialogue would be the most ineffective, the most ineffective. As we live in the 21st century, man's need for the most natural communication, his desire to be aware of his secrets and to be able to effectively influence others, has increased, and there are a number of reasons for this. First, we are moving from an industrial society to an information society. The abundance of information necessitated the sorting of information related to the interests of man, the right relationship with him. Information has become the rarest asset in the 21st century, which in turn changes the speed and pace of transmission of information to people. Second, the growing number of groups of people working in different professions, the urgency of the relationship between them requires not only simple communication in a tight information environment, but also professional, knowledge-based communication.

In general, economists, who predict that the XXI century will be the century of corporations, also say that this corporation is a well-developed, perfect skills for people to find common ground.[4]

In addition, such corporate communication often involves the transmission of clear and concise ideas, not directly face to face, but using modern technical means - mobile communication, faxes, e-mail, Internet, etc. This also requires the deliberate formation of specific communication skills.

Third, the number of professions has recently increased, which are called sostionomic group professions, in which the “man-to-man” dialogue determines the effectiveness of the activity. For example, pedagogical activity, management system, various services, marketing, etc. In such circumstances, the deliberate increase in people’s communication skills determines the product of labor. Therefore, the role and potential of the sciences in the field of communication, its nature, techniques and strategies, teaching communication (social psychological training) in society has increased dramatically. G.M.Andreeva In the book “Social Psychology” suggests the following structure:

1. The communicative side of communication, ie as a process of interaction or exchange of information between the parties to the communication;

2. The interactive side of communication, ie as a process of influencing the behavior of the interlocutors;

3. The perspective side of communication, that is, as a process related to the perception and understanding of each other by the interlocutors. B.F Parigin writes about the psychological complexity of communication in relationships:

“Communication is such a multifaceted process that it involves:

A) The process of interaction of individuals;

B) The process of information exchange between individuals;

C) The process by which one person treats another;

G) The process by which one person influences others;

D) The opportunity to empathize with each other;

E) The process of understanding each other.

Thus, while interpersonal relationships are the most complex and multifaceted of human activities, many studies by world psychologists in the field of social psychology have shown that this phenomenon is both necessary and simple for the individual. Looks mysterious.

Psychological Means of Human Behavior And Communication

As people interact with each other, one of their main goals is to influence each other, that is, to persuade each other, to motivate, to change attitudes, and so on. Is to make a good impression. Psychological influence is the ability to influence people's thoughts, feelings and actions through various means. In social psychology, there are three main means of psychological influence.

1. Verbal influence is the effect we make through words and speech. The main tools are words. It is known that speech is a conversation, a process of interaction, the means of which are words. In both monologue and dialogic speech, a person wants to use all his vocabulary to find the most effective words and influence his partner.

2. The paralinguistic effect is the factors that disturb, amplify, or weaken the speech surrounding speech. These include high or low speech, articulation, sounds, pauses, stuttering, coughing, tongue movements, and cries. So, for example, if a friend promises us something, we know how sincere he is. We believe, of course, that with a burning, open face and a bold voice, “I will do it!”

3. The meaning of nonverbal influence is “speechless”. These include the positions of the interlocutors in relation to each other in space, situations (near, far, intimate), gestures, facial expressions, pantomime, views, direct feelings, appearance, various signals (noise, smell). For example, if in the first minutes of a meeting your friend looks at you and looks around and says, “I am glad to see you,” do you believe it? The characteristic feature of the communication process is that when the interlocutors try to influence each other, they first think about what to say, what words to use. In fact, those words and the actions around them play an important role. For example, according to the famous American scientist Megrabian’s formula, the positive impressions of first-time interlocutors are positive for 7%, paralinguistic factors for 38%, and nonverbal actions for 58%.

ABSTRACT

This paper offers a discrete-time method. Support vector machines (SVM) and wavelet transform (DWT) (SVM) for the purpose of locating a problem in an underground distribution cable Theta mimic fault signals, ATP/EMTP is utilized. The woman's mother the wavelet daubechies4 (db4) is used to decompose high-dimensional data. These signals have a frequency component. The maximum amount offing the first, the coefficient was derived from the positive sequence current's an input; a scale capable of detecting bus faults is employed. The training pattern's pattern. It is shown that the planned the method produces acceptable results and will be very helpful in the future. The creation of a power system protection plan.

KEYWORDS: *Wavelet Transform; Fault Location; Underground Distribution Cable; Support Vector Machines.*

1. INTRODUCTION

Several methods have been used in the literature to identify the fault position in underground cable, including age cable , Murry loop pulse radar, bridge technique, and travelling wave , however each methodology has its own set of solutions. The most successful method for locating faults is based on a traveling wave, and it was first suggested in the 1980s .For Type A and Type D modes, most studies have solely evaluated the fault site based on the traveling wave. Type A algorithms are one-end algorithms that utilize voltages and currents measured at one end of a line to estimate the distance to a defect. Type D algorithms are two-end algorithms that need both a precise technique of time synchronization and a simple way of getting the measurements from the two terminals to a common point in order to identify the fault site. The Type D mode is more precise than the Type A mode and it may reduce or eliminate the impacts of fault resistance, loading, and charging current. Discrete wavelet transform (DWT) [1]based on travelling wave has been used in earlier research to detect high frequency components and locate problem sites in the subterranean distribution system. The fastest two first peak times acquired from comparison are used as input data for travelling wave theory.Figure 1 discloses the system used in simulation studies[2]

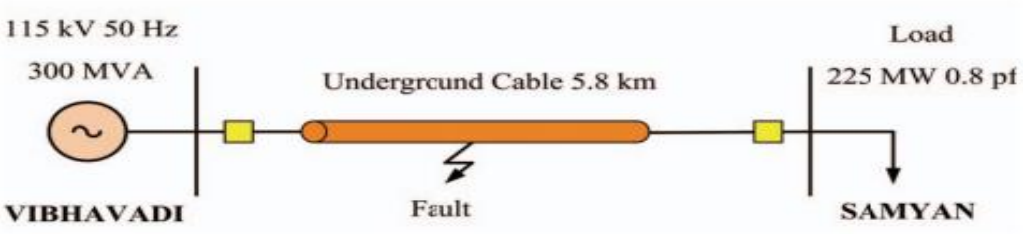

Figure 1: The system used in simulation studies

The first peak time that can identify fault collected from all buses is compared, and the fastest two first peak times obtained from comparison are utilized as input data for travelling wave theory. Although the accuracy of fault sites predicted by the travelling wave theory is excellent, the impact of changes in the traveling wave's propagation velocity cannot be overlooked. Artificial intelligence (AI) has also been used to locate faults in the literature .Although the artificial neural network method may provide accurate defect detection results, it is restricted in part by its sluggish training performance. A new algorithm has been created in order to solve this issue. If the problem sites in the subterranean cable can be detected using wavelet transform and support vector machines, it would be interesting to explore a suitable support vector machines method for inclusion in newly created protection systems.[3] As a result, the purpose of this article is to describe the creation of a novel decision algorithm for use in protective relays to identify fault location. ATP/EMTP is used to mimic fault situations. The DWT is then used to extract the current waveforms produced from the simulation. The support vector machines are used to build the decision algorithm. The suggested algorithm's validity is evaluated using a variety of fault origination angles, fault locations, and faulty phases. In addition, the decision algorithm's design is described in depth and illustrated using case studies based on Thailand's power transmission networks.

*1.1.*EMTP-Based Power System Simulation

At a sampling rate of 200 kHz, the ATP/EMTP is used to mimic fault signals. The system used in the case studies is based on the subterranean distribution system shown in Figure 1. In addition, a cross-sectional view of a cable. To keep things simple, the fault resistance is set to tenpin the simulations, fault patterns are created by changing system parameters as follows: - Fault types include single line to ground, double line to ground, line to line, and three-phase fault. - Fault sites range from 1 km to 5 km (each step equals 1 km) from the transmitting end of the subterranean cable. On the phase a voltage waveform, fault inception angles range from 0 to 150 degrees with a 30 degree step. Example of simulated fault signals using ATP/EMTP. Figure 1 depicts a fault that occurs with phase A to ground fault at a distance of 1 kilometer from the transmitting bus. For the fault detection method, the fault signals produced using ATP/EMTP are interfaced to MATLAB.Figure 2 discloses the configuration of cable in simulation studies[4].

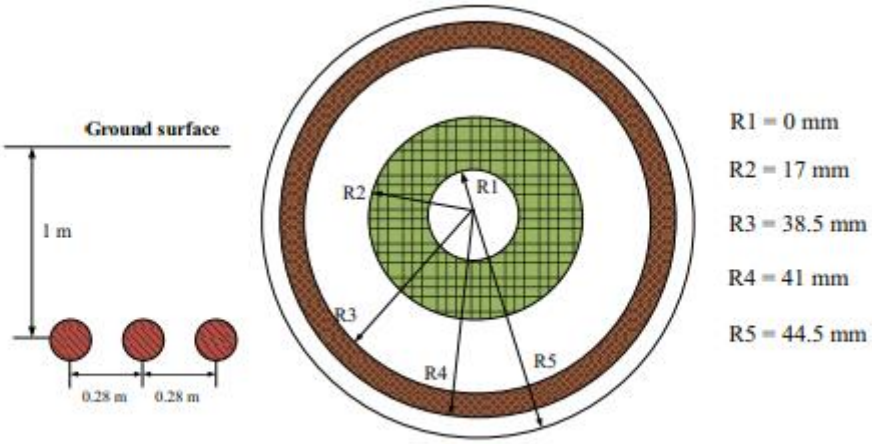

Figure 2: The Configuration of Cable in Simulation Studies.

Positive sequence current signal is used to execute the fault detection judgment method. To compute the positive and zero sequences of currents, the Clark's transformation matrix is used. The defect detection decision method based on computer programming approach is developed as illustrated in Figure 4 using many trial and error procedures. To decompose high frequency components from positive sequence current data, the mother wavelet daubechies4 (db4) is used. The comparison of the coefficients from each scale is being investigated after applying the DWT to the positive sequence currents. The coefficients acquired using DWT of signals are squared so that the rapid shift in the spectra can be clearly [5]observed and it can be seen that when a fault occurs, the coefficients of high frequency components have a sudden change compared to those before the fault occurs. This abrupt shift is utilized as a predictor of fault occurrence. If the coefficients of any scales are modified approximately five times before a fault occurs, the fault detection decision system predicts that faults will occur in subterranean cable. That in the prior fault situation, the coefficient detail (cD1) of positive sequence current is smaller than the coefficient detail (cD1) in the post fault condition. The coefficient detail (cD1) in each scale of the wavelet assumes that these signals represent fault conditions[6].

2. DISCUSSION

The result produced from the fault detection method may assume the normal state of these signals since the wavelet transform does not clearly alter as. As a consequence, the fault detection algorithm assumes that "if coefficients of any scale are altered about five times before a fault occurs, there are faults happening in subterranean cable, and the coefficients in the first scale that may identify fault is examined.

*2.1.*Application:

DWT is applied to the quarter cycle of voltage and current waveforms following the fault initiation using the simulated signals. For SVM, the coefficients of scale 1 computed using the DWT are utilized. The fundamental concept behind SVM is to use a kernel function to transfer the training data from the input space into a higher dimensional feature space. The optimum hyper plane in this feature space is found to optimize the classifier's generalization capabilities The input data is standardized and split into 300 sets for training and 150 sets for testing before the training process begins. The support vector machines include two inputs, five SVM models, and a single output. As shown in Figure 7, the input patterns are maximum coefficients in the first scale of the positive sequence current at 14 cycle for post-fault currents. The support vector machines' output variables are labeled with a value range of 1 to 15, which corresponds to different fault sites as indicated in Table I.SVM model types SVM's outputThe distance between

the transmitting and receiving ends is measured (km) Five SVM models are examined throughout the training process, and each model includes two fault sites, as indicated in Table I. Only the output is allowed as distance of fault or other fault location for each SVM model because the modified parameters with the lowest error are chosen as the most suitable parameters. Case studies are varied after the training procedure to verify the decision algorithm's capacity. A total of 150 case studies are available[7]. Different case studies with various kinds of faults are carried out, including variations in fault initiation angles and positions in underground cable. Table II also shows the results of a comparison of average error between a decision algorithm based on the suggested 91 method and a decision algorithm based on Apisit et al's DWT based on travelling wave theory. It can be observed that the algorithm's prediction of fault sites is very accurate. This is an improvement above the fault location identified by Apisit et al using the travelling wave hypothesis.Figure 3 discloses the Configuration of Cable in Simulation Studies.

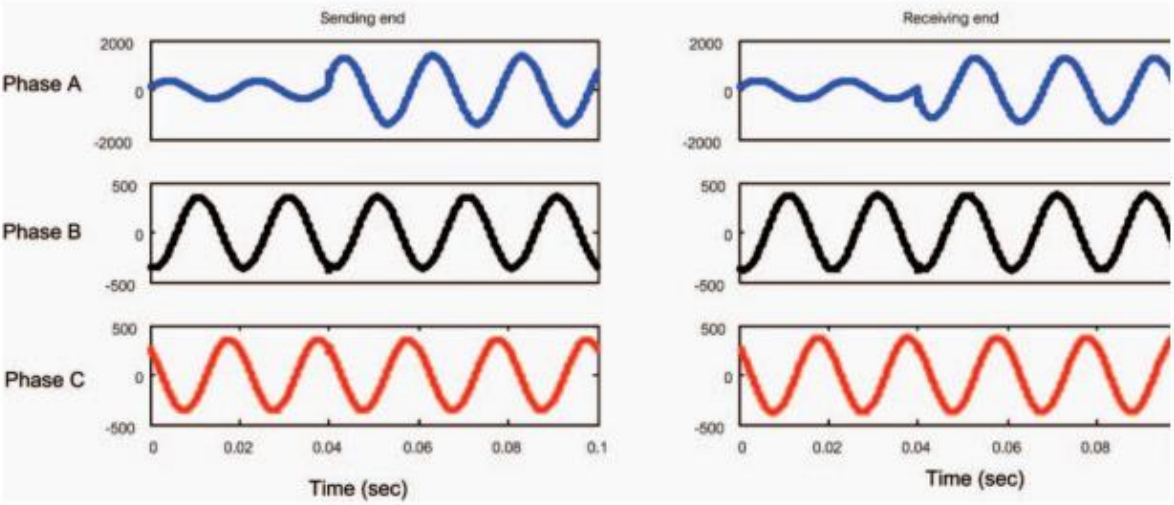

Figure 3: The Configuration of Cable in Simulation Studies.

Support-vector machines (SVMs, also known as support-vector networks) are supervised learning models that evaluate data for classification and regression analysis in machine learning. Vladimir Vapnik and colleagues at AT&T Bell Laboratories developed it (Boser et al., 1992, Guyon et al., 1993, Vapnik et al., 1997[8] SVMs, which are based on statistical learning frameworks or VC theory developed by Vapnik (1982, 1995) and Chervonenkis, are one of the most reliable prediction techniques (1974). An SVM training algorithm creates a model that assigns new instances to one of two categories, making it a non-probabilistic binary linear classifier, given a collection of training examples, each marked as belonging to one of two categories (although methods such as Platt scaling exist to use SVM in a probabilistic classification setting). SVM translates training examples to points in space in order to widen the distance between the two categories as much as possible. New instances are then mapped into the same space and classified according to which side of the gap they land on.SVMs may do non-linear classification as well as linear classification by implicitly translating their inputs into high-dimensional feature spaces, which is known as the kernel trick.When data is unlabeled, supervised learning is impossible, therefore an unsupervised learning method is needed, in which the data is clustered naturally into groups and new data is mapped to these groups. The support-vector clustering method was developed by HavaSiegelmann and Vladimir Vapnik to classify unlabeled data using support vector statistics generated in the support vector machines algorithm. It is one of the most frequently used clustering algorithms in industrial applications. In machine learning, classifying data is a frequent job. Assume that certain data points are assigned to one of

two classes, and the objective is to determine which class a new data point will be assigned to. A data point is regarded as a displaystyle pp-dimensional vector (a list of displaystyle pp numbers) in support-vector machines, and we want to know whether we can separate such points using a displaystyle (p-1)(p-1)-dimensional hyperplane. A linear classifier is what this is termed. There are many hyperplanes that may be used to categorize the data. The hyperplane that indicates the greatest separation, or margin, between the two classes is a plausible option as the best hyperplane. As a result, we select the hyperplane to maximize the distance between it and the closest data point on each side. If such a hyperplane exists, it is referred to as a maximum-margin hyperplane, and the linear classifier it creates is referred to as a maximum-margin classifier; or, more simply, the perceptron of optimum stability. A support-vector machine, in more technical terms, creates a hyperplane or collection of hyperplanes in a high- or infinite-dimensional space that may be used for classification, regression, or other tasks such as outlier identification. Intuitively, the hyperplane with the greatest distance to the closest training-data point of any class (so-called functional margin) achieves a decent separation, since the bigger the margin, the lower the classifier's generalization error. Even though the initial issue is expressed in a finite-dimensional space, the sets to discriminate are often not linearly separable in that space. As a result, it was suggested that the original finite-dimensional space be transferred onto a much higher-dimensional region, supposedly making separation simpler there. The mappings used by SVM schemes are designed to ensure that dot products of pairs of input data vectors can be computed easily in terms of the variables in the original space, by defining them in terms of a kernel function displaystyle k(x,y)displaystyle k [9][n higher-dimensional space, hyperplanes are defined as a collection of points whose dot product with a vector in that space is constant, where such a set of vectors is an orthogonal (and therefore minimum) set of vectors. The hyperplanes' vectors may be selected as linear combinations with parameters displaystyle alpha _ialpha I of pictures of feature vectors displaystyle x ix i that appear in the data base. The relation displaystyletexstyle sum _ialpha _ik(x i,x)=text constant defines the points xx in the feature space that are mapped into the hyperplane with this choice of a hyperplane. Displaystyletexstyle sum _ialpha _ik(x i,x)=textconstant.displaystyle textiles sum _ialpha _ik(x i,x)=text constant. Each term in the sum measures the degree of closeness of the test point displaystyle xx to the corresponding data base point displaystyle x ix i. If displaystyle k(x,y) becomes small as displaystyleyy grows further away from displaystyle xx, each term in the sum measures the degree of closeness of the test point displaystyle xx to the corresponding data base point displaystyle x ix i. In this manner, the sum of kernels above may be used to calculate the distance between each test point and the data points originating in one of the discrimination sets.

3. CONCLUSION

The method described in this article is based on aTo find faults, a mix of DWT and SVM algorithms is used. The cable's subterranean placement db4 (Daubechies 4) is a db4 (Daubechies 4) visas a mother wavelet, you've been chosen. The DWT has been put to use. To split fault signals into high frequency components in defect detection, positive sequence current signals are utilized. The highest DWT values during the 14th positive cycleAs an example, the sequence for post-fault current waveforms is utilized. Input for the SVM decision-making training procedure algorithm. The average error from the two groups was compared. The method presented in this article produces the following results: Table II shows the findings, which clearly indicate that the newIn terms of forecasting the future; an algorithm may offer a higher performance. Locations of faults with an average inaccuracy of 0 km[10]

ABSTRACT

The issue of fault finding in AC and DC power networks has recently been addressed using electromagnetic time reversal (EMTR). The impact of losses on the use of EMTR to detect faults is examined in this study. Three back propagation models are presented and explored. Even though the telegrapher's equations are not precisely time-reversal invariant in this instance, we demonstrate that a back-propagation model with losses results in a flawless estimate of the fault site.

KEYWORDS:*Electromagnetic Time Reversal (Emtr); Fault Location; Transmission Line; Telegrapher's Equations*.

1. INTRODUCTION

In order to enhance power supply dependability and decrease restoration time and costs, secure power system operation need precise and fast problem identification techniques. Locating faults along transmission lines is a serious issue in power systems and EMC that has been studied extensively since the 1950s .Many fault finding techniques have been suggested in the literature, but they always fall into one of two [1]types I impedance-based methods or (ii) travelling wave-based approaches. The fault localization accuracy may be influenced by fault impedance, power system load flow, dispersed generators, and series compensation, despite the fact that impedance-based techniques are simpler and computationally efficient. When compared to impedance-based techniques, travelling wave-based methods may offer more accurate and reliable findings. These techniques, on the other hand, need multiterminal, time-synchronized measurement stations for complicated and/or inhomogeneous networks to correctly detect the fault site .Razzaghi et al. developed an effective fault finding approach using the electromagnetic time reversal (EMTR) technology [2]in. The technique uses the telegrapher's equations' time invariance to locate faults of various types and impedances in complex and inhomogeneous networks, and it has been proven to be extremely efficient and accurate. One of the most significant benefits of this technique is that it only requires one measuring site. The proposed method based on time reversal theory is applied in three steps: measurement of fault originated electromagnetic transients in a single observation point, simulation into a suitable model of the

targeted network of the back-injected time-reversed measured fault signal for different guessed fault locations, and (3) determination of a fault location. The proposed method has been successfully validated for a variety of networks, including inhomogeneous networks made up of overhead transmission lines and underground cables, radial distribution networks, series-compensated transmission lines, and, most recently, multi-terminal HVDC networks. For lossless lines, the telegrapher's equations are invariant under a time-reversal transformation, as described in. Unless an inverted-loss media is included for the reverse times, electromagnetic propagation including a dissipative medium is not strictly time reversal invariant .However, putting an inverted-loss medium into practice may be difficult, particularly when utilizing commercial coding. In this regard, we aim to investigate three distinct back-propagation models: lossless, lossy, and inverted-loss, in order to examine the impact of line losses on the accuracy[3] of the fault identification technique in this article. The transmission line (TL) theory will be used to underpin the study. We'll use Figure 1 to depict the equivalent circuit of a differential length of a single-wire line above a ground plane for the purpose of simplicity. Losses (in the conductor and in the ground) basically result in an attenuation of transmitted transients and a change of propagation speed, both of which are frequency dependent. The hange of the propagation speed is anticipated to be more important than the attenuation of the amplitude in the application of the EMTR to fault identification when time is key. It’s worth noting that this isn't a practical model since the line becomes active and provides energy to the signal traveling down it. Although certain software does not support negative parameters, this model may be numerically implemented. In this instance, the telegrapher's equations are easily shown to be time-reversal invariant. Under the premise that the line parameters are precisely known, the application of this model should result in an accurate location. The losses in back propagation are ignored in this approach. [4]In other words, the per-unit length parameters of the back-propagation line associated with losses become: As a result, the propagation and phase velocity will not be the same as during direct propagation, potentially leading to errors in fault location identification’s consequence, the back propagation propagation constant is as follows: The back propagation in this model is done using a lossy line model. In this instance, the back propagation line per-unit-length parameters are: The propagation speed, which is a crucial characteristic, stays constant even if a lossy medium is not time-reversal invariant. As a result, it can be shown that at the fault site, all contributions from discontinuities that would occur in a real network would add up in phase. As a consequence, we may anticipate more accurate results from this model than from a lossless back-propagation model. [4]we’ll use a basic configuration of a 10-km long single-wire overhead line over a finitely conducting ground to compare the performance of the three models presented in the preceding section. The imagined fault is 8 kilometers from the left terminal, which records the voltage transient produced by the fault. The method for locating EMTRs is outlined in and summarized in Section I. The losses are taken into account in the direct time propagation, and the back-propagation is simulated using each of the three models given in Section III. The calculation is performed in the frequency domain, with a frequency range of 1 kHz to 1 MHz, and is done in Matlab. The line's per-unit-length parameters were calculated using the equations given in. [5]the magnitude of the total per-unit-length longitudinal impedance Z' as a function of frequency. The contributions of the inductive term, ground, and wire impedances are also presented in the same figure. It can be observed that the ground losses are more significant than the conductor losses. Figure 1 discloses the Equivalent circuit of a single-wire line above a ground plane

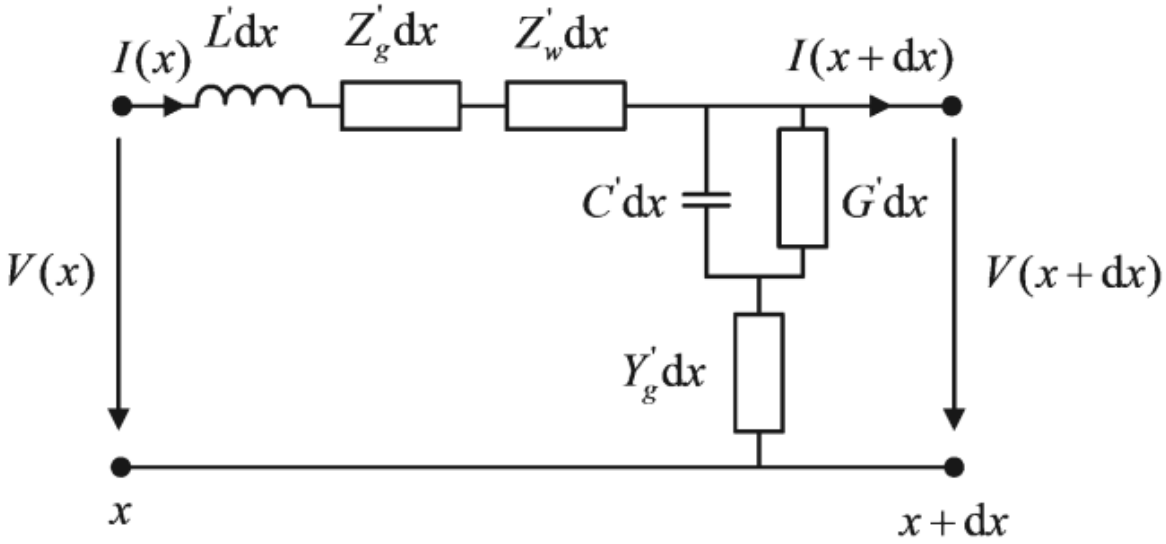

Figure 1: Equivalent Circuit of a Single-Wire Line above a Ground Plane.

2. DISCUSSION

The distribution of lots capacitive term is clearly dominating, and the losses due to transverse air and ground admittances are minimal .the magnitude of transverse admittance per unit length as a function of frequency. g = 0.001 S/m is the ground conductivity. When losses in the line are taken into account, the plot of phase and group velocities as a function of frequency because the line in question is above, the velocity is almost equivalent to the speed of light in vacuum when losses are taken into account. Frequency-dependent phase and group velocities. g = 0.001 S/m is the ground conductivity. The normalized energy of the current flowing from the conductor to the ground in back-propagated time at various estimated fault sites along the line is shown in The simulations were run using the three back-propagation models given in and two different ground conductivity values, g = 0.01 S/m and g = 0.001 S/m).The lossy and inverted-loss models were able to identify the defect at the right location, as can be shown (8 km). The lossless back-propagation model, on the other hand, was unable to correctly identify the problem. The location errors for the two ground conductivity levels examined (0.01 S/m and 0.001 S/m) were 800 m and 1.3 km, respectively .The findings are in line with those obtained when using EMTR to detect lightning discharges . Figure 2 discloses the Fault current energy normalized to its maximum, for the three proposed models. (a) Ground conductivity σg = 0.01 S/m. (b) Ground conductivity σg = 0.001 S/m[6].

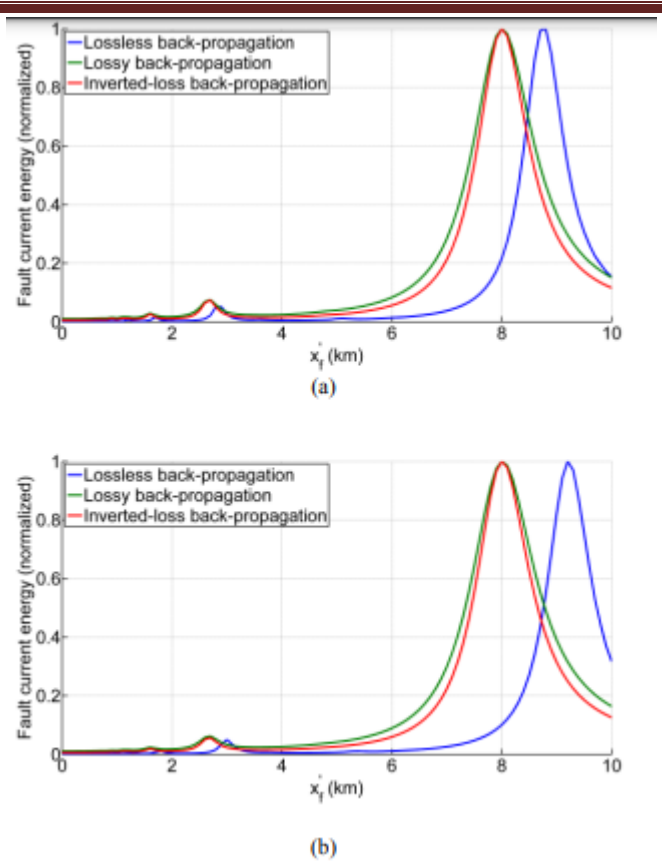

Figure 2: Fault Current Energy Normalized To Its Maximum, For The Three Proposed Models. (A) Ground Conductivity Σg = 0.01 S/M. (B) Ground Conductivity Σg = 0.001 S/M.

An iterative method may be used to concentrate energy on a passive source, such as a kind of isolated reflector. The TRM sends off a plane wave that moves toward and is reflected by the target. The reflected wave reaches the TRM, giving the impression that the target has sent out a (weak) signal. As is customary, the TRM reverses and retransmits the signal, sending a more concentrated wave toward the target. The waves get more concentrated on the target as the procedure is repeated. Another option is to utilize a single transducer in conjunction with an ergodic cavity. An ergodic cavity, by definition, is one that allows a wave to originate at any place and travel to any other point. An unevenly shaped swimming pool is an example of an ergodic cavity: if someone jumps in, the whole surface will eventually ripple with no apparent pattern. A wave beginning at any place will reach all other locations an unlimited number of times if the propagation medium is lossless and the borders are perfect reflectors. This feature may be taken advantage of by recording for a long period with a single transducer to capture as many reflections as feasible[7].

The time reversal method is based on a property of the wave equation known as reciprocity: if a wave equation solution exists, then its time reverse (with a negative time) is also a solution. Because the conventional wave equation only has even order derivatives, this happens. Although certain media are not reciprocal (for example, extremely lossy or noisy media), many others, such as sound waves in water or air, ultrasonic waves in human bodies, and electromagnetic waves in free space, are. In addition, the medium must be somewhat linear. A matching filter may be used to simulate time reversal methods. If the original signal is a delta function, the received signal at the TRM is the channel's impulse response. The TRM effectively auto correlates the impulse response by sending the reversed version back via the same channel. The origin, where the original source was, has a peak in this autocorrelation function. It's crucial to

understand that the signal is focused both in space and time (in many applications, autocorrelation functions are functions of time only).The TRM may also be thought of as a "channel sampler" in a time reversal experiment. The TRM monitors the channel during the recording phase and utilizes that information to focus the wave back to the source ideally for transmission.Mathias Fink of the ÉcoleSupérieure de Physique et de ChimieIndustrielles de la Ville de Paris is a renowned researcher. His team has conducted many ultrasonic TRM tests. A single source transducer, a 96-element TRM, and 2000 thin steel rods placed between the source and the array were used in an intriguing experiment. Both with and without the steel scatterers, the source delivered a 1 s pulse. In the retransmission phase, the source point's temporal and spatial widths were measured. With the scatterers, the spatial breadth was approximately 6 times smaller than without. The spatial breadth was also smaller than the diffraction limit, which was defined by the size of the TRM with the scatterers. Because the scatterers improved the array's effective aperture, this is feasible. The focusing was still very excellent even after the scatterers were shifted slightly (on the order of a wavelength) between receive and transmit stages, demonstrating that time reversal methods may be resilient in the face of a changing medium. Furthermore, José M. F. Moura of Carnegie Mellon University was heading a research team attempting to apply Time Reversal concepts to electromagnetic waves, and they were able to obtain resolution beyond the Rayleigh resolution limit, demonstrating the effectiveness of Time Reversal methods. Their research focuses on radar systems, with the goal of improving detection and imaging methods in extremely crowded settings, where Time Reversal techniques seem to be most useful. The beauty of time reversal signal processing is that no knowledge of the channel is required. The process of transmitting a wave across the channel essentially measures it, and the data is used to concentrate the wave during the retransmission phase. To optimize the system, one does not need to solve the wave equation; all one has to know is that the medium is reciprocal. As a result, time reversal is well suited to applications using inhomogeneous material. The fact that time reversal signal processing employs multipath propagation is an appealing feature. Multipath effects must be compensated for and corrected in many wireless communication systems. By using the energy from all routes, time reversal methods take use of multipath[8].

Fink envisions a cryptography application based on ergodic cavity geometry. The key would be made up of two transducer sites. One plays the message, while the other captures the waves as they bounce about the cavity; this recording will appear as noise. There is only one place to launch the waves from in order for them to concentrate when the recorded message is time reversed and played again. Only one other place will show the focused message wave if the playback location is accurate; all other locations should seem noisy[9].

3. CONCLUSION

Electromagnetic time reversal (EMTR) is a relatively new concept. Effectively used to the issue of power grid failure detection networks. We provided an examination of the impact in this article. Financial losses due to the use of EMTR to detect faults the use of EMTR to detect problems is, in theory, simple. For lossless lines, the Telegrapher's rule applies. Under a time-reversal transformation, equations are invariant. A dissipative medium is used in electromagnetic transmission. Unless an inverted-loss model is used, it is not strictly time reversal invariant.Forthe reversal timings, medium is taken into account. The usefulness However, implementing an inverted-loss medium may be difficult. Especially when utilizing commercial codes, this may be an issue.We looked at three alternative back-propagation models.to solve the problem of EMTR not being lossyinvariantIlossy, (ii) lossless, and (iii) inverted-lossWe demonstrated this via a numerical example involving aa single-wire line that, as anticipated, runs above a conducting groundFor back-propagation, an inverted-loss model produces aEstimation of the fault position to a tee. We've also shownthat a back-propagation model that takes losses

into account results in an exact position estimate of the fault, even if even if the telegrapher's equations aren't exactly correct in this instance Invariant with respect to time. This is an important outcome since it enables commercial programs to be used to mimic the back propagation phase, when time-reversed fault-generated transients are fed into the network. The evaluation and modeling of future work will be included. More realistic setups (underground wires, etc.)Lines and networks with many conductors)[10]

ON-LINE IDENTIFICATION OF INCIPIENT FLAWS IN UNDERGROUND CABLES USING SINGLE-END SHEATH CURRENTS

ABSTRACT

Underground cable problems would occur frequently until they developed into permanent defects. The detection of incipient faults may help assess the condition of cable insulation and give an early warning before subterranean wires break down. In the modal domain, the properties of incipient fault traveling waves are investigated, and theoretical analysis reveals that the sum of sheath currents may be utilized to identify incipient faults. To identify an incipient defect, both the over-current and the wavelet transform modulus maximum of the sum of single-end sheath currents are evaluated. The defective phase is chosen based on the root-mean-squares of three phases once an incipient problem is identified. PSCAD/EMTDC is used to create a cable system model and simulation results indicate that the detection method can correctly identify incipient faults in a variety of fault situations.

KEYWORDS: *Terms-Incipient Faults, Over-Currents, Sum Of Sheath Currents, Underground Cables, Wavelet Transform Modulus Maxima.*

1. INTRODUCTION

With the expansion of the electrical system grid, underground cables have become more popular. Underground cables must operate safely and reliably to provide power supply dependability. In contrast to problems in overhead transmission lines, cable breakdowns are gradual and take place over time. Before permanent defects develop, cables may suffer incipient problems. Insulation degradation is the most common cause of incipient problems. Incipient flaws become more common as the degradation progresses. Incipient flaws would eventually fail and become permanent defects .Incipient faults usually last a half-cycle and are extinguished when the current reaches its first natural zero crossing. Traditional protection systems are unable to identify these developing flaws until they have progressed to the point of catastrophic collapse. Early detection of incipient defects may give an early warning for the failure of the faulty cable, preventing unanticipated outages and losses. The wavelet analysis is used to evaluate IEEE transient voltages and currents in the time domain, frequency domain, and time-frequency domain. The superimposed current components and neutral current are used in to identify incipient defects. Another study uses the amplitude of neutral current and the magnitude of rate

of change of neutral current to identify self-clearing transient faults. However, since these techniques monitor voltages and currents from buses or neutral lines, they are complex and have limited application. Based only on single-end sheath currents, this article offers a new technique for identifying incipient defects in subterranean cables. Because most high-voltage cables include a metallic wrapping around the conductor, the suggested technique may be used in a variety of situations[1].

The following is a breakdown of the paper's structure. Section II presents sheath bonding techniques and uses PSCADIEMTDC to create a cable system model. The features of incipient fault traveling waves are examined in Section III, and it is concluded that the sum of sheath currents may be utilized to identify incipient faults. The detection method for incipient errors is presented in Section IV.In Section V, incipient defects are simulated in PSCAD under various circumstances and the detection results are shown. The conclusion is found in Section VI.The conductor currents contribute the most to the induced voltage in the metallic sheath of single conductor cable, which is also linked to the length and arrangement of the cables .When the cable is extremely long, the induced voltage raises to a high level, increasing the loss, reducing cable life, and endangering human safety. As a result, the sheath must be grounded to keep the induced voltage to a minimum. Bonding and grounding techniques for various cable lengths include both-end bonding, single-end bonding, cross-bonding, and cross-bonding with The PSCAD/Frequency-Dependent EMTDC's (Phase) model represents all parameters' frequency dependency, making it the most sophisticated and precise time domain line model [11]. As illustrated in Fig. 3, a simpler cable system is constructed in PSCAD using the Frequency-Dependent (Phase) model. A 35kY source, a 35/220kV transformer, three cable lines, and loads make up the system. Each cable line is 500 meters long and is divided into three stages. Transient faults lasting 5ms are used to mimic incipient defects, with a solution time step of 0.1 fls.A three-phase cable system is made up of three single-conductor cables. The three phase cable system has six conductors since each single-conductor cable has two conductors, namely the conductor and the sheath. There is electromagnetic coupling between the conductors. The six-conductor system must be decoupled in order to investigate the properties of traveling waves from incipient faults. A, a, B, b, C, c (uppercase letters indicate conductors, lowercase letters indicate sheaths) are the conductors and sheaths of three phases, respectively. The six conductors are rearranged in the following order: A, B, C, a, b, c, a, b, c, a, b, c, a, b, c, a, b, c, a, b, c The voltage phase-modal transformation matrix S may therefore be QT in high frequencies, and the current phase modal transformation matrix Q can be the extended matrix of Clarke transformation matrix. The Clarke transformation matrix looks like this.Figure 1discloses THE Schematic Diagram of Single-End Bonding[2]

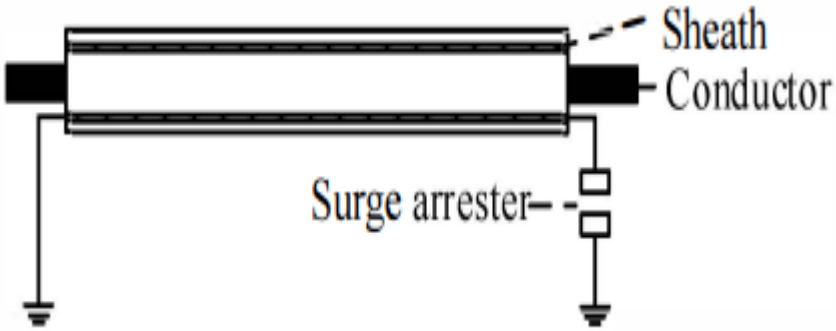

Figure 1: Schematic Diagram of Single-End Bonding

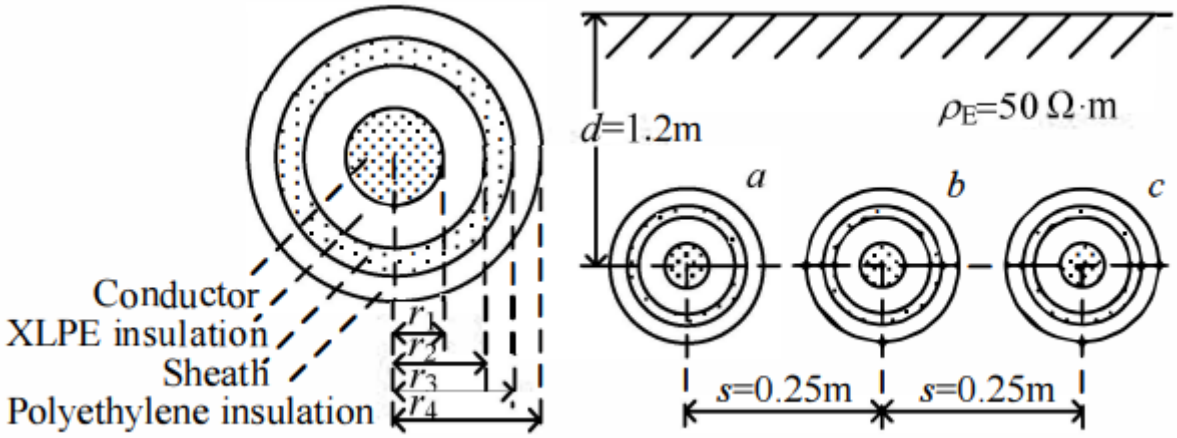
2. DISCUSSION

2.1.Application:

A single-wire earth return (SWER) or single-wire ground return is a low-cost single-phase electric power transmission line from an electrical grid to distant regions. Its distinctive characteristic is that the earth (or sometimes a body of water) is utilized as the current's return route, obviating the necessity for a second wire (or neutral wire).Single-wire earth returns are often utilized in rural electrification, but they may also be used for larger isolated loads like water pumps. It's also utilized in undersea power lines for high-voltage direct current. A comparable technology is used in electric single-phase railway propulsion, such as light rail. It utilizes earth resistors to minimize rail voltage dangers, but the main return currents are still via the rails.Figure 2 discloses the Structure and Arrangement of Single-Conductor Cables



.

Figure 2: Structure and Arrangement of Single-Conductor Cables.

When traditional return current wire would cost more than SWER's isolation transformers and minimal power losses, SWER is a feasible option for a distribution system. SWER is similarly safe, more dependable, and less expensive than traditional power lines, according to power experts who have worked on both. However, SWER is somewhat less efficient than conventional lines. When maintenance is inadequate, SWER may create fires, and bushfire is a danger. An isolating transformer with a capacity of up to 300 kVA supplies power to the SWER line. This transformer separates the grid from the ground or the earth, converting grid voltage (usually 22 or 33 kV line-to-line) to SWER voltage (generally 12.7 or 19.1 kV line-to-earth)[3].The SWER line is a single conductor with a number of distribution transformers that may run for tens or even hundreds of kilometers. Current travels from the line, via the main coil of a step-down isolation transformer, to earth through an earth stake at each transformer, such as a customer's premises. The electricity ultimately returns from the earth stake to the main step-up transformer at the line's head, completing the circuit. As a result, SWER is a real-world example of a phantom loop. The resistance of the soil consumes energy in regions with high-resistance soil. Another problem is that the resistance may be high enough to prevent adequate current from flowing into the earth neutral, causing the grounding rod to float to higher voltages. Circuit breakers that self-reset are typically caused by a voltage differential between the line and the neutral. The decreased voltage differential between line and neutral may prevent breakers from resetting in dry, high-resistance soils. In Australia, areas with extremely dry soils require extra-deep grounding rods. [1]SWER has to be anchored below permafrost, which is high-resistance, according to Alaskan experience. The client will be supplied either single ended single phase (N-0) or split-phase (N-0-N) power in the region's standard appliance voltages through the secondary winding of the local transformer, with the 0 volt line linked to a safety earth that does not usually carry an operational current’s many as 80 distribution transformers may be fed by a big SWER cable. Typical transformer ratings are 5 kVA, 10 kVA, and 25 kVA. The load density

on the line is typically less than 0.5 kVA per kilometer (0.8 kVA per mile). The highest demand of any one client is usually less than 3.5 kVA, although higher loads up to the distribution transformer's capacity may also be provided. In the United States, several SWER systems are traditional distribution feeders without a continuous neutral (some of which were obsolete transmission lines that were refitted for rural distribution service). A grounding rod is installed on each pole inside the substation that feeds such lines, and a grounded conductor is installed on each branch from the line between the pole next to and the pole carrying the transformer (giving each transformer two grounding points for safety reasons).Mechanical engineering SWER line's mechanical design may reduce its lifetime cost while also increasing its safety. The conductor used in ancient SWER lines was [4]Number-8 galvanized steel fence wire since the line has high voltage with modest currents. The AS1222.1 standard is used in more contemporary systems. Aluminum-clad high-carbon steel wires in coastal regions, aluminum wrapped wires rust, although they are otherwise more appropriate. Wind vibration may damage the wires because of the large spans and high mechanical stresses. Spiral vibration dampers are used on the wires in modern systems. Because polymers are susceptible to UV degradation, most insulators are made of porcelain. Higher-voltage insulators are installed by certain utilities so that the line may be readily upgraded to carry greater power. 12 kV lines, for example, may be insulated to 22 kV, whereas 19 kV lines could be insulated to 33 kV. SWER lines have historically utilized reinforced concrete poles due of their cheap cost, minimal maintenance, and resilience to water, termites, and fungus. In most cases, local labor can manufacture them, reducing prices even further. Metal poles are prevalent in New Zealand (often being former rails from a railway line). Poles made of wood are allowed.

2.2.*Working:*

To allow giraffes to pass safely under the lines in Mozambique, poles have to be at least 12 m (39 ft) tall. If a location is prone to lightning, newer designs include lightning ground straps into the poles before they are erected. The straps and wire may be adjusted to make a low-cost lightning arrestor with rounded corners that won't draw a lightning strike. For proof, this section needs more citations. Please contribute to the improvement of this article by citing credible sources. It is possible that unsourced[5] content may be questioned and deleted. (March of this year) (To find out when and how to delete this template message, see the instructions at the bottom of this page.)) [6]Because the earth is isolated from both the generator and the user, SWER is touted as a safe system. Most other electrical systems utilize a common ground or a metallic neutral linked directly to the generator. It's crucial to get your bearings. Near the earth points, significant currents on the order of 8 amperes run through the ground. To avoid electric shock from an earth potential increase around this point, you'll need a good-quality earth connection. There are also separate grounds for power and safety. Because the ground points are duplicated, the system remains secure even if one of them is destroyed. A suitable earth connection is typically a 6 m copper-clad steel post driven vertically into the ground and connected to the transformer earth and tank. 5–10 ohms is a decent ground resistance, which may be tested using appropriate earth test equipment. SWER systems are intended to keep the earth's electric field below 20 volts per meter to prevent shocking humans and animals nearby. Automatic circuit breakers are also included as standard features (reclosers). The majority of overcurrent faults are transitory. Because the network is rural, the recloser will remove the majority of these problems. For transformer protection and switching, each service location requires a rewirable drop out fuse. A conventional high-rupture capacity (HRC) fuse or low voltage circuit breaker should also be used to safeguard the transformer secondary. On the high voltage side, a surge arrestor (spark gap) is popular, particularly in lightning-prone regions.The majority of fire safety risks in electrical distribution are caused by aged equipment, such as corroded wires and broken insulators. In many situations, the reduced cost of SWER

maintenance may lower the cost of safe operation. SWER prevents lines from colliding in the wind, which is an important fire-safety feature, but the official inquiry of the Black Saturday[5] bushfires in Victoria, Australia, revealed a flaw. These showed how a damaged SWER wire may short to ground over a resistance comparable to the circuit's typical load, which in this instance was a tree. Without a ground-fault indicator, this may result in significant currents. In fire-prone regions, where a conductor may break and electricity may arc over trees or dry grass, this may be dangerous. Ground-return current may impair bare-wire or ground-return telecommunications if the grounding region is closer than 100 m or sinks more than 10 A of current. Radio, fiber optic channels, and mobile phone networks remain unaffected. A metallic return line from the load to the generator is required by several national electrical standards (most notably in the United States).Each SWER line in these jurisdictions must be authorized by exception. Benefits in terms of cosSWER's primary benefit are its cheap price. It's often utilized in sparsely inhabited regions when the expense of constructing a standalone distribution line is prohibitive. The cost of capital is approximately half that of a two-wire single-phase line. They may cost up to 30% less than three-wire three-phase systems. The cost of maintenance is approximately half that of a comparable line[7].SWER also lowers the number of poles, which is the most expensive part of a distribution network. Traditional 2-wire or 3-wire distribution lines offer a greater capacity for power transmission, but they may need up to 7 poles per kilometer and spans of 100 to 150 meters. Because of SWER's high line voltage and low current, low-cost galvanized steel wire may be used [8]. Steel's higher strength allows for spans of 400 meters or longer, decreasing the number of poles per kilometer to 2.5.The power company's construction expenses may be further lowered if the poles also carry optical fiber cable for telecommunications (metal conductors may not be utilized).SWER may be utilized in a grid or a loop, although it's more common to use it in a linear or radial form to save money. A single-point failure in a SWER line causes all customers farther down the line to lose power in the traditional linear manner. SWER, on the other hand, has fewer components in the field, thus it is less likely to fail. Winds, for example, cannot cause lines to collide since there is only one line, eliminating a source of damage as well as a source of rural bushfire Excessive ground currents from shorts and geomagnetic storms are less common than in traditional metallic-return systems because the majority of the transmission line has low resistance connection to earth. As a result, SWER has fewer ground-fault circuit-breaker openings that may cause service interruptions. Upgradeability Without the need for additional poles, a well-designed SWER line may be significantly upgraded as demand increases. Replace the steel wire with more costly copper-clad or aluminum-clad steel wire as a first step. It's conceivable that the voltage may be increased. Some long-distance SWER lines currently have voltages of up to 35 kV. Normally, this would need the replacement of insulators and transformers, but no new poles are required. A second SWER line may be added if additional capacity is required.[9]

3. CONCLUSION

A new on-line detection method for incipient errors is presented in this article. The total of single end sheath currents may be utilized to identify incipient defects, according to theoretical analysis and simulation calculations. Both the over-current and the wavelet transform modulus maximum of sheath currents are evaluated in the detection method. The suggested detection method can correctly identify 798 incipient defects under various circumstances, according to simulation results in PSCAD/EMTDC. Sheath currents can be readily monitored via the sheath grounding lines, thus using the sum of sheath currents as the detecting signal provides a high sensitivity. As a result, this technique has a broad range of applications[10].

ABSTRACT

The theory of linguocultural codes is one of the basic theories in the field of linguoculturology. This phenomenon, which takes place mainly in stable and metaphorical units, is an important linguocultural phenomenon that reflects the national way of thinking of each nation and the order of perception of objective reality. The article commented on the interpretation of existing linguocultural codes in general linguistics, saying that cultural codes are primarily a phenomenon related to the national-cultural character of a people; Therefore, the study of the nature of each language, including the mythological notions, national values, cultural norms, customs and beliefs of the people, the axiological attitude to reality, should be the focus of researchers, its role in the study of units was substantiated and problems in this regard were pointed out.

KEYWORDS:*Linguocultural studies, artifacts, archetypes, linguocultural codes, biomorphic codes, zoomorphic codes, spiritual codes, somatic codes, spatial codes, temporal codes, subject codes, linguocultural communities, linguistic landscapes of the world, stable connections, metaphors.*

INTRODUCTION

One of the founders of linguocultural studies, V.N. Telia writes: “Culture has its own language: it speaks to us through architecture, painting, music, dance, literature and other products of human creativity. But the most universal means of the “language” of culture is the natural language” [9, p. 12]. Linguistics, which is a product of the integration of sciences, formed in collaboration with the fields of linguistics, cultural studies, ethnography, psycholinguistics [8, p.8-9] introduced a number of new concepts such as connotativeness, cultural semaphore, precedent units, linguistic consciousness, linguistic landscape of the universe, value landscape of the universe. Among them, the concept of cultural codes has a special place. It is well known that a set of customary and obligatory methods of perceiving the world, historically formed, stabilized, and specific to that language community in the minds of each language community,

creates a linguistic picture of the world. The linguistic landscape of the world is a collection of universal and at the same time nationally adapted methods of perceiving and conceptualizing the world. In linguocultural studies, cultural codes are recognized as one of the important components of the linguistic landscape of the world [7, p.79]. According to V.N. Telia, cultural codes are a system of secondary symbols consisting of various material and formal means used to encode a particular cultural content [9, p.13].

The definition of cultural codes by DB Gudkov, ML Kovshova is also close to the above definition:

“Cultural codes are a system of symbols that represent the cultural content of the material and spiritual world of man, which can be both verbal and nonverbal” [2, p.6] Experts in the field of cultural codes often quote the figurative description of the Russian researcher V.V.Krasnix in his article "Cultural codes and standards (invitation to interview)”. According to the scientist, cultural codes can be thought of as a net thrown into existence. This "network" of our thinking divides, organizes shapes and evaluates the world around us [4, p.6]. According to culturologists, cultural codes are the key to understanding culture, which allows the identification of cultural information encoded in any form [6, p.512].

MAIN PART

Based on scientific definitions and interpretations of cultural codes, it can be said that the term refers to a system of material or ideal symbols that express a particular cultural content in a conditional, symbolic, and coded way. Cultural codes are the product of the process of categorizing the world by man, and in this, as noted above, human language is one of the most important expressions of cultural content. Codes realized through verbal means are linguocultural codes. Linguocultural codes are reflected in the language in linguocultural units such as proverbs, phrases, constant analogies, metaphors, curses, prayers, and applause, which mainly reflect the figurative thinking of the people. In such codes, people's ideas about the material and spiritual world, national thinking, axiological views are clearly visible. Types of linguocultural codes in the scientific literature include somatic code, spatial code, temporal code, subject code, biomorph code, spiritual code [4, r.8], anthropomorphic code, spatial code, war code, medical code, architectural code, sports code, geometric code, gastronomic code, dress code [7], mythological code, theomorphic code, color code [5, p. 169]. Some researchers consider zoomorphic code and phytomorphic code to be types of biomorphic code; biomorphic code is sometimes also referred to as plant-landscape code.

On the main types of cultural codes in linguocultural studies, V.V. Krasnix's classification is recognized. The scientist defines somatic code, spatial code, temporal code, subject code, biomorphic code and spiritual code as the most basic types of cultural codes. In his opinion, the content expressed in these codes is consistent with the archetypal ideas of Russian culture, reflecting the first simple impressions about the structure of the universe. [4, p.8] It is well known that man began the study of being by self-knowledge. It was the first attempt to civilize the world. Man first described the being from himself (for example, *the top of a mountain*), and then began to describe himself by this method (for example, *if the head survives, a doppia (national head wearing) is found*).

In this case, the name of the members of the human body has a symbolic (portable) meaning. V.V.Krasnix cites as an example the use of the words *golova* (head), *plechi* (shoulders), *ruki* (hands) in the sense of “man” in the *schitat po golovam, naeyoplechaxlejalabolshayaotvestvennost, ne xvataetrabochixruk* [4, p. 9]. As a result of the evolution of human thought, some somatic codes became spatial codes. The scientist cites this as evidence that the human heart is perceived as a space of emotions and the head as a space of thoughts and this is reflected in a number of expressions. The same situation can be found in the

linguistic culture of many peoples of the world, especially in the Uzbek language. For example, one of the semantics of the internal lexeme is synonymous with comatisms of heart, mind, soul, tongue [12, p.248].

In this regard, S. Ikramova writes:"The lexeme of diarrhea comes as a basic component in the phrases bitterness, swallowing, swallowing, emptying, dog scratching, fever, nausea, diarrhea: ... stomach ache, swallow, dog scratch , a distressing state of eating phrases; a state of spiritual relief from emptying the bowels; the words heartbroken and hot inside signify a state of impatience. From this it is clear that the Uzbek lexeme represents a spiritual space in the Uzbek worldview" [3, p. 98].

Spatial code is also one of the main codes in linguocultural studies. Spatial code is logically related to temporal code because the concepts of time and space are associatively understood in the human mind and require each other. "While space represents the scale of things, the order of their relative positions, continuity or continuity, time represents the sequence of events, the continuity of processes. It is known that every material body has a place, a volume, a scale. Space is the order of the points that make up the universe at a particular moment in time, while time is the sequence of events that take place at a particular point in space "[1, p. 234].Spatial code is associated with semantic oppositions such as its *own - alien, far - near, high - low, east - west*, and is the result of efforts to perceive the world as divided by man [5, p. 169].Human perceptions of flora and fauna are reflected in biomorphic codes. According to V.V.Krasnix, many standards in different linguocultures emerged as a product of biomorphic codes [4, p.16]. 3 This can also be seen in the Uzbek standards such as *ant* (symbol of hard work), *fox* (symbol of cunning), *lion* (symbol of courage), and *donkey* (symbol of stupidity). Subject codes are formed through the symbolic meaning of the names of most everyday objects:Words such as in the cauldron, everything goes to the bucket, the king has a gray patch on the bed, there is a belt around his waist, he puts his coat upside down, the pot in the units to lift the sieve out of the water, the bucket, the bed, the belt, ton, galvir show how the concepts of household items have become a tool for Uzbek linguists to express reality and social relations in it.The spiritual code, which is one of the codes of culture in linguocultural studies, is a code that reflects the cultural opposition, moral or religious values of the people, such as good - bad, beautiful - ugly, high - low. According to V.V. Maslova, the spiritual code has an ontological nature, and evaluation and expression are its main features [7, p.83]. In verbal expression, subject codes are often combined with spiritual codes. For example: Your homeland is a golden cradle; not a friend staring at the table; put a blanket in the shade.

It should be noted that the scientific views on the codes of culture formed in Russian linguistics also had an impact on other linguistics. In Uzbek linguistics, however, there is very little information about cultural codes. The glossary of linguistic and cultural terms explains the terms culture code, somatic code, time code, spatial code, subject code, spiritual code, biomorphic code [11, p. 22, 29-30, 34-35]. In Chapter 2 of F.Usmanov's research, analogies are studied in conjunction with linguocultural units [10, p. 58-90].

CONCLUSION

The theory of cultural codes can be used to study the Uzbek linguistic landscape of the world, to determine the evolution of the laws inherent in the national thinking of our people. At the same time, it should be noted that linguocultural studies is primarily a field that studies the relationship between mental concepts and linguistic units. Cultural codes are primarily a phenomenon related to the national-cultural character of a people. Thus, the study of linguistic and cultural codes in our linguistics is based on the nature of the Uzbek language, in which the mythological ideas, national values, cultural norms, customs and beliefs of the people, the axiological attitude to reality must be the focus of researchers. In linguocultural research, the main criterion should be

to determine the place of the Uzbek national thinking in the perception and description of the world through language. This requires the study of the internal aspects of our language - the Uzbek language, the factors of national cognition, psyche, and worldview. Trends such as a deeper approach to the object of language, its analysis in the context of mental and spiritual abilities inherent in the human phenomenon, the discovery of specific rules of Uzbek "thinking grammar" are stabilizing as the main principles of modern Uzbek linguistics.

ABSTRACT

This article is devoted to the analysis of the usage of Information and communication technologies in speaking classes taking into consideration the importance of speaking fluently and accurately in foreign languages, especially in Englishand Russian.It also concentrates on the significance and essential role of ICTs for improving English and Russian oral skill, as well as it shows technologies areas as the main motivational devices for language learners. Apart from that, it shows the study findings and results of the preliminary questionnaire and initial test taken from teachers and students.

KEYWORDS: *Information And Communication Technology (ICT), English As A Foreign Language (EFL), English As A Second Language (ESL), Russian As A Foreign Language (EFL), Russian As A Second Language (ESL), Imitative Speaking, Intensive Speaking, Responsive Speaking, Interactive Speaking And Extensive Speaking, CD-Roms And Dvds.*

INTRODUCTION

There is a great and vital role of Information and communication technologies (ICTs) in enriching English as a foreign language (EFL) learners' oral language proficiency. Foremost, we should state speaking skills and their importance in learners' life. When thinking about learning a foreign language, we should say that the primary aim of almost all learners is to be competent and fluent speakers of the target language. Most students reckon that among four key skills, speaking is the most interesting and difficult as well. However, they try to pay more attention and interest to their oral performance.

We often hear and face with some learners whose English is good or bad, we may say he/she is good or bad at English. So, we should keep in our mind that it is not so easy to learn to speak English fluently and accurately when it is our second or foreign language. Many students can read and write well in the target language, but they are poor at speaking and listening. Most learners are too afraid of talking in class. They are shy and lack confidence, even some students sound very "bookish" when they speak–it's as if they are reading from a book or it seems as they have learned by heart the context. Most learners love to speak and they are keen on speaking English, but they make many grammar and lexical mistakes. It is not surprising as English is not our mother tongue as a native speaker. To reduce some impediments which are occurred while

learning English and speaking in the target language fluently and easily we should involve the use of several simultaneous processes–cognitive, physical and socio-cultural with the help of utilizing and integrating ICTs in the classroom.

MAIN PART

According to Bygate, "speaking is a skill that all people use when they are interacting with each other; therefore, speaking is regarded as the most important

The skill that learners require speaking fluently in the classroom situation" [1, 4]. Most language learners indeed want to have enough practice in speaking a foreign or second language to communicate with their peers and people who visit from overseas. Using language is one of the effective ways of expressing thoughts and ideas, and opinions as well.

According to Brown, there are five types of speaking based on the speaker's intentions. They are imitative speaking, intensive speaking, responsive speaking, interactive speaking and extensive speaking [2, 18].

We want to state deeply about all five types of speaking and show the importance of ICTs to improve each type.

Imitative speaking is repeating others' speech, phrase or sentence as a parrot. This kind of repetition includes all language features as grammar, lexis and others to interact in communication and in this type of speaking great attention should be paid to pronunciation. If we talk about the significance of ICTs in this type of speaking there will be a huge role of technologies in this part. ICT may take place of teachers in the English classroom and it is used as a "repetition tool" during learning new vocabularies, songs and poems and so on. It will be more useful and interesting for learners rather than the teacher's repetitions.

In Intensive speaking, the speaker should know the semantic properties of the language, as short stretches, intonation, stress and rhythm. And this type of speaking includes some assessment tasks as sentence and dialogues completion and reading aloud as well. In this, part computer devices are acting as in the first type of speaking and besides that computer, projector and electronic board should be used while improving intensive speaking. To fulfil the tasks as dialogues, monologues, sentences completion instead of a blackboard, an electron-multimedia board can be utilized for enhancing learners' interest and motivation. As learners cannot be effective in tomorrow's world if they are trained in yesterday's skills.

Responsive speaking includes short interactions as dialogues, conversations with simple questions and small talks. Such as

A: Pardon me, do you have the time?

B: Yeah, ten-fifteen.

In this kind of speaking computer tools are vital as the wings of a bird. Because after watching small dialogues and conversations' videos on a computer screen or projector learners may have enough practice by seeing and there will be good participation during the class. As seeing is half learning and most of the students are a visual type of learners, and in this case, it is very handy to use IC technological devices.

Interactive Speaking differs from responsible speaking, as responsible speaking includes brief conversations, however, interactive speaking involves complex and long dialogues and interactions. There are two forms of language: transactional language and interpersonal language. The transactional language aims to exchange only specific information. Interpersonal language is full of slang, ellipsis, which means it is colloquial language. Interviews, role play and discussion activities are considered as main assessment tasks of interpersonal language. After

listening or watching about some topics via projector or computer, learners may reflect their opinion on the current theme and will make discussion and debates among students.

The last type of speaking- Extensive Speaking includes speeches, oral presentations and story-telling. It is more formal and we cannot use informal monologues like casual speech. To show a presentation or deliver our speech effectively, we should use IC technologies, it will be very fruitful for the speaker and more interesting for the audience.

There are some ICT techniques in the classroom which are effective and helpful for teachers to enhance learners' oral performance and they are key factors for mastering speaking skills. Using CD-ROMs and DVDs is important in learning and teaching English. Teachers of oral expression may use these devices to teach the speaking skill for its significant advantages. According to Dundey and Hockly believe that "the use of CD-ROMs in the classroom has a positive effect on students' performance because when they are exposed to authentic language independently as they called autonomous learning" [3, 115].

So, it is vital to use these tools in the teaching of speaking skills. Using DVDs is helpful for language learners as there may be given subtitles at the bottom of the video. The language learners may switch off the audio of the video andrepeat subtitles several times and without subtitles, they may listen and watch the video then they can act the dialogue by themselves with no subtitle or video.

Using chat is one of the essential ways of improving spoken performance if it is well organized and well-timed. Dudney and Hockly stated that "chat is a tool that allows for synchronous, real-time, communication over the Internet". We consider chatting as an important tool in enriching learners' accuracy and fluency [3, 71].

Speaking and writing are considered productive and active skills while listening and reading are regarded as receptive skills. Therefore, teaching and learning one of the productive skills-speaking is more difficult rather than reading and listening. However, the primary aim of language study is to develop both receptive and productive skills.

METHODS

Research aimed at finding and analyzing got data from both teachers of oral production and first-year students of Samarkand State Architectural-Civil Engineering Institute. Most first-year students cannot speak English confidently and correctly. Lack of practice and interest in learning spoken skills is one of the main reasons for misunderstanding oral performance. The primary aim of the study is to highlight the importance and usefulness of ICTs in improving students' speaking skills.

Foremost, this chapter states the usage of ICTs and their significance in Samarkand State Architectural-Civil Engineering Institute education process. It is a fact that most students when they were applicants to the Institute of FL they learned deeply grammar of the target language. Therefore, today they are lack oral experience or practice to use the language in communication or while expressing their opinions, they are afraid of reflecting their ideas. However, most of such students possess good writing skills, they can easily express their thoughts with the help of their writing skills, they may share their ideas in three or five pages even more than these, however, they (students) cannot speak even two or three sentences without hesitation. To reduce their hesitation and shyness teachers of the Institute, try to give some tasks which are based on group or team working and making presentations on current given topics with the help of IC technologies.

The current study takes place at Samarkand State Architectural-Civil Engineering Institute. The participants are selected from different first-year students. It is important to mention that their level of knowledge, backgrounds and use of the target language differ from each other.

In this study, the primary instrument is teachers' interviews and the secondary is students' questionnaires. The researcher interviewed five teachers of EFL at SamIFL and there was used a semi-structured interview. We selected them to know how and in what case they use ICTs during classes and to improve their students' speaking skills. The interview comprised eight questions, four of them belonged to teachers' experience in teaching oral production courses, and four of them were connected with the usage of ICTs as new tools of teaching FL.

The students' questionnaire is considered a secondary instrument in this research. It was concerned with the first-year students of Samarkand State Architectural-Civil Engineering Institute to know how and when as well as in what context they use IC technologies and to have some information about the usage of ICTs in developing their oral proficiency or not. The questionnaire includes seven questions as one of them was about participantsthemselves, four questions connected with their interests and attitude toward speaking skills, and the other two questions belonged to whether they prefer using ICT resources to enhance their oral production or there are any other ways or methods which are used by students.

RESULTS AND DISCUSSIONS

Teachers' interview was taken to know the significance of ICTs in speaking classes and to improve students' skill, motivation and interest as well. This interview included ten questions.

One question is based on which IC devices do theypossess and we can see the following results below:

Electronic devices	**Number**	**%**
Laptop	5	100%
Electronic Music Device	3	60%
Memory cards	4	80%
DVDs, CDs, MP3 player	2	40%
Printer	3	60%

When we asked what do they think, why do some students find that speaking in the target language is very difficult to speak fluently or accurately in FL. This question was given to know whether teachers are aware of students' difficulties and challenges while speaking in a foreign language or not. Two EFL teachers stated that the reason for the difficulty in speaking is lack of vocabulary and pronunciation, however, one of them thought that lack of practice causes a barrier in speaking. And other two of them added some learners are not competent because they do have not self-confidence, shyness and doubting about their level.

When we asked which method or technique, do they usually use in oral expression sessions, three teachers said they usually use ICT devices and the audio-video method, as well as visualizations, are helpful for their lesson. Two of them stated they use a mixture of methods of course, with the help of ICTs, like debates, dialogues, role-play. They thought that the usage of ICTs make a fun and interesting atmosphere in the classroom.

After collecting data from teachers next section is devoted to students' questionnaires.Thirty-four students were chosen in this part, twenty of them were male, and fourteen students were female from different the first year. They tried to answer all questions to prevent any misunderstanding. There are given their gender and general information about participants.

This table is showed that female learners are more than male learners, so students use IC technologies more than male learners in learning spoken skills.

Gender	Male	Female	Total
Number	14	20	34
Percentage	41%	59%	100%

When we asked about their difficulties in speaking English, eight students who are good at speaking have not any problems and challenges in oral production. However, the rest of 76% of students have some difficulties in speaking. Lack of practice, vocabulary and pronunciation are the main reasons that they may face while speaking English. Some of them added that the carelessness of a teacher who works with only active and competent students is also one cause of our barriers.

When we asked about theirthought on whether or not ICTs can enhance their speaking skill, the minority of 17% of students do not think that ICTs are helpful tools for developing their skills. As there may not be enough IC technologies and they are not always interesting, contrarily they may disturb us while learning a new thing. However, 83% of learners claimed that IC devices help us to improve speaking skills and feel more confident and comfortable.

CONCLUSION

In summary, based on the above data and research findings, we conclude the following about how well teachers and students use ICT and how much they are aware of them. As we can see that different learners have various ways of learning. However, most students believe that IC technologies can help to improve their oral production. The primary aim of the study was to help learners to enrich their speaking abilities through using of ICTs in lessons.

"WHO DESTROYED HIS OWN IDENTITY?"

Ibrohim Hakkul*

*Professor,
Doctor of Philological Sciences,
Head of the Department of the Institute of Uzbek Language,
Literature and Folklore of the Academy of Sciences,
Republic of UZBEKISTAN

ABSTRACT

The article discusses the second spiritual birth, which reveals the secret of perfection and requires special research. And in it the examples taken from the poems of the great poet are analyzed. This theme also helps to introduce a new approach to Navoi poetry. It is well known that the classical literature of the East is based on the worldview, oral creativity, religion, culture, spiritual needs and artistic tastes of the peoples of the East. The expansion of interest in the Western world to read it has undoubtedly served its benefit. In scientific research and interpretation, the lack of understanding of the essence, psychological principle, and symbolic structure of this literature has damaged it.

KEYWORDS: *Valodat, Identity, Ego, Greed, Soul, Irfan, Tasawwuf, Sect, Sufi, Symbol.*

Being human is about understanding your identity....
(MirzoBedil)

INTRODUCTION

It is well known that the classical literature of the East is based on the worldview, oral creativity, religion, culture, spiritual needs and artistic tastes of the peoples of the East. The expansion of interest in the Western world to read it has undoubtedly served its benefit. In scientific research and interpretation, the lack of understanding of the essence, psychological principle, and symbolic structure of this literature has damaged it. Uzbek literature, formed under the influence of Soviet-era Russian literature, had neither the will nor the ability to oppose it and advance its own views. As a result, the topics and issues studied by Uzbek literary critics have been largely mastered or copied from abroad. There was no other way to do it. Because classism, partisanship, and ideology have all ensured that we do not go beyond the line set by the rules that must and must be followed.

THE MAIN FINDINGS AND RESULTS

In Eastern classical literature, love for the universe and man begins with love for Allah and His beloved Messenger Muhammad (peace be upon him). In order for man to know himself and manifest himself, he must first know and master the secret of divine love. Otherwise, he will be

lost in love as well as in the vast and eternal truths of life. Unable to protect his life from fleeting lusts and inclinations, he falls into a whirlpool of mistakes. After the victory of the atheist creed, which launched an uncompromising attack on Allah, religion and the Shari'a, it was forbidden in literature to speak about the people and the Creator, the prophet and the ummah, life and the hereafter. To express acceptable views on the policy of the Soviet government and the instructions of the Communist Party was to introduce unprecedented lies and fabrications. Thus, for almost seventy years, the study of religious and moral topics in literature, along with religious literature, has been banned. What was the result of studying and interpreting the Qur'an in accordance with an ideology that was completely alien to its nature and history, separating it from the centuries-old literary samples that had developed on the basis of the teachings of the Qur'an and the Prophethood?Unfortunately, this question has not yet been answered clearly and concisely. None of our classical poets even imagined the concepts of class or ideology. But when one is acquainted with the research of their life and work, one gets the impression that each of them has a preconceived notion of class belief. In the literature centered on Allah and the Prophet, almost all ideas or issues concerning man and humanity are resolved directly or indirectly in connection with these beings, and their effect on thinking and education is also unique. Why the enlightened stimulus and gnosis of reading classical has works diminished over time? Because of the essence hidden behind them, the content put forward by scientists is drastically different from each other. If the emotion, mood, situation, tone of spirit in the literary text is not revived, the poet will not be deeply interested in the commentary or interpretation. There is no point in a sarcastic, distracting analysis.

Introducing a person to himself, depicting the world of identity in figurative forms is one of the first tasks of artistic creation. After all, the “I” ensures its existence. The “I” reflects the unique characteristics of a person. It reveals the strong and weak, private and general aspects of the slave.

In the history of Eastern culture and enlightenment, the descriptions of “O’z-*Own*”, “O’zlik-*own identity*”, “Men-*I*”, and “Menlik - *Self*” are divided into two. The first is human, the second is spiritual self.Since the human ego is formed on the basis of man's natural, that is, innate, lustful inclinations, the people of mysticism and blame have put forward the idea of radically reforming it, of forming a polished "I" free from animal and satanic lusts. And this is called spirituality - the second birth. This birth took place mainly through the training of a perfect pir or murshid in the process of traveling leech. YunusEmro's confession, “I have one, inside me”, belongs to me. In mysticism and theology, the experience of recognizing the greed, of the uncompromising struggle against the greed, has changed the way a person thinks about himself and his inner imagination.

“Man is afraid to know his inner world, says the Turkish philosopher Nuriddin Topchi. Therefore, at some point in his life, he avoids himself in a way that is different from the previous ones”[3:75].

However, in order to know who one is, to observe oneself correctly, one must try to overcome the feelings of fear, retreat, and hesitation.

According to the famous psychologist G. Gurjiev: “When a man begins to understand himself, he sees the horrors that he fears. He does not know anything about himself unless he becomes so afraid” [2: 180]. Sufis, dervishes, and theologians, on the other hand, have uncompromisingly studied the negative strengths and imperfections of the human body, creating a new doctrine of spirituality - the spiritual self. They believed that Jesus could not ascend to the heavens of the unborn malachite (purity, freedom, divinity). Based on this idea, Sufis and Sufis spoke of two things, the physical and spiritual birth of man. This birth and growth is achieved through the

knowledge of the body (Navoi emphasizes this, “Think about your body”), the knowledge of the greed, the strengthening of morals, the purification of the heart and soul.

Just as the science of being, greed, morality, heart, and soul developed into a broad exploration of self-knowledge and the essence of humanity, so did the development of mystical and mystical literature. By the twentieth century, the prestige and influence of anthropology in the arts had declined sharply, especially after literature had moved away from psychology and its interest in the spiritual world had waned. There is no need to distinguish between what is lust, what is spirit and beauty. Navoi often solves the new concept of “Menlik - *Self*” in three words. These are: lust, self, and fanaticism. The poet interprets the ending of the requirements of human “Menlik - *Self*” in a single rubai.

Nafsamrida har nechakitolping'aysen,

Ko'pgarchibutunluqtilasangsing'aysen,

Komistayunechaelg'ayoling'aysen,

Nafsingg'axilofaylakimting'aysen.

No matter how much you try to control your desires

Even though you want a lot of integrity,

How many hands do you want,

You listen to me against your desires.

Man can desire integrity; he can see himself as a whole person. But as long as his memory is the lust of lust and his memory is the devil, he cannot save himself from being crushed in the mill of breakage, lust, and greed. The famous Arab mystic A.A. Afifi writes: According to the IhwaniSafa, what is expressed as “I” and “you” is the existence of what each of us calls greed. There is no evidence for the existence of the greed, whether practical or theoretical, other than enlightenment”[1: 359]. The sages of the sect, on the other hand, have argued that the “I” is separated from the “you” and that when it is separated, it acquires a universal meaning. Because enlightenment is an inner knowledge born of the observation and pleasure of the heart. Enlightenment reflects the spiritual power, purity and privileges of the soul.

In the early Sufis, the word *fano*-death was used to mean the abandonment of self-consciousness and the elimination of certain qualities and characteristics of the “I”. Then, the main condition for being free from lust and attaining the revelation of Allah is stated. On one of the continents, Navoi writes.

Kimkio'zlukimoratinbuzdi,

Bo'ldinaqdifanomuzdi.

Ul imoratnibuzmayinsolik,

Bo'laolmasbunaqdg'amolik.

Who destroyed the building of identity?

It was clearly death.

Do not demolish the building,

It has no certainty.

Destroying the “building of identity” and gaining a cash fan is the acquisition of a powerful new spiritual “I”free from human qualities. The “building of identity” is, of course, lust. The pain of getting rid of it is the main pain in mystical literature. The famous orientalist R. Nicholson wrote,

“The Sufi poet wanted to say”, Drink wine to get rid of your lust, and leave your material existence in the midst of divine spectacle.' From the point of view of almost all representatives of mystical and mystical literature, the place and status of the human "I" and self is low, and the second - the spiritual “I” is very high. Because the first is human, that is, physical, material, physical, emotional, animal, and sensual. The second embodies spiritual, spiritual, occult, and spiritual qualities. Mysticism exemplifies the superiority of these two “I”. And the tax gave him the authority to find what he was looking for in a fan. Fano – *death*actually knows that there is nothing and that there is no boron. Existence, that is, the world man - was created from nothingness and will return to nothingness again. Therefore, one must first understand that there is a loss in achievement, an achievement in loss.It is then that he does not spend his life in ignorance, falling into the trap of raw and transient purpose, selfish interests and claims, as if he is bound to something and does not stop spiritually. “The supreme goal of BoyazidBistomi”, says Suleiman Ulutagh, “is to create an absolutely free identity, free from influence, interest, and danger, by going through an “*Men*-I” and a “*o’zlik*-self” [4: 153]. Thus, the Iranians, the poor, and the dervishes focused so much on the development of a free, active, independent self that they preferred to remain silent rather than speak or write until they were freed from the influence of lust. According to them, “The word is like wine that intoxicates the mind. Anyone who is addicted to drinking this wine will never give it up. Since the calamity of the word is known to the mystics, they do not speak at all until there is a real need. And they look very carefully at the beginning and the end of the word”[6: 503]. Such a precise attitude to words and thoughts is like a fairy tale today. The first sign of talent is to feel the word deeply, literally giving it a new life. A selfish poet, writer, scientist can never do such a thing.

Sufis and Sufis seem to need to dwell on another aspect of the worldview.

For centuries, the people of Adam have spoken of goodness, kindness, generosity, love, devotion, and encouraged others to acquire these qualities and attributes, but as time went on, the gap between goal and action increased. Those who succumbed to lies, deception, hypocrisy, and nonsense were disillusioned with words and speech. The people of Sufism, then, persevered and suffered not for the sake of propagating goodness and goodness, but for the sake of purifying the heart and mind from worldly sorrows and materialistic lusts, cultivating their morals, and expelling ignorance from their hearts”[5: 198].

Navoi always encouraged people to stay away from the people of the world, including materialists, worldly people, liars, swindlers and swindlers who never tired of changing their appearance depending on the situation and circumstances. The great thinker and poet wrote in a poem:

Fardbo'lkim ul kishidunyodabo'lmishahlitark,

Kim fanoyo'lidatarkiahlidunyoaylamish,–

The individual may leave the people of the world,

Who has left the world in the way of death, -in another, he says:

EyNavoiy, qilsangerdiofiyatkunjinVatan,

Munchamunglug'jonigg'aozorbo'lg'aymuedi, –

OhNavoi, if you did, the homeland of recovery,

I wish I could hurt so much, -he says.

Has the people of the world today, the people of the state, and the people of ignorance changed and become different than before? Consider this dream:

Muhandisetopayuegnimaqanotyasatay,

Uchubhavosidaqushlararoo'zumniqotay.

An engineer can find a wing on my shoulder

Tighten myself between the birds in the flying air.

If someone says that this feeling is stuck in the maze, that such an escape does not inspire anyone, then it is impossible to imagine how much the poet suffered and suffered in order to get rid of his human ego.

CONCLUSION

The principles of bravery, Sufism, rindiness, and blame have had a great impact on the realization of the dream of the peoples of the East to know themselves and create a new priestly "I". But the spiritual power and opportunity that united these teachings was a state of fanaticism and fanaticism. It is obvious that classical poets, in particular, Alisher Navoi, do not cover the concept of "I" and "*Menlik*-self" without studying it objectively.

What is even more useful is that the image of a mortal man, an animal, an angel in appearance, a devil inwardly, a friend in appearance, a secret enemy, helps to know the true nature of people and not to be deceived by unimaginable tricks.

The great Pakistani thinker and poet Muhammad Iqbal is a fan of the world, "I" is eternal. Nothing but me. It is hidden in your biography to cultivate the truth of self ...". In this sense, the study of Navoi's work is an inspiring, irreplaceable lesson.

ABSTRACT

The current major global environmental policies for a much more affluent world are the Sustainable Development Goals (SDGs), the New Urban Agenda (NUA), and indeed the Paris Agreement. The built environment has been recognized as a key contributor to biodiversity loss, and will therefore play a significant role in a future where environmental values are reinforced. Because people and nature are the primary victims of biodiversity loss, there should be a seamless connection between the built and natural environments. The purpose of this review article is to look at the relationship between the built environment, biodiversity, and the United Nations Sustainable Development Goals. The article examines the importance of a sustainable built environment in biodiversity conservation, which is critical for attaining the SDGs in general and SDG 15 specifically. The study employs a qualitative analytical method including a workshop of information creation with 16 professionals from government and business.

KEYWORDS: *Biodiversity, Built Environment, Construction Industry, Sustainable Development Goals, and SDG15.*

INTRODUCTION

Fabrication is the least sustainable industry, using almost half of the world's non-renewable resources. The constructed environment has been claimed to have a direct impact on the natural environment due to the quantity of energy and money required to maintain the company. It's also worth noting that greenhouse gases contribute to biodiversity losses in the built environment, reducing the ecosystem's ability to sustain living creatures. Natural and man-made ecosystems are intertwined, and this connection has a major impact on the planet. All living things, including plants, animals, fungi, microorganisms, and variations within or across species and ecosystems, are included in the term biodiversity[1].

The 2030 Sustainable Development Goals (SDGs) are intended to address global problems such as human well-being and environmental protection. The SDGs are interconnected, and in order to fulfill them, the planet's ecosystems and resources - land, water, and fresh air - must be taken into account[2]. The ecosystem services (ES) concept has a lot of promise for better planning, strategy, and decision-making. Understanding how various habitats (forests, rivers, wetlands, and

so on) connect to the social and economic advantages of grasslands is critical for long-term biodiversity protection and ecosystem sustainability. The Earth and Water Ecosystems are linked because human activities on the ground exert pressure on the water ecosystem, affecting the production of ES by rivers and lakes[3].

The Sustainable Development Goals (SDGs), which were adopted by all UN member states in 2015, are a bold strategy for achieving sustainable human development by 2030.

Mental health and wellbeing are particularly addressed under SDG 3, which stresses the inclusion of mental health treatment in universal health coverage, in contrast to the Millennium Development Goals. Because the worldwide human suffering and financial costs associated with mental illnesses are significant and increasing, including mental health in the SDGs is critical. 2,3 According to a recent return on investment study, investments in mental health treatment have the potential to improve the skills and productivity of afflicted people and families. 4 However, there is mounting evidence that mental illnesses are highly socially influenced in cultures throughout the world. The social and economic circumstances that have a direct impact on the incidence and severity of mental illnesses in men and women throughout their lives are known as social determinants of mental disorders. Adverse social and economic conditions, such as poverty, income disparity, interpersonal and communal violence, and forced migration, are all important predictors of mental illness. Because mental illnesses are so socially driven, increased access to mental health treatments is unlikely to alleviate the worldwide burden of these disorders[4].

In this perspective, by addressing upstream socioeconomic factors, the SDGs have the potential to decrease the burden of mental illnesses at the population level. To achieve this decrease, more clarity on which socioeconomic factors to target and how they relate to the SDGs is required. To present, there is relatively little unified data, especially from low- and middle-income countries, about the socioeconomic and violence-related variables that should be addressed for mental illness prevention. Although the SDGs aim to address a number of serious global issues, including violence, climate change, displacement, and economic inequality, little is known about how tackling these issues may prevent or decrease the prevalence of particular mental illnesses[5].

This research had two goals: first, to create a preliminary conceptual framework for the social determinants of mental disorders that is aligned with the SDGs; and second, to use that framework to systematically review evidence on the social determinants of mental disorders in order to identify potential mechanisms and targets for interventions that address these determinants. This endeavor necessitates gathering research material on the socioeconomic determinants of mental disease throughout the life cycle from low-, middle-, and high-income nations[6]. A strategy like this has the potential to improve alignment between the SDGs and reductions in the incidence of mental illnesses, as well as propose action across a variety of sectors. It may also show possible interaction mechanisms between socioeconomic variables and mental illnesses. As a result, there may be an opportunity to modify current poverty alleviation and violence reduction methods outlined in the SDGs to avoid the emergence of mental illnesses in communities[7].

In order for policy to be assessed, both at and within the SDGs, there must be dependencies between the objectives in terms of possible interactions. This problem is not new, and similar concerns have been raised in the past when attempting to link climate change adaptation to poverty reduction, achievement of the Millennium Development Goals, and balancing economic development, environmental sustainability, and social inclusion for human well-being. Because of the SDG framework's comprehensive nature, there are many potential linkages around the SDG system 169 that policymakers must examine[8]. Though a methodology for characterizing

SDG interactions has been suggested, there is presently no comprehensive, data-driven study of interactions between all SDG indicators. Such interactions may be classed as synergies or trade-offs in the broadest sense, and vice versa. This was tied together in a symbolic formulation of synergies and trade-offs based on the findings of a correlation study across official SDG indicators, nation accounting, and the full period for which data is available.

The following are the Sustainable Development Goals:

- No Poverty
- Hunger eradication
- Good Health and Happiness
- Education of High Quality
- Equality between men and women
- Sanitation and Clean Water
- Energy that is both affordable and clean
- Economic Growth and Decent Work
- Infrastructure, Innovation, and Industry
- Reducing Inequality
- Communities and Cities that are Sustainable
- Consumption and Production in a Responsible Manner
- Action on Climate Change
- Underwater Life
- Life on the Ground
- Institutions of peace, justice, and strength
- Partnerships for the Goals

As a result, the goal of our research is to offer the first comprehensive measurement of synergies and collaborations. Internal and external trade-offs, as they have in the past, inside and around the SDGs, at home and globally scaled. As a result, we emphasize the most often discovered trade-offs, highlighting the need for focused and transformational action to overcome previous patterns and provide the largest potential global advantages. The research also compares and contrasts possible synergies that are critical for future strengthening and cross-leveraging. The analytical approach for assessing SDG interactions provided here is a critical contribution to making it work in order to successfully implement the SDG agenda[9].

When it comes to infrastructure and housing developments, the Built Environment seldom considers the relationship between biodiversity and human well-being; biodiversity plans for sustainable urban expansion are rarely considered. Despite the built environment's negative impact on biodiversity, new construction projects or the restoration of existing assets have the potential to enhance the ecological value of most construction sites (Green Building Council). The built environment is a significant contribution to biodiversity loss and climate change due to the enormous amount of resources consumed by the building sector. As a result, it is proposed that the built environment will play a major role in resolving the biodiversity loss problem[10].

ROLE OF SUSTAINABLE DEVELOPMENT

➢ The Sustainable Development Goals And Biodiversity:

The Biodiversity Conference, held in conjunction with the Earth Summit in Rio de Janeiro in June 1992 (the 'Rio Convention'), established the foundation for worldwide biodiversity protection. The 2030 Sustainable Development Plan, on the other hand, lays the groundwork for shared objectives and priorities targeted at addressing society's current problems. Biodiversity contributes to ecosystem services that are critical to human well-being and economic activity, as

well as the achievement of the Sustainable Development Goals. However, it is critical to recognize that biodiversity preservation is deeply ingrained in the majority of SDGs.

SDG 15 has a significant effect on SDG 3 (Good Health and Well-Being), SDG 6 (Clean Water and Sanitation), SDG 11 (Sustainable Cities and Communities), SDG 12 (Sustainable Consumption and Production), SDG 13 (Climate Action), and SDG 15 (Climate Action) (Biodiversity-Life on Land).

The Sustainable Development Goal 15 [12-15] is mainly concerned with the preservation and wise use of the planet's ecosystems and wildlife. Humanity's existence and improved quality of life are largely reliant on biodiversity. Human activities such as over-consumption of natural resources, however, are placing increasing pressure on biodiversity as a result of continuous urbanization.

SDG 15 is a global target set by the United Nations that must be achieved by 2030. (UN, 2015). For example, SDG 15 objective 15.9, which is relevant to SDG 1 (End poverty in all its manifestations), demonstrates the interconnected yet interwoven character of the SDG 15 and the other SDGs (UNDP, 2016). Over the next 15 years, the SDGs aim to build a sustainable world that offers people freedom and dignity while also preserving the environment.

Framework For Thought

We created a new conceptual framework that included the main socioeconomic causes of mental health problems and connected them to the Sustainable Development Goals. On the basis of existing epidemiological data, we first defined the major categories of social determinants of mental illnesses, including demographic, economic, neighborhood, environmental events, and social and cultural domains. The panel contains definitions for these domains. We developed these categories based on prior conceptual work on the socioeconomic determinants of mental health. 9 The domains were selected for their conceptual coherence and distinctness, as well as their ability to include both distal and proximal levels of impact on a person's mental health outcomes. Second, we compared these domains to the frameworks developed by the WHO Commission on the Social Determinants of Health to verify that all important components were included (for example, the use of a multilevel approach and the inclusion of a life-course dimension).

Finally, we matched the SDGs to the areas where they seemed to be the most relevant. When an SDG seemed to be important for more than one domain, the group of writers agreed on the domain for which it seemed most relevant. The conceptual framework was used to arrange the domains. Mental illnesses are influenced by both distal and proximal factors in each area, which are mediated by family-level and biological characteristics. 10 proximal variables refer to persons, things, or events in the immediate external environment with which the individual interacts that enhance or decrease the risk of mental illnesses, according to Bronfenbrenner's ecological approach. Distal factors are societal structural arrangements or trends that have an impact on population mental illnesses, and are often mediated by proximal variables. This paradigm aims to reflect the significance of an ecological approach10, as well as the complex multidimensional ways in which socioeconomic factors interact with major genetic markers to influence mental illnesses.

The following are the SDG 15 objectives:

15.1 By 2020, ensure that terrestrial and inland freshwater ecosystems, forests, wetlands, mountains, and dry areas are conserved, restored, and used sustainably.

15.2 Promote the implementation of sustainable forest management for all kinds of forests by 2020, including halting deforestation, restoring damaged forests, and significantly increasing afforestation and reforestation worldwide.

15.3 By 2030, aim to create a land degradation-neutral world by combating desertification, restoring land and soil, particularly land impacted by desertification, drought, and floods, and achieving a land degradation-neutral world.

15.4 By 2030, ensure the protection of mountain ecosystems, including biodiversity, in order to increase their capacity benefit, which is critical for sustainable development.

15.5 Take immediate and substantial efforts to prevent natural habitat degradation and biodiversity loss.

15.6 As agreed upon globally, encourage fair and equitable distribution of the benefits resulting from the use of genetic resources, as well as proper access to such resources.

15.7 Take immediate measures to stop poaching and trafficking of protected species of flora and animals, as well as illicit wildlife product demand and supply.

15.8 By 2020, implement measures to avoid and significantly minimize the effect of invasive alien species on land and aquatic ecosystems, as well as to manage or eliminate priority species.

15.9 By 2020, include ecological and biodiversity values into national and local planning, development, poverty reduction initiatives, and accounting.

Biodiversity and the Built Environment: An Overview

The developed environment has an impact on biodiversity, resulting in habitat loss and destruction. The built environment will play a key role in sustaining biodiversity; it is essential to have green urban areas in the built environment to preserve biodiversity and provide chances for people to interact with nature. The ecology and biodiversity are key components of the urban environment that contribute to a higher quality of life through enhancing catastrophe resistance. It is claimed that a holistic approach to a sustainable built environment improves overall quality of life. Beyond habitat and species protection, biodiversity offers social, cultural, and environmental advantages. The goal of biodiversity conservation should be to restore and improve the population of species and ecosystems today and in the future.

DISCUSSION

The urban environment, in general, and the building industry, in particular, have an important role to play in conservation of biodiversity, although this is not usually a top priority for the construction industry. The construction sector may also pave the way for putting biodiversity at the heart of long-term development. The effect of the built environment on biodiversity is creating climate change as a result of the loss of building ground cover. Biodiversity may also be incorporated into the built environment via the creation of green urban areas, such as solar farms, which can help to preserve urban biodiversity. The integration of biodiversity into new building projects will be a key component of the planning application process. In a built area, biodiversity may be found near rivers, parkland, street plants, gardens, and empty lots.

CONCLUSION

The study's goal was to look at the link between the Sustainable Built Environment and Biodiversity Conservation, which is at the heart of the Sustainable Development Goals. This paper looks at how to use sustainable building methods to improve biodiversity protection and promotion as a component of the built environment. The ability of the earth to adapt to climate change is strengthened by a built environment with integrated biodiversity, which improves air quality, flood protection, and people's general health and welfare in the community. It will need

political leadership at both the world and national levels in terms of policy direction, including new biodiversity protection laws.

ABSTRACT

"White Biotechnology," as it's known. The molecular tools developed by White Biotechnology are enzymes that catalyze certain activities inside living cells. When operating in an aquatic environment or under mild reaction conditions, enzymes are renowned for having high substrate specificity as well as enantioselectivity. And White Biotechnology uses microorganisms and enzymes to make a variety of chemical substances.White Biotechnology uses microorganisms and enzymes to manufacture a large variety of chemical products. Therefore, the demand for new and useful biocatalysts is steadily and rapidly increasing. We have developed methods for the isolation of new enzyme genes, constructed novel expression systems, and optimized existing enzymes for biotechnological applications by methods of directed evolution. Furthermore, we have isolated and characterized biocatalysts relevant for the preparation of enantiopure compounds.

KEYWORDS:*Biocatalysts, Directed evolution · Metagenomics · Overexpression.*

1. INTRODUCTION

The synthesis of a range of chemical compounds utilizing microorganisms is referred to as industrial or "White Biotechnology." White Biotechnology's molecular tools are enzymes that catalyze particular processes inside live cells. Enzymes are known for having excellent substrate specificity and enantioselectivity when working in an aquatic environment under moderate reactions. These properties suggest that they could be used as biocatalysts in the chemical sector to I catalyze chemical reactions for which no specific chemical catalysts are available, as well as (ii) conduct “green chemistry” by substituting environmentally friendly bioprocesses for chemical processes that require a lot of energy and produce a lot of toxic waste. Prof. Maria-Regina Kula, retiring head of the old Institute for Enzyme Technology on the Research Institute Jülich's campus, pioneered biocatalyst research and its bioactivities in Germany. I and II enzymes were identified and described in close collaboration with nearby Institutes of Biotechnology, and biocatalytic methods with both isolated enzymes and entire microbial cells were developed, which now play a major part in the biotechnology sector[1]. The continuous replenishment of the cofactor nicotinamide adenine dinucleotide (NADH) using the format dehydrogenase system in a membrane reactor is a well-known example of a biotechnological

application. The stereoselective reduction of ketones using alcohol dehydrogenases is utilized in industry in conjunction with a NADH-dependent leucine dehydrogenase to produce chiral alcohols. Professor Kula's old institution is now known as the "Institute for Molecular Enzyme Technology," and it is part of the newly established Center of Microbial Biotechnology (CMB). It includes the Helmholtz Research Center Juelich's Institutes of Biotechnology I and II, as well as the Heinrich-Heine-University of Düsseldorf's Institutes of Molecular Enzyme Technology and Bioorganic Chemistry. In the area of white biotechnology, the CMB represents a unique combination of scientific knowledge, molecular biological, chemical, and biotechnological techniques, as well as cutting-edge equipment[2].

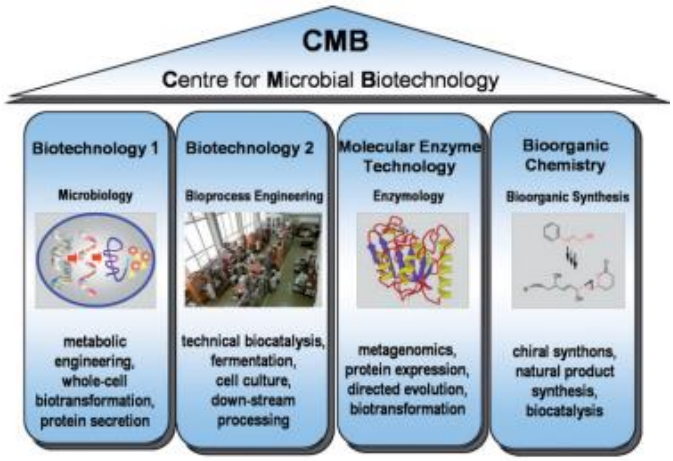

Figure 1 : illustrate the search and development within the Institute of Molecular Enzyme Technology[3]**.**

1.1.Biodiversity As A Source Of Potential New Biocatalysts:

Finding enzymes with novel and well-defined characteristics is sometimes like looking for a needle in a haystack. Biotechnologically interesting biocatalysts have been identified over many decades by growing the microorganisms that generate them in the laboratory. However, improved detection techniques have shown that only approximately 1% of all microorganisms found in an environmental sample can be grown under normal laboratory settings in recent years. The issue then emerged as to whether the genetic potential of non-cultivable microbes (up to 500 000 species in 1 g soil) might be exploited for biotechnology[4]. The metagenome is the entire DNA contained in a given environment (for example, a soil sample). The DNA from such a metagenome may be extracted directly, eliminating the requirement to grow microbes in the lab. The obtained metagenomic DNA is enzymatically chopped into acceptable fragment sizes, cloned onto appropriate vectors, and then injected into a heterologous host organism, most often the enterobacterium Escherichia coli. In this manner, so-called "metagenome libraries" are created, which are collections of thousands of clones that may be analyzed for specific enzyme activity[5].

1.2.Phototrophic Bacteria For A White Biotechnology That Is Sustainable:

Currently, anoxygenic phototrophic microorganisms like R. capsulatus, a Gram-negative purple bacterium, are seldom employed in biotechnological operations. In comparison to “conventional” microorganisms, phototrophic bacteria have a number of benefits. Under phototrophic growth circumstances, R. capsulatus, for example, utilizes sunlight as an energy source, combining energetic and anabolic activities in a highly efficient way. It is an excellent

model organism for future-oriented "phototrophic biotechnology" because of its metabolic capability. As a result, our objectives in the area of phototrophic biotechnology include the long-term generation[6].

- chemical compounds that are new
- bioenergy as well as renewable raw materials

1.3.Directed Evolution For The Creation Of Molecular Enzymes:

Enzymes are cellular biocatalysts that have evolved to fit their natural environment, which is typically an aqueous solution with a neutral pH, normal pressure, and moderate temperature. However, conversions using non-natural substrates including under non-natural reactions are often required when using biocatalysts in White Biotechnology applications. For example, in order to account for the stability of the products, the Oxynotidae catalyzed adding of hydrocyanic acid to alkynes must be performed out in an acidic environment. As a result, the pH stability of the enzymes must be modified. Another common issue is the insolubility of educts and products in water: a biocatalytic reaction must be carried out in an organic solvent, yet most natural enzymes are ineffective under these circumstances. Enzyme engineering may theoretically solve these issues; but, in most instances, such logical techniques of enzyme design are not applicable since 3-D structures are required, which are only known for a limited number of enzymes. Directed evolution is a different method that doesn't need any structural or functional understanding of the enzyme in question. In the lab, the natural concept of mutation and selection is achieved by combining a variety of random mutagenesis techniques with selection, or screening, to generate and discover enzyme variants with enhanced characteristics. Researchers have used directed evolution to develop enzymes with increased substrate specificity, thermo- and solvent stability, and enantioselectivity[4], [7].

1.4.Synthetic Chemistry's New Biocatalysts:

Product production may be catalyzed by isolated enzymes or entire cells, which can then be utilized as intermediates in a variety of chemical reactions. Table 1 lists some of the enzymes that have been discovered and described at the Institute of Molecular Enzyme Technology.

1.5.Enzymes That Produce C-C Bonds Include:

Enzymes that catalyze the production of carbon-carbon bonds are among the most important biocatalysts in the chemical industry. Biocatalysts that catalyze the motion of chiral building blocks for the production of bioactive molecules such as medicines are especially intriguing in this regard. Because various enantiomers of the same molecule may have quite distinct biological effects, it is now essential to synthesize both enantiomers of a chemical separately and test each one for its biological effects. Individual enantiomers are frequently difficult to produce using traditional chemical techniques. Because biocatalysts catalyze specific processes with strong enantioselectivity, they may address this issue[4].

2. LITERATURE REVIEW

Jemli et al. studied Enzymes are used in a broad range of industrial applications or processes, including food and beverage, animal feed, textiles, detergents, and medicine. Because their original forms do not satisfy the criteria for industrial use, enzymes screened from natural sources are often altered before hitting the market. Protein engineering is the process of creating new enzymes with particular functional characteristics, such as stability, catalytic performance, reaction product inhibition, as well as substrate selectivity. For enzyme engineering, two methods have been used: rational design and guided evolution. The strong and innovative methods for protein engineering that have been discovered so far provide great possibilities for the creation of industrial enzymes with particular characteristics and the manufacture of high-

value products at reduced prices. The goal of this review is to highlight the most important areas of enzyme application and to give an updated summary of past protein engineering research in which natural enzymes were changed to satisfy the operating parameters needed for industrial use[8].

Current difficulties and possibilities of white biotechnology are encouraging protein engineers to utilize a directed evolution method to create new and effective biocatalysts for a variety of applications, according to Ashwani et al. In the past, several techniques of enzyme engineering were employed in an effort to create enzymes with better functions and characteristics. With directed evolution studies, recent advances in the fields of random mutagenesis, screening, selection, and computational design have improved the flexibility and fast creation of enzymes under high selection pressure. Directed evolution techniques enhance enzyme fitness without requiring a deep knowledge of them, and they clearly show their potential importance in modifying enzymes for industrial application. Despite considerable progress in biocatalyst creation to date, there is still a need to enhance mutagenesis methods and create simple screening and selection technologies that do not need extensive human involvement. This study examines the fundamentals and key advancements in directed evolution techniques, as well as improvements in mutagenesis, screening, including selection procedures, as well as instances of enzymes created using these methods. Several widely used techniques for generating molecular diversity, as well as some newly employed tactics, are described, along with their benefits and drawbacks[7].

The chemical sector has a huge demand for innovation, according to Langer et al. More and more established chemical processes are being converted to biotechnological methods in order to save resources, energy, and time. White biotechnology is needed to find and develop new enzymes, biocatalysts, and applications. Because the cultivability of microorganisms residing in particular environments is limited, methods must be developed that provide access to the vast untapped wealth of microbial variety. Metagenomics has the potential to offer novel and varied enzymes, biocatalysts, and bioactive compounds, as well as make industrial biotechnology an economically and sustainably successful endeavor[9].

3. DISCUSSION

The synthesis of a range of chemical compounds utilizing microorganisms is referred to as industrial or "White Biotechnology." White Biotechnology's molecular tools are enzymes that catalyze particular processes inside live cells. Enzymes are known for having excellent substrate specificity and enantioselectivity when working in an aqueous environment and under moderate reaction conditions. Microorganisms and enzymes are used by White Biotechnology to create a wide range of chemical compounds. As a result, there is a steady and fast increase in the need for novel and useful biocatalysts. We've used directed evolution to create techniques for isolating new enzyme genes, building new expression systems, and optimizing existing enzymes for biotechnological uses. Despite the fact that the GDH/ADH system has the identical enzymes, the gene order on the plasmid is inverted. The cellular enzyme activity were significantly reduced by this design (1500 U/g cell wet weight). This finding showed that not only the expression of the enzymes themselves, but also their ratio, is essential.

The high cellular enzyme activity obtained in the majority of settings demonstrate the excellent quality of these whole-cell biocatalysts. These strains can carry out efficient asymmetric reductions, and all reactions have high enantioselectivities of > 99.9% enantiomeric excess. These ADH-catalyzed biocatalytic methods are classic examples of how to use white biotechnology to make chiral chemicals with high optical yields and under moderate reaction conditions.

4. CONCLUSION

Various prochiral ketones were utilized as substrates in whole-cell bio transformations after the whole-cell biocatalysts were constructed and characterized. The typical substrate of ADH from L. kefir, acetophenone, is given below as an example. The specific cell activity produced by reducing 10 mMacetophenone utilizing the various systems ranged from 1 to 3000 U/g cell wet weight, with the ADH/GDH system providing by far the highest yield. Despite the fact that the GDH/ADH system has the identical enzymes, the gene order on the plasmid is inverted. The cellular enzyme activity were significantly reduced by this design (1500 U/g cell wet weight). This finding showed that not only the expression of the enzymes themselves, but also their ratio, is essential. The high cellular enzyme activity obtained in the majority of settings demonstrate the excellent quality of these whole-cell biocatalysts. These strains can carry out efficient asymmetric reductions, and all reactions have high enantioselectivities of > 99.9% enantiomeric excess. These ADH-catalyzed biocatalytic methods are classic examples of how to use white biotechnology to make chiral chemicals with high optical yields and under moderate reaction conditions.As a result, there is a steady and fast increase in the need for novel and useful biocatalysts. We've used directed evolution to create techniques for isolating new enzyme genes, building new expression systems, and optimizing existing enzymes for biotechnological uses. Also identified and studied biocatalysts that can be used to make enantiopure chemicals.

HYDROGELS: A REVIEW

Dr. Vishnu Prasad*

*Faculty of Engineering,
Teerthanker Mahaveer University,
Moradabad, Uttar Pradesh, INDIA
Email Id- vishnu.engineering@tmu.ac.in

ABSTRACT

Until 1960, Poly HEMA was generally neglected. Hydrogels have been in nature since the beginning of time. The polymerization of HEMA and crosslinking agents in the presence of water and other solvents has led to the emerging area of biomedical hydrogels. This article tries to summarize the research that have been done on the categorization, implementation, and management of the selectivity option for hydrogels. The next generation of super porous hydrogels (SPHs) and super absorbent polymers (SAPs) has been highlighted as a suitable mild technique for the study of solution-dependent phenomena. Hydrogels, also known as smart and/or hungry networks, are presently the focus of much scientific research due to their promise in high-tech applications in the biomedical, pharmaceutical, biotechnology, bio separation, biosensor, agricultural, oil recovery, and cosmetics sectors. Smart hydrogels show a significant physiochemical transformation in response to small changes in the environment. Such changes, on the other hand, are reversible; following a reaction, the hydrogels may return to their original form as soon as the catalyst is removed.

KEYWORDS: *Applications, Classifications of Hydrogels, Glucose, Ph, Stimuli, Temperature.*

INTRODUCTION

Hydrogels are a three-dimensional network of polymers made from natural or synthetic materials that have a great degree of flexibility due to their high water content. They may be able to hold a large quantity of water or biological fluids under physiological circumstances and have a soft rubbery consistency comparable to living tissues, making them an excellent material for a variety of applications[1]. Hydrogels having properties such as desired functionality, reversibility, sterilizability, and biocompatibility satisfy both cloth and organic needs to treat or replace tissues and organs, as well as to interact with biological devices. Hydrogels have been discovered in nature as a result of life on the planet. Bacterial biofilms, which are hydrated extracellular matrix additions, and plant structures are both examples of water-swollen motifs[2].

Early in human records, gelatine and agar were also recognized and utilized for various purposes, but the present records of hydrogels as a category of substances intended for biological programs can be traced. Poly (2-hydroxyethyl methacrylate) (polyHEMA) was mentioned in this

article. In a nutshell, it was described as a tough, brittle, and glassy polymer that was genuinely no longer taken into account of significance. Poly HEMA was mostly ignored after that publication until 1960. In the presence of water and other solvents, Wichterle and Lim reported the polymerization of HEMA and crosslinking marketers. They created a smooth, water-swollen, elastic, and transparent gel in lieu of brittle polymers. This breakthrough paved the way for the current field of biomedical hydrogels as we know them today. Following then, the number of different hydrogel formulations gradually increased over time[3].

This review looks at how hydrogels are used in a variety of areas, including biomedical, biotechnology, pharmaceutical, and separation era disciplines. The clever hydrogel provides a platform for a variety of applications, including micro fluidic control, biomimetic, biosensor/bio actuator, and sorption ability, thanks to its fantastic properties, such as reversible swelling/dispelling behaviour, excessive environmental sensitivity, excessive ionic conductivity, excessive permeability, floor homes, novel mechanical residences, and sorption ability. According to this evaluation, hydrogels can be processed in a variety of ways, including the traditional one-step method of direct polymerization of the multifunctional monomer by crosslinking or multistep tactics, in which the primary polymer is synthesized with precise useful agents and then reacted with a crosslinking agent, as suggested by Ahmed. To reveal the most mechanical strength, chemical homes, Stimuli reaction, density, biodegradation, and biological and environmental response, unique medical procedures for developing and processing a particular hydrogel for a given application are needed. Solution polymerization and suspension polymerization are the most common methods for creating a variety of hydrogel networks with molecular scale control over shape, as well as crosslinking density, initiator, emulsifier, and response situations, as well as tailor-made properties such as chemical, physical, and organic reaction to stimuli, mechanical strength, biodegradability, and solubility.

Superabsorbent polymers (SAPs) were introduced and extended to sectors where water preservation capacity became a significant problem around three years ago. Amazing porous hydrogels (SPHs) were discovered in 1998 to have greater elastic elasticity, mechanical strength, and water upholding potential than other types of water absorbent polymer devices. This assessment provides a comprehensive review of SAP and SPH development and differentiation, as well as a comprehensive course for fabric engineers to process a hydrogel of their own design[4]. Due to their purity, high absorption capacity, well-described structure, properly-described functionality, degradation, and stability in different tiers of pH, temperature, strain, and enzymes, artificial polymers have replaced herbal polymer hydrogels. As a result, the number of herbal and synthetic polymers available increases, as do their categories[5].

Concept Of Hydrogels

Classifications Of Hydrogels

The physical properties of hydrogels are determined by their physical properties, swelling characteristics, guiding method, origin, ionic fees and resources, biodegradation cost, and crosslinking location. The crosslinking process in physical gels has a physiological aspect[6].

Hydrophobic association, chain aggregation, crystallization, polymer chain complexion, and hydrogen bonding are some of the physiological methods used to accomplish this. To make a chemical hydrogel, a chemical technique called chemical covalent crosslinking (simultaneously or set up polymerization) is used. Chemical hydrogels are eternal and irreversible due to configurational changes, while physical hydrogels are reversible due to conformational modifications. Another kind of hydrogel is the twin-network hydrogel, which is created by combining physical and chemically crosslinked hydrogels via an electrostatic connection. It has recently been recruited to overcome the risks of completely relying on physical or chemical hydrogels with a strong liquid absorption capacity across a wide pH range and a greater

sensitivity to pH changes than chemical hydrogels. Few researchers have recently suggested another twin-community consisting of graphene-polymer composites with improved mechanical characteristics and self-recovery capability[7].

Hydrogels

Hydrogels that react to environmental stimuli show unexpected changes in their growth movements, community structure, mechanical strength, and permeability, earning them the moniker "environmentally sensitive, smart hydrogels." Light, tension, temperature, electric fields, magnetic fields, mechanical stress, and the strength of many electrical resources are examples of physical stimuli that alter molecular interactions at critical start points. Chemical stimuli include pH, ionic elements, and chemical agents, all of which affect the interactions of polymer chains with solvents and between polymer chains at the molecular level[8].

Any other splendour, referred to as dual responsive hydrogels, is the result of combining two Stimuli responsive mechanisms within a single hydrogel system[9]. A dual responsive polymer machine is made up of Polyacrylic acid and co-polyvinyl sulfonic acid. The reactions to ligands, enzymes, antigens, and other biochemical agents constitute a biochemical stimulus. Stimulus sensitive hydrogels are thus appealing biomaterials for pharmacological, medicinal, and biotechnology applications[10].

Hydrogels that respond to pH

Patel and Mequanint developed polymeric hydrogels with ionic pendant structures that may accept or give protons in response to a pH change in the environment. The degree of ionization, known as pKa or pKb, is significantly altered in a pH sensitive hydrogel at a certain pH. This fast shift in the net fee of the ionized pendant organization produces an abrupt quantity transition by creating electrostatic repulsive interactions between the ionized organizations, resulting in a large osmotic swelling pressure. Anionic and cationic hydrogels are two types of pH sensitive hydrogels. Anionic hydrogels contain carboxylic or sulfonic acid pendent agencies, which deprotonate when the pH of the environment exceeds the pKa, resulting in the ionization of the pendent businesses, which enhances the swelling of the hydrogel. Cationic hydrogels, on the other hand, include pendent corporations and amine corporations, in which ionization occurs below the pKb, causing swelling due to increased electrostatic repulsions.

Hydrogels That Respond To Temperature

Temperature-sensitive hydrogels are identified by their capacity to swell and contract when the temperature of the surrounding fluid changes, implying that the swelling and deswelling behavior is mostly determined by the ambient temperature. Hydrogels that respond to temperature may be classified as either positive or negative temperature responsive structures.

Hydrogels That Respond To Glucose

Appropriate insulin shipping hydrogel architectures must be created for diabetes treatment in order for the glucose-sensing provider to activate the release of insulin. Insulin carriers and glucose oxidase combinations with glucose sensitive hydrogels are attractive. HEMA and PMA are examples of "bio-clever" fabrics in which designed molecular reputation is combined with actuation, according to Podual and Brahim et al. The system's pH is lowered when glucose is converted to gluconic acid by glucose oxidase in the presence of oxygen, causing cationic hydrogels to expand and insulin to be released. Glucose oxidase has been covalently bonded to the hydrogel machine to minimize its rapid diffusion out of the device and enhance the regulated loading of insulin.

Hydrogels Have Several Uses

Hydrogels are a significant collection of resources with excellent technical, biological, and medicinal applications. Polyelectrolyte hydrogels are particularly useful because they transport or expand fees along the chain and bind with oppositely charged species to form complexes, highlighting their numerous applications in drug shipping, protein, peptide, insecticides, nutrients, hormones, agriculture, horticulture, biotechnology, and cell creation, pharmaceutical and biomedical packages. Cationic polymers are gaining popularity in the synthetic industry because they can break down large structures into smaller ones and cover high DNA charges, which are required for transfecting a wide range of cell types, gene, antisense, and bile acid sequestrates, as well as growing viral and non-viral vectors for DNA and oligonucleotide delivery. Hydrogels exhibit a large number of changes in response to minor changes in their environment, such as changes in the electric field, magnetic field, solvent, pH, ionic energy, and temperature.

Physically cross-linked hydrogels

Fundamentally cross-linked hydrogels, also known as reversible gels, have gained popularity owing to their relative simplicity of manufacture and the fact that they do not need the use of cross-linking agents during the synthesis process. Physical interactions between various polymer chains inhibit the dissolution of physically cross-linked gels. Because cross-linking agents are usually avoided in culinary, pharmaceutical, and biomedical applications, choosing the right hydrocolloid type based on concentration and pH may result in a wide range of gel textures.

The following are some of the techniques for making physically cross-linked hydrogels that have been described in the literature:

a) Freeze-thawing: Physical cross-linking may be accomplished by repeating freeze-thaw cycles. The development of microcrystals in the structure occurs as a result of freezing and thawing. Poly hydrogels made by freezing and thawing are a common example. These hydrogels, which are held together by hydrogen bonds, are more porous, spongy, rubbery, and elastic than PVA hydrogels made by conventional techniques. These gel matrices are now widely used in biotechnology, particularly in the immobilization of molecules (proteins, peptides) and entire cells.

b) Stereo complex formation: In recent years, hydrogels for drug delivery systems based on stereo complex formation have been developed. The main benefit of this method is that it is simple to make a hydrogel by dissolving each component in water and combining the mixture. PLA is an excellent example of a stereo complex that has good stereo complex characteristics. PLA's capacity to create stereo complexes was discovered for the first time. However, one major drawback of stereo complexation is the limited variety of polymer compositions that may be utilized.

c) Ionic interaction: Hydrogel systems are made up of ionic polymers that have been cross-linked by the addition of di- or tri-valet counter ions. The concept of gelling a polyelectrolyte solution with multivalent ions of opposing charge is based on this technique. Chitosan-glycerol phosphate salt and poly-[di(carboxylatophenoxy) phosphorene calcium salt are two examples of hydrogels in this group.

d) H-bonding: Hydrogen bonding interactions may be used to create physically cross-linked gel-like structures. The creation of a hydrogen-bond CMC (carboxymethyl cellulose) network by distributing CMC is the greatest example of such a hydrogel. The sodium ions in CMC were replaced by hydrogen in the acid in this procedure.

Maturation (heat-induced aggregation) is a heat-induced aggregation process that results in the creation of a hydrogel with finely organized molecular dimensions. The heat-induced gelation of gum Arabic is the greatest example of this hydrogel system. The phenomena are caused by the

aggregation of gum Arabic's proteinaceous components, which is produced by heat treatment. As a result of the aggregation, the molecular weight increases, resulting in the formation of a hydrogel with enhanced mechanical characteristics and water binding capacity.

Hydrogels That Have Been Chemically Crosslinked

Covalent bonding occurs across various polymer chains in chemically cross-linked hydrogels. As a result, unless the covalent crosslink sites are cleaved, they are stable and cannot be dissolved in any solvent. Due to the difficulties in decoupling factors such as gelation time, internal network pore size, chemical functionalization, and degradation time, the design flexibility of a physically cross-linked hydrogel is limited. Chemical cross-linking, on the other hand, produces a network with a high mechanical strength and, depending on the kind of chemical bonding in the building blocks and crosslinks, relatively long degradation periods.

The following are some of the techniques for making chemically cross-linked hydrogels that have been described in the literature:

a) Cross-linking via chemical means

b) Grafting Hydrogel preparation

c) Polymerization by radicals

d) Reaction of condensation

DISCUSSION

Without either an uncertainty, polymeric hydrogels have a number of important properties that qualify and allow them to show exceptional characteristics, allowing them to be used as vital instruments in virtually all sectors, including biomedical, agricultural, industrial, and environmental applications. Significant changes are made from time to time to revolutionize the area of hydrogels for their wide range of uses. Polymeric hydrogels, which correspond to current generations of materials, have been thoroughly studied in this study, and their technological applications have been briefly addressed. Recent developments in hydrogels have revolutionized current research in areas such as drug delivery systems, electrical conductivity, water purification, agricultural sector, decontamination of organic waste, and so on, and these developments are presented in this comprehensive review of the various types of hydrogels such as superabsorbent hybrid hydrogels, Conducting polymer hydrogels, Polyline hydrogels, and so on, and these developments are presented in this comprehensive review of the different types of hydrogels such as super absorb

CONCLUSION

This review examines the literature in the field of hydrogels over the last two decades, focusing on the classification of hydrogels based entirely on their unique physical and chemical properties, with a focus on stimuli responsive hydrogels for biomedical, environmental, and industrial applications. The technique of creating hydrogels and the design system have an impact on the production of hydrogels via several methods that need and specify a high level of sensitivity. The path taken by the research in this review demonstrates that the combination of polymers that react to different stimuli must be identified, and future generations of hydrogels that spontaneously swell when in contact with lungs and cancer cells must be explored. SAP and SPH, a progressive and ecologically friendly category, are new materials that expand quickly to a huge length regardless of their initial length and display beautiful houses, worldwide connections, and are easily recognized. The compounds tend to take in a lot of water or aqueous fluids in a short amount of time. Researchers interested in ion impregnated and altered selectivity in the future will be very interested in this new category. Miniaturization of these hydrogels with more desired durability, mechanical properties, and biocompatibility for brand spanking new

applications is required in this era of nanofabrication. As a result, determining medical requirements while also minimizing the complexity of the hydrogel technique will be the main objective for the foreseeable future.

DEVELOPMENT DIVISIONS OF UZBEK CINEMA

Murodjon Toyshiboevich Nasirdinov*

*Teacher,
Namangan State University, UZBEKISTAN

ABSTRACT

At the end of the twentieth century, a device was invented to film moving objects, people, and animals - in general. The name of this apparatus is derived from the Greek words cinematic motion and graph and is called cinematography. Since then, the art of cinema has found the art of making new films.

KEYWORDS:*Cinema, Art, Literature, Theater, Aesthetics, National, Film Essay, Work, Plot.*

INTRODUCTION

The art of cinema is the creation of a work by re-imagining the events of life on their own or in the absence of a special instinct, by means of multiplication. The art of cinema is an important tool in shaping the taste of remembering the ethnic perspective of the audience's depiction of events. Uzbek filmmakers X. Devonov portrayed real life in his chronicle films, which consisted of films made in Central Asia for 191 years, ranging from films to Oriental American exotics. In 1924, the Bukhara CompanyBukhkino was established, and in 1925, the SharqYulduzi film factory was established in Tashkent and began the development of Uzbek art. In the early years of Soviet rule, Soviet cinema in general was based on a chronicle of Uzbek cinema. Russian filmmakers K. Gertel, M. Doronik, Ch. Sabinsky, O. Fereliksky and others greatly contributed to the emergence of Uzbek feature cinematography. N.Ganiev, the assistant to the Russian filmmakers who created the first films of the SharqYulduzi film factory, founded the Uzbek national cinema. Actively participated. The emergence of sound cinema in the 1930s increased the artistic value of the art of cinema. "The creation of the film Kasam (directed by A.Usaltev in 1934-7) ushered in the era of sound films in Uzbek cinema. The development of sound cinema has further strengthened the ties of Uzbek cinema with advocacy and theater.

Film music is a genre of music associated with the formation and development of cinematography, which was originally designed to suppress the noise of the cinema apparatus. Gradually becoming an important tool of film dramaturgy, special music is usually written for each film. Sometimes it is expressed from the existing music. Soviet composers S. Prokofiev, Dunesky Multiplication are also used. Cinematographic music is inextricably linked with the plot, the emotional experiences of the voices, dramatic situations, contradictions and so on. Film and music cooperation has been established in Uzbekistan since the 1920s. As a genre, film music began to take shape in the second half of the 1940s. In writing music for the first Uzbek films, V.A. Uspensky, A. Kozlovsky used Uzbek folk melodies and songs and works by Uzbek

composers. For example, “Ravot songs” 1927 – “Tokhir and Zuhra 1945” and others In many Uzbek films created in recent years, the East is used as a means of dramatic development. For example, Abu Ali Ibn Sino (composer M. Burhanov 1957), Furkat (composer S. Yudakov 1959), Hamza (composer K. Akbarov, 1961) and other films play an important role in film music. For example. In 1959, the composers K. Akbarov, M. Бурхонов, M. “I was fascinated” created by Levnevs, in 1960 the composer M. Levnev’s “Mahallada duv-duv gap” and others. Music plays a major role in musical comedies, historical biographies about composers, conductors, singers, as well as film concerts, film operas, choreographic films.

In a cartoon, music has a special meaning. In it, the image is exchanged on the basis of educational rhythm, and the pictures are processed according to the finished music phonogram. In the interpretation of the image, the artist creates taking into account the nature of music (Abulqosimova:1999,p.23).

The first film in Uzbekistan was shown in 1897 at the Old Jova Square. Since 1908, foreign films have been shown in Tashkent, Samarkand, Kokand and other cities. The films shown in Central Asia consisted mainly of films influenced by the eastern exotics of America, France. The first cinematographer Khudoibergan Devonov in his first documentaries described the traditions of the Uzbek people, the landscape of Khorezm.In 1924, the Russian Bukhara company Bukhkino, and in 1925, the establishment of the Sharq Yulduzi (Uzbekfilm) film factory in Tashkent (1935) began the development of Uzbek cinema. However, due to the lack of national staff, attempts to set up a studio and organize regular photography at the Bukhkino company failed. The arrival of filmmakers in the Tashkent studio and their low level of professionalism did not allow them to create films of real national content. The films they created were only exotic and propagandistic in nature. The film began with the use of national prose and drama. The creation of a film based on scripts written by Russian experts themselves was a huge loss for the national cinema. It did not take shape for many years. Its formation as an “Uzbek national cinema” was impenetrable.

The content given in the silent films reflects to the audience more the point of view of the speeches of European experts, because the foundations of the authors, far from knowing the national traditions, were created in this spirit. Films from the 1920s, such as “Umbrella Carriage”, “Cunning Claw”, and “Chodira” are among them (Abulqosimova:1999,p.27).

The emergence of sound cinema has also increased the artistic value of Uzbek cinema. The first Uzbek sound film, “Qasam”, details the national acting culture, Uzbek life and psychology. “Nasriddin in Bukhara”(1943) revealed the real potential of the folk theme, showed how to build a beautiful and expressive series of visual aids, created a high level of performance. “Tohir and Zuhra” “broke” the boundaries of films based on folk tales, laid the foundation for the creation of historical films, allowing to feel the breadth of expressive play in the national spirit. The film “Tokhir and Zuhra” served as an important basis for the creation of the film “Alisher Navoi” (directed by K. Yormatov in 1947). Also, such artistic centuries as “Boy ila Xizmatchi”, “Kutlug Kan”, “Shohi sozana” were screened.

In Uzbek cinema, young people have formed a new view of modern requirements, moved away from the old stereotypes and assumptions, and have the opportunity to look at the world in a poetic way. At the same time, it came to be a page of educational value for urban boys and girls who knew that life consisted only of love, rejoicing, dancing in cafes, and dressing beautifully. This is especially true of director E. In Eshmuhammedov's works (Nafosat (1966) and Sevishganlar (1969) and others) he stood out. “Maftungman”, “Mahallada duv-duv gap”, “Sen yetim emassan”, “Kalbingda ko’z yosh”, “Tashkent non shahri”, “Sinchalak”, “Oxirgi kun”, “Ulugbek yulduzi”, “Natasha” and other films (Axmedova:2000,p.30).

Historical-revolutionary films ("The Destruction of the Black Consul") as a result of a new look at the accumulated experience of national filmmakers in the organizational and creative work, increasing the demand for screen art. In addition to The Seventh Bullet, a number of contemporary films have been made. They are "Violence", "Summer Rain", "Disaster Underfoot", "Tragedy of Love", "Fiery Trails", "Bitter Bean", "Other's Happiness", "Man Follows Birds", "Duel Under the Maple" and others. There are also "Nodirabegim", "Abu Rayhan Beruni", "Fiery Roads", "Shumbola" and others, which tell about the life of great scholars (National encyclopedia of Uzbekistan:2002,p.35).

In order to expand the research of Uzbek cinema, he sought to create films that more deeply and vividly reflect the social processes taking place in society. The screen has risen another notch in terms of quantity and quality, while genres have grown in form and content. Their diversity has increased. There seemed to be an escape from the usual content that had fallen into the mold.

"Alibaba and the Forty Thieves", "Here's That Boy Back", "Golden Wool Sheep Skin", "Awakening", "Disobedience", "Password", "Regina Hotel", "Armon", "Suyunchi", "Bride's Revolt " ,"The Case of Maysara","In the Dream"and other films are distinguished by their superior aesthetic quality and new forms (National encyclopedia of Uzbekistan:2002,p.603).

Uzbekistan Popular Science and Documentary Film Studio - short and full-length documentaries. The film studio, which produces chronicle scientific and popular films, was separated from the Tashkent Feature Film Studio in 1932. The first films consisted of chronicles and film sketches dedicated to the life of the republic. The first soundtrack was made in 1933 "Oasis in the Kizilkum"

The film studio joined Uzbekfilm in 1948, became independent in 1964, and in 1970 a branch of the Karakalpak ASSK was established. Nowadays, the social prestige of cinema has increased. The range of topics has expanded, with an increase in the number of works by local writers. Folklore, historical, contemporary and philosophical themes were reworked. "Women's Kingdom", "Scorpion", "Parimomo", "and Mother" and others are the latest films of recent years.

The founder of Uzbek cinema, N. Ibragimov, introduced world art to the world. Ganiev, People's Artist K. Yormatov's work will remain a bright page in the history of Uzbek cinema. Also, Y. A'zamov, Sh. Abbosov, L. Faziev, L. Sobitov, R. Botirov, A. Xamroev, A. Qobilov, Q. Kamalova, L. Musaqov, I. Ergashev, N. Faziev, A. Pann, M .; Krasnoyarskiy, A. Mukarramov, A. Penson, D. Fatxullin, A. Ismoilov, L. Gravitskiy, D. Operators like Abdullayev have made an invaluable contribution to the development of national cinema and its place in the world cinema. In addition to Uzbekfilm, there are such film studios in Uzbekistan as Vatan, Imon, Inson, Yogdu, Dostonfilm, Samarkandfilm, Shod and Yulduz. Uzbek documentaries date back to the 1930s. F. Nazarov, Yu. Gasilov, V. Dimkoviskiy, K. Alikaev, M. Kovrat, N. Ganiev, Yu. Azamov and others worked with high spirits in the early years of documentary film and achieved educational success. Physical training in production "Wonderful work", M. Kayumov's films "Victory of Uzbek Cotton Growers", "Holiday of the Uzbek People", "Big Fergana Canal", "Strong Stream" were highly appreciated. In particular, the film "Tashkent Textile Combine" (1938) won a gold medal at the World's Fair in New York (Issues of art criticism:1998,p.103).

During the war, feature films such as "To Friends at the Front", "Gift to the Front", "5th Republican Concert" were made.Post-war documentary filmmakers began their careers with enthusiasm and courage. Bright and lively films have been made, such as "The City with Four Gates", "Come to Uzbekistan", "Five Hands of Mankind", "Farkhod Lights", "Soviet Uzbekistan".Subsequent documentaries reflected the factories and plants being built in Uzbekistan, hydropower plants, the development of nature reserves, the life and work of science and art devotees, artistic achievements, major international competitions. "From spring to

spring", "13 swallows". "Teacher", "Gas and Chemistry of Uzbekistan", "People of the Blue Fire", "On the Road and in the Motherland", "The Story of Ashurov", "Frankly" and others.

M. Kayumov's many years of work are a separate page in the history of Uzbek documentary cinema. Who created side by side with him. Sh. Zoxidov, G. Nodirov, A. Saidov, O. Tursunov, N. Ataullaev, R. Rasulov, M. Arabov, A. Yoqubov, N. Rakhimova's contribution to the development of documentary cinema is great.In recent years, Uzbek documentaries have become more balanced. The range of topics has expanded. Films have been made that are in tune with life. The older generation was replaced by new young directors, cameramen, screenwriters and other professionals. "Sharof Rashidov", "Abdulla Qodiriy", "Pain", "Islam Karimov in the early 21st century", "Spring of Uzbekistan", "Gold of Uzbekistan", "Bread", "Road to the World", "Armed Forces of Uzbekistan", "Furkat" and others are the best films of recent years. In the development of modern documentary film D. Salimov, B. Muzaffarov, Sh. Maxmudov, Sh. The role of Kurbanbaev and others is different.Cartoons such as "Mysterious Box", "Mercy and the Beetle", "Winter Tale", "City Frogs", "Magic Samovar", "Apple Tale" cover various topics.Over the next decade, animated films created in a variety of genres provided the next-generation development. "Bahrom and Dilorom", "Pile", "New old fairy tale", "Flowers in the field" and others are among them.For many years, Uzbek Film has been served by a dubbing team that translates the world's best films into Uzbek and delivers them to the Uzbek audience. One of the founders and active participants in this industry is Q. Мирмухаммедов, M. G'aniev, S. Saidov, B. Xaydarov, S. Iskandarov, J. Obidov, B. Kutyakov, A. Sharanovs can be shown.The issues of cinematography are dealt with by the Art Research Institute. Filmmakers N. Prepared at the Ganiev Film College and the Tashkent Institute of Arts. The Union of Cinematographers of Uzbekistan (1962-1969 Association of Cinematographers of Uzbekistan) has had a House of Cinematographers since 1996 and a Museum of Cinematography since 1972.It should be noted that in the late 80's, as a result of the process of building privileges and the formation of a number of independent states in the early 90's, many young artists entered the art of cinema with new themes, new heroes and new creative pursuits. Most of the films made during this period are devoted to contemporary topics, and they are mainly dominated by evaluation criteria. The tradition, based on such a socio-critical analysis, was decided at the political level as a result of a reassessment of the recent past. The socialization of artistic observation was observed in the films "Who are you", "A trap for rabid dogs", "One step to the right, one step to the left", "Until dawn", "The back of the moon". However, such a revival in the modern theme began to fade slowly in the second half of the 1990s. In the historical moments of Uzbekistan's independence, the ability to communicate directly with its time and audience, to target the existing problems in the process of reforms in key areas of the nation's life, began to push the art of cinema to the forefront of public life. The process of reviving the spiritual heritage, understanding the national culture has attracted the attention of filmmakers to the history of the distant and recent past, the themes and personalities that were once hardened into a layer of forgotten values. This, in turn, weakened his interest in contemporary topics and pushed him aside for some time. By the end of the 90s of the 20th century, the number of films about the present, the current events and the life of our people has decreased.

TREATISES OF ORIENTAL SCHOLARS ON THE PERFORMING ARTS

Shahzodbek Shukhratjon ogli Rustamov*

*Teacher,
Namangan State University, UZBEKISTAN

ABSTRACT

The theoretical views of Eastern scholars were formed on the basis of existing experience in the performing arts, and in their treatises they provided detailed information about the role and importance of music in society. Al-Husayn's (15th century) pamphlet "Musical Canons" provides information about the dutar, a two-stringed musical instrument that is widespread among the peoples of Central Asia. Qutbiddin al-Sherazi (1236-1310), known as an Iranian music theorist, made exemplary comments on the bowed tanbur in his treatise and considered the human voice to be the most pleasing of musical instruments.

KEYWORDS:*Work, Music, Instrument, Performance, String, Science, Melody, Tanbur, Flute, Rubob, Dust, Law.*

INTRODUCTION

Al-Farabi's (873-950) "Book of Great Music" ("Kitab al-musiqa al-kabr"), Ibn Sina's (980-1037) "Book of Healing" ("Kitab ush-shifo") encyclopedia –Khorezmi's (X century) "The key to knowledge", Sayfuddin Urmavi's (1216-1294) "The book about nobility" or "The book of Sharofiya", Jami's (1414-1492) "The treatise on music" contain important information about music performance and folk instruments given Sayfuddin Urmavi is known as a talented oud player, singer, and famous musician (Rosenshild:1969,p.33).

He was born in Urmavia, Azerbaijan. Sayfuddin's greatest achievement was that he developed a perfect system of modes. Ibn Zayli's (Complete Book on Music) (Kitab ul-kabir fil-musiqiy) (died 1044) is his only and invaluable book in musicology. He developed a new way of expressing moods in letters in music. Abdukadir Maroghi (15th century), Abdukadir ibn-Royibi (Maroghi) was born in the city of Marog in Azerbaijan, but spent the second half of his life in the palace of Timur - in Samarkand and died in Herat. In his pamphlet The Collection of Tones in the Science of Music (Jami al-alhan fi-ilm al-musiqiy), he enriched the doctrine of music with information about the existence of a kind of musical instrument, such as the kamoncha, the seven-stringed gijjak (National Encyclopedia of Uzbekistan:2000,p.53).

Al-Husayn's (15th century) pamphlet "Musical Canons" provides information about the dutar, a two-stringed musical instrument that is widespread among the peoples of Central Asia. Qutbiddin al-Sherazi (1236-1310), known as an Iranian music theorist, made exemplary comments on the bowed tanbur in his treatise and considered the human voice to be the most

pleasing of musical instruments. Darvish Ali, a musicologist from Bukhara who lived in the 17th century, gave detailed information about musical instruments such as tanbur, chang, kanun, rubob, kobiz, gijjak.

The legacy of the thinkers of the Great East also has historical value in the study of folk instruments. The famous work of Abu Nasr Muhammad Farobi "Kitab al-musiqa al-kabir" ("The Great Book of Music") is of great importance. In this book, the medieval scholar distinguishes between two types of musical performance: the resonance of melody in the human voice (the art of singing) and the playing of instruments. As a talented performer, Farobi focused on the role of musical instruments in the life of society, and wrote:

The above opinion of Farobi proves that the instruments played a leading role not only among the courtiers, but also among the townspeople and artisans, as well as in the musical culture.

The second part of the book is entirely devoted to the musical instruments of that period. It describes tanbur, nay, rubab, chang, law and other musical instruments in a consistent and detailed manner. Pharoah considered the stringed, mizrobli lyutnya to be the most common instrument at that time. Lyutnya is affected by a specific mizrob (click), and on the handle are ligatures (lado). In the IX-X centuries lyutnya was called ud in Arabic. This instrument is still preserved in many Eastern countries, among the peoples of the Caucasus. Samples of modern oud are available in the experimental laboratory of the Tashkent State Conservatory.In The Great Book of Music, Farobi describes another instrument, the tanbur. According to the scientist, the tanbur is one of the closest types of instruments to the oud (Trigulova:2008,p.23).

In the tanbur, the strings are pressed using a nail (a special metal click-nail). The tanbur is as common and popular as the oud. The tanbur had two or three brass strings. Two types are known: Khorasan and Baghdad tanburs. The status of the Baghdad tanburs was less (five), and the instrument handle was shorter. The Khurasan tanbur had many statuses, with curtains on the handle from the throat of the instrument to half of the handle. This type of tanbur has not lost its form to this day and is used in solo and ensemble music.Farobi also describes nay. He puts different wind instruments into the piano group according to the principle of sound formation.One of them is a simple reed or a multi-hole reed located in one direction. This type of flute, or flute of various names, still exists today among the peoples of the East. The Vietnamese call it sao, the Tajiks tutek, the Tatars kaval, the Kazakhs sibizga, the Azerbaijanis ney (very rare), the Kyrgyz uoo, choor (shepherd's instrument), and the Uzbeks nay. The scholar also dwells on the common trumpet, which is often made of mulberry wood.

Farobi also mentions dunay (mizmar). The Danube is similar to the modern neighboring or Turkmen folk instrument gosha-dili tyuy duke (an instrument made of double reed tubes).Farobi's treatise also describes in detail the rubab that existed during his lifetime. The rubab of that period, like the modern Kashgar rubab, consisted of a resonator and a much longer handle. There were two types of twisted wire rubab. 1 wooden decal and the main part is made of wood, 2 the lower part is made of leather (Gruber:1953,p.21).

Farobi testifies that the dust belongs to a series of musical instruments that create a melody through the vibration of open strings. There were 15 strings of dust at that time, which were diatonic tuned and had a volume equal to two octaves. All the instruments described in the pamphlet were used to accompany singing, dancing, soloism, and ensemble performance. Farobi testified that the oud played a leading role in the ensemble's performance. In the Book of Musical Instruments, the scholar explains how to tune instruments such as the tanbur, rubab, and chang to fit a melody or a solo singer. Thus, the great scholar of the East laid the foundations of the field of instrumental studies, which studied instruments as a branch of musicology. This field was later enriched and developed in the works of other scholars as well.

According to the period in which he lived, the great scholar Ibn Sina was very close to Farabi. His major treatise, The Book of Medicine, contains a treatise on music, describing his scientific and philosophical knowledge of the music of that period. In these pamphlets a lot of space is given to the definition of instruments. Ibn Sina divides the music of his time into two groups: mizrobli, nohunli (barbad, tanbur, rubob) and open-stringed instruments (shahruh, chiltor, lyre, chang, harp) drawn along the entire resonator cover.At that time, the famous thinker of the East, Sayfiuddin Urmavi, developed a system of musicology. He was known as a master musician, singer and master composer. Based on his experiments in Udda, the scientist stated his theoretical rules. In Urmavi's Book of Piety, the oud is said to be the most popular and modern of musical instruments. Ud had five pairs of strings and 7 status (ladi) in the order of a quarter. The strings are called bam, masnas, masna, zir and the highest hadd. The improved double-stringed oud has retained its structure in recent times. Shirazi (1236-1311), Jami (15th century), al-Husseini, Maraghi, and Ibn Sina also wrote about the five twin strings and the seven maqams (ladas) of Ud, which were tuned to the quartet. A complete sketch of the oud handle given in Jami's "Booklet on Music" gives a complete picture of how to tune it. According to the scientist, the existing 12 maqoms are the basis of ancient mature music. Focusing on the impact of community music on listeners, he believes that it has a deep spiritual and spiritual significance (Musical aesthetics of the Western European Middle Ages and the Renaissanc:1965,p.38).

The pamphlets created in the XIII-XVII centuries contain descriptions of stringed instruments such as chang, kanun, nuzkha, rubob, tanbur, as well as the tambourine.Darvish Ali's (17th century) treatise on music, created in Bukhara, can serve as a source of information about traditional instruments. It contains rare information about the culture of music, in particular, the instruments that exist in the major cities of Central Asia, as well as talented performers.

Darvish Ali's treatise is a valuable source for studying Central Asian music of the 16th-17th centuries. The play tells the creative biographies of famous singers, musicians and composers.

Darwish Ali, like his predecessors, called the udni, which is considered the best in terms of vibrational tone among stringed mizrob instruments, the "king" of instruments. According to the pamphlet, it is dedicated to Zuhra, the patron saint of dust instruments.

The powder described had twenty-six strings and seven curtains for the performance of the seven statuses. In addition, the pamphlet mentions such instruments as law, rubab, kobiz, gijjak, music, ekbon-nay, (damli, leather), ruhavza (six-stringed nohunli), which is widespread in China.Seven of the instruments described by Darwish Ali, tanbur, chang, kanun, ud, rubab, kobiz, and gijjak, were common at that time.Darwish Ali's data confirms the idea that in the practice of music, the ensemble originally used stringed and stringed instruments that produced the appropriate calories. The pamphlet mentions the names of the dustman Dilorom, the flute players Abduqadir and Hodja Abdullah, Mawlana Qasimi-Rabbani, Sultan-Ahmadi – "crazy" rubabists, brothers Sheikh Abu - Bakri Rabbani and Sheikh Behduchi, wise jurist Sheikh Shamsi Rabbani and many other famous masters.

The testimony of Darvish Ali is also valuable in that a large part of the instruments he recorded (flute, trumpet, dust, law, rubab, tanbur, gijjak, kobiz, doira, drum, oud) were used in modern Uzbekistan, Tajikistan and other Central Asian republics, as well as in Azerbaijan. has survived to our day and is improving. These musical instruments have long been firmly rooted in the cultural life of the Uzbek people and have been widely used in its cultural life. Therefore, it is appropriate to call these instruments Uzbek folk instruments. In the works of Abdul Fazl Boyhaqi (XIV century) the names of stringed mizrobli (rud, barbad, tanbur), tambourine and percussion instruments (trumpet, litavra and drum) are mentioned.

It is known that in the literature of the East in the past the system of response to the works of poets ("nazira") was widely used. Many "Khamsa" were created in the same way. In his epic

Sab'ai Sayyar (one of the epics of Hamsa), Navoi reinterpreted the ancient legend of Bahrom Gor. The protagonist of the work is a duster named Dilorom. The poet embodied his instrument as a symbol of music.

According to Zahriddin Muhammad Babur (1483-1530), Alisher Navoi in his time helped many oud players to show their talents. The "Boburnoma" mentions the names of performers of Uzbek folk instruments. Babur also mentions such talented performers as Shah Kulmi-Gijjaki, Hussein Udi, Khoja Abdullah Marvarid Qanuni.

During the Navoi period, the performance of nay, ud, gijjak, kanun, karnay, surnay, drums, doira, chang was widespread. All of them were used both in ensemble performance and solo performance. Dust stood out as a solo instrument.

Comparing the data of the written monuments of the XV-XVII centuries, it can be concluded that by this time, the culture of performance on folk instruments in Central Asia had matured. Performers of Uzbek folk instruments also created their own musical works. At that time, there were talented dust, ud, gijjak, law, nay, tanbur, bulaman performers and mature singers, who formed their own ensembles. Solo performance is also developed.

In his "memoirs", Wasifi mentions the name of Haji Abdullah Marvarid, a lawmaker who invented a great style like a trellis. The melodies and songs he composed were popular among the people. Thus, in the fine arts and literary heritage of the XIV-XVII centuries there was a rich material confirming the stability of the main types of musical instruments, which have their roots in the distant past.

The treatises of Central Asian scholars on music, fiction, and painting allow to some extent to restore some of the broken links in the long chain of historical development of Uzbek folk instruments that have survived to our day. Hundreds of years have passed, and musical instruments have taken their place in solo, ensemble and orchestral performance and are still alive today.

ABSTRACT

The article notes that the educational process in modern conditions, with all its possibilities, should be aimed at the development, socialization of the individual and the upbringing of skills of independent, critical, creative thinking, the use of innovative educational technologies in order to increase the motivation of students, improve the quality and effectiveness of training, consistent, continuous, purposeful, systematic assimilation of information, necessary for the organization of life and professional activity of students based on the experience of developed foreign countries, conducting scientific research to achieve their formation by educated, personality-oriented educational technologies are aimed at the development of personality, personality characteristics, abilities of the student taking into account his strategy of thinking and actions, fostering interaction between the teacher and the student on the basis of cooperation and freedom of choice, ensuring the recognition of the student as a value, increasing the motivation of students in the educational process., in order to improve the quality and efficiency of teaching, the use of a number of educational technologies that have an innovative nature and are necessary for consistent, purposeful, systematic mastering of lessons, students are treated with such issues as creative search, conducting small studies, putting forward certain hypotheses, substantiating results, reaching certain conclusions, focusing on the formation of skills and abilities.

KEYWORDS: *Technology, Creativity, Purpose, Innovation, Interest, Use, Motivation, Quality, Student, Education, System, Process, Result, Form, Method, Development.*

INTRODUCTION

Further development of the educational system, introduction of the credit-module system, coordination of educational processes on the basis of innovative approach, development of students' educational-cognitive competency plays an important role. Today, in the education system, the activation of educational and cognitive activities of students in the preparation of

future teachers, the organization of Independent Education is an important factor for the acquisition of modern professional knowledge. A number of researchers are dealing with the issues of increasing the intellektual activity of educators, the evaluation of their preparations. The results of the studies reveal the need for independent education through the development of effective methods of organizing and managing educational and cognitive activities in institutions of higher learning, the formation of individual educational training of students. In this regard, it is important to develop the educational-cognitive competencetirishga to develop the technology of effective organization and conduct of independent work of students through the application of educational technologies aimed at improving the educational-cognitive competence of students, improvement of existing technologies, development of adaptive options for controlling independent education in the field of educational-cognitive activity of students.

Determination of didactic aspects of the formation of methodological culture as an important structural basis of professional training of students in the educational process, improvement of pedagogy of development of methodological knowledge in the style of the basis of innovative activity, finding content of flexibility and mobility in rapidly changing socio-economic, cultural conditions in students, improvement of didactic bases of use of, on the basis of international assessment programs, the development of organizational and pedagogical measures to improve the quality of education is an important priority[1]. Among these tasks, the education of young people with a high spiritual vision and the realization of their potential are one of the pressing issues of today and the priority in their solution is the development of educational-cognitive competence of students in the spheres of professional education. In this regard, regular acquaintance with effective pedagogical technologies, methods and forms of implementation is recognized as an urgent problem.

MAIN PART

It is desirable to use educational technologies of innovative nature in order to motivate students, improve the quality of teaching and improve their effectiveness[2]. The same situation was observed in the experience of developed foreign countries and scientific research was carried out in order to prevent it, to ensure consistent, continuous, targeted, systematic mastering of the necessary information for the organization of vital and professional activities in education recipients, to achieve their formation as educated. As a result of these studies, a number of educational technologies have been created and they are generally referred to as “personality-oriented educational technologies”.

Personality-oriented educational technologies are educational technologies that are aimed at developing the personality, specific characteristics, abilities of the student, taking into account the thinking and action strategy, and their specific aspect is to create a comfortable, necessary environment for the comprehensive development of the personality of the educational recipient[3].

Problematic from personality-oriented educational technologies, educational technologies such as project, collaboration, interactive serve to bring about the faulting of student-learning activities[4].

The following can be recognized as effective educational technology in ensuring the attainment of students' learning and cognition activities today:

1. Problematic educational technologies.

2. Interactive educational technologies.

3. Collaboration education technologies.

4. Project Education Technology archives-project topics.

At the same time, the importance of the educational activities organized on the application of these technologies of education in the field of student's educational and cognitive activity is great.

Today, based on the experience of world education, there is a wide range of use of the following types of personality-oriented educational technologies in educational institutions[5].

Problematic education is an advanced pedagogical technology that reflects the essence of modern education. Its use in educational practice serves to form such skills and skills as creative research in educators, the implementation of small studies, the promotion of certain hypotheses, the justification of results and the conclusion of certain conclusions. In problem teaching, the method of solving problem situations is actively used. In solving problematic situations, controversy is used. It is effective to work in such a phase, especially in small groups.

Interactive learning technology. Today, the use of interactive educational technology is becoming increasingly popular. This educational technology is organized on the basis of cooperation between the main participants of the educational process – the teacher, the student and the group of students, heated discussions, the possibility of mutual exchange of views, free thinking in them, a double statement of their personal views, joint solutions in problematic situations, mutual proximity of students in mastering educational materials," teacher-student – the group of students is characterized by" mutual respect, understanding and support for each other, being in a sincere relationship, achieving spiritual unity, etc.

Collaboration education technology. This educational technology consists in the joint development of educators and students in the process of their educational activities, their understanding of each other, their sense of closeness to each other, their stages of activity and the analysis of the results achieved in them jointly, is of particular importance with the reflection of progressive, developing ideas in themselves.

The main directions of the technology of cooperation education are: the organization of relations based on educational cooperation, denying pedagogical demand; individual approach to students, students on the basis of ideas of humanism; achieving the decision-making of professional and spiritual unity in the educational process[6].

The main directions of the technology of cooperation education are: the organization of relations based on educational cooperation, denying pedagogical demand; individual approach to students, students on the basis of ideas of humanism; achieving the decision-making of professional and spiritual unity in the educational process[7].

Project educational technology archives-project topics The project is a concrete plan, a product of effort aimed at developing the content of pedagogical activity, guaranteeing its outcome on the basis of the goal.

The project is represented in the form of a program, a model, a technological map.

The basis of the project is an idea of a scientific or creative nature.

Designing is a practical effort aimed at developing the content of an activity or process through forecasting, forecasting, planning the expected result based on initial data[8].

The design is based on the system" idea – goal – expected result – prediction – prediction – planning"[9]. Design is carried out with the help of various tools, namely material objects, weapons, for example: computer technology, vatmon or ordinary work paper, ruler, pencil, marker, copy apparati printer, etc.

Pedagogue for the creation of the project:

- Create a project;

- Step-by-step lighting of the process;

- Clearly set the goal;

- To identify objectives;

- Formation of the content of educational material;

- To develop a system of questions and answers;

- Justification of the methodological structure of the process or event;

- It is necessary that the student has the skills and qualifications such as the diagnosis of the level of knowledge and the assessment of the level of his her upbringing.

The design of the educational process – the development of its project (scheme), taking into account all omillarni for the effective organization of the learning process obtained separately[10].

Legislation on the design of the educational process:

1) the effectiveness of the design of the educational process is ensured by the purposeful coverage of all components (technological process, technological process management, tool, information, socio-economic provision)in the project;

2) technological means of education are selected depending on the individual characteristics of the students;

3) design strategies are selected according to the individual style of the teacher;

4) the quality of design depends on the scale of feedback (between the teacher and the student), the content of the design, as well as on the effectiveness of all factors.

In the design of educational processes, it is considered appropriate to pay attention to the content of education, the purpose of education, the correct definition of the expected result, the correct selection of educational methods, forms and tools, the exact criteria for assessing the knowledge, skills and qualifications of students in advance, their proper implementation and harmonization with each other in the allotted time.

One of the important requirements for the organization of modern education is to achieve high results in a short period of time, without excessive mental and physical exertion. The delivery of certain theoretical knowledge to students for a short period of time, the formation of skills and skills in certain activities, as well as the control over the activities of students, the assessment of the level of knowledge, skills and qualifications acquired by them requires a high pedagogical skill from the teacher, a new approach to the educational process.

RESULTS AND DISCUSSIONS

In modern conditions, special attention is paid to the effective use of opportunities for the full realization of individual opportunities of education, increasing its interest, needs, development of abilities[11].

Problematic educational technology is considered to be an improved technology, and today it is used more effectively in higher educational institutions. Its task is to motivate the process of active cognition and formulate a research method in thinking. Problematic education corresponds to the goals of the upbringing of a creative active person[12].

According to its essence and didactic capabilities, problematic educational technology is aimed at the formation of skills and skills, such as creative research in students, the implementation of

small studies, the promotion of certain hypotheses, the justification of results, the conclusion of certain conclusions.

There are the following types of problematic education[13]:

1. Problematic statement of knowledge (problematic lecture).

2. Solve problematic tasks (problematic practical training).

3. Conducting small scientific research (problematic experience).

All the types of problem character are defined in the organization of educational activities of students:

- Individual;

- In pairs;

- Create opportunities for them to work in a small group.

In the course of the training, students will be able to fully understand the essence of the problem theoretically, collect data, sort them out, promote several options for the solution, find the optimal solution, describe the solution, organize actions such as dalillash their own opinion. It is ensured that the student (in an individual case) or students (in pairs and group)will be able to react to the solutions by the expert groups formed by the teacher or students who have deeply mastered the topics.

Necessary conditions are created for students to work with problems of didactic, practical and scientific character in the course of training and in conditions outside the audience[14].

Interactive education technology is considered to be educational technology, which is recognized as the most optimal way to increase the effectiveness of Education. Interfaality represents the ability of participants in the educational process to develop knowledge, skills, skills and the ability to organize a joint, collaborative action to master certain moral qualities[15]. Interactive educational technology is based on the organization of the interaction of students on the way of mastering knowledge, skills, qualifications and certain moral qualities.

Interfaithality in the educational process means that students have the ability to organize a joint, collaborative action through the acquisition of knowledge, skills, qualifications and certain moral qualities. And from a logical point of view, interphalicism, first of all, expresses the conduct of social subjects in conversation (dialogue), an action, an activity based on mutual cooperation[16].

Interactive education is organized on the basis of cooperation between the main participants of the teaching process - teachers, students and groups of students, lively discussions, the opportunity to exchange ideas, to think freely, to express personal views without hesitation, to seek solutions to problems; in mastering is characterized by the formation of mutual intimacy of students, mutual respect, understanding and support of each other, a sincere relationship.

In interactive education, the conversation is organized between the following persons:

1. Student-student (work in pairs).
2. Student-a group of students (work in a group or small group).
3. Student-student team (class, work in a group team).
4. Student-information and communication technologies.

In the essence of interactive educational technology, the organization of the conversation in the form of “student – information and communication technologies” means the acquisition of

knowledge, skills, skills by students independently or under the guidance of the teacher with the help of information technology.

With the help of interactive educational technology, the teacher is able to form such qualities as the development of students' abilities, independence, self-control, self-management, conducting effective conversations, working with peers, listening and understanding their thoughts, independent, creative, critical thinking, promotion of alternative proposals, freely expressing their thoughts, protecting their point of view, striving to find a solution to the problem, getting out of Most importantly, through the use of interactive educational technologies, the teacher acquires the opportunity to objectively assess the students' actions based on interaction through organization, orientation, management, control and analysis in order to achieve a specific educational goal.

In the process of applying interactive learning technologies, students will have the following opportunities:

- Work in collaboration with a group or team;

- Freely express their ideas among peers, demonstrate their knowledge without any mental barriers;

- Creative approach to problem solving;

- Achieve spiritual intimacy with group or teammates;

- Ability to fully demonstrate their internal capabilities and abilities;

- Thinking, summarizing thoughts, sorting the most important ones;

- Self-control and independent assessment;

- Make sure of your own options and strength;

- Mastering the skills of moving in different situations and getting out of difficult situations.

Interactive education technology has the following capacities:

- Around interest in mastering knowledge in students;

- Entourage each participant of the educational processstiradi;

- Has a positive effect on the psyche of each student;

- Creates favorite conditions for through mastering of the educational material;

- Has a multifaceted impact on students;

- Awakens the students' opinion and attitude on the topics;

- Develop vital skills and skills in student;

- Ensures that students' behavior is changed to the positive side.

Interactive learning technology is used in the following forms:

I. Complete the creative task.

II. Solve problematic situations.

III. Social project.

Cooperation education manifests itself in certain signs. Partridge :

- Paying attention to the personality, individuality of the student;

- To master the ready knowledge and deny their re-development;

- Development of independent and critical thinking in students;

- To ensure the emergence of a positive attitude towards the educator and peers;

- Development of cultural communication skills in students;

- Create an environment based on cooperation and mutual equality.

During the use of this technology, students were able to perform the following types of teaching assignments in pairs, in small and large groups:

1. Preparation of educational projects.

2. Create a presentation.

3. Creative worklanm preparation.

The involvement of students in the preparation of educational, scientific and creative projects in the educational and cognitive activities can also guarantee expected effective results. Working with projects takes a special place in the higher education system, creating an opportunity for the student to acquire knowledge that traditional methods of teaching can not provide.

Effective project:

- have practical value;

- provide students with the opportunity to conduct independent research;

- it is necessary that he, like the work process itself, should not be able to guess from the very beginning both when working with it and when completing it;

- it should be able to provide the manifestation of sawdust in solving a wide range of tasks;

- must be able to establish cooperation between students.

There are also factors that negatively affect the effectiveness of projects. In this place, the following factors are indicated:

1. Personality factor: lack of warm attitude of the educator to the preparation of projects; the origin of conflicts due to age differences in the process of communication between the educator and the student; different approach to work.

2. Professional factor: the fact that educators do not have the necessary level of knowledge on the problem under study.

3. Organizational factor: the combination of a large number of students to the project managers; the focus of a large number of time on the solution of organizational issues; the “single allocation” of the student in the educational process (self-exclusion); the inadequate provision of the training process with technical, technological equipment.

Projects prepared by students can be divided into two types. Partridge:

1) projects aimed at solving a specific problem and having a practical nature;

2) projects that direct students to learn some kind of material, to perform exercises designed to achieve some kind of goal.

In the preparation of projects, students must be fully armed with methodical instructions. Arming students with methodological guidelines in the direction of project preparation ensures that such work has a qualitative, practical value. It is not profitable to give the following methodical instructions to students:

- Project essence coverage;

- Explain the requirements for working on the project;

- Familiarization with job evaluation criteria;

- To provide information about the teachers who lead the project (their work experience, academic orientation, base information);

-To show forms of work on the project (work directly, work in the laboratory, carry out research in the library, study, design and compile-build (design) - related projects).

CONCLUSION

The use of innovative educational technologies in order to enhance students' educational and cognitive activities, improve the quality and effectiveness of teaching is considered necessary. Problematic education, interactive education, collaborative education, project education technologies serve to enhance students' learning and cognition activities. Therefore, it is emphasized the need for active use of them. In recent years, step-by-step, but consistently developing personality-oriented educational technologies directly serve the purposes of improving the quality of education, increasing efficiency, providing highly qualified, mentally stable, competitive professionals. In essence, problematic, interactive, collaborative, project technologies serve to prevent the same, tedious process of teaching in the educational system, on the contrary, to create the necessary conditions for it to be interesting, active, vibrant.

Different types of activities, social relations, as well as various subject-practical actions in the learning process take place in the life stages of a person's life. However, only cognition in the learning process will give a person a specific description of learning activities. Learning-based understanding takes a specific form in an individual's learning activities, such as experimenting, building, designing, and performing subject-practical actions in solving research problems.

ABSTRACT

Most nations recognize the creation of new plant varieties as a kind of intellectual property right (IPR) stemming from the International Convention on the Prevention of New Varieties of Plants. Article 27.3(b) of the WTO Agreements on Tariffs and Trade of Intellectual Property Rights requires its members of the World Trade Organization (WTO) to "provide for the plants varieties by either patents or by an appropriate generis system, or by any combination thereof." The connection between patenting as well as plant variation rights protection is examined in depth in this article, which examines the recent decision by the European Patent Office's Extended Board of Appeal that techniques for growing broccoli and tomatoes were not patentable. It comes to the conclusion that the right to patent agricultural inventions is becoming more politicized.

KEYWORDS:*Intellectual Property, Patents, Plant Breeding, Plant Variety Rights Protection.*

1. INTRODUCTION

Plant variety protection: Under the International Convention for the Protection of New Varieties of Plants, the development of new plant varieties is protected as a type of intellectual property right (IPR) in most countries (UPOV). Article 27.3(b) of the WTO Agreements on Trade - Related of Intellectual Property Rights (TRIPS) requires members of the World Trade Organization to "provide for the protection of plant varieties whether by patents or from an effective sui generis system, or by any combination thereof." Although the TRIPS Agreement does not specify which "sui generis system" will meet the agreement's requirements, most of the WTO's 153 members have passed domestic legislation depending on the 1991 version of UPOV[1].

Plant varieties that are distinct, homogeneous, as well as stable can be protected under UPOV. If a variety has not been commercialized in the country of preservation for more than a year, it is considered new. A variety is distinct if one or more important botanical characteristics distinguish it from all other known varieties. Plant characteristics within a variety are uniform if they are consistent from plant to plant. If the plant characteristics are genetically fixed and thus

remain the same from generation to generation, or after a cycle of reproduction in the case of hybrid varieties, the variety is stable. Breeders have the right to use protected varieties to create new varieties, according to the 1991 version of UPOV. This exception, on the other hand, is limited to new varieties that are not "essentially obtained" from guarded varieties. This limitation was added by the drafters to protect second-generation breeders from claiming protection for a different flavor by making only cosmetic changes to existing varieties. The limitation of farmers' privilege to save seed for propagating the commodity of the harvest they acquired by planting a protected variety "on their own holdings," within reasonable limits and subject to the protecting of the breeder's legitimate rights," is probably the most contentious aspect of the 1991 Act from the perspective of farmers. Earlier versions of UPOV allowed farmers to sell or exchange seeds for propagation with other farmers[2].

Seed-saving privileges and the ability to develop non-essential new varieties from protected work were built into the legislation as compromises to address public policy concerns. It was recognized that allowing individuals to privatize food varieties could jeopardize food security by locking up breeding material and preventing farmers from saving seed for future harvests. Plant breeders, on the other hand, found any derivation of new varieties from existing protected varieties unpleasant, whether necessary or non-essential, and any seed-saving by farmers robbed them of fresh sales. As a result, they turned to patent law to protect their new varieties, which does not include these exceptions[3].

1.1.Plant Varieties Are Patentable In The United States.

Biological material, including plant varieties, has never been excluded from the scope of patentable subject matter in the United States. Plant varieties in the United States may be protected via a system of plant patents, utility patents, or the Plant Variety Protection Act (PVPA). The Plant Patent Act (see note 3) grants patent protection to new asexually reproduced plant varieties. A plant variety must be novel and distinct, and its invention, discovery, or reproduction must not be obvious under this scheme. One of the scheme's drawbacks is that each application can only make one claim, which must cover the plant variety. In Pioneer Hi-Bred International Inc. v. J.E.M. Ag Supply Inc. the Federal District court, Court of Appeal fixed any possible conflict between patent protection as well as protection under the Plant Variety Protection Act (PVPA). Pioneer's patents covered the manufacture, use, sale, as well as offer for sale of the company's inbred as well as hybrid corn yield product lines, as well as certificates of protection for the same cotyledons varieties of corn underneath the Protection of Plant varieties Act. The defendants claimed that the Plant Variety Protection Act had excluded seed-produced plants from the Patents Act's domain of patentable subject matter. The Federal Circuit dismissed this argument, citing the Supreme Court's decision that "when two statutes are capable of coexistence, it is the duty of the courts to regard each as effective[4].

1.2.Patenting's Impact On Plant Variety Right Protection:

Given the interrelationship among patents as well as plant variety protection, it's possible that a plant breeder could infringe on a patent while developing a new variety. In order to address this issue, Article 12 of the EU Directive on the Protection of Biotechnological Inventions mandates compulsory cross-licensing in instances when a breeder cannot obtain or use a plant variation right without infringement on a previous patent. In such cases, the breeders may seek for a non-exclusive compulsory license to use the invention, which will be granted "subject to payment of an adequate royalty. A compulsory license is also applicable when a patent holder is unable to exploit an invention without infringing on a plant variety right. The Dutch association for seed and young plant breeding, tissue culture, production, and trade has issued a statement on the relationship between patents and plant breeders' rights.

- Patent-protected biological material should be readily accessible for the creation of new kinds, according to the report.
- In accordance with the UPOV Convention's "breeders' exemption," the use and exploitation of these new varieties should be free. (iii) Patent rights shall not be permitted to impede the above-mentioned open availability, use, as well as exploitation in any manner, either directly or indirectly[5].

1.3.Plant Breeding Techniques May Be Patented.

The European patent legislation's exclusion of "essentially biological manufacturing of plants and animals" Directive as comprising "entirely of natural phenomena including such crossing as well as selection" would seem to rule out patent protection for plants breeding methods, but the EPO Enlarged Board of Appeal recently put this theory to the test in two decisions. One question was whether a broccoli crossing and selection method could be patented. Another referral was for a similar kind of innovation using tomato crossing as well as selection[6].

- Is a non-microbiological method for the production of crops that includes the stages of crossing and choosing plants exempt from the exclusion of Article 53(b) EPC simply because it includes a technological feature as a further step or as part of any of the phases of crossing and selection?
- If the answer to question 1 is no, what are the appropriate criteria for differentiating non-microbiological plant production processes that are excluded from patent protection under Article 53(b) EPC from those that are not? Is it particularly important to determine where the claimed invention's core resides and/or if a technological element adds value to the claimed invention above a minor level?

1.4.The Following Is A List Of Technical Requirements For Patentable Inventions:

The EBA's decisions in Broccoli and Tomato highlight the fundamental issue of whether botanical discoveries qualify as patented inventions under patent law. The answer to this issue will vary depending on the current country patent legislation. The United States has the most permissive patent legislation in the world. The Supreme Court had to decide whether a genetically modified bacteria capable of degrading multiple components of crude oil was patentable in Diamond v Chakrabarty in 1980. The patent examiner in that instance had rejected the application on two grounds:

- Microorganism are "product of nature," therefore
- They are not patentable subject matter under US patents act since they are living entities. The Supreme Court dismissed these objections, famously stating that Congress intended for the patent system to "cover everything under the sun that is created by man" as patentable. As a result, the Court determined that the microbe was patentable subject matter.
- The Court did, however, point out that the patent claim at issue ‘was not to a previously undiscovered natural occurrence, but to a non-naturally occurring manufacturing or composition of matter a result of human creativity. To put it another way, it took some human involvement to make a biological invention patentable.

The European Patents System emphasizes the importance of a claimed invention's technical nature. The Convention on the Granting of European Patents' Rule 27 Implementing Regulations defines patentable biotechnological innovations as those that concern[7]:

- Biological material that has been separated from its natural habitat or created via a technological method, even if it has previously existed in nature;
- Plants or animals if the invention's technological feasibility is not limited to a specific plant or animal type;

- A microbiological or other technological procedure, or a product derived from one, other than a plant or animal variety.

In the Broccoli and Tomato instances, the EBA regarded the criterion that innovations had a technical character to be a critical factor in determining whether plant breeding techniques were patentable. The EBA found that, with the creation of new plant varieties for which a special property right was to be introduced underneath the subsequent UPOV Conference in 1960, the parliamentary architects of the EPC were particularly worried with excluding from patentability the kinds of plant breeding processes that were the subject of the EPC's legislative architects' concern. The fact that procedures altering the DNA of plants via technological means such as irradiation were mentioned as instances of patentable technical processes suggested that these were processes to be avoided[8].

The EBA also made reference to the reasons given in the memorandum of the Committee of Experts' Secretariat for agreeing to the partial substitute of the words "purely" biological by the word "essentially" as reflecting the legislative actual intent that the mere use of a technological device in a process of reproduction should never be sufficient to make the process a patentable technology. The EBA ruled that the inclusion of a technical step, whether overt or covert, in a process based on plants sexual crossover and subsequent selection does not exempt the claimed invention from exclusion if that technological step merely helps to execute the breeding process' process stages. It's worth mentioning that the EBA forbids plant breeding methods from being patented. It has been pointed out that plant breeding products are still patentable. Plant breeding claims would have to be deleted, according to an analysis of EPO reporting requirements for recent patent applications, although the plant itself would be patentable. As a consequence, civil society representatives have a "clear legal prohibition on granting patents on animals or plants, breeding techniques, significant biological material, and the food produced." This case shows the political aspect of plant breeders' as well as botanists' work, which was previously thought to be purely technical. Greenpeace, an environmental non-governmental organization, is a cofounder of "No Patents on Seeds" and has been in the forefront of raising public awareness about the issue. Similarly, the NGO ETC Group has been fighting the "patenting of life" for a long time, with Greenpeace protestors destroying a GM wheat crop being grown at a government experimental facility in Australia in July 2011 exemplifying the strength of feelings on the issue. After a Freedom of Information request for further information about the proceedings was denied, the attack occurred. Drought-resistant crops were the goal of the GM trials, which were part of a larger research effort. The concern that large life sciences corporations would jeopardize the independence of small independent farmers and breeders is at the root of the opposition to this study[9], [10].

2. DISCUSSION

The EBA determined that a plant-production process based on the sexual crossing of whole genomes as well as biomass production selection, in which human interference, including the provision of a technical means, provides to enable or assist the achievement of the processing steps, is excluded from patentability as just being essentially biological inside the meaning of the term. As a result, the EBA determined that traditional plant breeding is not patentable. If, on the other hand, a procedure of sexual crossing as well as selection contains a technical step that, by itself, introduces as well as modifies a trait in the genetic code of the plant produced, rather than the introduction as well as modification of that traits being the side effect of the mixing of the genetic makeup of the plant selected for sexual crossing, because that process is l. This principle only applies when the additional step is executed within the steps of sexually crossing as well as selection, regardless of the number of repetitions; otherwise, the exclusion of sexual crossing and selection processes from patentable subject matter could be circumvented simply by adding steps that do not properly directly relate to the crossing as well as selection process, such as upstream

steps trying to deal with sexually crossing and selection, as well as downstream steps dealing with sexual crossing and selection. Per se patent protections was available for the prior or future stages, according to the EBA. This will be the case with plant genetic engineering methods, which vary from traditional breeding techniques in that they operate mainly by inserting and/or modifying one or more genes in a plant.

3. CONCLUSION

It's worth noting that the EBA prohibits the patenting of plant breeding techniques. Plant breeding products, it has been pointed out, are still patentable. According to a study of EPO inspection reports for recent patent applications, claims related to plant breeding would have to be removed, but the plant itself would be patentable. As a result, representatives of civil society have a 'clear legal ban on awarding patents on animals or plants, breeding methods, important biological material, as well as the food produced'. This case highlights the political component of plant breeders' and botanists' work, which had hitherto been regarded as a matter of technical research. Greenpeace, an ecological NGO, is a cofounder of 'No Patents on Seeds,' and has been in the forefront of raising public awareness about the problem. Similarly, the NGO ETC Group has waged a long-running fight against the "patenting of life." The damage of a GM wheat crop being produced at a governmental experimental site in Australia by Greenpeace protesters in July 2011 exemplified the intensity of emotions on this subject. The assault came after a Freedom of Information request for additional information about the proceedings was turned down. The GM experiments were part of a research project aimed at developing drought-resistant crops. The fear of big life sciences companies jeopardizing the freedom of tiny independent farmers and breeders lies at the heart of the resistance to this research. This debate over the patentability of plant biotechnology product, as well as plant breeding techniques, highlights the increasingly political context in which experimental botany takes place. Current research into the effects of climate change on the growth of weeds, insect pests, and crop diseases, as well as methods to design plants to resist salt and aridity, will increasingly be conducted in a political environment.

ABSTRACT

Guar gum is a new agrochemical derived from cluster bean endosperm. Guar gum powder is widely used as an ingredient in the culinary, pharmaceutical, paper, textile, explosive, oil well drilling, and cosmetics industries. Guar gum is made from the seeds of the drought-tolerant plant Cyamopsistetragonoloba, which belongs to the Leguminosae family. Indian cluster bean, guar, and guaran are terms for the guar gum flour and galactomannan fraction of guar gum. Guar gum's capacity to create hydrogen bonds with water molecules makes it suitable for industrial usage. As a result, it's mostly utilized as a thickener as well as stabilizer. It also aids in the management of a variety of health issues, including diabetes, bowel motions, heart disease, and colon cancer. The manufacturing, processing, composition, characteristics, food applications, and health advantages of guar gum are discussed in this article.

KEYWORDS:*Cholesterol. Cluster Bean, Dietary Fiber. Guar Gum, Hydration Rate, Viscosity.*

1. INTRODUCTION

The seed of the crop failure plant Cyamopsistetragonoloba, a members of the Leguminosae family, are used to make guar gum. Indian cluster bean, guar gum flour, as well as galactomannan fraction are the popular words used in scientific literature for the bean, guar gum flour, and galactomannan fraction, respectively. Despite the fact that Hymowitz introduced the idea of Tran's domestication, there is no widespread agreement on the beginnings of this plant. This theory described how C. tetragonoloba, the domesticated guar plant, evolved from the drought-tolerant wild Africa species C. senegalensis. Arab merchants brought the latter species from Africa to the South Asian subcontinent as feed for horses somewhere between the 9th as well as 13th century A.D. The domesticated variety is most often linked with Pakistan as well as India, where it has been cultivated for generations as a human and animal food source. In the United States, the guar gum business grew in the 1940s and 1950s. Guar was introduced to the United States prior to World War I mainly as a green manure, but it was not utilized in industrial uses until 1943, which is likely the primary reason for its limited research[1]. The supply of locust bean gum, which was extensively utilized in the paper and textile industries and was imported from Europe and North Africa at the time, had decreased and was difficult to come by.

As a result, researchers at the Institute of Paper Chemistry in Appleton, Wisconsin, and the United States Department of Agriculture set out to discover a native species that might serve as a locust bean gum replacement. Guar gum was reexamined as a result of this search, and it was discovered to be the best answer to the issue. During World War II, the commercial development took place at the University of Arizona. Whistler (1948) of Purdue University studied the gum after the end of the war. He studied the molecular structure and, after studying the characteristics of guaran, a pure polysaccharide, he saw its vast commercial potential and suggested that the guar plant be developed as a domestic crop for industry. Gum is a useful papermaker's adjunct in getting temporary wet strength in sheets, such as paper toweling, and it also aids hydration during the beating of different pulps, according to studies. The services of the United States Department of Agriculture's Soil Conservation Commission were recruited, and as a consequence, many seeds were examined for their potential. The best results were from guar, or Cyamopsistetragonolobus, an annual drought-resistant leguminous plant that grows three to six feet tall and has been used as cow and horse feed in some parts of India for generations. Guar gum is similar to locust bean gum in that it is made up mostly of the complex carbohydrate polymer galactose and mannose, but the amounts of these two sugars are different. Guar flour is said to be useful as a beater addition for increasing the strength of some types of paper. Guar also offers characteristics that may be helpful in warp sizing, printing copied or pasted, and some finishing processes, according to reports. Separating the gum-containing endosperm of the seed from the outer, mostly fibrous parts is required to extract the gum. Guar gum consumption grew quickly, but it was the discovery of anionic and cationic guar gum derivatives, as well as their application in oil and gas well stimulation, that propelled guar gum to its current commercial prominence. Guar gum thickens dye solutions in textile and carpet printing, allowing for more clearly drawn patterns. Guar gum has been used in explosions for over 25 years as a water-blocking addition to dynamite. It's become the main gelling agent in water-based slurry explosives in recent years. The addition of tiny quantities of guar gum to the pulp improves the papermaking process. It acts as a fiber deflocculant as well as a dry strength enhancer[2].

1.1.Production:

Guar gum is a gel-forming galactomannan produced by grinding the endosperm of Cyamopsistetragonolobus, a leguminous plant that has been cultivated for millennia mostly in India and Pakistan, where it is a major crop and has long been utilized as a source of food for people and animals. The guar plant is mostly a sun-loving plant that can withstand high temperatures but is sensitive to cold. A soil temperature of 25–30 °C and, preferably, a dry environment with scarce but frequent rainfall are required for optimum development. Rain is required for optimal development of the guar plant before sowing and again to promote seed maturity (Anderson, 1949). Guar beans of poorer quality are produced when there is too much moisture in the early stages of development and after the seeds have matured. In general, the monsoon rain pattern in northern India and Pakistan offers excellent growth conditions for guar. Guar is cultivated in India and Pakistan for almost 90% of the world's supply. The crop's unique need for the appropriate quantity of rain at the right time of development and maturity renders it highly reliant on yearly rainfall patterns, resulting in periodic significant fluctuations in guar availability and pricing. Guar is also grown in the southern hemisphere, in semi-arid regions such as Brazil, Australia, South Africa, and parts of the United States such as Texas and Arizona. Guar seed output in these nations is projected to be 15,000 MT per year. In Australia, the agro-climatic conditions are also favorable for guar production. The Department of Agriculture and Rural Industrial Development Agency has made efforts to encourage guar production in Australia. Similarly, it is claimed that China and Thailand are attempting to cultivate guar. As a result, India and Pakistan may no longer have a monopoly on guar in the future[3].

1.2.Processing:

The way guar gum is processed differs from one plant to the next. The basic overview of the guar gum production process. Guar seeds are spherical in form, brownish in color, and smaller than pea seeds when separated from their pods. The gum is extracted commercially from seeds mostly via a mechanical process that includes roasting, differential attrition, sifting, and polishing. The germ is removed from the endosperm when the seeds are cracked. Each seed yields two halves of endosperm, which are referred to as underutilized guar split. Refined guar splits are produced when the fine layer of fibrous material that comprises the husk is removed and separated from the endosperm halves by polishing.

1.3.Non-Food Uses Include:

Guar gum demand has risen in recent decades as a result of the creation of various guar gum derivatives, such as anionic and cationic derivatives. Guar gum's current economic significance stems from its usage in oil and gas well stimulation, particularly hydraulic fracturing, which uses high pressure to break rock. Guar gum thickens fracturing fluid, allowing it to transport sand into cracked rock. Due to the presence of sand, this crack stays open, allowing gas or oil to flow to the well bore. The guar derivatives hydroxypropyl guar (HPG) and carboxymethylhydroxypropyl guar (CMG) are used in fracturing fluids (CMHPG). Guar gum thickens dye solutions in textile and carpet printing, allowing for more clearly drawn patterns. Guar gum has been used in explosives for over 25 years as a water-blocking addition to dynamite. It's become the main gelling agent in water-based slurry explosives in recent years. Guar gum's water-blocking, swelling, and gelling properties allow it to be used as an ingredient in the explosives business. Even under damp circumstances, the explosive properties of ammonium nitrate, nitroglycerine, and oil explosives are preserved by combining them with guar gum. The addition of tiny quantities of guar gum to the pulp improves the papermaking process[4].

1.4.Properties Physico-Chemical:

The behavior of guar galactomannan and other polysaccharides in an aqueous media determines their biological characteristics. On dispersion, guar gum swells and/or dissolves in polar solvents, forming strong hydrogen bonds. It only generates weak hydrogen bonds in nonpolar liquids. With decreasing particle size, lowering pH, and rising temperature, the rate of guar gum dissolution and viscosity development usually rises. In the presence of dissolved salts and other water-binding compounds like sucrose, hydration rates are decreased[5].

1.4.1. Rate Of Hydration:

Guar gum's rate of hydrating varies. In practical applications, a 2-hour hydration period is needed to achieve maximal viscosity. The rate of hydration is mainly determined by the particle size of guar gum powder. As a result, extremely fine mesh guar gums are available for fast initial viscosity. However, for maximal hydration and viscosity, a significant time gap is still required.

1.4.2. Activity Of Hydrogen Bonds:

Guar gum's hydrogen - bonded activity is owing to the presence of a hydroxyl group in the molecule. With cellulosic material and hydrated minerals, guar gum forms hydrogen bonds. The electro kinetic characteristics of any system are significantly altered by the addition of guar gum. When hydroxyl groups in guar gum are replaced with hydroxypropyl groups, steric hindrance occurs, lowering hydrogen bond stability. Viscosity and hydration rate are affected by a variety of factors. Guar gum's viscosity and hydration rate do not stay constant with changes in temperature, pH, solute, concentration, and other factors.

1.4.3. Temperature:

The most important element affecting the rate of hydration as well as maximum viscosity is temperature. When guar solutions are produced at higher temperatures, they achieve maximum

viscosity considerably quicker than when they are made at lower temperatures. However, prolonged heat is thought to have a degradative impact. In most instances, heated guar gum solutions have a lower ultimate viscosity than cold water guar gum solutions that have been allowed to hydrate slowly. For maximal viscosities of guar gum dispersion, a temperature range of 25–40 °C is recommended. At 25 degrees Celsius, the viscosity of a 0.5 percent (w/w) guar solution is considerably greater than at 37 degrees Celsius[6].

1.4.4. pH:

Guar gum solutions are stable at pH levels ranging from 1.0 to 10.5. This is owing to the fact that it is non-ionic and uncharged. The pH has no effect on the final viscosity of guar gum, but it does influence the hydration rate, which varies with the pH. The fastest hydration happens at pH 8–9, while the slowest hydration occurs at pH. Sugar Glucose compete with guar gum molecules for both the available water in a guar-sugar solution, thus the presence of sugar in guar gum solution causes a delay in the hydration of guar gum molecules[7]. Guar-sugar solution viscosity diminishes with time and is inversely proportional to sugar content. Sweeteners including aspartame, acesulfame-k, cyclamate, and neotame have little effect on guar gum solutions' inherent viscosity. Other than water, salt is the most frequently used component in meals, and its impact on guar gum has been extensively studied. Guar gum solutions in brine behave similarly to guar gum solutions in water. Salt has little effect on the rate of hydration; nevertheless, sodium chloride marginally improves the ultimate viscosity of completely hydrated guar gum. When a physiological buffer, such as Krebs bicarbonate, is added to a 0.25 percent guar gum solution, the viscosity is reduced compared to gur gum in water alone. The hydration of guar gum solution is hampered by salts. With the addition of salts, the viscosity of a 0.5 percent guar gum solution rises[8].

1.5.Applications In The Food Industry:

Guar gum is a new food additive used in different food items for food stability and as a fiber source in the food business. It is popular among both manufacturers and consumers since it is a cost-effective and natural addition. It is utilized as an addition in a number of meals because it alters the behavior of water, which is a frequent component in many foods. Table 3 lists some of the most frequent guar gum culinary uses. Title 21 CFR 184.1339 covers permissible usage levels and limits in different goods, confirming guar's "generally recognized as safe" (GRAS) classification[9].

1.6.Advantages To Your Health:

Animal experiments have been performed to see whether guar gum has any detrimental or positive effects. Clostridium butyricum fully degrades guar in the large intestine. Only when the guar gum is administered to the animals at a high concentration of approximately 10–15 percent on a weight basis does it cause harm. Because of the reduced feed intake and poor digestion caused by the high dosage, the animal's development would be stunted. The main reason of the negative effects is thought to be the increased viscosity of the contents of the digestive system as a consequence of guar gum consumption at greater concentrations[10].

2. DISCUSSION

The seeds of the drought-tolerant plant Cyamopsistetragonoloba, a member of the Leguminosae family, are used to make guar gum. Indian cluster bean, guar gum flour, and galactomannan fraction are the common names used in scientific literature for the bean, guar gum flour, and galactomannan fraction, respectively. Guar gum is a new agrochemical derived from cluster bean endosperm. Guar gum powder is widely used as an ingredient in the culinary, pharmaceutical, paper, textile, explosive, oil well drilling, and cosmetics industries. Guar gum's capacity to create hydrogen bonds with water molecules makes it suitable for industrial usage. Guar gum aqueous

solutions have a high viscosity. Its characteristics allow it to be used in a variety of sectors, including food, pharmaceuticals, textiles, oil, paint, paper, explosives, and cosmetics. Its cheap cost is another reason for its appeal in the business. It is used in the gums and stabilizers sector because to its low cost. It has a broad range of uses in the culinary sector, including ice cream, sauces, drinks, pastry, and meat. It is also utilized as a dietary fiber supplement in food items. Its intake lowers the risk of heart disease by lowering cholesterol levels in the body, controlling diabetes, and maintaining human bowel movements.

3. CONCLUSION

Guar gum is produced from the seed endosperm of the guar plant, Cyamopsistetragonolobus, which has been grown in India and Pakistan since ancient times. Guar gum is a good substance to look at. It has a high propensity to create hydrogen bonds in water, making it a new thickener and stabilizer. Guar gum aqueous solutions have a high viscosity. Its characteristics allow it to be used in a variety of sectors, including food, pharmaceuticals, textiles, oil, paint, paper, explosives, and cosmetics. Its cheap cost is another reason for its appeal in the business. It is used in the gums and stabilizers sector because to its low cost. It has a broad range of uses in the culinary sector, including ice cream, sauces, drinks, pastry, and meat. It is also utilized as a dietary fiber supplement in food items. Its intake lowers the risk of heart disease by lowering cholesterol levels in the body, controlling diabetes, and maintaining human bowel movements.

ABSTRACT

Block chain technologies have attracted a lot of attention from both the corporate sector and academia because to its decentralized, persistent, privacy, and auditability features. A survey is performed in this survey paper via a search for journal/research papers related to Block chain technology. To conduct this study, datasets were obtained from a variety of academic websites, including Science Direct, ACM Digital Library, and In der Science, to name a few. Following the first round of exclusion, 150 research papers were evaluated for the database survey's final round. The primary aim of this research is to provide academic academics with a comprehensive analysis of Block Chain technology and their many applications. The difficulties of implementing Block chain, as well as the security and privacy concerns that it raises, are also discussed. This study looked into the use of block chain technology in a variety of applications, as well as its implementation problems.

KEYWORDS: *Block Chain, Block Chain Applications, Healthcare, Privacy And Security.*

1. INTRODUCTION

Because of block chain's decentralized, peer-to-peer transaction, and irreversible characteristics, block chain technology has become more popular in recent years. It is a public digital ledger that is available to all network users. SantoshiNakamoto's Bit coin crypto money from 2008 inspired the concept. The market has expanded to include nearly 2000 coins since then. Despite this, Bitcoin is still a niche currency in many parts of the globe. Bitcoin is connected to a number of problems. The transaction confirmation and mining procedure in the Bitcoin system takes approximately 7-8 minutes.

This idea may be applied to a broad variety of industries, including healthcare, IoT, industry, and supply chain monitoring. The study's primary goal was to look at academic implementations of Block chain in a range of applications, as well as some recent developments by different organizations to utilize Block chain technology in various fields. Digital data is sent from one

end to the other in today's world via an unreliable transmission path. Here, privacy and secrecy are major considerations. Block chain technology allows for secure and private peer-to-peer communication[1].

Transactions in block chain technology can be viewed by anybody, but they can't be changed once they've been recorded. Following a comprehensive study of the literature, it was found that block chain is being utilized in a number of useful applications. According to the authors of, block chain is a probabilistic state device that is useless when decision finalities is needed. The authors addressed some of the possible uses of block chain technology, as well as how it might be used to solve a variety of traditional database issues[2].

1.1.Distributed Ledger Technology

Block chain technology is one of the most difficult study fields today, yet it lacks technological details that would enable it to be used in almost any area. The research papers are categorized according to their intended purpose. The difficulties of using block chain technology in different applications were also addressed in this research. The following is the main contribution of this paper:

1.2.Block Chain Communication System

Block chain is a decentralized peer-to-peer communication method. It's also open to the public, much like a digital ledger. It may be used to protect stored data or transactions without the participation of a third party in a trusted environment. Documents from five technical databases are included in the first keyword chain: IEEE Xplore, ScienceDirect, the ACM Digital Library, the Science Website, and Indian Science. There were 751 research articles in the first phase. We reject 526 articles after reading the abstracts. Any articles that were no longer relevant were also removed. We looked at the whole sheet of paper in the second phase and performed some more elimination.

Bitcoin is based on block chain technology. The encrypted ledger is stored on a database that is open to the public. Block chain is a global data-base system that can be accessed from anywhere in the world by anybody with an internet connection. A block chain, unlike conventional databases, is not owned by a single organization, such as a bank or a government. It becomes very difficult to deceive the system using false papers, transactions, or other information when a complete network is working on it. A distributed ledger, often known as a block chain, is a network of nodes that keeps track of data indefinitely. This not only decentralizes but also disseminates information.

A local Block Chain Copy may be updated on a regular basis to keep all of the nodes in the network synchronized. A block chain is a decentralized computing and information dissemination network that allows many nodes to make decisions independently of one another. Single points of failure are a concern with centralized systems. To prevent a single-point failure in a decentralized system, multiple coordinate points are used. In a distributed system, each node works together to complete the task[3].

2. DISCUSSION

Peer-to-peer (P2P) is how block chain operates. Using the, the transaction is verified. Before being added to the system's block chain, it must have a hash task, a digital-signature, as well as public-private keys. The function of hash is used to tamper-proof the blocks in a block chain system. If they use a digital signature to establish their identity, no one can dispute their own activity on the block chain networks. A digital signature is used for signing and transmitting a document together with the transaction by a node. The remaining nodes in the network can check

the signature. The signature is confirmed with the public key after the message is signed with the private key[4].

2.1.Advancements In Block Chains

The block chain system's digital signature prevents non-repudiation. The architecture of block chain can be permissioned or permission less. It varies based on the application's network. One of the challenges of block chain is scalability. The smart contract and computing paradigm in a public block chain were explained by the authorsBlock chain, as a software connector, aids in the explicit expression of critical design concerns on the system's ultimate performance and quality qualities. The study described in offered a unique technique for confirming block transactions with high accuracy[5].

In order to confirm a transaction replacing its original signature, a new interactive incontestable signature (IIS) system between the dealer and the owner is used. By this signature, the dealer may ensure the owner that the transaction is not republished in the Block chain. The system has been proven to be secure in terms of unforgeability for owners and incontestability for dealers. The authors provide a lesson on the Block chain concept and its operation. Without the use of a central authority, Trust Chain may create trusted transactions between strangers. This opens up new areas of Block chain application, with a focus on individual trust.

The notion of Block chain technology was born out of the Bitcoin cryptocurrency, and it has since been used in a variety of fields. The following paragraphs summarise Block chain applications in the financial fields, government, healthcare, IoT, legal, reputation, transport, business, cloud computing, power grid, e-business and supply chain.

2.2.Application of Blockchains:

Healthcare is a field in which patients, doctors, and medication departments must use cutting-edge technology to deliver well services to end customers. Privacy is the main issues concerns that must be addressed in the health-care industry. The features of Block chain show how to deal with the problem that has occurred. Digital data base can be shared amongst several users while protecting privacy using Block chain.

The Block chain is employed in the digital right management system by the licensor, users, and mining. The Block chain provides a decentralised framework for the distribution of digital content. The licensor grants authorization to each d9gital document uploaded via the modern contract. In addition, the user has a smart contract that allows them to access as well as play the digital-document stored in the Block chain database. The usage of Block chain in a digital legal context has previously been explained in certain study. Block chain, according to the authors, may be a solutions for present legal frameworks controlling contracts between countries, allowing for the preservation of a digital record without the need for a third party.

In the egovernment in China, the authors examined the benefits of the use of Block Chain technology such as enhanced quality, service volumes, openness, accessibility and the exchange of information across various organisations. The Block chain is resistant to internet attacks, transactions are public, and once a transaction is put to the Block chain, it cannot be edited or deleted, making data transactions safe, protected, as well as accessible to all. According to the authors, block chain technology may be utilised in governance since it is decentralised, secure, peer to peer, and accessible to all network users.

The power grid businesses include trade in energy, solar systems, intelligent metering [108] and microgrid energy. End users can deliver intelligent services through Block Chain Technology. A block string is a collection of short messages and timeline blocks that are broadcast to all network nodes. All nodes in the network are allowed to sign messages using the public/private

key combination, and are pseudonymized. Before the rest of the network, each node signs a message. On a regular basis, a new message is mined, and the message is then posted to the Block chain[6].

When you add a message to a block, it becomes persistent and irreversible. The authors described a Block chain-based transitive micro-grid concept that can ensure transactional integrity across decentralized computing nodes. PETra's trading workflow was also extended by the authors. PETra is based on distributed ledgers like Block chains and allows for anonymous communication, bidding, and trading. The hybrid Block chain technology, which combines public and private Block chains, adds new capabilities to the power grid.

There are seven levels of ITS. Each layer is linked to a set of hardware or application services that help in the delivery of intelligent services. Device security and data privacy are increased when coupled with Block chain technology. Secure key management is one of the most critical challenges in the heterogeneous network, according to ITS. The physical layer is made up of several physical sensors that are integrated into the vehicle. The data layer is made up of a series of blocks linked together by encryption and hashing algorithms. Block chain-based ITS connects vehicles in a peer-to-peer paradigm at the network layer[7].

In the consensus layer, various types of consensus algorithms are utilized for data validation in order to achieve mutual confidence among peers. Then, according to the consensus algorithm, some incentive is distributed, and the modern contract is completed. Lastly the application layer offers the system with intelligent services and smart management. In their work, the authors developed a methodology for collaborative data collection using public Block chain. The system-specific Block chain was created using the Proof of Work consensus mechanism.

Storage, processing, services, infrastructure, and applications are all provided through cloud computing. In a network, cloud computing has numerous advantages. The authors presented a unique Software Defined Networking (SDN)-based distributed cloud architecture that allows supervisor fog nodes at network's edge to fit the design requirements. The concept suggested is a distributed blockchain cloud architecture, providing low-cost, secure and on-demand access to competitive IoT network computer infrastructure.

The provenance architecture the two articles, ProvChain as well as JointCloud, demonstrated how Block chain features like trust, no-central processing, as well as end-user safety and privacy may be used to solve cloud computing's drawbacks. Users may observe their transactions in the Block chain system in the form of a digital ledger.

In a P2P network, a traditional reputation system has a number of drawbacks, including data updating, accuracy, maintaining a vast file-systems, as well as dynamic network change. The network are prone to attack such as the collusion attack and the Sybil attack. The major issues in the system are overcome via a Block chain-based reputation system. The authors of the study first analyzed present reputation system before presenting the first generalised reputations system based on the Block chain that can be deployed to different networks[8].

The study makes a substantial contribution by setting up a systemic framework to collect information on the identity and reputation of individuals online, so that personal assessments of behaviour are fully conducted. Some of the main contributions are as follows: The suggested method includes a social depdence network identity grouping mechanism as well as an intelligent contract management framework referring to personal online ratings on the basis of the aggregated digital identity, and experimental implementation based on the Block Chain Technology[9].

In recent years, the rapid expansion of internet purchasing has resulted in a massive increase in E-business. Customers are more interested in the E-business model because of trusted data marketplaces. From a research standpoint, just a few studies have been conducted in this application area. The authors illustrate how intelligent and paid IoT data may be transacted utilising the Peer to peer chain and intelligent contracts. Authors can aid small, medium and huge companies by offering block-chain e-commerce solutions[10].

Companies and enterprises can migrate their activities to Syscoin without the requirement for a third party. The distinctive features of Syscoin in an architectural framework enabling the use of integrated mining and minimal inflation are also debated in this article. It also allowed for the adoption of trustless payments and services in commercial settings today. Syscoin token holders will be able to participate in joint venture as well as partnership, & get an investment proposal.

2.3.Authenticity And Privacy:

Different nodes are responsible for different types of data or transactions.

A Chinese government agency has launched a Block chain-based authentication system: The Chinese government's research body devised a Block chain as Service policy for a burgeoning supply-chain. It is solely focused on 2 key goals: to store unchanging data and to track changing to data. This new platforms was created to help countries develop faster by pursuing Block chain technology. Other industries that use Block chain-as-a-service include JD.com, a Chinese e-commerce behemoth, which uses the Block chain platform to track beef imports, and Walmart, which uses Block chain for shipping matters.

Other industries that use Block chain-as-a-service include JD.com, a Chinese e-commerce behemoth, which uses the Block chain platform to track beef imports, and Walmart, which uses Block chain for shipping matters. The application of RFID and Block chain technology in the construction of a traceability system for the food supply chain as well as process validation. Tracking and exchange of authentic Agri-Food data in the manufacturing, processing, storage, distribution and sale of linkages can successively achieve trackability with trustworthy information along the agri-food supply chain.

The authors provided a solution based on the Block supply chain in their study to tackle problems such as dual marginalisation and asymmetry of information. In order to provide an open, transparent, impartial, trustworthy and secure information platform for every member of the supply chain the authors created a food supply chain traceability scheme based on HACCP (Hazard Analysis and Critical Control Points), Block chain, and the Internet of Things[7].

2.4.Challenges Faced Technology By Block Chain

Block chain technology research challenges:-

- How can an efficient Block chain distributed system be designed that allows for system scalability?
- How do you make a mutual choice in a permission-based system while disregarding rogue nodes?
- Mining processes that require less computing power to complete.
- Development of a Block chain application based on smart contracts
- Using the Block chain network to distribute task scheduling.
- As the Block chain grows in size, how can each node efficiently store and validate data?

3. CONCLUSION

Block chain, according to the author, is a peer-to-peer (P2P) decentralized transaction ledger that is accessible to the public. Since 2008, Bitcoin and Block chain have been two of the most

important technologies in the information system. In a number of applications, block chain may be used to conduct transactions in a secure environment without the need of a third party. In this survey study, the architecture and working idea of Block chain are described first, followed by a description of the survey methodology. The examples below show how Block chain technology may be utilized to solve current centralised systems in a decentralized way while also resolving various security issues. Block chain is most often used in the Internet of Things (IoT), healthcare, and other high-demand application areas. Some progress has been achieved in terms of privacy and security concerns, according to the study's results, but much more work remains. Block-chain technology's advantages include decentralization, public visibility, transparency, and security, to name a few. However, there is still more research to be done on the network, scalability, and mining process of the Block chain system.

ASSESSING THE SOCIAL PROTECTION OF LABOR MIGRANTS IN UZBEKISTAN

Mahfuzakhon Khujakizi Shamsieva*

*Senior Lecturer,
PhD in History,
Department of History of Uzbekistan,
Ferghana State University, UZBEKISTAN

ABSTRACT

The article highlights that globalization and integration processes to further accelerate international labor exchange, and the efforts undertaken for social protection of labor migrants who returned to Uzbekistan during the pandemic. International labor migration is the movement of workers between countries around the world that occurs during organized or spontaneous migration and is influenced by a variety of factors. These are traditionally divided into three factors: economic, demographic, and political, all of which are interconnected. The most significant among them is the economic factor.

KEYWORDS:*United Nations, labor migrants, pandemic, Agency of External Labor, International Organization for Migration, Center for Economic Research and Reforms, "Charity to You", Center for Social and Legal Support of Women and Their Families, poverty reduction.*

1. INTRODUCTION

The root of migratory process dates back to ancient times, when the fundamental division of labor and the separation of livestock and agriculture first emerged.

International labor migration is the movement of workers between countries around the world that occurs during organized or spontaneous migration and is influenced by a variety of factors. These are traditionally divided into three factors: economic, demographic, and political, all of which are interconnected. The most significant among them is the economic factor.

2. MATERIAL AND METHODS

Globalization and integration processes have boosted worldwide labor exchange in recent decades. The number of international labor migrants grew by 11.4 percent between 2015 and 2019, according to the United Nations and the World Economic Forum. Immigrants made up 3.5 percent of the global population in 2019and there was an increase by 25 % compared with 2000[1]. It's worth noting that women account for 48 percent of all migrants [2]. Women's engagement in labor migration is a particularly difficult and contentious process.

The rising scale of migration processes highlights the necessity to enhance the protection of migrants' and their families' interests. It should be emphasized that in this field the Republic of Uzbekistan is enlargingmutually beneficial collaboration with foreign countries and prominent international organizations.The Ministry of Employment and Labor Relations of the Republic of Uzbekistan, in particular, has developed close ties with the labor ministries of Russia, South Korea, Japan, Turkey, the United Arab Emirates, the United States, Azerbaijan, Kazakhstan, and Tajikistan.

Cooperative affairsare being established with UN agencies and international institutions.A Memorandum of Understanding between Uzbekistan and the International Labor Organization was signed on February 28, 2017 in Tashkent. On November 27, 2018, in Geneva, at the 109th session of the Council of the International Organization for Migration, the United Nations Agency for Migration Uzbekistan became the 173rd member of the IOM.

To safeguard the social interests of labor migrants in the Republic of Uzbekistan, the International Organization for Migration's Constitution was ratified on December 12, 2018. The International Organization for Migration's Constitution includes the effective protection of migrants' rights, as well as the gathering, selection, and preparation for migration, language training, giving information to migrants, medical examinations, and other migration services [4].

On August 20, 2019, the Decree of the President of the Republic of Uzbekistan "On measures to further strengthen the guarantees of protection of citizens of the Republic of Uzbekistan and their families engaged in temporary employment abroad" was adopted to protect the social interests of participants in labor migration [5]. In addition to ensuring the protection of the rights and interests of citizens going abroad for temporary work, the document also sets a number of tasks to create decent living and working conditions for migrant workers and their families.

It’s known that due to the pandemic, strict quarantine measures were implemented around the world, interstate transportation was restricted, the number of jobs available to labor migrants in the labor market decreased dramatically, and the number of unemployed rose by 195 million in the second quarter of 2020 due to falling wages [6].

The process of external labor migration of Uzbekistan is primarily transitory and seasonal, according to the Center for Economic Research and Reform, with most migrants working abroad in the spring and summer and coming home in the winter, will be hired in sectors where skills are not required.

More than 2 million Uzbek migrants labor in the Russian Federation, accounting for 83 percent of all Uzbek migrants. Due to the pandemic, 508,688 migrants, including 126,422 women, in 2020 and 9,279 women out of 32,888 migrants returned to Uzbekistan in the first quarter of 2021.

Migrants returning to Uzbekistan are being provided with social protection measures, as well as practical support from governmental and non-governmental non-profit organizations. The Agency of External Laborprovided legal assistance to 5,513 migrant workers, consulting services to 200,893, social aid to 3,883, financial assistance to 2,769, and one-time financial assistance to 1,750 during the five months of 2021.121 labor migrants were housed temporarily in hostels. The bodies of 168 people who died in foreign countries were brought back. 145 people who were in perilous situations abroad were repatriated. The medical expenditures of 17 critically injured labor migrants were compensated, and they were returned. Unpaid wages and compensation were paid to migrant employees in the amount of $ 460,000.

In September-October 2020, in non-governmental organizations such as "Charity to You", the Center for social and legal support of women and their families, the regional branch of the Center for Support of Citizens' Initiatives and "Perspective Generation" helplines were

established on the basis of social partnership with government agencies, and free legal, psychological, medical and social assistance has been provided to migrants and their families seeking to return from abroad in the time of a pandemic. Legal assistance was provided to 65 migrants who suffered from human trafficking during the pandemic for repatriation and recovery of their documents. The Center provided social rehabilitation assistance to 100 migrants in 35 psychological, 30 legal, 20 social and 15 economic issues.

3. RESULTS

The Center's initiative "Comprehensive services to vulnerable sectors of society in Uzbekistan, who were heavily suffered from the SOVID-19 crisis, in order to swiftly restore their health and support them" is noteworthy. The Center's specialists conducted questionnaires as part of the project to study the social situation of migrants returning from abroad during the pandemic, and based on this review, projects were made with the assistance of business consultants to ensure the employment of 12 vulnerable family migrants.The United Nations International Organization for Migration has allocated 321.8 million sums to finance these projects. Migrants and their families returned from abroad have been given free 4 welding shops in Andijan, Izbaskan, Altynkul districts, and 4 baking shops in Karasuv, Andijan, Altynkul and Kurgantepa districts, 3 sewing shops in Pakhtaabad, Asaka and Andijan, equipments for constructing a greenhouse in Andijan district. [10: 5-p].

It's important to mentionthat the epidemic has shifted most migrant workers' intentions. They end up with returningfrom compulsionin most cases, not of their own volition. As a result, their financial position deteriorates, putting them in risk of becoming impoverished.

In Uzbekistan, measures have been created to methodically organize work on poverty reduction. Tasks such as vocational training, financial literacy, entrepreneurship, infrastructure improvement, and the provision of targeted benefits have been indicated as being particularly important.

Today, Uzbekistan plans to work with specialists from international financial organizations, the United Nations Development Program, the World Bank, and the Asian Development Bank to create and execute conceptual documents on poverty reduction. It is planned to develop a poverty reduction strategy and concept in Uzbekistan until 2030, based on advanced foreign experience in poverty reduction, particularly that of China.

4. CONCLUSIONS

Today, China has done a great deal to eliminate poverty. According to the World Bank, China has pulled 850 million people out of poverty to date. In 1981, the poverty rate in China was 88 percent, but it is now 0.7 percent While the poverty rate in China was 88 percent in 1981, it accounted for 0,7 percent in 2019. This number corresponds exactly to the poverty rate in developed countries.

In conclusion, it should mentioned that one of the methods to reduce poverty in the country is to increase international cooperation to defend the social interests of labor migration participants.

AHMAD YASSAVI AND YUNUS EMRE

Islombek Sultonalievich Mannopov*

*Teacher (PhD),
Fergana State University, UZBEKISTAN

ABSTRACT

The issue of the influence of Khoja Ahmad Yassavi's work "Devoni hikmat" on the creativity of the Turkish people's poet Yunus Emre has been investigated. Khoja Ahmad Yassavi founded Uzbek Sufi literature with his poems called "hikmat". He relied on the experiences of sufi literature in Arabic and Persian [1, 154]. The Turkic peoples were inspired by religious songs of oral creativity. The weight of his wisdom was mastered by folk poetry. Another of the main factors of this phenomenon is the interest of the Turkic peoples in the ideas of Sufism.

KEYWORDS: *Wisdom, Wisdom Tradition, Yassavi Followers, Yassavi Order, "Devoni Hikmat", Turkish Folk Poetry Genres, Yassavipropriety.*

INTRODUCTION

The important role of Khoja Ahmad Yassavi in the history of the spiritual life of the Uzbek people is explained by the fact that it was founded on the first Turkic sect. Yassavi sect soon spread to very wide areas.

Khoja Ahmad Yassavi founded Uzbek sufi literature with his poems called "hikmat". He relied on the experiences of sufi literature in Arabic and Persian [1, 154]. The Turkic peoples were inspired by religious songs of oral creativity. The weight of his wisdom was mastered by folk poetry. Another of the main factors of this phenomenon is the interest of the Turkic peoples in the ideas of Sufism.

Wisdoms came to the field with the aim of promoting more enlightened-mystical ideas, and not artistic skill. His contemporaries yassavi regarded wisdom not as a simple work of art, but as a sacred work that promotes the ideas of the Quran, Hadiths and Sufism.

Therefore, after Khoja Ahmad Yassavi, the tradition of saying wisdom did not disappear, but, on the contrary, continued to appear more powerful.

MAIN PART

Thanks to the wisdom of yassavi and the school of literature, Turkish poets, who worked in huge territories around one literary language.

In the history of the Tatar people and literature, too, Ahmad Yassavi and his caliph Suleyman Bakirgani occupy a special place. The influence of proverbs on the work of tatar folk poets, such

as the narration of Tatar written literature, more precisely the Qul Ali (XIII century), the Qul Sharif (XVI century), the Mavloquli (XVIII century), is clearly felt.

The Turkish scientist Professor Fuad Kupruli emphasized the issue of the emergence of Turkish folk literature in his book "the first thinkers in Turkish literature", which he wrote a century ago, and noted that Turkish folk literature is a continuation of Central Asian Turkish Sufi literature [2, 119].

Turkish scientists Kemal Eraslan, Mustafa Tatchi, Mehmed Sheker, Nejdet Yilmaz, Hasan Kamil Yilmaz and other scientists have also covered the issue of the impact of Ahmad Yassavi's creativity on the Turkish poet Yunus Emre.

From some sources and poems it is known that Yunus Emre was born from 1240 year, lived 80 years, died in Eskishahar-Sarikuy (now Yunus Emre) and was buried here. Yunus Emre is a person who received madrasah education, knew Arabic and Persian well, studied the sciences of the Quran and hadith deeply, was a mature fanatic scientist of his time. In the XIII century, he came Anadolu from Khorosan and studied the teaching of sufism from such masters as Haji Bektash Vali and Taptuk Bobo (Taptuk Emre).

Before us, his work "Devon", which contains more than 400 poems, was written in the form of masnavi in the spirit of a sufi sermon called "Risolatun-Nushiyya" (Treatise of fertilizer).

He lived a dervish life and traveled to the territories of Azerbaijan, Iran, Anaduli [3, 286].

Since the X century, when religious-mystical works were called wisdom, the poetic genre was not considered, but didactic-philosophical content was taken into account. And the emergence of poems called wisdom is directly related to the personality and activity of Khoja Ahmad Yassavi. Yassavi called the poetic pendants, which he himself said, "wisdom". Poems called "wisdom" played an important role in the literary, spiritual and educational life of our people.

In "Devoni hikmat" there are examples confirming that the pandnoma is a poem, which is sung by hikmat - Ahmad Yassavi:

Қул Хожа Аҳмад қиёматдин айди муни,

Ҳикмат қилиб халойиққа ёйди муни,[4, 114]

«ҳикмат қилиб» деганда назмга солинганини эътироф этган.

Wisdom poets keep their poems written in the style and spirit of yassaviyya in accordance with tradition and call it "wisdom". They admit that their poetry is wisdom. For example, the poet of the XVI century wisdom Ubaydi:

Ҳикмат аҳлидек агарчи айтадур ҳикмат вале,

Қул Убайдий бор дурур шарманда ўз гуфторидин, [5, 356]

He calls his poems wisdom.

In “Devon” of Yunus Emre «Маним турур бу жумла иш, ҳикматларимла ёзу қиш” has such misra. He calls his poems "wisdom", like Ahmad Yassavi and his followers, constantly emphasizing that he was engaged in saying wisdom.

When yassavi's followers say wisdom, they mean not a poem of didactic-philosophical, aphoristic content, but exactly "Devoni hikmat" and ashor written on it. In the creativity of wisdom Ahmad Yassavi, a special genre of poetry was formed.

In his work "Tazkirai Qayumiy", Pulotjon Domulla Qayumov calls the poems "navhali ashor", which is read in a special musical tone [6, 562]. Wisdom as a separate poetic genre has the following characteristics:

1. Weight feature (finger is written in the poetry system) 2. Syncretic feature (pronounced in combination with words and music) 3. Style feature (hoop). 4. Feature of ethno-ritual. (In the sessions of the remembrance to be said by heart as to the people and later to be organized special rituals for reading wisdom). 5. Performance feature. (Proverbs are read by a speaker and singer with special abilities).

Poems in the genre of wisdom differ from other poetic genres in that they are primarily written in the finger system. In "Devoni hikmat" there is an inner rhyme, gazal shaped gazals in which each verse consists of fourteen syllables. These proverbs are four misra, seven syllables in each misras are repeated, the finger is written in the seventh Category (4+3).

4 3

Мунда ўзин / билгонлар, 7

Ҳаққа қуллуқ / қилгонлар, 7

Ҳақ йўлига / киргонлар, 7

Ёруқ юзли / бўлғуси. 7

Yunus Emre used the seventh category in his poems:

4 3

Жон бўлгил /жон ичинда, 7

Қолма гумон / ичинда. 7

Истаганинг / топарсан, 7

Яқин замон / ичинда. 7

Yunus Emre continued his poetry weight in accordance with the traditions of Yassavi. Also actively applied eight (4+4), sixteen (8+8) constellations of the finger system.

Another feature of the genre of wisdom is the performance in a musical tone. We tested the musical reading style of proverbs in the experiment. We have brought to the attention of national music scientists. We have shared experience. We saw it playing. Proverbs were performed on the curtains of earnings and brains, like some folk songs. Since the poem retains its features of rhythm, literature belongs to the genre.

In the land of Anaduli, the main factor in the formation of poems, which are called "divine", "breath", "meaning", is the genre of wisdom. Because the poems of Yunus Emre, also called "divine", also performed music.

Another feature of the genre of wisdom is the expression in the folk style. Ahmad Yassavi, through his wisdom, founded the Turkic style of Uzbek classical literature. Turkian, that is, the national enlightenment, has become the main style of creativity of literature. The folk style in the poetry of such creators as Boborahim Mashrab, Sufi Olloyor, Khujanazar Huvaidu, Ziyovuddin Hazini came into existence on the basis of the same tradition. The most basic feature of educational literature in Ahmad Yassavi's poetry is that it is written in harmony with the general public. In wisdoms, folk poetry is based on the weight and tone, the effective use of Turkic words, the use of existing speech units, proverbs and phrases in the language of the people living, the tashbeh of events encountered in the everyday life of ordinary people, their choice as a representation, etc. are the main factors that have caused the Turkish style.

Books such as “дўстлар”, “эй, ёронлар”, “Қул Хожа Аҳмад айтди буни”, “Қул Хожа Аҳмад сўзин эшит” which are often found in "Devoni Hikmat", have risen to the level of creative method in Ahmad Yassavi's wisdom. In Yunus Emre poetry, too, we see the phenomenon of

exposure to Yassavi from the specific art of exclamation: “Юнус Эмро айтур буни”, “Эшитинг, эй ёронлар”, “... хабарин айтдим, эшит”, “шарх ила айтдим, эшит” and so on.

It should be noted that "Devoni Hikmat " and Yassavi followers have a common feature in their works. This is a state of regret for one's own sins and shortcomings. This is not a weakness, in fact, a sign of courage, the first step that the solic has taken in perfection. Yassavi and reproaches are a common aspect of the currents. In many poems of Yunus Emre, including in the verse ""“Ёрлақагил, сен Юнусни, гуноҳкор қулларинг ила”, the same mood is expressed. Aliases used in Ahmed Yassavi wisdoms-"Qul "(Qul Khoja Ahmad), "Miskin” (Miskin Ahmad)are assigned a spiritual, educational and psychological task. He encourages the reader to repent because of the sin and writings he has done.This creative method, which is also inherent in the literature of enlightenment in the poetry of Yunus Emre, in many places. He also followed Yassavi and used the nickname "Miskin":

Мискин Юнуснинг жони, тўрт табиат ичинда,

Ишқ ила жон сирригапинҳон боргим келади,

Yunus Emre as an outstanding poet achieved a wider artistic expression in his poetry than Ahmed Yassavi, teaching "tawhid", "vahdat ul-wujud". At the same time, Mansur Halloj expressed the phenomenon of "Anal haq" through the method of bringing talmeh in accordance with the tradition of "Devoni hikmat":

Унда маст бўлганларнинг, “Анал Ҳақ”дир сўзлари,

Ҳаллож Мансур кабидир энг камина девонаси

The main theme of Yunus Emre's poetry is love and affection, as in the "Devoni hikmat". His poems on the theme of love and affection characterized by the fact that Ahmad Yassavi is much more enthusiastic and excited about his wisdom, said in a state of attraction. At the same time, in his poetry, thoughts in harmony with "Devoni hikmat" are expressed artistically, such as “Ишқ йўлида жон бермоқ”, “Дўст йўлида жаҳд айламоқ”, “Жон ва кўнгилда дўст севгисини пинҳон тутмоқ”, “Ишқ йўлида нафс орзусидан кечмоқ”, туну кун риёзатда бўлмоқ, суҳбат ва хилватда тиз чўкмоқ”, “Ишқ йўлида Дўст жафосига сабр қилмоқ”.

One of the criteria that shows the tradition of follower to Ahmad Yassavi is the wisdom written by wise poets.

One of the followers of Yassawi, Qul Sulaymon's «Эшитгулик дўстлар дуо қилмиш керак», Ubaydi's “ичинда”, «менга сен ўқ кераксан», «Кўч айладик, эй рафиқ», «Ҳақ ишқининг телбаси», Miskini's “Сўфинақш бўлдинг вале ҳаргиз мусулмон бўлмадинг”, Khudoydod's «Ё илоҳим нечук сени тобғой мано» and dozens of other proverbs "Devoni hikmat" with poems in the same weight and expressed in form, subject and idea.

Аҳмад Яссавийнинг “ичинда” радифли ҳикмати:

Холиқимни истарам тун кун жаҳон ичинда,

Тўрт ёнимдин йўландум кавну макон ичинда.

Тўртдан еттига етдум тўққизни бир ер этдим,

Иккидан ўнга етдум чархи кайвон ичинда.

Yunus Emre in "Devon" proves that he continued his yassavi tradition of connecting the verse to some poems in the "Devoni hikmat":

Жон бўлгил жон ичинда, қолма гумон ичинда,

Истаганинг топасан, яқин замон ичинда.

Руку, саждада қолма,амалингга ишонма,

Илму амал ғарқ бўлур, нозу ниёз ичинда.

Despite the fact that Yunus Emre grew up as a great thinker poet with his creative style and pencil, he continued the traditions of "Devoni hikmat" in his creativity. This phenomenon should be viewed as a COURTESY OF THE TRADITION OF SCOUTING.

CONCLUSION

In conclusion, in the work of Yunus Emre there are the following principles of the traditional Yassavi tradition: 1) the tradition of theme and idea; 2) the tradition of language; 3) the tradition of style and tone; 4) the tradition of image, model and expression; 5) the tradition of the poetic system.

EXPRESSION OF ARTISTIC IDEA IN MODERN UZBEK PROSE BY MEANS OF THE COLOR OF SUBJECTS

Abiljon Abdusamatovich Abdurakhmonov*

*Senior Teacher,
Doctor of Philosophy in Philological Sciences (PhD),
Fergana State University, UZBEKISTAN

ABSTRACT

This article is about the symbolic significance of the use of color in subjects in an artistic work. In the story of the modern Uzbek prose Abdulla Qahhor "Тўйдаги аза" and Shukur Kholmirzaev "Яшил Нива" color application in the precmets is studied. It is determined that the directed towards the manifestation of a deep philosophical-aesthetic creative idea, which is opposed to the traditional symbolic expression of color, indicating the psychological dramatism of the personality of the former saline period.

KEYWORDS: *Modern Uzbek Prose, Expression, Image, Color, Symbolism, Portrait, White, Red, Blue, Green, Creative Idea.*

INTRODUCTION

"Any color can be read as a word or interpreted as a signal, a hint or a sign," [1.18]. In fact, people have long known that colors have special meanings, hidden meanings. Symbols of colors have a long history. This is reflected in legends, fairy tales, ancient legends, belief and superstitions, the traditions of our ancestors. At the same time, colors symbolized not only mavhum concepts, but also specific phenomena: for example, the social state of people, their different psychological states. It manifested itself in the choice of clothes of a certain color, folk words, rituals, etc. Different peoples have created a certain symbolism, in which colors are preserved to this day. Gyote noted that "each color has not only a psychophysical and symbolic meaning, but also "emotional", "moral influence"[2.200]

The application of color in modern Uzbek prose began to be closely scaled with the teaching of genres, which were to changes in spiritual life.

MAIN PART

If in the stories of the Uzbek prose, which were updated at the beginning of the XX century, mainly colors were used simply for the external image in the expression of objects, then in the later period this process began to be oriented for a much broader expression of meaning. We will be able to observe a mature example of this, especially on the example of the work of the word master Abdulla Qahhor. If we are to periodize the use of color in modern Uzbek prose according

to their artistic and aesthetic significance, then its second period is undoubtedly associated with the work of Abdulla Qahhor.

In modern Uzbek prose, it was characteristic to limit the use of colors mainly by the expression of portraits and objects. But Abdulla Qahhor was able to use them as an important factor in the expression of an artistic idea, without simply giving up the color of portraits and objects, harmonizing the features of symbolism. As a vivid example, it is possible to bring the story “Тўйдаги аза” .

Basically three colors are involved in the story: white, red and blue. Each color has a deep ideological-philosophical place in the three periods of the story, combining around itself a complex of aesthetic views inherent in the symbolic expression of this color.

When each color "activity" begins, it is immediately noticeable that a second psychological environment limit begins.

The main hero of the work is docent Mukhtarhan. The work begins with giving his description in a portrait.

"Docent Mukhtorkhon Mansurov is a hot, incredibly sociable old man, so sociable that the person who saw him would have said that every season has its own subtleties, not only about the seasons, but also about the seasons of life. His one-two black left-handed white turtleneck beard... Shut up and see if the beard is so good to a person, too!.."[3.315]

In the story, we observe that the symbolic expression of the white color, which represented the beard of teacher Mukhtorkhon Mansurov, served to establish the attitude towards the interpretation of the whole person. It is known that white color in our people means innocence, whiteness, purity. And the concept of "whitewash", which he entered in a state of stagnant attachment with a beard, means wisdom. It is understood that docent Mukhtarov is the most respected person in the neighborhood.

The kulmanation point in the dynamics of the plot of the work also occurs again in the color medium. These are the scenes associated with the teacher to marry. The scene associated with the first white color closes: "meanwhile, teacher appeared a week after going off the cliff. The people in the teapot, who saw him coming down from the bus, remained; the old man broke his beard, such a beautiful beard, with in! There was no one left who did not feel sorry, offended."[3.316]

It turns out that with the "extermination" of the beard, the "teacher" also loses its qualities, which symbolizes the white color.

The red color is now entering the work reality scene. Red color is manifested by the combination of both symbolic and natural, and artistic-aesthetic properties. It turns out that the red color begins directly from the scene of the covenant "teacher" to marry.

Teacher has spread the saying that marrying her studentship is a twenty - year-old woman. [3.317]

In its symbolic meaning, red color symbolizes joy, enthusiasm. And by Abdulla Qadiri (also in the symbol of the wedding in our national culture), the red color is opposed to the traditional symbol, negative concepts are used within the framework of the exodus.

While staying close to the wedding, the bride went to the Atele at the beginning of the street, where she was ordered a shirt, what she saw from the women who found out about it. The bride, in fact, is young, but as if she is fat on interest yum-round; on her shoulders is a sleeveless red dress, on her head is like the crown of a popushak, but a red hat; a bag in her hand, a feather in her leg is also red. [3.317]

As a result, the mood of the work, in which the red color comes out:

One of the women who watched him head-to-head with hostility and hatred, turned and walked out of the atele:

- Die not like a cock candy! - he said.

– Let lick the cock candy in the old time, too, die! - said another one.

This nickname immediately broke up. He hated this woman who stole the pleasure of the neighborhood by beating her hand at the domla, extinguished the lamp, which always illuminates the hearts of people, with an indignation that pierces the stone, both he and he did not see. This anger began to rot the feeling of respect and love for the teacher in the hearts of people. When people say teacher, it became sad. Teacher, he must have noticed that, as far as possible, was eager to remain invisible to the eyes of people. [3.317]

A month after the wedding, the bride had a strange grief: sometimes at night the remained choking; as long as it was visible to the doctor, the doctor said, "the cure for this trouble is the sea air."Teacher ran from the morning to my office the next day, before four o'clock she handed over the train ticket with voucher to the bride.

In the evening, a taxi to the door was cross-country. [3, 318]

Entering the scene of the work, the "blue taxi" with its color makes a big turn in the plot of the work. According to our national-religious views, the blue color is interpreted as the color of mourning. (Wearing blue in mourning, tie a blue crochet in front of the house). The writer makes fruitful use of the tragic scene in the plot of the story together with the "cock candy", which is characterized by the negative symbol expression of the blue color, the negative aspects of the red color.

"Teacher, despite the fact that he was exhausted all day long by the hand, took two heavy suitcases to the car himself and put in her luggage with his own hands; he put on the same sleeveless red shirt, a red hat and opened the door of the car to the bride, who again came out of the yard as a cock candy, and then"[3.318]

The end result is known, as a result of the fact that the blue car will serve more than its own capacity to the "cock candy" dressed in red "teacher... die mold!"[3.318]

So we observe the following important aspects of the colors in the story that have arisen:

1. White (positive environment) (white beard "teacher")

2. Red (negative environment) ("cock candy")

3. Blue (tragedy) (blue car)

So it turns out that in the story Abdulla Qahhor was able to use mainly the symbolic feature of the three colors in a fertile way in expressing an artistic idea. He did not limit himself to the use of color expression in describing such external manifestations as something-an object, a portrait, through which the color is used as an auxiliary factor.

Another bright example of highlighting an artistic idea by means of a subject color is observed in the story of the writer Shukur Kholmirzaev called “Яшил Нива”. In the story, the green color with "Нива" is used together on the 5th place, which also performs a specific linguistic function in the plot. The essence of the work is also manifested in the psychology of the philosophical-symbolic mushad hero in the framework of the symbolic expression of the green color through this green "Нива" sentence.

Somehow, like me personally, there is an educated all there. And I want to be spoken (Let sadqai go to be spoken!) "dictator official" can also be found in other regions. Ultimately, even the seeds of green "Нива" flourished. And there are many such high-pitched dawans in our republic.[4]

Green color symbolizes vitality, life in relation to its traditional symbolic expression. Like in the story of Abdulla Qahhor "Тўйдаги аза", in this role we will meet the situation, which is opposed to the traditional symbolic expression of colors.

The green "Нива" cited by the writer as a symbolic expression of the "dictator officials" who have taken root in society. In the game is basically just what is brought to the image of the green "Нива". The reader cannot see, he does not even know who is inside the machine, as the hero of the work did not stare. But in his heart, comes to the riddle through exactly the same green color.

"Well, we were going through a turn, so the tortuous blossoming apples reached a single green "Нива" through it-but it got in front of us and started to go slow. Ne see by eye, as if that's the car! Famous car!..

Thus, although the green "Нива" has fallen on the road, began to go very slowly. Of course that's the machine. From the side-data, the antennas are removed, which means that there is also an racy inside. The machine itself is deng, new. But as it turned out from the side, the rear window was loy, so it was not visible how many people were sitting inside. [4]"

It can be understood by the author that the "Нива" is directed to a deep philosophical-symbolic solution from the issuance of exactly green. That is, here the green color is pointed to green in the style of the creature, which lives in any conditions, rather than a positive symbol of life. In a word, the concept also arises, as if referring to the slime that presses on clean water bodies.

Despite the fact that the green "Нива" is imitating, the heart does not bet that the hero of the work chased him. Those who chased him will be aware of what days have fallen on his head.

Although during the case of the work, the hero of the work heard from the DDN that the dictator was besieged, he would not dare to chase the green "Нива", which by chance was exterminated.

Thus, although the green "Нива" has fallen on the road, began to go very slowly. Of course that's the machine. From the side-data, the antennas are removed, which means that there is also an racy inside. The machine itself is deng, new. But as it turned out from the side, the rear window was loy, so it was not visible how many people were sitting inside. [4]"

"So, while the green “Нива” got down to the road, began to go very slowly. Of course that's the machine. From the side-data, the antennas are removed, which means that there is also an racy inside. The machine itself is deng, yap-new. But as it turned out from the side, the rear window was loy, so it was not visible how many people were sitting inside. [4]"

Through this landscape, which is the most kulmination point in the work, he manages to shed light psychology of the people in the same former saline society.

CONCLUSION

Hence, in the story of Shukur Kholmirzaev “Яшил “Нива”, Green was used more productively in expressing negative symbolic concepts than the traditional positive symbol.

Well, in modern Uzbek prose, the psychological dramatism of the person of the former society of Soviets is exposed by means of the symbolic expression of the colors of the subject.

ABSTRACT

Wearable gadgets, household appliances, and software may now exchange and transmit information over the Internet thanks to the Internet of Things (IoT). Given the enormous quantity of private information included in shared data, maintaining information security on shared data is a critical problem that must not be overlooked. In this article, we start with a basic overview on IoT information security and then go on to the information security issues that IoT will face. A world where physical items are seamlessly linked into the information network, and where physical objects may become active participants in business processes. The varied and large-scale devices and networks that differentiate IoT security issues from traditional ones are the main features. These two qualities, heterogeneity and complexity, make IoT security much more difficult. In this essay, the present challenges and research opportunities in IoT security were addressed. Finally, we'll discuss research areas that may lead to future work on solutions to the security problems that the Internet of Things faces.

KEYWORDS: *Communication, Information, Iot (Internet OfThings), Security, Software.*

1. INTRODUCTION

When the phrase "Internet of Things" (IoT) was originally coined, one may wonder what exactly constitutes "Things." Until recently, many groups of academics and organizations attempted to define the Internet of Things. “A world where physical items are seamlessly linked into the information network, and where physical objects may become active participants in business processes,” Haller suggested as an IoT definition. Sarma define "Things" as "physical things that represent identities with Internet connection" in order to broaden the scope of the IoT concept. Figure 1 shows the IoT Security[1].

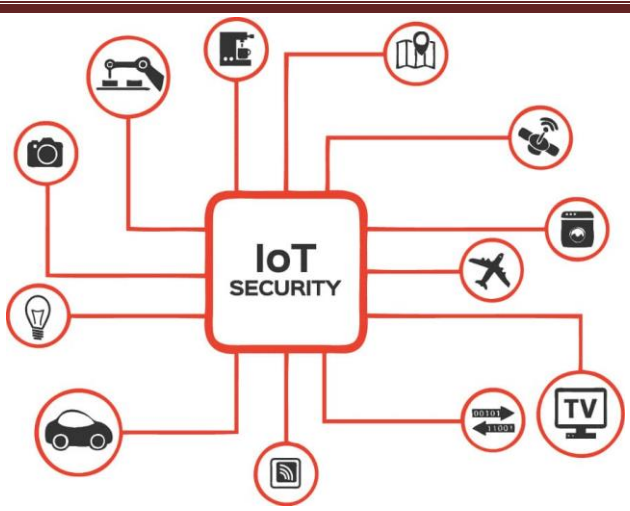

Figure 1: The above figure shows the IoT Security [opensourceforu].

Despite the fact that the IEEE IoT Initiative is working on a white paper for a formal definition of IoT, there are currently no standard definitions. We describe a "Thing" on the Internet of Things in this article as a physical or virtual item that connects to the Internet and may interact with humans or other things[2].

New security problems emerge as the Internet of Things expands, while existing security vulnerabilities become more severe. The heterogeneity and enormous size of the items are the primary causes. The effect elements are further split into two categories: the variety of the "Things" and the "Things' communication." It is split into two groups due to the fact that each category has its own set of security issues.

First, the “Things” have a security issue because of vulnerabilities caused by poor software design, which allows malware or backdoors to be installed. Because of the variety and size of the “Things” in the Internet of Things, such security issues are more complicated than the ones we have today.

In terms of the “Things’” communication medium, the networking environment for IoT is anticipated to be diverse. Various types of communication medium may confront different security issues. The availability of the "Things" will be jeopardized if these security issues are ignored. In terms of communication content, the diverse data format and protocols make content security more difficult. The author will quickly discuss relevant IoT research topics in this post, as well as the difficulties that these research areas face[3].

1.1 IoT Security Research in Progress:

The current study topics covering elements of IoT infrastructure, cryptography, software vulnerability, malware, and mobile devices will be briefly discussed in this section.

1.1.1 Identifying and finding objects in the Internet of Things:

The ability to uniquely identify an item came first, ahead of other security concerns. The basis of IoT is a good identification mechanism. An ideal identification technique not only uniquely identifies things, but also represents their properties. DNS (Domain Name System), for example, is a suitable identification technique that uniquely identifies a host on the Internet, as well as represents the host's property via FQDN (Fully Qualified Domain Name) naming policy and offers address mapping through DNS resolution. The EPCglobal board released Object Name Service (ONS) in 2005, based on the success of DNS, to find the information and services associated with a particular Electronic Product Code (EPC). The ONS concept suggests that a framework similar to this might be used for IoT item identification[4].

The network location of the items is also essential since they are linked to the network. IPv4/IPv6 is now the most commonly utilized locating technique. Despite the fact that IP addressing may still be a contender for the future Internet, Named Data Networking (NDN) is suggested as a naming infrastructure for the Future Internet Architecture (FIA). NDN is a data-oriented approach that mixes naming and addressing, with packet routing based on object names directly, as opposed to host-oriented IP addressing[5].

1.1.2 Authentication and Authorization in the Internet of Things:

Another significant topic of study is how to authenticate the items. Authentication has traditionally been accomplished using a variety of techniques, including ID/password, pre-shared secrets, and public-key cryptosystems. Access control may be database-based or crypto-based to obtain authorization.

Traditional authentication and authorization techniques may not be relevant in the IoT due to the variety and complexity of the devices and networks. Authenticating and authorizing using cryptographically pre-shared keys, for example, is not possible. Key management will become a tough job if the number of items grows quickly.

Despite research efforts to address the issue of object authentication and authorization, no common agreements or standards exist in this field.

1.1.3 Privacy in the Internet of Things (IoT):

At this time, data about user activity while surfing the Internet is being gathered in order to improve the user experience. In the case of IoT, data gathering is not restricted to Internet surfing activity; data about a user's daily routine is also gathered so that the "Things" around him or her may work together to offer better services that meet personal preferences[6].

In the event of misuse of personal information, maintaining the privacy of the acquired data is a problem that has to be addressed.

1.1.4 Lightweight Cryptosystems and Security Protocols:

Sensor nodes, smart gadgets, and wearable devices are examples of resource-constrained IoT devices with limited processing power and battery capacity. Many suggested cryptosystems and security protocols are safe and resilient; however they may not be appropriate for resource-constrained devices. For example, some recent study has focused on this topic.

1.1.5 Analysis of Software Vulnerabilities and Backdoors in IoT:

Software vulnerability, in addition to authentication and authorization issues, is a major focus of contemporary security research. Programming errors created by developers are inevitable throughout the development stage of a piece of software. Software vulnerabilities are bugs that result in security issues. When new software vulnerabilities, often known as zero-day vulnerabilities, are discovered, attackers may use this information to exploit a huge number of computers.

System architectures are comparable across devices in the conventional PC sector. The business market, for example, is dominated by the Windows operating system on x86 platform architecture. Developers may concentrate on the mainstream and use well-known software. As a result, with appropriate education, security awareness in software development is very simple to implement. Diverse hardware platforms and bespoke operating systems make it challenging to train programmers on security awareness in the heterogeneous IoT. Furthermore, as software complexity grows at an exponential rate, it is more important than ever for software engineers to pay attention to every element of safe programming. At this time, a lot of research studies have shown that IoT devices are vulnerable to attackers[7].

Software vulnerabilities may be discovered via program analysis before a product is published. The dynamic analysis method of monitoring the targeted program in a controlled environment is an effective way for verifying a program. Many sophisticated analysis methods, like as taint analysis and symbolic execution, are made possible by it. Because of the resource restriction, these analytic tools, which often need a lot of processing power, are incompatible with IoT devices.

Furthermore, the majority of these sophisticated analytic methods are extremely reliant on the system platform.

Building these analytical methods necessitates bespoke development for many platforms in a variety of IoT settings.

Software flaws may result in a variety of backdoor issues. First, attackers use software vulnerabilities to carry out harmful intentions without leaving any trace on a victim's machine. As a result, attackers may install a backdoor in a susceptible device to gain control of it. Because of the resource limitations of IoT devices, security methods such as intrusion detection systems (IDS) and antivirus, which need a significant amount of computing power, are not suitable. As a result, injecting a backdoor onto a victim's computer is very simple for attackers. Another kind of backdoor is one that is purposefully introduced into a software package for management or testing reasons by suppliers. However, attackers may find and exploit these backdoors to steal user data. Using reverse engineering methods, a skilled opponent may analyze code and find this kind of backdoor. Although users may inspect the gadget before to deployment, doing so takes reverse engineering expertise and a considerable amount of human work. Furthermore, the evaluation must be repeated in the event of system updates. When software receives patches for security upgrades, this process becomes a daily activity. As a result, this kind of backdoor is simple to set up yet difficult to detect. That is the primary reason why certain government agencies place restrictions on the use of untrusted devices[8], [9].

1.1.6 Malware in the Internet of Things:

Symantec verified the discovery of the first IoT malware, Linux, in November 2013.

Darlloz, who brings up the malware problem in the context of IoTsecurity.IoT services take advantage of the high level of connection among different devices, while also enticing attackers as a hotspot for broadly disseminating their virus. Any infected IoT device connected to a susceptible user may contaminate a device owned by the victim, allowing the attacker to move one step closer to the targeted vital device and the enormous data of interest it stores. Malware may also just hide in an end-device, which is seldom equipped with robust security protection, enabling long-term profiling/control of IoT devices such as surveillance cameras, in addition to the fast dissemination advantage. This is a major breach of Internet users' privacy. Previous research studies also address the potential dangers posed by malware to IoT devices and emphasize their significance. To our knowledge, however, there is currently very little study devoted to the countermeasure of IoT-targeted malware. The reason for this may be due to the limited number of real-world IoT malware cases, making it difficult to generalize an effective remedy. Regardless of Linux's existence. Darlloz claims that IoT malware is no longer a fictitious foe, but a real danger to IoT devices. In the Internet of Things, the danger of malware and countermeasures will become important, and they must be handled[10].

1.1.7 Android Operating System:

The Android platform, which is the most popular mobile operating system, has dominated the mobile market. More and more smart gadgets based on Android have been created as personal assistants, which have undoubtedly dominated the IoT. The Android platform drew the attention of IoT developers in various ways due to its open and embedded-system focused architecture.

Many Android features, including as battery conservation, near-field communication, multi-sensors, and voice control, have been incorporated in IoT devices. Android, for example, has long been a component of the Internet of Things. Despite the presence of other competitors like as Apple iOS, Windows Phone, and Mozilla Firefox OS, Android is backed by a huge developer community that is propelling IoT in a variety of directions.

2. DISCUSSION

The author has discussed about the IoT Security, when the term "Internet of Things" (IoT) was first created, many people wondered what precisely "Things" meant. Many scholars and organizations tried to define the Internet of Things until recently. As an IoT definition, Haller proposed "a future where physical things are seamlessly connected into the information network, and where physical objects may become active players in business operations." To expand the scope of the IoT idea, Sarma defines "things" as "physical objects that represent identities with Internet connectivity." As the Internet of Things grows, new security issues arise, while old security flaws become more serious. The main reasons are the objects' heterogeneity and huge bulk. The impact components are further divided into two groups: "Things' diversity" and "Things' communication." Because each category has its own set of security concerns, it is divided into two categories.

3. CONCLUSION

The author has concluded about the IoT Services, The diverse and large scale devices and networks are the key characteristics that distinguish IoT security problems from conventional ones. IoT security is made considerably more challenging by these two characteristics, heterogeneity and complexity. The current problems and research possibilities in IoT security were discussed in this article. New research subjects are also addressed, as well as potential solutions.

ABSTRACT

Since the advent of Bitcoin, the first and biggest cryptocurrency, blockchain technology has been recognized as a digital currency platform. It has previously been used for decentralization of markets in general, rather than just decentralization of money and payments. A distributed system has several advantages, including increased computing power by combining the computing power of all connected nodes, increased reliability due to the lack of a single point of failure, and so on. The blockchain's decentralized transaction ledger may be used to register, confirm, and transmit various types of contracts to other network participants. We fully examine state-of-the-art blockchain-related applications that have appeared in the literature in this article. A number of previously published publications were carefully considered for inclusion based on their contributions to the blockchain body of knowledge. In the last part of the article, many points are examined and debated.

KEYWORDS: *Applications, Blockchain, Cryptocurrency, Software.*

1. INTRODUCTION

A software system can be classified into one of two architectural approaches: centralized or distributed. The nodes in a centralized software system are spread out and connected to a single central coordination node. A distributed system, on the other hand, consists of several interconnected nodes with no single point of control. However, there are several disadvantages to a distributed system, including communication overhead and security issues related to untrustworthy nodes abusing network access.

Meanwhile, blockchain can be viewed as a component of a distributed software system's implementation layer. Blockchain can be used to achieve and maintain data integrity in distributed systems. Furthermore, blockchain can be thought of as a purely peer-to-peer system composed of individual nodes in a network. In peer-to-peer systems, dishonest and malicious peers become the most serious integrity threat. Because unknown peers with unknown reliability and trustworthiness may exist, individual nodes try to exploit the system for their own purposes. As a result, blockchain is required to address these important issues[1].

Initially, blockchain's main application was to link cryptocurrencies to traditional banking and financial institutions. Blockchain technology creates a new banking ecosystem, allowing financial institutions to conduct transactions directly between themselves without the need for central authorities or intermediaries. Every transaction must be verified by the consent of more than half of the network's participants. This means that no participant can change any data on the blockchain without the permission of other participants[2]–[5].

The purpose of this paper is to provide and explore information about blockchain technology and its current applications in the real world. The paper categorizes published works in the literature, such as academic journals, conferences, technical reports, and so on. Several studies on blockchain technology have been conducted as part of review studies. Most studies, on the other hand, have not included a comprehensive discussion of blockchain-related applications.

1.1.Fundamentals of Blockchain Technology:

Blockchain is a type of distributed ledger (data structure) that stores transaction or event information. It is copied and shared across the network's members. Since blocks are added and linked to the preceding block using a hash function, the chain's size continues to grow. To generate a hash, a cryptographic hash function is needed. Bitcoin, for example, employs the SHA-256 algorithm, while Litecoin and Primecoin use the Scrypt and Cunningham chains, respectively. It also allows us to quickly check the input mapping to a particular hash value. It would be impossible to have the same hash for two distinct inputs.

A network node (user) validates and preserves the ledger in the blockchain using a consensus mechanism (a set of rules that allows users to reach a mutual agreement), eliminating the need for a central authority or intermediary. Each node maintains a full copy of the ledger. Section III delves into the practical application of blockchain for financial transactions, since the primary goal of blockchain is to address the issues that present in the Bitcoin cryptocurrency[6], [7].

1.2.BlockchainApplications:

The use of blockchain technology in many fields is extensively explored in this section. Furthermore, financial services, healthcare, business and industry, and other new applications have all been classified as such applications.

- **Service in the Financial Sector:**

The blockchain technology has been widely used for financial transactions, or cryptocurrency. Cryptocurrencies have become popular software systems in recent years. The initial transaction is included in the first block, often known as the genesis block. The first block's hash is sent to the miner, who uses it to create a hash for the second block. Similarly, the third block generates a hash that includes the previous two blocks, and so on. The genesis block may be traced back to all subsequent blocks on the blockchain[8].

Cryptocurrency has its own monetary system (coin). The process of adding a new block to the blockchain is known as mining. Each node checks the blockchain to see whether the currency is genuine and hasn't been spent yet. A larger number of parties must agree before the transaction records are added to the blockchain. Because the mining process consumes a lot of resources, it's difficult for an attacker to verify an incorrect transaction. Each mined block is checked to determine whether it contains a valid proof of stake or proof of work.

- **Healthcare:**

Blockchain offers enormous promise for solving the existing health-care system's interoperability problems. It may be used as a standard to enable stakeholders such as healthcare organizations, medical researchers, and others to securely exchange electronic health records

(EHRs). Sharing EHR allows us to improve the quality of medical treatment and improve doctor recommendations, for example.

However, managing healthcare data, that is, collecting, keeping, and analyzing it, is not an easy job, especially when privacy concerns are involved. Healthcare information should not be shared with anyone else since it may be used fraudulently by malicious users or attackers.

To address these concerns, a healthcare data gateway (HDG) based on the blockchain storage platform has been suggested. It is a smartphone application that allows users to simply manage and restrict data sharing. Users may process patient data using the suggested approach without jeopardizing patient privacy. Furthermore, the data is kept in a private blockchain cloud, guaranteeing that medical data cannot be tampered with by anybody, including doctors and patients.

Following that, the use of blockchain for pervasive social network (PSN) based healthcare is suggested. We can exchange medical data collected by medical sensors via PSN. The authentication protocol between medical sensors and mobile devices in a wireless body area network (WBAN) and the EHR data exchange utilizing blockchain in the PSN area are the two primary security protocols in a PSN-based healthcare system. Medical data transactions, such as node address and medical sensors, are generated and broadcast by each node in the PSN. The miners, on the other hand, are in charge of transaction verification and the production of new blocks.

Finally, proposes a blockchain-based access control system. Identification, authentication, and permission are all part of the access control process. It establishes a state of accountability in which user access can be tracked for what specific activity in a system. After confirming their identity and cryptographic keys, users may obtain EHR from shared data pools using the proposed approach. Identity-based authentication is used to accomplish user authentication. In addition, a lightweight block structure is suggested to improve the existing blockchain implementation.

- **Industry and Business:**

The rise of the Internet of Things (IoT) has offered numerous benefits, including the ability to link things and people. As a result, the authors suggest an e-business architecture that is tailored to the IoT context. The distributed autonomous corporation (DAC) is used for this purpose as an entity that provides transaction services without the need for human involvement. The proposed system's main component is a transaction mode in which peer-to-peer transactions are carried out autonomously, with Bitcoin and IoTcoin serving as the currency and exchange certificate, respectively.

When presenting an agri-food supply chain traceability system utilizing RFID and blockchain technologies, the authors address the significance of food safety and quality. Blockchain is used to ensure that information exchanged and published is accurate and trustworthy. Furthermore, in the age of Industry 4.0, there is a concept known as'smart manufacturing.' Industry 4.0 refers to the ability of goods and services to be shared across networks, such as the Internet or blockchain. In terms of supply chain management, Industry 4.0 is anticipated to bring decentralization and self-regulation to the fore.

- **Additional Implementations:**

The present application of blockchain in a variety of domains, including right management, reputation, digital content distribution, WiFi authentication, and IoT security, is addressed in this section.

The two papers propose and explore a novel decentralized right management system idea based on blockchain technology (BRIGHT). This is in stark contrast to the conventional method, which often involves a central third-party. The suggested system is anticipated to feature a robust anti-attack mechanism and will allow us to reduce customer service costs. Furthermore, a reputation system has a lot of possibilities for assessing our community's trustworthiness. It is calculated using our past transactions and interactions in a network, such as an e-commerce website. By incorporating blockchain into the reputation system, it will be possible to address the main problems that now exist in the system, such as freeloaders..

A new WiFi authentication protocol has been developed. This is based on Bitcoin 2.0, which is a Bitcoin-based alternative cash system. Users must first download and install the Auth-Wallet program, after which Auth-Coins are provided. Tokens are exchanged between users and access points for authentication. Finally, blockchain implementation for smart home security. A private and local blockchain is used to offer secure access control to the IoT devices. The blockchain not only provides a lightweight security mechanism for smart home devices, but it also creates an immutable time-ordered database of transactions. In addition, a smart home miner is a device that processes transactions in the smart home from a central location.

2. LITERATURE REVIEW

Z. Zheng et al. discussed a review on challenges of Blockchain[9]. Decentralization, persistency, anonymity, and auditability are just a few of the advantages of blockchain. Blockchain applications include a broad range of topics, including cryptocurrencies, financial services, risk management, internet of things (IoT), and public and social services. Although a number of studies have focused on different applications of blockchain technology, there is yet to be a thorough assessment of the technology from both a technical and an application standpoint. To close this gap, we conducted a thorough blockchain technology study. This article, in particular, explains the blockchain taxonomy, analyzes common blockchain consensus algorithms, evaluates blockchain applications, and discusses technical difficulties as well as recent advancements in addressing the issues. Furthermore, this article discusses the future paths of blockchain technology.

A. Reyna et al. discussed a review on Blockchain and its integration[10]. Conventional gadgets become smart and autonomous under the Internet of Things (IoT) vision. Thanks to technological advancements, this vision is becoming a reality, but there are still difficulties to overcome, especially in the security sector, such as data dependability. Given the anticipated growth of the IoT in the next years, it is critical to establish trust in this massive incoming data stream. Blockchain has emerged as a critical technology that will revolutionize the way we exchange data. Building trust in dispersed settings without the need of authority is a technical advancement that has the potential to transform a variety of sectors, including the Internet of Things. IoT has used disruptive technologies like big data and cloud computing to overcome its constraints since its inception, and we believe blockchain will be the next one. This article examines this connection, examines difficulties in blockchainIoT applications, and reviews the most relevant research in order to assess how blockchain might possibly enhance IoT.

3. DISCUSSION

Cryptocurrency has been a hot subject for a few decades, with enormous technical capabilities that have drawn billions of dollars in investment. According to the "Global cryptocurrencies benchmarking research," the value of digital money grew by more than three times in early 2016, almost reaching $25 billion in March 2017. Blockchain is a technology that allows cryptocurrency to exist (among other things). The authors of this article discussed blockchain and its characteristics, as well as cryptocurrencies. As with any other technology, there are advantages and disadvantages to it, and Blockchain technology is no exception. Big deals will be

done in cryptocurrency in the future, but when it comes to India, cryptocurrency has a long way to go since there are UPI systems in place now, and maybe transactions will be done in digital currency in the future as well.

4. CONCLUSION

In terms of solving data integrity problems, increasing transparency, preventing fraud, and creating trust and privacy, blockchain technology has a bright future. Finance, accounting, e-government, business process management, insurance, entertainment, trading platforms, healthcare, the internet of things, and law firms, among other sectors, have the potential to be transformed by blockchain technology.

As a consequence, depending on the area or sector in which it is utilized, Blockchain Technology has a lot of promise for providing new solutions, since technical innovation and applications may help achieve economic efficiency and social benefits. However, using Blockchain Technology in a number of industries may be prohibitively costly. To migrate or transfer outdated systems, businesses must invest a significant amount of money. The most recent state-of-the-art research articles on blockchain technology were examined and debated. A number of articles were carefully selected from an internet database and then categorized into various categories. This article provides an overview of current blockchain research as well as real-world applications.

ABSTRACT

Decentralization, persistency, anonymity, and auditability are just a few of the advantages of blockchain. Blockchain applications include a broad range of topics, including cryptocurrencies, financial services, risk management, internet of things (IoT), and public and social services. Although a number of studies have focused on the use of blockchain technology in different application areas, there is yet to be a thorough assessment of the technology from both a technical and an application standpoint. To close this gap, we conducted a thorough blockchain technology study. Other than Bitcoin, blockchain may be utilized in a variety of applications. Blockchain has shown its capacity to disrupt traditional sectors because to its basic characteristics of decentralization, persistency, anonymity, and auditability. This article provides a comprehensive overview of the blockchain. This article, in particular, explains the blockchain taxonomy, analyzes common blockchain consensus algorithms, evaluates blockchain applications, and discusses technical difficulties as well as recent advancements in addressing the issues. Furthermore, this article discusses the future paths of blockchain technology.

KEYWORDS: *Bitcoin, Block, Blockchain, Cryptocurrency, Risk.*

1. INTRODUCTION

Cryptocurrency has recently received a lot of interest from both business and academics. The capital market for Bitcoin, which is generally referred to as the first cryptocurrency, reached ten billion dollars in 2016.

Bitcoin's core mechanism is the blockchain. All committed transactions are recorded in a chain of blocks in blockchain, which may be thought of as a public ledger.

When additional blocks are added to the chain, it continues to expand. Decentralization, persistency, anonymity, and auditability are all important features of blockchain technology. The integration of many fundamental technologies such as cryptographic hash, digital signature (based on asymmetric cryptography), and distributed consensus mechanism allows blockchain to operate in a decentralized context. A transaction may be carried out in a decentralized manner using blockchain technology. As a consequence, blockchain has the potential to significantly reduce costs while also increasing efficiency[1]–[3].

Although Bitcoin is the most well-known blockchain application, the technology may be used in a wide range of applications beyond cryptocurrencies. Blockchain may be utilized in different financial services such as digital assets, remittance, and online payment since it enables payments to be completed without the need of a bank or an intermediary. Furthermore, blockchain technology is emerging as one of the most promising technologies for the next generation of internet interaction systems, such as smart contracts, public services, internet of things (IoT), reputation systems, and security services[4]–[6].

Despite the fact that blockchain technology offers enormous promise for the development of future internet services, it is beset by technical difficulties. To begin with, scalability is a major issue. The size of a Bitcoin block is currently restricted to 1MB, and a new block is mined every 10 minutes. As a result, the Bitcoin network is limited to 7 transactions per second, rendering it unsuitable for high-frequency trading. Larger blocks, on the other hand, need more storage space and take longer to propagate across the network. As people want to maintain such a huge blockchain, this will eventually lead to centralization. As a result, finding a balance between block size and security has become difficult. Second, it has been shown that miners may earn more than their fair share of income by using a selfish mining technique. Miners conceal their mined blocks in the hopes of making more money in the future. As a result, branches may occur often, impeding blockchain growth. As a result, some remedies to this issue must be proposed. Furthermore, even when individuals solely utilize their public and private keys to conduct transactions, privacy leakage may occur in blockchain. It's even possible to trace a user's actual IP address. Additionally, existing consensus methods like as proof of work (PoW) and proof of stake (PoS) have significant flaws. PoW, for example, consumes a lot of power, and the phenomena of the wealthy becoming wealthier may show up in the PoS consensus process. These issues must be solved in the development of blockchain technology.

Blockchain literature may be found in a variety of places, including blogs, wikis, forum postings, codes, conference proceedings, and journal articles. Tschorsch and Scheuermann (2016) conducted a technical analysis of decentralized digital currencies such as Bitcoin. With significant additions to blockchain technical aspects, consensus methods, blockchain applications, research difficulties, and future prospects[7]–[9].

1.1 The Architecture Of The Blockchain:

Like a traditional public ledger, the blockchain is a series of blocks that contain a full list of transaction data. A blockchain is shown in Figure 1 as an example. Each block contains a reference to the block before it, which is basically a hash value of the preceding block called parent block. It's worth mentioning that hashes of uncle blocks (children of the block's forebears) would be kept in the Ethereumblockchain as well. The genesis block is the initial block in a blockchain that has no parent block.

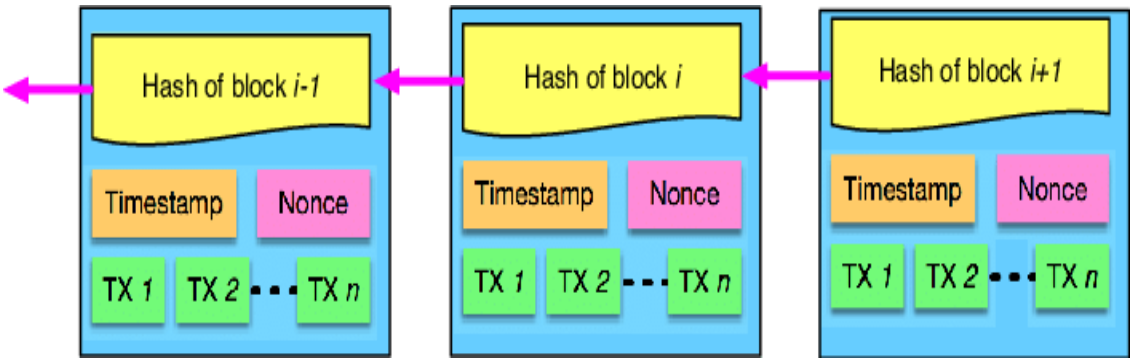

Figure 1: The above figure shows an example of blockchain which consists of a continuous sequence of blocks.

1.1.1 Block:

The block header, in particular, contains the following information:

- The block: specifies which set of block validation criteria should be used.
- Parent block hash: A 256-bit hash value that refers to the preceding block.
- Merkle tree root hash: the sum of all transactions in the block's hash value.
- Timestamp: Current timestamp expressed in seconds since 1970-01-01T00:00 UTC.
- nBits: a concise representation of the current hashing target.
- *Nonce:* a four-byte field that begins with 0 and grows with each hash computation

A transaction counter and transactions make up the block body. The maximum number of transactions that may be stored in a block is determined by the block size and the transaction size. To verify transaction authenticity, Blockchain employs an asymmetric cryptography method (NRI, 2015). In an untrustworthy environment, a digital signature based on asymmetric cryptography is employed. After that, we'll show you how to create a digital signature.

1.1.2 Electronic Signature:

Every user has a private and public key pair. The transactions are signed using the private key. The digitally signed transactions are dispersed throughout the network and then accessed using public keys that are accessible to everyone. Figure 2 depicts a digital signature in the context of blockchain. The signing phase and the verification phase are both included in a conventional digital signature. Let's look at Figure 2 one more. When Alice wishes to sign a transaction, she first creates a hash value from it. She then encrypts this hash value with her private key and transmits the encrypted hash together with the original data to another user Bob. Bob validates the received transaction by comparing the decrypted hash (created using Alice's public key) to the hash value computed from the received data using the same hash function as Alice's[10]. The elliptic curve digital signature method is one of the most common digital signature algorithms used in blockchains.

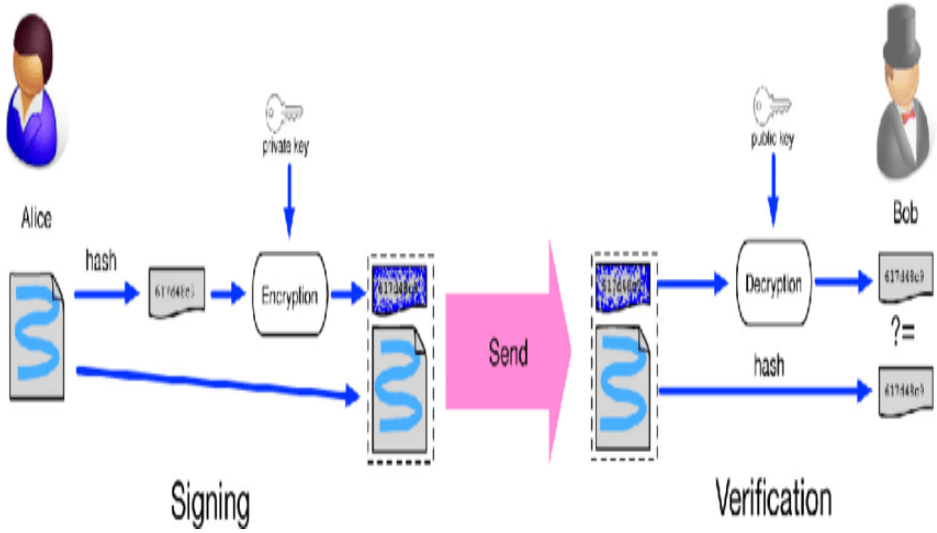

Figure 2: The above figure shows the Digital Signature used in Block chain.

1.2 Blockchains Key Characteristics:

In conclusion, the main features of blockchain are as follows.

1.2.1 Decentralization: Decentralization is a term that is used to describe the process of Each transaction in traditional centralised transaction systems must be verified by a central trusted agency (e.g., the central bank), resulting in cost and performance bottlenecks at the central

servers. A transaction on the blockchain network, on the other hand, may be performed between any two peers (P2P) without the need for central agency authentication. As a result, blockchain may substantially decrease server expenses (both development and maintenance) while also alleviating performance constraints at the central server.

1.2.2 Persistency: It is virtually difficult to tamper with the network since each transaction must be verified and recorded in blocks dispersed across the network. Other nodes would also verify each broadcasted block, and transactions would be verified. As a result, any fabrication would be readily detectable.

1.2.3 Anonymity: Anonymity is a virtue. With a created address, any user may communicate with the blockchain network. Furthermore, a user may create a large number of addresses in order to protect his or her identity. There is no longer a central authority in charge of users' personal information. This technique ensures that the transactions on the blockchain are kept private to some extent. Due to the inherent limitation of blockchain, it cannot ensure complete privacy protection.

1.2.4 Auditability: Users may easily check and track prior records by visiting any node in the distributed network since each transaction on the blockchain is verified and logged with a timestamp. Each transaction in the Bitcoin blockchain may be traced back to prior transactions repeatedly. It enhances the data stored in the blockchain's traceability and transparency.

1.3 Blockchain systems taxonomy:

There are three kinds of blockchain systems now in use: public blockchain, private blockchain, and consortium blockchain. The author examines these three kinds of blockchain from various angles.

1.3.1 Consensus Determination: Each node in a public blockchain may participate in the consensus process. In a consortium blockchain, only a limited number of nodes are responsible for verifying the block. In the case of a private chain, it is entirely under the authority of a single organization, which may decide on the ultimate consensus.

1.3.2 Read Permission: A public blockchain's transactions are accessible to the public, while a private blockchain or a consortium blockchain's read permission is limited. The consortium or organization may determine whether the information kept is public or private.

1.3.3 Immutability: It is a quality that cannot be changed. It is virtually difficult to tamper with the public blockchain since transactions are stored on various nodes throughout the distributed network. The consortium blockchain or private blockchain may be reversed or tampered with if the majority of the consortium or the dominant organization wishes to tamper with it.

1.3.4 Effectiveness: Because the public blockchain network has a high number of nodes, propagating transactions and blocks takes a long time. With network security in mind, public blockchain limitations would be considerably more stringent. As a consequence, transaction throughput and latency are both restricted. Consortium blockchain and private blockchain may be more efficient with fewer validators.

1.3.5 Centralized: The primary distinction between the three kinds of blockchains is that public blockchains are decentralized, consortium blockchains are partly centralised, and private blockchains are completely centralised since they are owned by a single entity.

Consensus Process: The public blockchain's consensus process is open to everyone on the planet. Both consortium blockchain and private blockchain are permissioned, unlike public blockchain. To participate in the consensus process in a consortium or private blockchain, one node must be certificated.

Because public blockchain is accessible to the whole globe, it has the potential to attract a large number of users. In addition, communities are extremely active. Every day, new public blockchains arise. The consortium blockchain may be used in a variety of commercial applications. Hyperledger is currently working on blockchain frameworks for corporate consortiums. Ethereum has also made tools available for creating consortium blockchains. In terms of private blockchain, many businesses are still adopting it for efficiency and auditability.

2. DISCUSSION

The author has discussed about the blockchain, because it allows payments to be made without the need of a bank or an intermediary, blockchain may be used in a variety of financial services such as digital assets, transfer, and online payment. Furthermore, blockchain technology is quickly gaining traction as one of the most efficient methods for the next generation of computer functionality offered, including smart contracts, public services, the internet of things (IoT), reputation systems, and security services.

Despite the fact that blockchain technology has a lot of promise for the future of internet services, it is plagued by technical issues. To begin with, scalability is a significant concern. A Bitcoin block can only be 1MB in size for now, and a new block is mined every 10 minutes. As a consequence, Bitcoin's network can only process 7 cycles per second, reducing the availability for high-frequency trading. Larger blocks, on the other hand, need more storage space and require more time to propagate through the network. People will ultimately want to maintain such a large blockchain, which will lead to centralization. As a consequence, striking the right balance between network capacity and security has become challenging. Second, it has been shown that by adopting a selfish mining method, people may earn more than their fair share of revenue. Mined blocks are hidden by miners in the intention of earning more money in the future.

3. CONCLUSION

The author has concluded about the blockchain, Because of its decentralized architecture and peer-to-peer nature, the blockchain is widely regarded and supported. Bitcoin, on the other hand, protects a lot of blockchain research. However, blockchain may be used in a number of areas other than Bitcoin. With its fundamental features of decentralisation, persistency, anonymity, and auditability, blockchain has proven its potential to disrupt conventional industries. We provide a thorough overview of the blockchain in this article. We begin by providing an overview of blockchain technology, covering blockchain architecture and important blockchain features. Following that, we'll go through some of the most common blockchain consensus algorithms.

The author examine and evaluate these procedures in a variety of ways. We also look at common blockchain applications. Furthermore, we outline some of the difficulties and issues that may stymie blockchain growth, as well as some current solutions. There are also some potential future directions mentioned. Nowadays, smart contracts are rapidly evolving, and a plethora of smart contract applications are being suggested. However, many creative applications are presently difficult to execute due to the numerous flaws and limitations of smart contract languages. In the future, we want to conduct a thorough study of smart contracts.

BOLSHEVIK POLICY IN PUBLIC EDUCATION: THE NATIONAL EDUCATION SYSTEM AND THE IMPLEMENTATION OF THE SOVIET MODEL IN EDUCATION

Rano Kadirova*

*Teacher,
Department of World Historyat Fergana State University,
UZBEKISTAN

ABSTRACT

As a result of the Bolsheviks' rise to power, so many reforms started to be done not only in the political but also in the social spheres. They had serious aspects especially in education, science, and culture, which are important in changing their minds. Reforming the national education system was not easy, but mandatory.

KEYWORDS: *Turkestan ASSR (Autonomous Soviet Socialist Republic), TASSR CEC (Central Executive Committee), People's Commissariat Of Education, Military Communism, Unified Labor School, Labor School – Communes.*

1. INTRODUCTION

Turkestan had an old system of schools, mosques, qorixonas (places where religious people recited the Koran and small children were taught to do so), otin oyi schools (female schools), and madrassas before the Russian Empire conquered the country. Since the colonial authority established the Governor-General of Turkestan in 1867, the local education system, as well as all economic and political activity, has been under its supervision. The Tsarist administration investigated the local educational system and determined that it posed a threat to colonialism's future. The madrassas, which had played a vital role in Muslim society for generations, were regarded by colonial administrators as "relics of the past" [*1: p. 29*].

2. MATERIAL AND METHODS

Despite the Tsarist government’s policy of Russification and brutality against the local religious education system, traditional religious schools continued to operate, and a new promising principle of national education evolved. With the impact of the 1905 revolution and, in particular, the overthrow of the Tsarist government, the principle of democratization began to take root in the education system.

The Bolsheviks, who came to power after the October 1917 coup, established the Turkestan People's Commissariat of Education in November 1917 in order to terminate the existing system of governance in the education system and build a Soviet model of public education [*2: 34-f,. 1-list, 30-work, 3-sheet*].

The Turkestan ASSR decreed on May 14, 1918, that the education system in Turkestan would undergo fundamental socialist transformation [*7*]. It stressed the importance of establishing a Soviet school that would be suitable for all.

The first alternative in the program plan was the Soviet school model, known as the "Unified Labor Schools", which was adopted by a decree of the RSFSR's Central Executive Committee on October 16, 1918. The unified school was divided into two phases: the first for children aged 8 to 13 (five years of education) and the second for youngsters aged 13 to 17 (four years of education) [*7*].

TASSR CEC issued a directive on the transfer of education in the mother language and published the "Regulations on the organization of Turkestan's schools."

The Republican People's Commissariat of Education's "Student Youth" campaign encouraged both boys and girls to attend school [*5: p. 412*].

Russian language lessons were launched in Turkestan national schools, while "Turkish" language classes were started in Russian schools; the republic's state languages were designated Russian and "Turkish". The teaching of Russian and Turkish in schools became mandatory from the third grade forward, although the study of both languages was optional.

The departments of public education were invited to "contact the local national affairs department to initiate efforts to open Muslim schools in the areas" [*2: 34-f,. 1-list, 86-work, 107-sheet*].

At a time when efforts to reform public education in the country were growing, Mulla Ghazi Yunus Muhammad oglu published an article titled "On the Reform of Madrasas" in the Great Turkistan newspaper [*10*].

According to the authorities, the reputation of religious schools was strong in Turkestan because the majority of the population was made up of locals who were affected by the believers.

The attitude of Bolshevik Soviet authorities in the RSFSR and Turkestan toward the local education system was heavily influenced by religion policy and the RSFSR CPC Decree of January 23, 1918 on the separation of the church and the state [*6: p. 271–274*]. TASSR passed a similar decree on November 20, 1918 [*2: 25-f,. 1-list, 144-work, 34-sheet*].

As a result of the "military communism" strategy intended to suppress the local system, the waqf properties was confiscated, and mosques, schools, and madrassas were abolished. The majority of local youngsters were unable to attend school due to the insufficient number of Soviet schools. By decree No. 6486 of the People's Commissariat of Education of the Turkestan ASSR on December 14, 1918, financial assistance for Muslim schools was terminated, and they were offered a transition to a new methodical system as a first step [*2: 34-f,. 1-list, 34-work, 26-sheet*].

M. Hasanov gave a positive assessment of the activities of schools and madrasas in Turkistan in his article "Autonomy of Turkistan: truth and fiction", and provided accurate information about the liquidation of waqf, the destruction of mosques, and restrictions on the rights of Muslim schools and madrasas by the Soviets [*3: p. 6–8*].

The Turkestan ASSR's People's Commissariat of Education has introduced a new school system. The school, according to the system, is split into three stages: primary (three years), secondary (seven years), and advanced. At the age of seven, a pupil was accepted to primary school. This stage comprises "the first four classes of all lower primary schools, all upper primary schools, and all secondary institutions (gymnasiums, practical schools, commercial schools, and so on)" [*2: 34-f,. 1-list, 25-work, 33-sheet*].

Seven-year schools were to be established in all parts of the Turkestan ASSR in 1918. However, it was impossible to complete this task at the time. The Bolshevik regime was not yet prepared for it, both economically and politically. As a result of the scarcity of local instructors, the establishment of "complete seven-year schools" was made possible. The benefit of this arrangement is that primary schools are entirely free. Soviet schools were formed in lieu of existing gymnasiums and educational institutions as Russian schools were quickly overhauled. There were "labor schools - communes" in addition to secondary schools. V.F. Lubensov was one of the first to establish a labor commune in September 1918. Similar schools were opened in Samarkand, Skobelev, and Kattakurgan in 1919-1920.

The Sovietization of school building may be observed in the fact that, while Soviet schools were first founded mostly in cities, they quickly spread to rural areas by 1919-1920.

3. RESULTS

The colonial regime's political emphasis on women's education began as a "red army struggle for old lifestyle" in the aftermath of the October coup. This may be seen in the way they strive to teach both boys and girls together. The idea, however, was met with significant resistance from the locals. As a result, the Bolshevik regime had no choice but to submit. As a result, it was suggested that separate schools for girls be established. Tashkent hosted the first such school, which enrolled 42 Uzbek women. Later, such kind of schools were founded in Andijan, Kokand, and Samarkand. Tashkent had 12 women's schools and Andijan had two in the early 1920s. At the time, 270 Uzbek and 130 Kyrgyz women were studying in the Kokand area.

The establishment of Soviet national schools was met with a lot of resistance. The restriction of religious schools and the transformation of Russian-style schools led to an increase in their proportion. Six Uzbek schools were established in Skobelov district at the beginning of the 1918-1919 academic years [*8: p. 561*]. Tashkent had 57 schools with 8,500 learners at the time. Over 100 schools have been built for the local community in the Samarkand region.

In the civil war-torn Fergana area, establishing Soviet schools was challenging. Nevertheless, in the "freed" territories, Red Army detachments began to open new sorts of schools. As a consequence, the number of schools in the Fergana area reached 350 at the start of the 1919-1920 academic years [*9: p. 247*].

4. CONCLUSIONS

The financial position of Soviet schools was exceedingly tough, regardless of how politicized the educational activity was. Textbooks and instructional tools, particularly pens, ink, and notebooks, were in limited supply. Furthermore, during the Bolsheviks' fast reform of education policy, there was a scarcity of local staff, which exacerbated the situation. The textbooks weren't perfect also. Furthermore, the brand-new system was met with skepticism by local youngsters. The study's effective operation was hampered by a lack of student discipline.

FACTORS INFLUENCING ORGANIZATIONAL AND ECONOMIC MANAGEMENT MECHANISMS IN THE CHEMICAL INDUSTRY

Bakhadir Abdugaffarovich Abdullaev*; Marina Lazareva**

*Senior Lecturer,
PhD,
Docent of Fergana branchof the Tashkent University Information Technologies,
UZBEKISTAN

ABSTRACT

The article examines in detail the factors that affect the mechanisms of management. The strategic direction is to anticipate changes in the external environment, identify risks. Operational management– maintaining operational parameters and responding quickly to deviations. Internal and external factors of influence are considered.

KEYWORDS: *Management Mechanisms, Digitalization, Strategic Direction, Operational Direction, Risks, Sustainable Development, External Factors, Internal Factors, Innovations.*

INTRODUCTION

The sustainable functioning of each industrial enterprise, its competitiveness today directly depends on the organizational and economic management mechanisms. Such mechanisms affect the position that the company occupies in the market, the level of its modernization, digitalization and directly on the standard of living of the company's employees.

THE MAIN PART

The ongoing modernization of the economy, the sustainable development of industry in the Republic will lead to a radical change in the role and importance of the chemical industry in the development of production and contribution to the country's GDP. Considering the functioning of industrial enterprises in modern conditions, it is important to take into account such areas as strategic and operational [1]. Both of these areas need to be considered comprehensively. The strategic direction of functioning is the ability to anticipate changes in the external business environment, early identification of risks associated with changes and adaptation, which is preventive in nature to ensure sustainable development. It is necessary to determine the mission of the main purpose of an industrial enterprise and a benchmark for long-term development, diagnose the environment of the enterprise to identify strengths and weaknesses, choose a strategic alternative, taking into account the formation of a promising innovation policy of economic growth of the enterprise.

The operational direction ensures the maintenance of optimal competitiveness parameters and rapid response to deviations. The peculiarities of the production and economic activities of enterprises in various industries create certain specific requirements for these areas.

The chemical industry has a number of features, such as complex chemical processes, dependence on deviations of the process mode, work with harmful and dangerous substances. The main difficulty of management in the chemical industry is the lack and/or unitedness of data on how all highly complex technological processes are going. Management in the industry should ensure full control over complex production, reduce costs, increase profitability and ensure the safety of production. Now the share of the chemical industry in the GDP of the republic is only about 1% [2].

The effectiveness of the organizational and economic mechanism of management of industrial enterprises, which is a complex multi-level system, is influenced by two groups of external and internal factors (Fig. 1).

External factors include political, resource, financial, economic, environmental, socio-demographic, and innovative. These are direct impact factors.

Internal factors include – economic, organizational, production, technical and technological, personnel, social, marketing.

All factors mutually influence and are closely related to each other in the process of economic activity of each of the enterprises. The ratio of factors and their interaction are relevant both for the entire economic system and for individual enterprises. In some specific moments, some factors have a greater impact, while the influence of others may weaken.

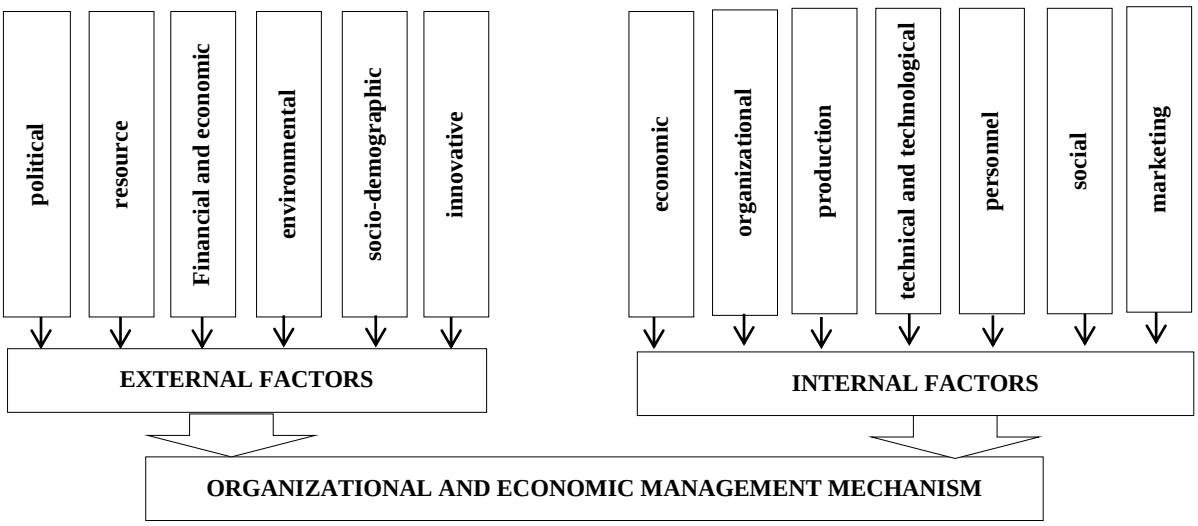

Fig 1. Factors affecting the effectiveness of the organizational and economic management mechanism (source: compiled by the authors)

External factors of influence arise in the environment and do not depend on the activities of a particular enterprise, but affect its functioning. They always require management decisions. External factors are characterized by complexity, mobility and uncertainty [3]. In turn, enterprises do not and cannot influence the external environment, they must adapt to it, observe it, make forecasts and react. To do this, the company needs to constantly make changes to the internal environment, and perhaps even counteract.

Now external factors at the international level have a great influence, which can have a destabilizing orientation. This increases the conditionality of the entire national economy as a

whole from them. When there was an administrative command system and a planned economy, it was believed that the external environment was almost irrelevant for enterprises. Now, in a market economy, this may already threaten the bankruptcy of the enterprise in the near future.

Political factors also play a significant role in the development of enterprises. The inflow of investments coming from foreign countries depends on them, as well as the access of domestic goods to foreign markets. The political stability of the country is determined by the attitude of the state to citizens, to property, to entrepreneurship. The development of Uzbekistan in the socio-economic and socio-political spheres is emphasized by the Action Strategy for the five priority areas of Development of the Republic of Uzbekistan in 2017-2021.

Special attention is paid to the chemical industry. It has a lot of problems and opportunities that are not yet involved. Sh.M.Mirziyoyev set tasks for its modernization, the widespread introduction of scientific achievements and innovations, the introduction of digital technologies, and increasing the level of automation.

Resource factors are considered in the complex of both material and labor, as well as financial resources, which are necessary for the stable operation of the enterprise. When introducing new modern management methods, enterprises must strictly take into account all the resources used and necessary, allowing them to be used profitably with the greatest return. This includes raw materials, materials, equipment and all types of energy.

Socio-demographic factors determine the labor resources of the enterprise. It is necessary to take into account the various qualities that make up the working capacity of the population, such as health, special skills, labor skills, qualifications. All this is especially important for chemical industry enterprises. This also includes social maturity, interests and needs.

Innovation is a factor that has a significant impact on the organizational and economic management mechanism. Scientific and technological progress in the field of "high" technologies, digitalization, computer technology, electronics, communication technologies are fundamentally changing the chemical industry, helping to save material and human resources. Chemical industry enterprises are the main center for the use of high technologies, innovations, and new developments. They have a high knowledge intensity, which is over 3.5% [4]. Such enterprises process a large number of information flows that are transmitted through various communications. Therefore, this factor can also be attributed to the internal management factor that forms the information environment of the enterprise. Further development of the enterprise, its ability to receive information from the external environment, process and analyze it, make prompt and correct decisions directly depends on innovative management factors. On October 5, 2020, the Strategy "Digital Uzbekistan-2030" was approved, which will significantly accelerate the digital transformation of economic sectors in the country.

Each company has its own internal management factors. It depends on them how the company will be able to overcome the crisis, stand up in competition, and ensure economic stability. They include economic, organizational, production, technological, personnel and marketing factors. In fact, it is the goal, task, structure, technology of the enterprise. If the state has a stable economy, then the problems of enterprise development are most likely hidden in internal factors – in the goals of the enterprise and in the ways to achieve them, management methods and organization of activities. Thus, analyzing the expected crisis phenomena and bankruptcy of enterprises in conditions of stable development, it was found out that in two cases out of three, internal factors become the cause of bankruptcy. These are those enterprises whose profits have become less than marginal costs [5].

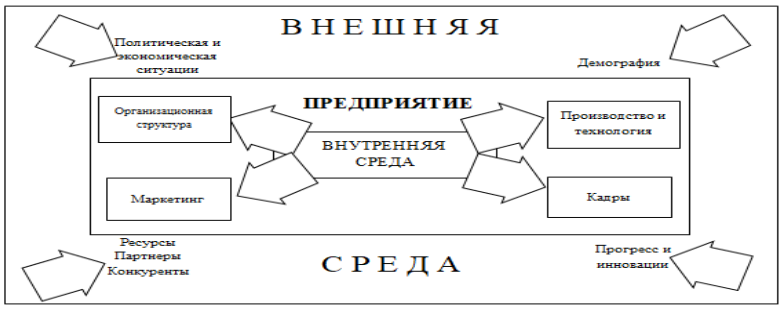

Figure 2 Factors of the external and internal environment of the enterprise

(Source: compiled by the authors)

Internal factors are factors of the internal environment of the enterprise that directly affect the development and functioning of the enterprise (Fig.2).

Production factors (production) – includes equipment and technologies that are used in production, as well as the degree of preparedness of personnel. The quality of the products directly depends on this factor. This is the main internal factor that determines the economic stability of the enterprise.

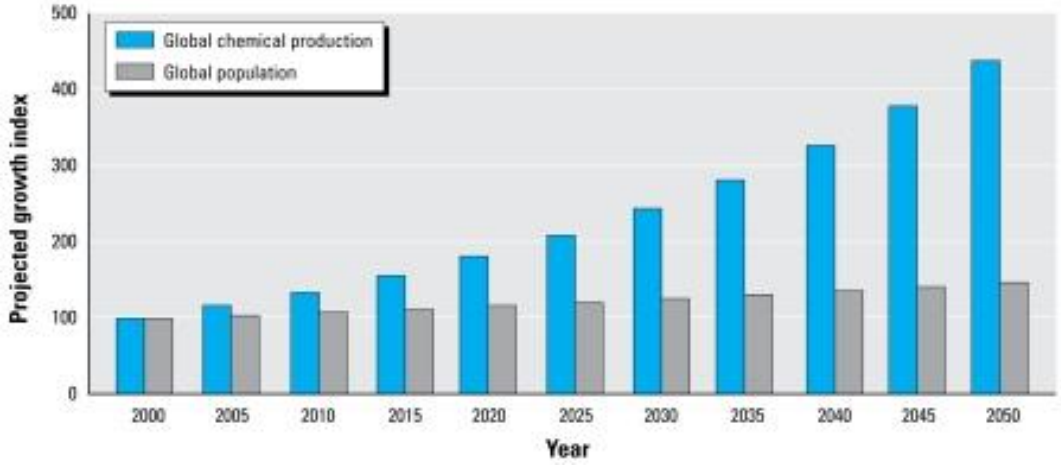
Another important management factor is personnel. The qualification of the personnel, the motivation of their work ensure the sustainable operation of the enterprise, its further development. The global chemical industry is entering an era when human resources are seen as the most important asset.

The chemical industry is an industry with significant costs. It has a high energy intensity, labor intensity and material intensity. Therefore, it is necessary to reduce costs, which is facilitated by a variety of marketing research [6]. Such studies are the main tool for identifying the causes and finding ways to improve. It is necessary to identify the weaknesses of competitors and improve their own advantages. The longer the marketing research period, the more accurate the data and the more reliable the results. It is necessary to comprehensively investigate the level of sales, demand and the factors influencing them. All decisions related to reorganization, the introduction of new technologies must be made on the basis of marketing research

The organizational structure is considered as a system that allows rational use of equipment, enterprise space, personnel.

An effective approach to management in enterprises is not an easy task. To ensure the sustainable development of an enterprise, it is necessary to take into account all factors affecting its development, apply innovative management theories and methodologies [7]. It is necessary to introduce digital transformation, attract experts who can diagnose the activities of the enterprise and all business processes taking place on it, form data arrays, identify bottlenecks, and study priority areas of digital technologies.

According to the forecast, chemical production in the world will grow at a rate of 3% per year, outpacing the growth rate of the world population, which is estimated at 0.77% per year. In accordance with this, chemical production will double by 2024 compared to 2000 (Fig.3)



CONCLUSION

Speaking about the organizational and economic mechanism of management of industrial enterprises, it is necessary to understand that it consists of tightly intertwined elements of an organizational and economic nature. The factors influencing this mechanism are divided into external and internal. The organizational and economic mechanism itself, being an integral system, is influenced by factors of the external and internal environment. He must use and strengthen the effects of favorable factors by developing the enterprise, at the same time counteract and reduce the negative impact of negative factors. A qualitative analysis of the factors affecting the sustainable development of chemical industry enterprises should be taken into account when developing organizational and economic management mechanisms and evaluating the activities of the enterprise.

To solve the problems of the chemical industry, which are associated with the management and optimization of various operations, it is necessary to study the latest achievements in the field of digitalization of the chemical industry, to apply complex tools of ERP, SCM and other control systems. Competent managers should fully understand all the internal critical factors of their enterprise, factors influencing from the outside. It is necessary to choose only those methods and means that correspond to the goals of the enterprise and remember: having been successful in the past, the method may be absolutely ineffective in the future.

ABSTRACT

The diagnosis of the main and concomitant diseases was made on the basis of the results of clinical allergological, functional, laboratory, X-ray studies. The power of forced exhalation was determined by a pneumotachometer, the threshold of sensitivity of the bronchial receptor apparatus to histamine and acetylcholine, the respiratory function of the nose, the number of eosinophil's in peripheral blood and nasal secretions were evaluated, the cause of sensitization of the body was found out [1, 5, 12]. The aim of the work was to evaluate the therapeutic effectiveness of course laser puncture in atopic bronchial asthma combined with allergic rhino sinusitis.

KEYWORDS: *Asthma, Allergy, Clinic, Bronchial Asthma, Neutrophil Activity.*

INTRODUCTION

Bronchial asthma is one of the urgent problems of modern pediatrics [2]. This also applies to the Central Asian region. In Uzbekistan alone, the incidence of bronchial asthma among children has increased 20-fold over the past 5 years [7, 8]. Bronchial asthma has a complex etiology and pathogenesis and is often combined with allergic rhinitis [4,6, The treatment of bronchial asthma continues to be a difficult task. After drug treatment, despite clinical improvement, most patients retain changes in respiratory function, immune status, etc. In this regard, there is a need to find new approaches to the treatment of bronchial asthma. One of the promising directions in the treatment of allergies in general and bronchial asthma, including, is the use of laser radiation. It has been established that it has a multifaceted therapeutic effect — anti-inflammatory reduction of vascular wall permeability, improvement of bronchial patency, microcirculation, increased oxygen content in tissues, stimulation of the body's immune defense [3, 4, 6, 8]90 children aged 7-14 years were under observation, 49 of them boys) 41 girls with atopic bronchial asthma combined with allergic rhino sinusitis were 60 and 30 practically healthy.

THE MAIN PART

The complex of par clinical studies included the assessment of hum oral (IgA, IgM, IgG, IgE) and cellular (T-, B-lymphocytes and their populations) immunity factors [10]. The phagocytic activity of neutrophils was determined by A. Stelzner [13].

For the treatment of patients, they were divided into 2 groups of 30 children each. The 1st group of children on the background of basic treatment received a course laser puncture.

For this purpose, an LG-78 helium-neon laser with a wavelength of 0.63 microns and an irradiation power density of 2 MW/cm2 was used. The exposure time is 10-15 seconds for one corporeal point and 5-10 seconds for one auricular point. The total exposure time is no more than 2 minutes for corporeal points and no more than 20 seconds for auricular points. Treatment was carried out daily. The course of treatment was 5-12 procedures with 2-week breaks. For course laser punctuation, the following corporeal (P7, P8, P10, E36, E41, VB20, V12, RF9, F8, VB41) and auricular (AT12, AT13, AT15, AT22, AT31, ATZZ, AT60, AT78, AT109) points were selected. This mode of course laser puncture is generally accepted in modern clinical practice [9, 10, 12]. The main criterion determining the duration of laser puncture courses, exposure and a set of exposure points was to improve the clinical condition of patients, eliminate or weaken the symptoms of the disease and improve clinical, laboratory, functional and immunological indicators.

The 2nd group of sick children (control) received only basic treatment, which consisted of anti-inflammatory drugs (intel, tailed), bronchodilators (inhaled short-acting β2-agonists), mucolytic, vitamins [1, 2, 6].

The effectiveness of treatment was evaluated by comparing the dynamics of the clinical condition of patients, clinico-allergological, functional and immunological parameters before and after treatment (after 2-4 weeks and, subsequently, after 1-2 years). Treatment was considered excellent when the indicators of functional, radiological, laboratory and immunological studies and the general clinical condition of patients improved (conditionally 5 points); good when the intensity of the painful symptoms of the main and concomitant diseases was significantly weakened and the indicators of most clinical and laboratory studies improved (4 points); satisfactory when the symptoms of the disease persisted, but their intensity partially weakened (3 points); ineffective when the condition of patients remained unchanged (2 points).

Digital data were processed by the method of variation AL statistics with the calculation of the reliability of numerical differences. The differences were considered significant under the condition that $t > 2$ and $p < 0.05$.

Analysis of the results of the obtained data showed that in the majority of sick children (63.3%), the occurrence and development of atopic bronchial asthma began with symptoms of allergic rhinitis and sinusitis. Along with this, in a significant part of children (30.0%), the disease began simultaneously with symptoms of allergic rhino sinusitis and bronchial asthma, and only in a relatively small number of patients (6.7%), the disease began with symptoms of bronchial asthma and after its development, symptoms of allergic inflammation of the nose and its par nasal sinuses appeared.

The cause of sensitization was non-infectious allergens:

1) pollen (20.0%) - wormwood, quinoa, ailanthus, cotton; 2) household and insect (53.3%) — household dust, dermatophagoides microliters; 3) epidermal (26.7%) — cat wool, dog hair. Among the contributing factors, hereditary burden of allergic pathology (75.0%), artificial or previously mixed feeding (65.0%) and allergic diathesis (55.0%) were important. According to the severity of the disease, the children were distributed as follows: mild - 21 (35.0%), average severity - 27 (45.0%), severe - 1-. (20.0%).

The conducted studies have shown the advantages of course laser puncture in comparison with basic treatment (Table 1).

The positive clinical effect of course laser puncture therapy began to be noted during the children's stay in the hospital, and subsequently achieved the best results within 3-4 weeks. The attacks of suffocation stopped completely, the symptoms of respiratory insufficiency and physical changes in the lungs were weakened or eliminated, the indicators of forced exhalation increased and the threshold concentration of biologically active substances increased by 2- 2.5 times. Nasal breathing improved. The percentage of eosinophil's in peripheral blood decreased more than 2 times, as well as the number of eosinophil's in smears - prints of the nasal mucosa. The functional activity of neutrophil phagocytes increased by 1.5-1.7 times.

Before the start of treatment, the color of the nasal mucosa was different — blue-white, pale pink with areas of ischemia. The rhinoscopic picture during remission in most patients was completely normalized or tended to normalize. Prior to treatment, radiography of the par nasal sinuses showed marginal or total darkening of the maxillary sinuses, which disappeared after treatment.

Allergic reactions developing on the basis of immune interactions of allergens with specific antibodies are crucial in the mechanism of development of atopic bronchial asthma. The study of the initial state of some indicators of the immune status revealed the presence of significant :: changes (Table 2). Thus, in sick children, the IdE content was more than 12 times higher than normal. The level of other immunoglobins (IgA, IgM, IgG), in comparison with similar indicators in practically healthy children, was either lower, or higher, or the same. The indicators of the cellular link of the immune system were characterized by a significant decrease in the relative and absolute number of the main populations and subpopulations of lymphocytes ($p<0.05$).

DISCUSSION

Against the background of course laser puncture, there was a significant improvement in the indicators of hum oral and cellular immunity - a decrease in the level of IgE by 1.5 times, an increase in IgG by 1.7 times, IgA by 1.3 times, CD3 by 1.7 times, CD4 by 1.7 times, CD8 by 1.8 times and CD22 by 1.4 times ($p<0.05$). No such changes were observed in children who received only basic treatment. During the next 1-2 years in children who received course laser puncture on the background of basic.

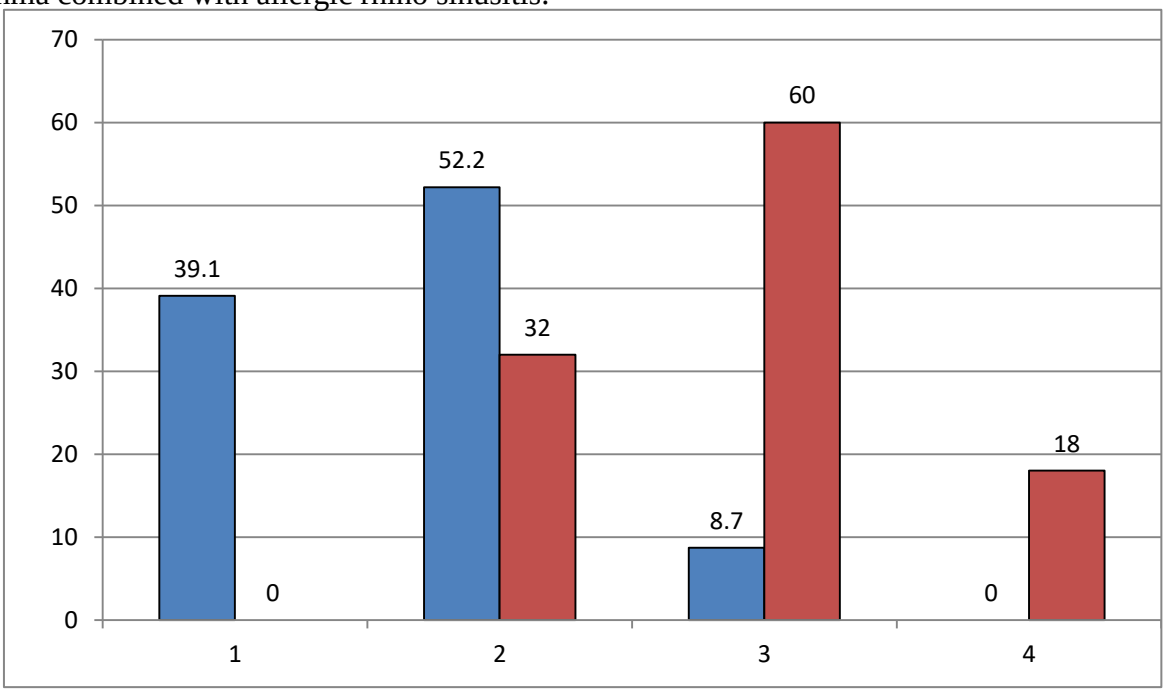
IgE, IU/ML	801,0±59,4**	504,6±66,7*	789,5±49,3**	753,6±49,3**	63,6±9,6
CD, %	51,5±1,4**	58,5±1,2*	54,4±0,7**	55,5±1,2*	62,7±1,1
10^9/л	1,05±0,09**	1,85±0,2*	1,15±0,04**	1,2±0,06*	2,0±0,1
CD4, %	30,7±1,3*	37, ±1,2*	33,2±1,2**	35,6±1,1	38,5±1,6
10^9/л	0,64±0,05**	1,1±0,09*	0,7±0,03**	0,75±0,05*	1,05±0,7
CD8, %	23,5±1,5**	29,3±1,3*	24,4±0,73**	27,8±1,0*	28,6±1,7
10^9/л	0,5±0,05**	0,9±0,09	0,53±0,05**	0,61±0,06	0,7±0,07
CD22,%	20,6±1,1**	26,6±1,2*	23,3±1,0**	24,7±1,0	27,2±1,1
10^9/л	0,55±0,04**	0,78±0,06*	0,58±0,05**	0,67±0,06	0,7±0,08

Therapy, there was an extension of remission periods, and relapses of bronchial obstruction became less frequent. It should be emphasized that the positive therapeutic effect was more often observed in children with mild and moderate course of the disease. In the group of children who received a course of laser puncture on the background of basic therapy, excellent and good results prevailed (on average 4 points), while in patients who received only basic therapy, good and satisfactory results (on average 3 points) prevailed (see figure). The positive therapeutic

effect of course laser puncture is obviously associated with the weakening and, in the future, the elimination of the inflammatory process in the nasal cavity, its par nasal sinuses and lungs, stabilization of the functional state of the immune system, a decrease in the synthesis of IgE.

Fig. Results of laser puncture application in the treatment of children with atopic bronchial asthma combined with allergic rhino sinusitis.

1-



excellent results, 2-good results, 3-satisfactory results, 4-no effect, ■laser puncture, ■ basic treatment.

CONCLUSION

Thus, the course laser puncture performed against the background of basic therapy has a significant positive therapeutic effect in the mild and moderate course of atopic bronchial asthma, combined with allergic rhino sinusitis, in children.

The pathogenesis of the positive therapeutic effect of laser puncture is complex and further research is needed to clarify it. In our opinion, it is impossible to exclude the positive effect of laser puncturing in the form of stimulation of hum oral and cellular links of the immune system, as well as improving the activity of some factors of nonspecific protection of the body and reducing bronchial hyper reactivity.

ABSTRACT

Convolutional Neural Networks (CNNs) have recently been utilized in a wide range of applications, including image and pattern identification, voice recognition, biometric embedded vision, food recognition, and video analysis for surveillance, industrial robots, and autonomous vehicles. Convolutional neural networks (CNNs) are gaining popularity for a variety of reasons. Feature extractors are created by hand in classic image recognition models. The weights of the convolutional layer utilized for feature extraction, as well as the fully connected layer, are used for classification in CNNs, and these weights are set throughout the training phase. The goal of this study is to evaluate a few convolutional neural network (CNN) learning machine approaches for image recognition. Furthermore, machine learning algorithms are used extensively in contemporary approaches to picture recognition. This article focuses on the development trend of convolution neural network (CNNs) model owing to various learning methods in image recognition during the 2000s, which is largely introduced from the angles of capturing, verification, and clustering, based on twenty five journals that have been reviewed. As a result, deep convolutional neural networks (DCNNs) have been very effective in a variety of machine learning and computer vision problems because they provide a large quality gain at a low computational cost. This training approach also enables models with many processing layers to learn different degrees of abstraction fordata representation.

KEYWORDS: *Computer Vision, Convolutional Neural Network,Image Recognition, Learning Machine, Neural Network.*

46. INTRODUCTION

Convolutional Neural Networks (CNNs) have shown to be extremely effective in a variety of machine learning and computer vision issues. Convolutional Neural Networks (CNNs) are also utilized in a number of fields such as recognition and robotics. Convolutional neural networks (CNNs) are gaining popularity for a variety of reasons. Meanwhile, during the past several years, convolutional neural networks (CNNs) have been used to recognize objects in the air with tremendous success. It is more organically and easily in terms of capturing a picture from a validity standpoint.

CNNs make assumptions about the image's nature, such as whether it's static or has pixel dependencies. As a result, as compared to traditional feed-forward neural networks with similar-sized layers, CNNs contain many fewer connections and parameters, making them easier to train while theoretically achieving the greatest results.Furthermore, because to their design performance, CNN capacity may be adjusted by altering their depth and breadth.

As a result, CNNs usually have a multilayer stack of basic modules such as a convolutional layer, a pooling layer, and a fully-connected layer. Each module converts the representation at one level into a higher and more abstract level, starting with the raw input. In the meanwhile, greater ordering of dataset representations increases elements of the input that are relevant for discriminating and limits unrelated variations for recognition tasks. Following that, the most recent picture recognition technology is introduced.

Only a year later, the deep learning approach based on convolutional neural networks has produced significant performance improvements in large-scale picture classification tasks, igniting a deep learning boom and establishing deep learning as a new hotspot in the pattern recognition domain. It enables a model with many processing layers to investigate data representation at different levels of abstraction. Furthermore, transfer learning is important in deep learning approaches when someone wishes to train on their own dataset for different reasons, such as when the dataset is insufficient to train the entire neural network, which might cause issues in transfer learning.

Transfer learning may be used to replace the fully-connected layers (and perhaps the final convolutional layer) in a pre-trained Deep Neural Network and train those layers on the relevant dataset. However, it has been discovered that deep neural networks (DNNs) are prone to over fitting when working with tiny data. The methodology of machine learning is crucial in this study to assure the quality and efficiency of images in terms of capture, verification, and clustering that wish to train more effectively, particularly in image recognition, by utilizing the correct learning machines method. The goal of this work is to investigate the many machine learning techniques that must be used in the CNNs mode based on the data and, on occasion, in the state they desire. There have been a lot of useful evaluations on Machine Learning methods, according to the literature. However, there is a lack of research on the distinctions between learning machines that recognize pictures and systems that train data. As a result, this study focuses on picture recognition in terms of capture, verification, and clustering, based on a survey of twenty-five periodicals.

47. DISCUSSION

After reviewing several related papers, conferences, book chapters, and websites, this section will discuss and reveal a superior method or approach for image recognition. Several image recognition systems praised by other writers, however, have certain drawbacks in their proposed methodologies. Convolutional Neural Networks were used to construct and present an overview of picture recognition.Deep Learning Neural Networks are the first technique for training a

dataset. Deep Identification verification features (DeepID2) and Image-Net will be used to train this also shown in Fig.1.

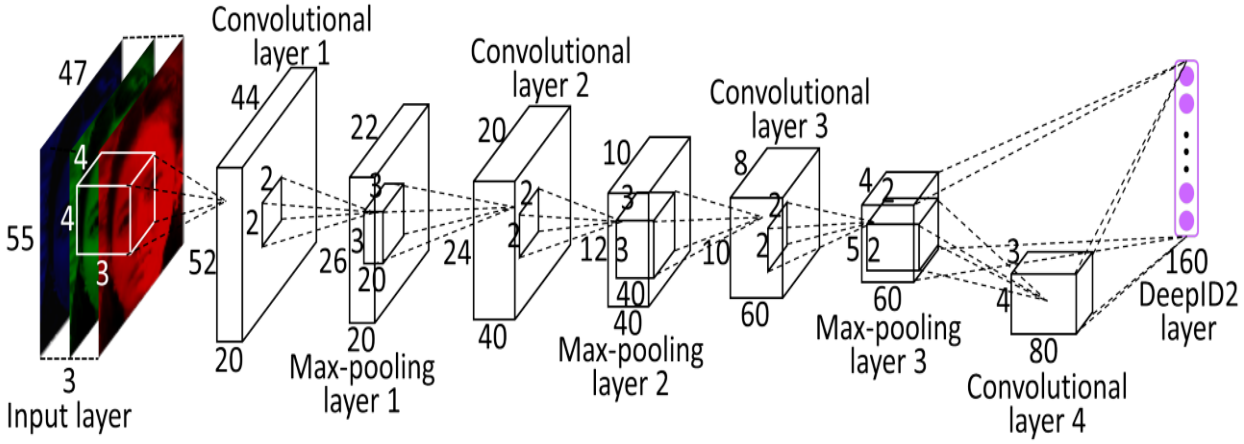

Fig. 1: The ConvNet structure for DeepID2 extraction[1]**.**

The image identification task increases inter-personal variations by drawing DeepID2 extracted from different identities apart, whereas the image verification task reduces intra-personal variations by pulling DeepID2 extracted from the same identity together, where both are required for image recognition.

The influence of image identification and verification supervisory signals on deep feature representation has been demonstrated to correspond with the two elements of creating ideal features, which are: Increasing inter-personal variations, lowering intra-personal variations, and combining the two supervisory signals result in much superior features than each of them alone.

While the second system, Image-Net, is similarly based on deep learning and will be taught to optimize the embedding directly rather than through an intermediate bottleneck layer. This system learns a direct mapping from face pictures to a compact Euclidean space in which distances are directly proportional to a measure of face similarity. Once this space has been created, conventional approaches for picture identification, verification, and clustering may be readily implemented utilizing Face-Net embedding as feature vectors[2]. The better usage of computer resources inside the network is one of the major characteristics of this design. The network's depth and breadth were raised while the computational budget remained unchanged. Picture-Net is a huge image collection with about 15 million annotated high-resolution photos divided into roughly 22,000 categories[3]. Each concept's photos are quality-controlled and annotated by humans.

When compared to shallower and narrower designs, the major advantage of this approach is a considerable quality improvement at a minor increase in computing needs. As define and detail the space of fully convolutional networks, illuminate the application for solid prediction tasks, and connect with previous models that adjust current classification networks into deep convolutional networks and move the learned representation with adjustment to the segmentation task. Then, to create accurate and comprehensive segmentations, build a skip architecture that combines semantic information from a deep and coarse layer with appearance information from superficial, shallow layers.

The second image identification approach is the Double Local Binary Pattern (DLBP), which was developed as part of an integrated automated system with two components: 1) peak expression frame detection and 2) expression feature extraction. In contrast to image-based expression recognition systems, video-based expression recognition systems frequently use online detection and choose low-dimensional feature representation for cost savings. In reality,

because the DLBP approach has a significantly smaller dimensional size and can successfully minimize detection time, it is used to identify the peak expression frame from the video.

This approach is further presented to achieve a more robust face feature for detection by handling illumination changes in the DLBP and Logarithm-Laplace (LL) domains. For the first time, the Taylor expansion theorem is used in the system to extract face expression features and an effective facial feature from the Taylor Feature Map. Face identification, facial analysis, texture classification, and a variety of other applications have all benefited from the usage of DLBP[4].

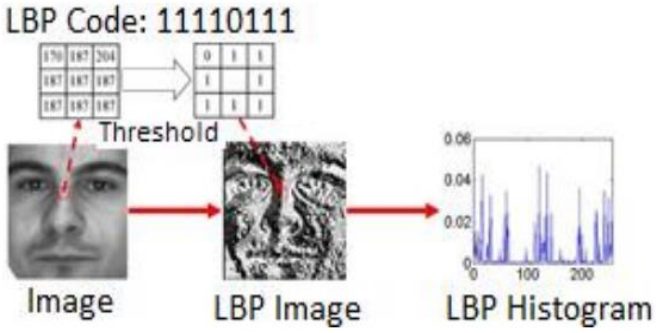

Fig. 2: Illustration of the feature extraction process for LBP[5]**.**

However, when the set comes from distinct datasets with the training data, the identification rate of the DLBP based on feature extraction technique drops dramatically, indicating that the deep learning model is easily over-fitted on the training data. The DLBP method, on the other hand, provides adequate picture identification performance even when the gallery and probe sets are from distinct datasets.Fig. 2: Illustration of the feature extraction process for LBP.

The third approach discussed in this study is Tanenbaum and Freeman's Bilinear Convolutional Neural Networks (BCNNs), which are used to represent two-factor changes in pictures such as “style” and “content” [6]. This method is the most advanced in fine-grained picture identification, but it fails to recognize distinct categories with indirect visual differences. These networks represent the picture as an outer product that is derived from two CNNs' features and captures local feature interactions in a transnationally invariant manner shown in Fig. 3.

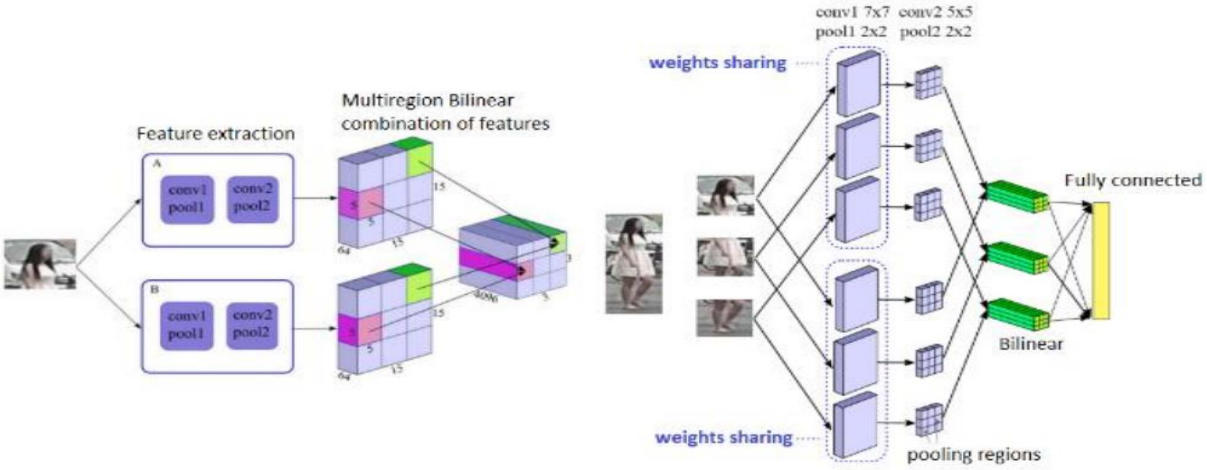

Fig. 3: The proposed architecture for person re-identification[7]

A thorough examination of these networks reveals that the bilinear features are substantially redundant, and that their size may be decreased by an order of magnitude without sacrificing accuracy. Second, it may be used for various image classification tasks including texture and

scene identification, and third, it can be trained from the ground up on the Image-Net dataset, providing constant improvements over the basic architecture.

As a result of the substitution of multiple fully connected layers with a bilinear pooling layer and a linear layer, BCNNs compare well to standard CNN designs in terms of speed. Furthermore, BCNNs are related to order-less texture representations built on deep features, but they can be trained in an end-to-end manner on the most accurate model shows that obtains 84.1 percent, 79.4 percent, 84.5 percent, and 91.3 percent per image accuracy for the Caltech-UCSD birds, NABirds, FGVC aircraft, and Stanford cars datasets, respectively, at 30 frames-per-second on an NVIDIA Titan X GPU [8], [9]. BCNNs have the benefit of using just picture labels and being easily applied to a variety of fine-grained datasets. This method is preferred for detecting images in deep water. BCNN, in particular, provides for the retention of certain spatial information as well as the extraction of more complicated features while increasing the number of parameters above baseline CNNs without over-fitting. There is a noticeable difference between the performance of BCNNs and the performance of regular CNNs.

Liu, Xu, and Chiu performed yet another thorough approach on Multiple Attributes (MA)[10]. Using LBP and PCA for feature extraction and dimension reduction, Euclidean and Manhattan classifiers, and Gabor Filters to extract features, Support Vector Machines, and k-NN classifiers were tested, and using Discrete Cosine Transform (DCT) to extract three feature blocks, as illustrated in Table 1, assist distinguish between males and women by identifying features such as long hair, short hair, with or without tie, skirt, and so on that are placed on the face, upper body, and lower body.

TABLE 1: THE ACCURACY OF EACH PAIR OF ATTRIBUTES

Parts	Attributes Classification	Weighting	Accuracy
Face	female face	0.3	90%
	male face	0.3	
	long hairs	0.2	92.5%
	short hair	0.2	
	no bread	0	87.5%
	bread	0.15	
Upper body	womens clothing	0.1	89.04%
	no womens clothing	0.05	
	no tie	0	85.04%
	tie	0.2	
Lower body	skirt	0.2	85.71%
	no skirt	0.05	
	hot pants	0.2	80%
	no hot pants	0.05	

This finding is in line with Liu, Xu, and Chiu's prior research. They also did a unique study on gender recognition enhancement by assigning weights to each of the distinct characteristics and calculating the male and female scores. Finally, by comparing the scores, the gender identification result is produced. The accuracy of gender recognition will reach a more substantial effect in a new study by Liu and his co-researcher, who used the distribution of attribute weights to get gender scores.

47.1. Comparison of Image Recognition Techniques:

The articles described above explored numerous approaches used in Convolutional Neural Networks to train image recognition learning. Then, in this part, a quick comparison is made between learning machines and traditional image recognition models, which employ precisely handcrafted low level characteristics. The features work well for particular data and tasks, but they require specialist expertise to be successful, and most of them have poor generalization capacity during the training process.

The results and accomplishment statistics demonstrate that CNNs not only beat other detection algorithms, but also outperform humans in situations such as categorizing things into fine-grained categories such as dog breed or bird species. Furthermore, CNNs were used to obtain the highest possible accurate detection rates (CDRs). Using the MNIST database of handwritten digits, CNNs obtained a CDR of 99.77 percent, a CDR of 97.47 percent using the NORB dataset of 3D objects, and a CDR of 97.6 percent on 5600 pictures of more than 10 items. CNNs have been approved as a more commercial use of machine learning methods in computer vision.

As a result, a variety of machine learning techniques exist to train deep learning, particularly in image identification, which requires a thorough knowledge of the picture, such as Alex-Net, VGG net, and GoogLe-Net, as opposed to the two techniques previously stated.

TABLE 2: COMPARISON FOUR TYPES OF MACHINE LEARNING TECHNIQUE

Machine Learning Technique	Advantage	Focused	System
Deep Learning	significant quality gain at a modest increase of computational requirements compared to shallower and narrower architectures	recognition, verification and clustering in image implemented	1)DeepID2 2)Image-Net
DLBP	Detect the peak expression frame from the video due to DLBP technique has a much lower-dimensional size and can successfully reduce detection time	video-based recognition system	Taylor Feature Map
BCNN	Require image labels only and can be easily applied to different fine-grained datasets	fine-grained image recognition	1)Tanenbaum 2) Freeman
Multipleattributes (MA)	Proprietary method of whole-body identification to make the best of multi-attribute (MA) recognition. Besides facial information, it also knows the type of clothing used	face image to make gender identification	1) HOG 2) SVM

Table 2 compares three training machine learning methods for Convolutional Neural Networks that are used to train the data in image recognition. Three factors were employed in the training session: advantage, concentration, and system. Furthermore, by doing extensive study into these approaches, it will be possible to discover an effective characteristic of a range of computer vision jobs. Indeed, certain deep neural networks, because to their deep design and huge learning capacity, come near to human performance on recognition tests. Because it understands the idea of training the data, it helps to eliminate some difficulties while using computer vision.

Furthermore, the emergence of deep learning as feature representations or classifiers has lately benefitted a number of well-established issues in computer vision. DeepID2 and DeepID2+, for example, make use of the concept of joint face identification-verification to decrease intra-personal variances, resulting in a considerable increase in face recognition accuracy[11].

48. CONCLUSION

This article examines a variety of identification, verification, and grouping approaches. The findings demonstrate that deep learning is extremely successful in large datasets. Due to more than twenty publications that have been evaluated, deep learning has succeeded in the system of

Convolutional Neural Networks based on picture implementation. Deep learning gives the greatest performance in image recognition issues and even outperforms humans in some situations. Furthermore, deep learning allows models to be trained directly on full-sized pictures, even when the data used is enormous.

Furthermore, deep learning is advised for use in any environment, including deep surface, such as underwater images, twisting space, and so on. Furthermore, deep learning has a favorable influence on image processing and computer vision, and this benefit is undeniable. Deep learning applications may be developed by doing research and understanding their limitations in order to generate the best results. In conclusion, based on the relevant aspects that have been studied, deep learning is the most successful data training technology ever owing to its ease of use and human-like approach when it comes to picture identification. Deep learning is extensively and primarily utilized for picture recognition, identification, verification, and classification as a consequence of the reading. As a result, this approach is more convenient in terms of comprehending or training data in computer vision picture recognition.

ABSTRACT

Blockchain technology and distributed ledgers are generating a lot of buzz and sparking a lot of initiatives in many sectors. The financial sector, on the other hand, is regarded as a major user of the blockchain idea. This is owing not only to the fact that the crypto-currency Bitcoin is the most well-known use of this technology, but also to significant process inefficiencies and a huge cost base problem unique to this sector. Furthermore, the financial crisis showed that even in financial services, determining the right current owner of an asset is not always feasible. Retracing ownership over a longer chain of changing buyers in global financial transaction services is even more difficult: when Bear Stearns, a US investment bank, failed in 2008 and was completely acquired by JP Morgan Chase, the number of shares offered to the acquirer was greater than the number of shares outstanding in Bear Stearns' books. The accounting mistakes could not be resolved, and JP Morgan Chase was forced to face the consequences of extra (digital) shares.

KEYWORDS: *Bitcoin, Blockchain, Network, Technology, Transaction.*

1. INTRODUCTION

1.1 Blockchain's Functions and Consequences:

A blockchain is made up of data sets that are made up of a series of data packages (blocks), each of which contains numerous transactions. Each new block adds to the blockchain's length, making it a full record of transaction history. The network can verify blocks using cryptographic methods. A timestamp, the hash value of the previous block (‘‘parent"), and a nonce, which is a random integer for validating the hash, are all included in each block.

This approach guarantees the blockchain's integrity all the way to the first block (the 'genesis block'). Because hash values are unique, fraud can be successfully avoided because modifications to a block in the chain alter the hash value instantly. The block may be added to the chain if the majority of nodes in the network agree through a consensus method on the legitimacy of transactions in a block as well as the validity of the block itself. This consensus mechanism, is the method through which a majority (or, in certain instances, all) of network

validators agree on the state of a ledger. It is a collection of rules and processes that enables many participating nodes to maintain a consistent set of facts"[1]–[3].

Although Bitcoin is the most well-known blockchain application, the technology may be used in a wide range of applications beyond cryptocurrencies. Blockchain may be utilized in different financial services such as digital assets, remittance, and online payment since it enables payments to be completed without the need of a bank or an intermediary. Furthermore, blockchain technology is emerging as one of the most promising technologies for the next generation of internet interaction systems, such as smart contracts, public services, internet of things (IoT), reputation systems, and security services.

Despite the fact that blockchain technology offers enormous promise for the development of future internet services, it is beset by technical difficulties. To begin with, scalability is a major issue. The size of a Bitcoin block is currently restricted to 1MB, and a new block is mined every 10 minutes. As a result, the Bitcoin network is limited to 7 transactions per second, rendering it unsuitable for high-frequency trading. Larger blocks, on the other hand, need more storage space and take longer to propagate across the network. As people want to maintain such a huge blockchain, this will eventually lead to centralization. As a result, finding a balance between block size and security has become difficult. Second, it has been shown that miners may earn more than their fair share of income by using a selfish mining technique. Miners conceal their mined blocks in the hopes of making more money in the future. As a result, branches may occur often, impeding blockchain growth. As a result, some remedies to this issue must be proposed. Furthermore, even when individuals solely utilize their public and private keys to conduct transactions, privacy leakage may occur in blockchain. It's even possible to trace a user's actual IP address. Additionally, existing consensus methods like as proof of work (PoW) and proof of stake (PoS) have significant flaws. PoW, for example, consumes a lot of power, and the phenomena of the wealthy becoming wealthier may show up in the PoS consensus process. These issues must be solved in the development of blockchain technology[4]–[6].

As a result, new transactions are not added to the ledger automatically. Instead, the consensus process guarantees that these transactions are held in a block for a certain amount of time (for example, 10 minutes in the Bitcoin blockchain) before being transmitted to the ledger. The information on the blockchain can no longer be altered after that. Blocks are produced by so-called miners, who are paid with Bitcoins for verifying the blocks in the case of Bitcoin. The example of Bitcoin demonstrates that the blockchain concept is capable of altering more than only the process of money transfers. People all around the globe may trust each other and transfer various types of assets peer-to-peer via the internet using encryption.

The above-mentioned distributed ledger system has many advantages. In contrast to centralized systems, the network's functions continue even if individual nodes fail. People do not have to evaluate the trustworthiness of the intermediary or other network members, which promotes trust. It is enough for people to develop confidence in the system as a whole. Data security is also enhanced by the lack of middlemen. The present practice of third parties acquiring personal data, entails the danger of security breaches[7]–[9].

Third parties may be rendered obsolete by using the blockchain, thus improving user security. Various articles on blockchains have been published in recent years in computer science, and they have, for example, examined consensus methods or suggested new ideas to address problems with smart contract privacy. However, academic papers in information systems surrounding blockchain presently mainly concentrate on cryptocurrencies, despite the fact that there are many industry whitepapers on blockchains. Figure 1 shows the example of a blockchain.

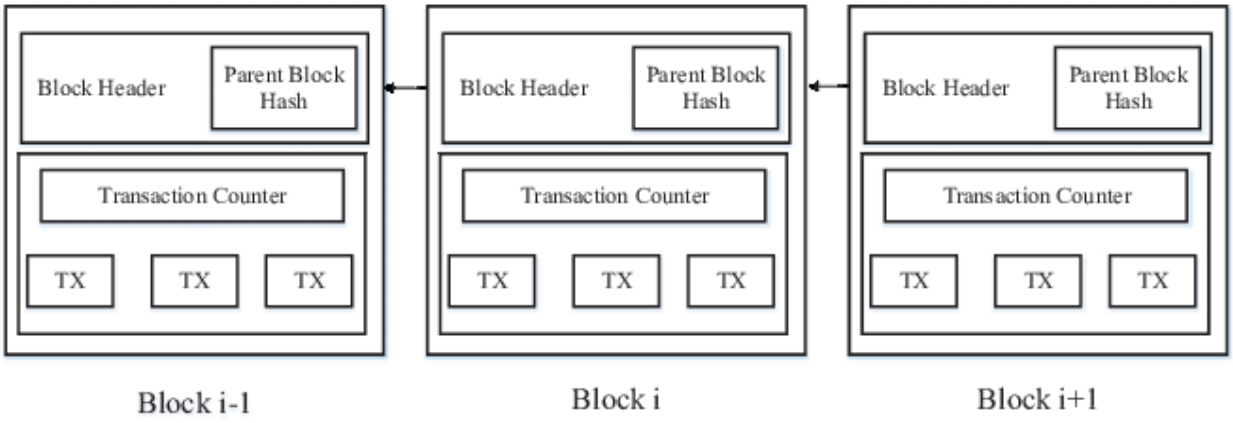

Figure 1: The above figure shows the example of a Blockchain.

There are disadvantages and possible dangers, which are addressed in this stream of research, in addition to substantial benefits. a number of Bitcoin flaws, including Bitcoin theft or loss (malware assaults, unintentional loss), scalability difficulties (delayed transaction confirmation, data retention, and communication failures), and structural issues (deflationary spiral), on the other hand, provide ideas for enhancing the current Bitcoin technology. For example, a "fair exchange protocol" may help users maintain their anonymity. Other writers have addressed the privacy concerns of Bitcoin. Privacy can only be preserved in the present Bitcoin environment by utilizing pseudonyms. As a complement to Bitcoin, this allows for fully anonymous cryptocurrency transactions. The successor to Zerocoin, Zcash, was released in 2016.

If new blocks are added to the network at a rapid pace, the process of creating new blocks may cause performance issues. To improve transaction speed ‘‘Inclusive Block Chain Protocols" as an alternative to the current blockchain topology. It will be fascinating to see if this new technology can solve performance issues[10].

1.1 Smart Contracts and Blockchain:

The development of blockchain technology in recent years has also bolstered other theories proposed in the literature. Szabo coined the phrase "Smart Contracts," which integrate computer protocols with human interfaces to carry out contract requirements. Smart Contracts are becoming more popular as a result of the blockchain since they can be used more readily with blockchains than with the technology available at the time of their creation 20 years ago. This novel method might, for example, eliminate the need for attorneys and banks to participate in asset-purchase contracts based on predetermined criteria. Smart Contracts may also be used to manage property ownership. These assets may be physical (e.g., homes, cars) or intangible (e.g., intellectual property) (e.g., shares, access rights). Ethereum, a decentralized system suggested by Buterin, is a notable example of blockchain technology that regards smart contracts as first-class citizens. Glaser and Bezzenberger offer a taxonomy of decentralised consensus systems as well as an overview of various kinds of systems. Ethereum is a blockchain that extends the Bitcoin blockchain to enable a wider range of applications. As a result, blockchain technology enables the use of cryptography to create contracts and to eliminate the need for third parties (such as a notary) to build confidence in the past. By automatically executing contracts in a cost-effective, transparent, and secure way, blockchain has the potential to disrupt the whole transaction process. Glaser proposes a paradigm for implication analysis of blockchain systems for digital ecosystems, as well as the architectural components of blockchain technology and their interactions.

The banking sector is even considering whether the blockchain will be able to replace significant portions of their present operations. The payment procedure is a good example of this. When

individuals pay for items with a credit card nowadays, the settlement takes several days. This delayed settlement would become a thing of the past if the blockchain was used.

1.2 Blockchain Applications and Future Trends:

1.2.1 Applications:

The differentiate between financial and non-financial applications that the blockchain may possibly solve. This disruptive invention has the potential to alter not just the nature of financial relationships, but also many other aspects of our daily lives. a British musician, sells her tracks on the blockchain, for example.

1.2.2 Future Trends:

Blockchains seem to have a wide range of applications, particularly in sectors that have traditionally depended on third parties.

It is necessary for both sides to develop a level of confidence. Atzori is a Greek word that means "to be indicates that politics and society as a whole may be in trouble. The blockchain has rebuilt the system. Many functions may be affected. If individuals began to organize and defend themselves, they would become obsolete. Decentralized platforms are being used by society. Finally, the author said that ‘‘government service decentralization via Permission blockchains are both feasible and desired. Can substantially improve the efficiency of government administration". The significance of reorganizing societies cannot be overstated. Countries that are impoverished. It is possible to better safeguard one's wealth making use of the blockchainparticularly in the developing world, when it comes to proving ownership, landowners have challenges. The municipal authority, for example, wants to expropriate the population. These existential dangers are manageable. Land titles are being integrated onto the blockchain. However, as you can see, As Glaser) points out, the interaction between the It's possible that the digital and physical worlds will collide. The weak link that jeopardizes the established digital trust a blockchain-based system there is also a discussion going on right now among scholars and academics. If crypto-currencies based on the blockchain are regulated, can do real-money tasks (European Central Bank) Money. Mishkin defines it as "something that isn't usually recognized as a form of payment for products or services or as a kind of currency the settling of debts" According to Luther and White, that crypto-currencies are very seldom utilized as a medium of exchange today a means of exchange provide empirical evidence. Bitcoin is mainly utilized as a currency, according to these findings. This is a speculative asset. Spending and accepting, on the other hand, may be difficult. Because to entrepreneurs' creative methods, things have become a lot simpler. Establishing crypto-currencies as a fiat currency replacement money. As a result, the blockchain may help. In the real world, alter the way people pay for products. When purchasing a home, homeowners must pay a lot of money. Property. ‘‘Blockchain," according to Goldman Sachs. May lower title insurance rates and earn $2–$3 billion in revenue Reduced mistakes resulted in a $4 billion cost reduction in the United States. Effort made by hand". While computer scientists are primarily concerned with technological issues, in this field, as well as cryptographic difficulties, researchers engineering for Business and Information Systems field will be able to concentrate on market design. Issues of trust and privacy, as well as their adoption the failure to embrace modern technologies Furthermore, this obstructive. Many established businesses may be affected by innovation. Models, as well as build new ones, which may have serious consequences. Affecting whole industries as a result, study at the crossroads is necessary. Technology, markets, and business models are unquestionably intertwined valuable.

2. DISCUSSION

The blockchain has been mentioned by the author. Blockchain may be utilized in a number of financial services, including digital assets, transfer, and online payment, since it enables

payments to be conducted without the need of a bank or an intermediary. In addition, blockchain technology is rapidly gaining momentum as one of the most efficient ways for the next generation of computer functions, such as smart contracts, public services, and the internet of things (IoT), reputation systems, and security services.

Despite the fact that blockchain technology has great potential for the future of internet services, it is beset by technical problems. For starters, scalability is a major issue. For the time being, a Bitcoin block can only be 1MB in size, and new blocks are mined every 10 minutes. As a result, Bitcoin's network can only handle 7 cycles per second, limiting high-frequency trading options. Larger blocks, on the other hand, need more storage space and propagation time across the network. People will want to maintain such a huge blockchain in the end, resulting in centralization. As a result, finding the appropriate mix of network capacity and security has become difficult. Second, it has been shown that individuals may earn more than their fair share of income by using a selfish mining technique. Miners hide mined blocks in the hopes of earning more money in the future.

3. CONCLUSION

When it comes to the blockchain, the author has come to a conclusion. The blockchain is highly respected and accepted due to its decentralized design and peer-to-peer nature. Bitcoin, on the other hand, safeguards a significant amount of blockchain research. Other than Bitcoin, though, blockchain may be utilized in a variety of applications. Blockchain has shown its capacity to disrupt traditional sectors because to its basic characteristics of decentralization, persistency, anonymity, and auditability. This article provides a comprehensive overview of the blockchain. We begin by giving a general introduction of blockchain technology, including its architecture and key characteristics. We'll next go through some of the most popular blockchain consensus algorithms.

In a number of methods, the author examines and evaluates these processes. We also take a look at some of the most popular blockchain uses. We also go through some of the challenges and problems that may impede blockchain development, as well as some of the existing solutions. There are also some suggestions for future paths. Smart contracts are quickly developing these days, with a variety of smart contract applications being proposed. However, owing to the many faults and limits of smart contract languages, many innovative applications are still impossible to implement. In the future, we'd want to do a comprehensive investigation into smart contracts.

ABSTRACT

Blockchain is being hailed as a technical breakthrough that has the potential to transform the way society trades and communicates. This reputation stems from its ability to enable mutually distrusting entities to exchange financial value and communicate without the need for a trusted third party. Furthermore, a blockchain enables for the preservation of data with integrity and the transparency of processes. In this article, we examine whether or not a blockchain is the best technological solution for a certain application situation. We compare the characteristics of permissionless (such as Bitcoin/Ethereum) and permissioned (such as Hyperledger/Corda) blockchains to those of a centrally controlled database. We provide a systematic approach for determining the best technological solution for a given application issue. We examine three use cases in detail, namely Supply Chain Management, Interbank and International Payments, and Decentralized Autonomous Organizations, using our approach, and end the paper with a forecast for future possibilities.

KEYWORDS:*Bitcoin, Blockchain, Data, Organization, Technology.*

1. INTRODUCTION

Bitcoin and its blockchain have made it possible for mutually distrusting organizations to conduct financial transactions without depending on a central trusted third party, while also providing transparent and integrity-protected data storage. Blockchain as a technology has gotten a lot of interest because of these characteristics, which include distributed cloud storage, smart property, the Internet of Things, supply chain management, healthcare, ownership and royalty distribution, and decentralized autonomous organizations, to mention a few. The above figure explains about blockchain[1]–[3].

In contrast to Bitcoin's permissionlessblockchain, which allows any writer or reader to join at any time, permissioned blockchains have been suggested, which enable only a limited number of organizations to write and read the blockchain. However, since a permissioned blockchain resembles a centralized database, the issue of whether a blockchain is better suited than a centralized database arises.

In this paper, we compare and contrast the characteristics of various blockchain kinds (permissioned and permissionless) with those of a centrally maintained database. We provide a technique for determining if a blockchain is suitable for a given issue based on the criteria, and if so, the kind of blockchain to employ.

We examine three use cases in depth, namely

- Supply chain management
- Interbank and international payments.
- Decentralized autonomous organizations, using our approach to determine if and which blockchain type makes sense for the particular applications.

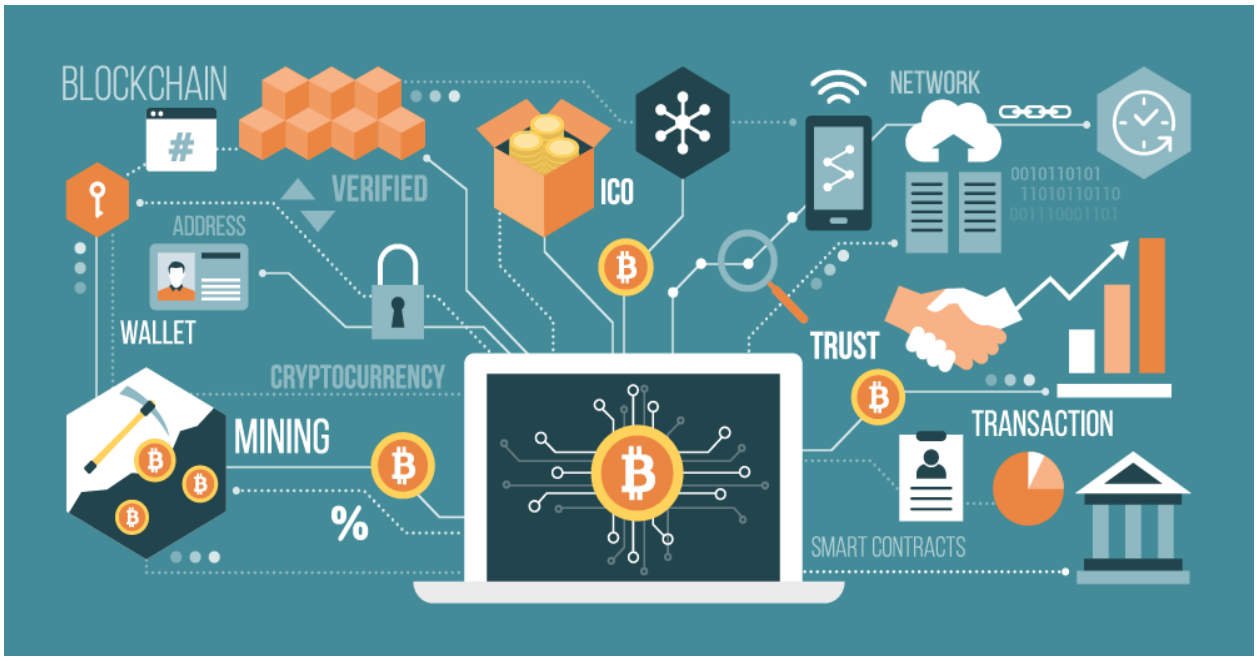

Figure 1: The above figure explains about blockchain [trentonsystems].

The following is how the rest of the article is structured. The most essential background of blockchain is briefly described in Section II. We offer a systematic approach in Section III for determining if a blockchain makes sense and, if so, whatever kind of blockchain would be suitable. In Section IV, we examine suggested use cases in depth using our approach. We examine relevant work in the field in Section V, and we wrap up the paper in Section VI.

1.1 Blockchain Introduction:

The necessary blockchain background as well as the parties involved are detailed in the next section. The term blockchain comes from the technological structure of the system, which is a chain of blocks. A cryptographic hash links each block to the one before it. A block is a data structure that enables a list of transactions to be stored. Peers in the blockchain network originate and trade transactions, which alter the state of the blockchain. As a result, transactions may exchange monetary quantities, but they are not limited to financial transactions alone, allowing for the execution of arbitrary code inside so-called smart contracts[4], [5].

Before we get into the particular distinctions between permissionless and permissioned blockchains, let's take a look at who makes up these networks. Any entity that publishes state to the database is referred to as a writer in any database system. This corresponds to a blockchain participant who participates in the consensus process and contributes to the blockchain's growth. As a result, a writer may collect transactions in a block and add that block to the blockchain. A writer's work may also qualify him or her as a validator. A reader is defined as any entity that is

not expanding the blockchain but is instead engaging in the transaction generation process, reading and analyzing the blockchain, or auditing the blockchain. Regulators and blockchain software maintainers are considered outside of this scope.

Blockchains with No Permissions Permissionlessblockchains, such as Bitcoin and Ethereum, are open and decentralized. Any peer may join and exit the network at any moment as a reader or writer. Surprisingly, there is no centralized body in charge of membership management or the ability to prohibit unauthorized users or authors. This openness means that any peer may read the published material. However, using cryptographic primitives, it is theoretically possible to create a permissionlessblockchain that conceals privacy-sensitive data[6]–[9].

Blockchains with Permissions Permissioned blockchains have recently been suggested as a way to only authorize a small number of users and authors. Individual peers are granted the ability to participate in the blockchain's write and read activities by a central organization.

Readers and writers may operate on different parallel blockchains that are linked to offer encapsulation and privacy. Hyperledger Fabric and R3 Corda are two of the most well-known permissioned blockchains.

1.2 Characteristics:

The most important features of distributed ledgers and centralized systems are described and compared in the following sections.

1.2.1 Public Verifiability:

Anyone may check the accuracy of the system's state using public verifiability. Each state change in a distributed ledger is verified by verifiers (for example, miners in Bitcoin), who may be a small group of people. Any observer, on the other hand, may verify that the ledger's state was updated in accordance with the protocol, and all observers will ultimately have the same view of the ledger, at least for a given period of time. Different observers in a centralized system may have completely different perspectives on the state. As a result, they may be unable to verify that all state changes were carried out properly[10].

1.2.2 Transparency:

Rather, observers must trust the central organization to supply them with accurate information. For public verifiability, the data and the process of changing the state must be transparent. However, the quantity of information that is visible to an observer may vary, and not every participant need access to every piece of data. Any system's ability to maintain privacy is critical. Between privacy and openness, there is a natural conflict.

1.2.3 Privacy:

Because transparency and public verifiability are not needed for the system to operate, privacy is definitely simpler to establish in a centralized system.

1.2.4 Integrity:

Information integrity guarantees that data is secured from unwanted changes and that the data obtained is accurate. Information integrity is inextricably related to public verifiability. Anyone may verify the integrity of data if a system offers public verifiability; otherwise, integrity can only be guaranteed if the centralized system is not corrupted.

1.2.5 Redundancy:

For many applications, data redundancy is critical. Replication across the authors provides redundancy in blockchain systems by default. Redundancy in centralized systems is often accomplished via replication on several physical servers and backups. Trust Anchor identifies

the person who represents the system's highest authority and has the ability to grant and revoke read and write access.

1.3 Conflicts of Transparency and Privacy:

Between openness and privacy, there is an inherent compromise. Anyone may view any piece of information in a completely transparent system, thus there is no privacy. A completely private system, on the other hand, offers no transparency. However, despite making the process of state transitions visible, a system may still offer substantial privacy guarantees, for example, a distributed ledger can give public verifiability of its overall state without revealing information about the state of any individual participant. Cryptographic methods may be used to provide privacy in a public system, but they usually come at the expense of efficiency. For example, the cryptocurrency Zerocash uses computationally costly encryption to guarantee complete anonymity while yet allowing public verification of the ledger state.

1.4 Where Does A Blockchain Make Sense?

Using an open or permissioned blockchain makes sense only when many mutually distrusting entities wish to interact and alter the status of a system without agreeing on an online trustworthy third party.

There is no need for a database if no data needs to be kept, therefore a blockchain as a database is useless. Similarly, if there is just one writer, a blockchain offers no extra assurances, and a traditional database is better suited since it delivers superior throughput and latency. There are two possibilities if a trusted third party (TTP) is available. First, if the TTP is always online, it may be delegated write operations and act as a validator for state transitions. Second, since the TTP is typically offline, it may act as a certificate authority in a permissioned blockchain, which means that all of the system's authors are known.

A database with shared write access is likely the best option if the authors all have mutual confidence in one another, i.e. they believe no one is malevolent. Using a permissioned blockchain makes sense if they don't trust each other. Depending on whether public verifiability is needed, anybody (public permissioned blockchain) or a limited group of readers (private permissioned blockchain) may read the state. A permissionlessblockchain is an appropriate option if the set of authors is not fixed and known to the participants, as it is for many cryptocurrencies such as Bitcoin.

2. DISCUSSION

A block is a data structure that enables a list of transactions to be stored. Peers in the blockchain network originate and trade transactions, which alter the state of the blockchain. As a result, transactions may exchange monetary quantities, but they are not limited to financial transactions alone, allowing for the execution of arbitrary code inside so-called smart contracts, for example. Before we get into the particular distinctions between permissionless and permissioned blockchains, let's take a look at who makes up these networks. Any entity that publishes state to the database is referred to as a writer in any database system. This corresponds to a blockchain participant who participates in the consensus process and contributes to the blockchain's growth. As a result, a writer may collect transactions in a block and add that block to the blockchain. A writer's work may also qualify him or her as a validator. A reader is defined as any entity that is not expanding the blockchain but is instead engaging in the transaction generation process, reading and analyzing the blockchain, or auditing the blockchain. Regulators and blockchain software maintainers are considered outside of this scope.

3. CONCLUSION

The author concluded about the blockchain, it's not easy to decide between a centralized database and a permissionless or permissioned blockchain. While this topic has been addressed before [29], we believe our paper is the first to provide a systematic approach for determining which technical solution is the greatest fit for whatever application situation. The necessary trust assumptions, application needs, involved parties, and technological features like as throughput and latency are all taken into consideration by our approach. This is due to its capacity to allow mutually distrusting entities to exchange financial value and communicate without the need of a trusted third party. Furthermore, a blockchain allows for the integrity of data to be preserved as well as the transparency of procedures. In this post, we look at whether a blockchain is the appropriate technical solution for a certain use case. The features of permissionless (Bitcoin/Ethereum) and permissioned (Hyperledger/Corda) blockchains are compared to those of a centrally managed database. We provide a method for finding the optimum technical solution for a certain application problem. We tested our approach on three well-known application scenarios that have sparked increased interest in blockchain technology, as well as additional use cases. We conclude that, depending on the application situation, each, permissionless and permissioned blockchains, and centralized databases have legitimate use cases that must be carefully evaluated.

GENEROSITY ISSUES OFNIZAMI GANJAVI AND ALISHER NAVOI'S WORK

Abrueva Mokhigul*

*Student,
Samarkand State University, UZBEKISTAN

ABSTRACT

In this article, NizamiGanjavi and AlisherNavoi's comments on generosity are interpreted in the form of epics.Movorounnahr in the blessed city of Mecca, when he went to Hajj, he borrowed money in the amount of fifteen thousand [But from there] upon his return, when he reached Halap, he canceled his plan to travel to merchant Movorounnahr, and if you return the money you had received from me before, then you would have gone back to your homeland after that, would not have allowed khodjazoda to return to his homeland either.

KEYWORDS: *Epic, Generosity, Comparative Analysis, Righteous Generosity, Statehood, Divine Character, Perfection.*

INTRODUCTION

AlisherNavoi's works have promoted many universal values of excellence: fairness, honesty, honesty, generosity, honesty, kindness, kindness, goodness, tolerance. These qualities not only make a person glorious, virtuous and believing, but also bring him closer to God, incline to divine qualities, says the great thinker [23,12]. After all, the meaning of the life of khazratNavoi was also closely related to generosity. In the work “Makorimul-akhloq”, which gives detailed information about the life and activities of the poet, there is such a story: “one time when one of the children of Khoja NasiruddinUbaydullah, a companion of the people, intends to travel to Movorounnahr in the blessed city of Mecca, when he went to Hajj, he borrowed money in the amount of fifteen thousand [But from there] upon his return, when he reached Halap, he canceled his plan to travel to merchant Movorounnahr, and if you return the money you had received from me before, then you would have gone back to your homeland after that, would not have allowed khodjazoda to return to his homeland either. Khodjazoda forcibly he stayed in the land and sent one of his people to Samarkand to collect that money and bring it to Halap. When this man, sent by him, arrived in the city of Herat, the charisman, took part in the blessed assembly of ulkhazrat (AlisherNavoi), who was the base of the world's great powers and the refuge of the pink, and spoke of the reason for which he stood in the city of Halap, khodjazoda. Then the lord said, "this money in insignificant quantities is not worth it to go to Movorounnahr and collect it and wait for your master [in Halap] so long" they said, and they sent him to Halap, handing that money over to one faithful man from their side. As a result, khodjazoda was relieved of captivity and went to his native country” [15,114]. This is just a drop from the sea of Navoi.

First of all, if we look for an answer to the question of what can be done, then the word "generosity" is described in the dictionary of Navoi's works as follows: “Generosity – sakho, generosity, openness with hands, nobility, and generosity.

MaydonisaxoichrajalodatKO‘rguz,

Topqanniberuramrig‘anodatko‘rguz. (“Xazoyinul-maoniy” Ia 470)

In the Explanatory Dictionary of the five-part Uzbek language: generosity – openness, nobility, generosity, high generosity, generosity. (III vol) given information. In NajmiddinKomilov's book "Khizrchashmasi“ it is said that generosity is synonymous with the concepts of ”karam“, ”futuvvat“, ”himmat" [23,15]. Karam, that is, generosity from the attributes of Allah, therefore, it is good to be karam, to please people with different tortures, it is the honor of these people. But, Navoi says, if it exceeds its limit, it is wasteful. Continue these thoughts in the work of the "Mahbubulqulub", 11-remark of his work shows the inequality of karam by putting generous and indifferent people against it, and at the same time by saying that it will be the norm in every case, it is also wasteful to spend excess:

“Isrofsaxoemasvaitfolnima’noahlisaxodemas. Haqmolinkuydurgannidevonaderlarvayorug‘ kundasham’ikofuriyyoqqonniaqldinbegonaderlar. Munohotuchunbermakxudnamoliqvaaningbilao‘zinsaxiydemakbehayoliq. Ulki el KO‘rmagunchabermas – laimdir, saxiyemas. Tilabberganni ham saxodinyiroqbil; ibrombilabergandinbermaganniyaxshiroqbil. Birtao‘tmakniikkibo‘lub, yarminbirochg‘abergannisaxiy de; o‘ziyemaybarinmuhtojgaberganniaxiy de” [16,108]. Hence, generosity must be done to the person in need in his place. As Navoi said, given at the right time is a buz coup, and the dice chopon, which is a nonsense gift, is naughty. As such, generosity is generous not only with material things, but also to build madrasahs, mosques, to beautify the ruined places.

Special emphasis is placed on the issue of ”SaddiIskandari” epic. In the XLV chapter of the epic, the story about generosity and forgiveness is quoted.

In Adam region was a merchant in the province, and he was the most skillful of merchants. As a son, he was very intelligent. The merchant was always busy with trade, and every ten days he traveled from the city to this city. Leaving one night's sleep and going to many trades, robbers attack the caravan before it has yet to cross any steppe and river. From the sweetness of the soul, everyone will escape on all sides. In the same conflict, the merchant saved his soul, but separated from his son. This grief makes it complete but:

Bu g‘amdinjigarnitopibyoraliq,

Dedi: “Menmenemdiyuovoraliq.

Quyundekyuzurg‘umdururhartaraf,

Bu xokiybadanbo‘lg‘uchabartaraf.

Murodimharimig‘aqo‘ysamqadam,

Biyobondasargashtalikdin ne g‘am” [8,253]

He had a thousand gold coins hidden in his waist, he would see the fund standing in his waist and look for his brown. Ran incessantly and reached a wonderful man. How many steppe conquerors poor this city is also accelerates his step to search. Behold, in one place, few people are gathering. And in their hands there is a captive. But his whole body is painted with his own blood, again playing the sword of the wicked on top. This is a sucking, which causes blood slander to such a kind of grip. To get rid of this revenge, they put a thousand-dollar price on him, but there is no one who can afford this suction. When the exhausted merchant saw this situation,

he took the cash that he tied to his chest, giving it a thousand gold, and he saved the captive of the lioness. Then looks at it's his liver-child. His joy was endless. Then asked the merchant's son how he got into such a situation. Son: “that day I got caught by the bandits me. Previously, they all wanted to kill me. And then, having sworn to take my head, they made me a condition, saying” let us not kill you, but now you make friends with us, and become our confidant in whatever we do. ”After such a promise of gift, before death, poor was convinced of their condition. And today they came to this kishvar and they fought with the whole people. In the same conflict, a man from the people became a martyr, I was enslaved to the people by the robbers. After submitting this case to the governor, by his decree, I was handed over to the heirs of the one whose aunt was killed by the robbers for the sake of diet. The sun of my life is full you have come” When the people are aware of the situation, it is also necessary to inform the king:

Ulus voqifo‘lg‘ochbuahvoldin,

Xabarberdilarshahg‘aulholdin.

Chu voqifbo‘lubulnavohishahi,

Karamnuktasiningbo‘lubogahi.

Yano qilditojirnipiroyaliq,

Burundinfuzunnaqdusarmoyaliq.

Ming oltungakimzohirettikaram,

O‘g‘ultoptiyuyuzmingiqbol ham [8,254].

At a time when the merchant himself needed gold, he saved a poor man from death, generosity brought him to a high rank was formed, and he reached the land of his own liver.

"SaddiIskandari" epic just like in ”Iqbolnoma" Iskandar and the chronicles of the doctors are cited, each judge puts forward his thoughts on the state administration and advises Alexander. In particular, Hurmus raises generosity high in public administration. And the king knew that he should be generous in order to achieve the love of the people.:

Ki: «Shahg‘asaxovaterurnoguzir,
Bo‘lurg‘aishixalqarodilpazir.

But not every expenditure made with bragging rights goes into generosity. For example, to give after asking is not even generosity:

Tilab, dog‘ibergansaxovatemas,

Saxoahlionisaxovatdemas.

Generosity such a thing is that the river king, looking with his eyes, first provides the soldiers with food, they do not leave any remuneration for what they claim; and then gives the workers and the martyrs the right, and then gives the people the right to a little more. This is to give food and necessary bats to whoever is hungry the next. Any given location for bragging, whether it is a hundred districts, whether it is a scrape – not a waste:

Mubohotilao‘zinetmasaziz,

Agar yuztumanbersa, gar birpashiz.

Ne sarfaylaro‘lsang, bunav’ aylasarf

Ki, busarferurasramoqtinshigarf. [8,442]

Navoi shows the king through the wisdom of Hurmus how the road of generosity should be. The chronicles are presented in the form of an admonition to the Badiuzzaman after the epic. The Sultan of the word estate addressed the prince in exchange for bob: O Prince, Iskandar was considered the shadow of God on earth in the sight of all the people of the world. His knowledge and knowledge were equal to the knowledge and knowledge of all the peoples of the world. Despite the fact that he knew so much, he would learn from everyone. Always a scientist-he saw the work of the council with the virtuous. I speak one or two mouths about it, my goal from this is to say that I hope that you will also hear these words and use these tips. Navoi Iskandar and 7 hakeem's wisdom on the rules of state administration and royal order came to the conclusion that the king himself must judge on the basis of Sharia and please the parents. So, in this chapter, the views of a total of nine scientists are presented, each of which is as important as the Hurmus mindset and relevant to our era.

Although it is not given in the style of stories in the book of Alexander, the general plot of the epic is impregnated with the question of generosity. In particular, after Iskandar Darius conquered his country, he began to rule the country with justice and gathered the people:

Qiyomatkunidanetarmanhazar,

Adolateturmanbataqvomagar.[10,510] said.

In the work, Iskandar was interpreted not only as a just king, but also as a strong righteous servant of faith. This is reflected in the fear of resurrection in the above verse. Iskandar himself, along with his fairness, urges the people to spend the day with his own efforts, helping the helpless:

Agar dundailkimgaganjkirsa gar,

Fido aylagumkimgaqismat u zar.

Berurmanharkimgabaxtdankalid,

Etibpoyayikoriharkasinipadid.

Hunarmandningboshinko‘targumbaland,

Eturmandevonanipoyiband.

Tekinxo‘rlaridaneturmanhazar,

Soqov, chorasizlaruzrlimagar.

Agar kuchlikordonibo‘lsayano,

Bekoryurmog‘ininaistarmano.

Ko‘rurmankishikichekarbo‘lsaranj,

Xayrishdayetmasangasarfiganj.

…bag‘ishlabjahongasaxobirlafarr,

Madadso‘zgabergumin’omizar.[10,510]

He establishes justice in the land of Iran, burns the cease-fire, marries Ravshanak and fulfills the will of Doro. This too was actually an appearance of generosity.

The issue of the generosity of the “Iskandarnoma” epic of NizamiGanjavi is also raised. First of all, while describing Iskandar notes that he is unequal in generosity:

Badavlaterdi-yusaxovatli, bas,

Yunondayo‘qerdiundanyaxshikas [12,64].

In the story of baker, too, it is briefly mentioned that Iskandar is a generosity. That is, he is so rich in such a short term that even if the king is so generously called a person cannot get rich by profession of bread in such a short term:

Shohisaxovatlishaharda, illo,

Kishinonvoybo‘lib, boyimasaslo [12,86].

When Iskandar reaches the level of the prophet, he jumps on a journey by the command of Allah and asks the doctors: Aristotle, Plato and Socrates to write a letter to him. These chronicles describe the regimes of the kingdom, just like the seven rulers in “SaddiIskandari”. They advise Iskandar in his chronicles. In the letter of Aristotle, it is called upon to stay away from the oppressors, to glorify the good, to do justice, and not to collect the treasure in vain, while telling the king not to oppress:

Xazinayelkangdayukerur, xalos,

Boshqalargabersang, bo‘lursenxalos [12,167].

Speaking of generosity, darveshs a part of it when the goods in your hand, the poor-he says the needy will be the shield of the plague of freaks, donation. It is necessary to do so secretly, even when making a donation. Only then can a person reach his goal:

Qo‘linggamolkirsamagarbeshukam,

Boridinehsonetdarveshlarga ham.

Nihoniyulushberyo‘qsilgahar gal,

Haqningxushnudliginarsadinafzal.

Kishikimnihoniyehsonqilgusi,

Ehsonibalogaqalqonbo‘lgusi.[12,168]

Plato king, in principle, says that it is necessary to eat a lot and be patient in the journey, to catch his soldiers in order, to deal with the event in each case, do not pour blood in vain, emphasizing that he will be far from women. It also calls the king generosity, like Aristotle:

Jahonsohibidirjahondainson,

Hamrohlariilabahamko‘rsa non.

Hamyoniniochib, xarjetsapulin,

Hal etsanechabiryo‘qsilmushkulin.[12,117]

Well, in both epics, one way of perfection is interpreted about generosity. Iskandar the world, calls the people to guidance, takes a lesson from good people (fruits and crops are without protection, but by the grace of Allah no one can touch the country (in the “Iqbolnoma”), gives food to them when they meet the people of the desert without food, teaches them the secrets of living well, flourishes the ruined countries.

AL-BIRUNI AND ALCHEMY

Surayyo Ubaydullaevna Karimova*

*D.Sc. (History),
Deputy Director for Scientific Affairs,
Abu RayhanBiruni Institute of Oriental Studies,
Uzbekistan Academy of Sciences, UZBEKISTAN

ABSTRACT

Abu Rayhan Muhammad ibn Ahmad al-Biruni (973–1048), an encyclopedic scholar from Khorezm, was engaged in almost all the exact and natural sciences known in his time and wrote about 150 works on them.However, based on the views expressed by the scientist in his works "India" and "Mineralogy", his attitude to chemistry was assessed negatively. Although al-Biruni sharply criticized the alchemists' idea of metal transmutation, in his scientific practice he used substances, instruments, and experimental methods used in chemical laboratories, i.e., a rational approach to the alchemy of his time.

KEYWORDS: *Khorezm, Al-Biruni, "Mineralogy", "Kitab Al-Jamahir Fi Ma'rifat Al-Jawahir", Alchemy, Transmutation of Metals, Synthetic Gold, Synthetic Silver, "Pharmacognosy".*

INTRODUCTION

The great Khorezm scholar Abu Rayhan Muhammad ibn Ahmad al-Biruni (973-1048) is known in the history of science as an encyclopedic scientist. Because he was seriously engaged in almost all the sciences of his time, especially the exact and natural sciences, as evidenced by his nearly 150 works in various fields of science. These works have been studied by scientists around the world for many years. As a result of this research, the scientist's significant contribution to the development of mathematics, astronomy, geodesy, geography, mineralogy, pharmacy, philology and history was recognized around the world.

Although al-Biruni'sencyclopedism appears in the fields of astronomy, mathematics, and the like, it has also left a significant mark on the natural sciences. In particular, his advanced ideas and practical experience in mineralogy, geology, pharmacology, and physics were innovative for his time.

But at the same time, al-Biruni's attitude towards alchemy, which was highly developed at that time and was the object of scientific interest of most scientists, was not as clear and positive as that of the aforementioned natural sciences. It is known that the 9^{th} – 11^{th} centuries were a period of development of alchemy in the Muslim East. By this time, the alchemical works of Jabir ibn Hayyan (721–813 or 815), the father of Oriental chemistry, and the great physician and

alchemist Abu Bakr Muhammad ibn Zakariyaar-Razi (865–925) were well known in scientific circles. Although these works also describe the chemical operations of making gold and silver artificially from ordinary metals, a number of minerals, chemical experiments, and instruments necessary for modern chemistry have been invented for this purpose. These substances and actions have been used not only in chemistry but also in medicine and mineralogy.

THE MAIN FINDINGS AND RESULTS

Naturally, al-Biruni, as a true natural scientist, was not indifferent to alchemy, but his attitude to this science has been negatively assessed so far (Mieli A:1922). The main reason for this is al-Biruni's critical approach to the attempts of alchemists to carry out metal transmutation in "India" and "*Kitab al-Jamahir fi Ma'rifat al-Jawahir*" ("Mineralogy").

For example, in his book "India", al-Biruni says: "Alchemy, although not called magic, is one of its types. You see, if this person shows a piece of cotton to someone for silver, it is not attributed to anything other than magic, and there is no difference in custom between showing silver as gold" (Rasulev, Hakimjonov, Jalolov's translation:1965).

There is a similar statement in "Mineralogy": "It is an undeniable fact that nature has created substances that people make artificially from metals better than them. But alchemists try to deny this. They think that the gold they see in their confused dreams is better than natural gold, because it is able to turn any substance added to it into gold, and natural gold does not have such power" (Belenitsky, Lemmlein, Baranov , Dolinina":1963).

Indeed, from the passages quoted above, there seems to be no room for doubt in this matter. But al-Biruni's remarks are aimed at the goal of alchemists, and there is evidence in his relevant works that the scientist made effective use of the tools and methods of chemical experimentation in his practice. This evidence can be found in the above-mentioned works of "Mineralogy" and "*Kitab al-saydana fi al-tibb*" ("Pharmacognosy") (Karimov:1974). This is also evident primarily from the sources used by al-Biruni.

In "Mineralogy", al-Biruni mentions the names of about twenty, and in "Pharmacognosy", more than fifty well-known natural scientists. Among them were works on alchemy by Jabir ibn Hayyan, Abu Yusuf Yaqub ibn Ishaq al-Kindi (d. 873) and Abu Bakr al-Razi's. For example, in the chapter on mineralogy on turquoise, and in 17 articles in "Pharmacognosy", excerpts from Jabir ibn Hayyan's *"Kitab al-nuhab fi al-tilsimat"* (The Selected Book on Talismans) are taken. They mainly describe the properties of minerals, their purification and artificial formation(Karimov:1974).

In both "Mineralogy" and "Pharmacognosy", al-Biruni used several works by al-Kindi. Of these, the one directly related to chemistry is called the *"Kitabkimiya al-'itrwa al-tasʿidat"* (The Chemistry of Fragrances and (Their) Dry Drying). It provides a description and details of 107 different methods of preparation of various fragrances and the tools required for this (Übersetzt von Kari Garbers Leipzig:1948).

In "Mineralogy", information on the properties of onyx (*jaz*) is derived from this work, and in "Pharmacognosy", a method of preparing a complex drug called "*ramic*" is obtained: "The greens are cut into two or three pieces in a mortar, not too small," he said. Then put them in an iron pot and heat with a stick until all it evenly is heated. After that, they are moistened with warm water and made into an ointment. Separately, boil a certain amount of Egypt *dushob* (grape or palm juice) until it is poured, soak the ointment prepared above with it and put it in a mortar. Wet the mortar handle in hot water and crush the ointment with it until it becomes a smooth mixture.

On a clean *saloya* (a stone used to feel substances) rub jasmine oil and put ointment on it. Lubricate the hands with jasmine oil, make small cakes from the ointment and dry in the shade. The cakes should be protected from dust and smoke" (Karimov:1974).

Ramik has been used in medicine as an astrigent drug as well as artificially prepared fragrances - the main ingredient of *sukk* and *gholiya*.

Al-Biruni respected Abu Bakr al-Razi as a scholar and used his works extensively. The titles of Razi's works weren't mentioned in "Mineralogy", but A.M. Belenitsky assumed that al-Biruni's "Book on Stones" on mineralogy and "Book on Yellow Stone" on alchemy, which has not reached us, and "*Kitab al-radd ' ala-l-Kindi fi raddihiy 'ala-l-sina'a"* ("Rejection of Kindi's book rejecting alchemy") [2: 406]. Excerpts from al-Razi's works have been used in the sections of Mineralogy on rubies, emeralds, corals, malachite, bodzahr, amber, "rain stones" and *harsini* (zinc). From these we find that the quote from *harsini*is taken from al-Razi's greatest work on alchemy, the *Kitab al-Asrar* (The Book of Secrets)(Kitab al-asrar, manuscript of the Abu Rayhan Beruni Institute of Oriental Studies,Uzbekistan Academy of Sciences).

In al-Biruni's "Pharmacognosy", al-Razi's book*Kitab al-hawi fi al-tibb"* (The All-Encompassing Book of Medicine), *"Kitab al-saydana"* (The Pharmacognosy), "*Kitab al-abdal*"(" Book of Substitutes"), *"Kitab al-aghziya"* ("The Book of Foods"), *"al-Tibb al-muluki*" ("The Medicine of Kings") and *"al-Kutub al-isnaʻashar"* on alchemiy " ("Twelve Books on Chemistry ") and the *"Kitab al-Asrar"* were mentioned.

The "Twelve Books on Alchemy" consists of 12 treatises, which al-Biruni referred to in his first tratise, *"Kitab al-madhal al-Taʻlami"* (Introduction to the Study of Chemistry), in an article by "Pharmacognosy" on *natrun*- soda(Karimov:1974). In addition to the cultural materials of this work, the articles devoted to *buraq*, *daus* (iron ore), malachite, glass, *zok*(vitriol), antimony, salt and mica contain relevant passages from *Kitab al-asrar*. They provide information on the appearance and properties of substances, as well as artificial preparation of some of them due to chemical changes. For example "... how to make a vitriol: dissolve the yellow vitriol in water and let all the particles dissolve. Then copper scrap is added and heated until solution turns green. The solution is then left until it turns into crystalline sediment. If they wish, for every 20 *dirhams* of vitriol, 1 *dirham* should be added and left".

As a result of this reaction, a copper sulphate salt was formed from the iron sulphate salt. In this article, there are several other methods of obtaining vitriols (Karimov:1974).

Another chemical source used by al-Biruni is the "*Kitabkimiyay*" (Book of Chemistry). Its author, Abu Zayd Ahmad ibn Sahl al-Balhi (850–934), was a student of al-Kindi and, according to some sources, a teacher of Abu Bakr al-Razi, engaged in philosophy, mathematics, astronomy, and geography (Karimov:1974). The reference to the "*Kitabkimiyay*" is given in the article "soda" and "vitriol" by "Pharmacognosy" (Karimov:1974).

A total of 107 minerals were included in the "Pharmacognosy", most of which was derived from alchemical works.

Al-Biruni discovered one of the most reliable methods of diagnosing substances still used in physics, mineralogy, and chemistry, in addition to the use of alchemical works and operations: he was the first in the history of science to accurately measure the comparative weights of several minerals, liquids, and metals. These comparative weights determined by al-Biruni differ very little from the specific weights measured in modern instruments. (Belenitsky, Lemmlein, Baranov, Dolinina: 1963).

CONCLUSION

To conclude, al-Biruni was engaged in almost all the natural sciences of his time and supported useful innovations for the development of science, using them in his scientific work. Realizing that the artificial production of gold, the transformation of one metal into another by chemical changes, the creation of a miraculous potion was the unattainable dream of alchemists, he was able to find a rational basis for their experiments and works and developed them in his works.

ABSTRACT

The aim of the study is to highlight the life and work of a bilingual poet, as well as a monographic study of the literary heritage in the Uzbek and Tajik languages, analysis and interpretation of his poetic skill as a poet. The object of the study is the manuscripts of the Shukuri divan, kept under identification number 5022 at the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan and number 1581 at the St. Petersburg Institute of Manuscripts, as well as more than ten anthologies and collections, which include Shukuri's poems.

KEYWORDS: *Devon, Anthology, Gazelle, Heritage.*

INTRODUCTION

AbdushukurShukuri is a great representative of the Uzbek classical literature of the late 18th and early 19th centuries. He followed in the footsteps of his predecessors – Navoi, Fuzuli, Bedil and in his poems, along with love and wisdom, glorified honesty, purity, humanity, humility. He created unique works in Persian-Tajik and Uzbek languages. The fact that he was a poet is evident in the confessions of Vozeh, Hashmat, Sadri Ziya, and SadriddinAini in the 19th century. The fact that Shukuri's work has been studied by world scholars is another proof that he is a unique poet.

Just as Persian-Tajik ghazalism has a long and exemplary history, the ghazalism of poets who wrote in the Turkic language deserves special attention in the researches of dozens of our scholars, such as Professor A.Hayitmetov1, N.Mallaev[1], Yo.Isxakov[2], R.Orzibekov[3], O.Nosirov[4].Teacher M. Shaykhzoda divided the ghazal into romantic, orifona and rindona types. The fact that this classification itself is connected with the mystical teachings of the ghazal testifies to the fact that religious and mystical ideas also play an important role in it. Indeed, if

we imagine the ghazal genre as a raging river, one bank of which belongs to the metaphors and the other to the lovers of divine love. Literary critic Yo. Isxakov spoke about the same issue, emphasizing that secular love is not contradicted in the poetry of A. Navoi, the sultan of the ghazal kingdom: “Figurative love is considered as a manifestation of romantic reality or a specific stage in the path of real love. For a spiritually pure, spiritually perfect person, the metaphor itself is the truth”[5]. In mastering not only ideological, but also artistic secrets of ghazal, Shukuri, along with his teachers who wrote ghazals in Turkish, diligently and inspiredly studied the works of world-famous poets of Persian-Tajik literature, such as Saadi, Jami, Bedil. But his mentor, his unique inspiration, was Alisher Navoi. From Navoi he followed not only in the application of ideas, content, methods of expression, but also in the description of the spiritual state, spiritual changes in the inner world of man through color and color types. In this regard, it is commendable that he continued the Navoi tradition in a worthy manner.

Navoi's "Navodir ush-shabab" devon has the following ghazal:

Kirsa ul gul hirmani agyor ila gulzor ara,

Men hamonotolpinurmenxirmanetkanxoraro,

Mening: if she enters garden, and I still want to enter this garden too.

This ghazal consists of 9 bytes and is written in the rhythm aruzframe ramalimusammani mahzuf (foilotun, foilotun, foilotun, foilun — - V --).

Shukuri's devonalso has a ghazal with the same weight, "Yordin ayrilgoli zohir erurlar ko’zda yosh, O’q bulur zohir kavokib hayli chun botsa quyosh"(because of separation with my love, I cry every night when the Sun sits). Tradition and innovation are also evident in the idea and art in this poem. Alisher Navoi's ghazal contains a unique verse based on a beautiful metaphor: “Yashilo’smabilanzebberilganqoshlaringgulzorsahnidajilvagarbo’lganikkitovusgao’xshaydi**”,**
(Your eyebrows adorned with green color are like two peacocks fluttering on the flower garden)
:

Lojuvardiyvo’smabirlanzebberganqoshlaring,

Jilvagarbo’lg’onikkitovuserurgulzoraro.

In the following verse of Shukuri, we see that the same metaphor has been developed and a new side of it has been opened:

Lojuvardiyvo’smachekkanqosharoxolulmasal,

Ikkitovusgularobirdonag’aaylartalosh. (D. p.58)

That is, the poet likens the mole between the eyebrows with a green color to two peacocks fighting over a grain in a flowerbed.

At this point, Shukuri also refers to the image of the mole. It is well known that the mole is one of the traditional images with a unique symbol in classical literature. In it the beauty of the mistress is understood. The mole on the lover's forehead, like a divine miracle, adds more beauty to the beauty of the earth. These analogies are even more remarkable with their peculiar difficulty.

While Navoi's tashbeh (like metaphor) has a special charm, Shukuri's tashbeh is no different from his predecessor's in terms of bringing the unexpected scene to life in the eyes of the reader. In other words, we can say that Shukuri was able to hit the way of Navai. Since poetry is an art of direct figurative expression, it is important that the images in it reflect the problems of the period more vividly than other types. The importance of color in creating an image is incomparable. “The symbolic use of colors in the ghazal to reveal different aspects of the human

spiritual world is one of the methods characteristic of Navoi's ghazal. In Khorezm Ogahi and in Bukhara Shukuri wrote separate ghazals in this way"[6].

As the literary critic S.Utanova rightly noted, "In Navoi's poems the meanings of purity, accuracy, goodness, light, greatness, justice, and most importantly, beauty are widely covered"[7]. In Navoi's devon "Navodir ush-shabob", there is a ghazal starting like:

Ashkdan bo'ldi qarorg'on kulbai vayronam oq,

Kulbaivayrondemakim, diydaigiryonimoq,–

Meaning: because of love my dark hut is white (bright) now, not only my hut but also my eyes are white (bright).

Inspired by this poem, Shukuri composed the following verses:

Jilvaazminqildi men sorikiyibjononimoq,

O'ldihijrondinqarorg'onkulbaiahzonimoq.

Yo'qsavoduxattubo'stonilamaktabdin manga,

Ne ajabbo'lmoqlig'idaftaridevonimoq[8].

Meaning: in white dress my love came to me, my hut turned into bright (it was dark here). I don't know how to write well and how can my Devon be clear.

The mental state of the lyrical protagonist is revealed in the ghazal on the basis of black and white contrast. The lover's hut was darkened by the grief of separation. The hut is a symbol of the world of the lover. The world is also dark in his eyes from the intensity of separation. Then the visit of the white dressed mistress illuminates the heart of the lover. The poet expresses this situation through the transformation of black into white:

Tiyrashomingsubhyanglig' ravshano'lsa, ne ajab,

EyShukuriy, gar netibchiqsamohitonimoq.

Apparently, both ghazals are beautiful examples of poetry. The radiant ghazal "Gul" in Shukuri's devon is another beautiful example of the passages made to Navoi. The poem is entitled "Payravi Amir Navoi". This can be considered as an expression of Shukuri's boundless love for Navoi's work. Shukuri, like Navoi, does not contrast figurative love with real love, but sees figurative love as a means to reality. The lover sung by the poet is the meaning of life, the light of the heart.

In Navai:

Orazingni bog' arochunko'rdi, hayronbo'ldigul,

Bargsizqoldi, nedinkim, bas, parishonbo'ldigul.

Meaning: Seeing your face in garden, the flower was leafless and oblivious.

In Shukuri:

Ko'kniqobinchexradanchunsoldixandonbo'ldigul,

Bulbulibechoralarg'aofatijonbo'ldigul.

Meaning: seeing her face, flower was happy, it was a flower for pure nightingales.

It is known that Bedil and Fuzuli, thinkers and Sufi poets, had a strong influence on Turkish and Persian literature. In Movarounnahr, for example, Turkic-speaking poets followed Fuzuli and Persian-speaking poets followed Bedil. Of course, Shukuri is no exception. We see the influence

of Fuzuli in his Turkish work and Bedil in his Persian work. Shukuri completes a number of taboos on Fuzuli's ghazals. Here is an example:

Ochargulorazin, bulbulninolono'ldig'inbilmaz,

Chu g'uncha hasta ko'nglitah-batahqono'ldig'inbilmaz[9] –

Meaning: *she shows her face, without knowing, he and his soul are destroyed.*

He called his ghazal "Payravi Fuzuli". Also, under the influence of the great Azar poet, composed ghazals such as "bilmaz", "bengzattim", "chu" . However, while these taboos have much in common with the poems that inspired them in terms of rhythm, rhyme, and radiance, their themes, ideas, and metaphors are entirely new.

Shukuri continued the traditions of his predecessors and also created *romantic,(ghazals in the description of love)orifona (ghazal is written completely in one rhythm)*and *rindona(ghazals in the description of wine)*samples of lyrics. If we look at the semantic structure of the poet's poems, we can see the mystical concepts and symbols, oriental images and expressions, traditional and symbolic figurative images. This clearly shows that the poet is determined to continue the traditions of the East, in particular, the Uzbek ghazal. Traditional images and concepts that are widely used in our classical poetry in Shukuri's poems:*chashmaihayvon, sunbul (a plant), ko'z (eye), oraz (face), xat (written, husn (beauty), lab (lips), xol (mole), rafiq, zulf (hair), quyosh (sun), oy (moon), gul (flower), bulbul (nightingale)* as well as *Christ , Layli, Majnun, Iskandar*, *Hizr* and many others.His poems are diverse in terms of subject matter. They cover social, moral, romantic, philosophical and other topics. In the poems of the poet, a certain theme does not lead, but the fact that he addresses different topics is the product of his attitude to life, to society. The theme of love in Shukuri's poetry is also distinguished by its unique diversity. This theme has been repeated over and over again in classical literature, and many royal works have been created in it. In his lyrics, the poet sang, along with divine love, love in the broadest sense, a man burned in the flame of love. The desires, aspirations, struggles, experiences, joys and sorrows of this person are the essence of the poet's poems. Along with the oral tradition of the people, the best traditions of our centuries-old poetry have played an important role in the development of the poet's lyrics, both ideologically and artistically.

"Poetry is the pursuit of light, of spiritual enlightenment. A poet is a person who sees the world in clear realities and shakes his pen in bright emotions, he lives in pain not only in the external world, but also in the inner world of a person"[10] – said teacher I. Haqqul. These ideas also apply directly to Shukuri's work. In the works of the poet we see that the call to love through poetic images and the glorification of a higher feeling play a central role. The age-old theme of classical literature, the innate feelings such as love for the Truth and attainment of Him (Allah), are beautifully and uniquely expressed.

One of the poet's poems on social issues is the ghazal "Diram". In this poem, which consists of 5 bytes, he truthfully reveals the injustices in life, the abominations of officials:

Va'da qildi ul bahori lutfi davlat ***yuz*** *diram,*

Yuz*chamanochtiko'ngilbo'gidaharyolg'uzdiram*[11].

Meaning : officials promised to give diram (money), although many times passed, they did not give.

In this byte he expresses his opinion through the art of repetition. That is, in the first verse, the word ***yuz (a hundred)*** is a rhyme, and in the second verse, the word ***yuz*** is an adjective. The poet says that the diram (coins) in the garden of the heart was opened a hundred times as a

flowwerbed, because great promises were made by the heads of state. Shukuri has suffered a lot as a representative of the common people. The income from his profession was not enough to live on.

ABSTRACT

Communication has never been the same since the introduction of cellular phones and many apps with varied functions seem to spring up on a daily basis. Various uses appear to spring up on a daily basis. Ad hoc networks were created with the aim of establishing networks made up of linked nodes, on-the-go. Ad hoc networks have many uses, the most common being vehicular ad hoc networks (VANETs) (VANETs). In VANETs, moving vehicles are regarded to be the mobile nodes and mobile vehicular nodes travel at high speeds. Mobility of the nodes makes it challenging to establish reliable communication connections between the nodes and the access points. A technique known as handoff is utilized to bridge this gap and is regarded to be one of the solutions for unreliable communication connections over longer distances. Handoff may typically be observed when the nodes are mobile and start to migrate away from the access points. This article examines and compares different handoff techniques that were presented by various researchers with an aim to enhance favorable characteristics while negating the rest of the components that do not assist in improving the efficiency of the handoff procedure.

KEYWORDS: *Ad Hoc Networks, Handoff, Switching, Routing, Access Points, Cross Layer.*

1. INTRODUCTION

Many handoff techniques have been suggested by various researchers, which aim at making the procedure an efficient and effective one. Handoff aims at re-establishing communicational connections and reconnecting mobile nodes and access points if the mobile node moves out of the coverage area of the access point or cell which is presently providing service[1]. TAPs are chosen based on a variety of factors which may include the distance of the TAP from the MN, the direction in which the MN is moving, the network selection type, etc. The technique of handoff is classified into many divisions which are dependent on the number of networks that are engaged in the process and the number of access points that the MN is connected to at the same time during handoff, inside the network. There are two kinds of handovers depending on the number of networks that are engaged in the procedure. They are horizontal handoff and vertical handoff. Figure 2 shows the classification of the different approaches based on the number of

networks engaged in the handoff procedure. Horizontal handoff is when the changeover process takes place inside the same network whereas vertical handoff is when the handover process occurs across different networks.

1.1.Heterogeneous Networks

Heterogeneous wireless networks (HWN) belong to the family of radio-based access networks which are constantly developing[2]. Basically, HWN is made up of various wireless networks such as Wi-Fi, WiMAX, LTE, Bluetooth, etc. Every network has its own set of characteristics which makes it distinct from the rest of the accessible technologies. Attributes such packet rate, delay, latency, energy consumption, range of the network, protocols are part of the network, the amount of space that the network and data related to it takes up, etc. are evaluated. These cells include picocells, microcells and femtocells and they are effective when it comes to boosting the capacity of the system on the whole, by decreasing the distance between the APs and the MNs, thereby lowering the amount of power needed to maintain strong communication connections.

1.1.1. Cognitive Radio-Based Network

CR-based networks, if utilized effectively, may reduce spectrum usage. Unlicensed users may also make advantage of the available spectrum without creating any interruptions for the main users who are broadcasting inside their allocated channels, with the help of CR networks. Features such as spectrum sensing and data transmission functions have been introduced to the physical layer of CR networks. Attributes such as decision-making ability for spectrum, the mobility of spectrum, spectrum sensing and spectrum sharing have been added to the list of characteristics that the MAC layer of CR networks can brag about. The sole distinction between the network layer of CR networks and the conventional system is brought about by the fact that the availability of the spectrum impacts routing[3].

1.1.2. Handoff in Heterogeneous Wireless Networks

The pace of transmission of data may be improved with the usage of multi-network vertical handoff since this allows the MN to communicate through the optimal network, thereby increasing the overall quality of service (QoS) (QoS). A vertical handoff (VHO) decision-making technique has been suggested and the primary emphasis of VHO lays in overall load balancing. The VHO technique likewise attempts at optimizing the quantity of electricity consumed[4]. To pick the most optimum network when confronted with numerous network choices, a path-selection is also incorporated in the approach. Controllers which are known as vertical handoff decision controllers (VHDCs) are installed in the APs. The controllers offer the handoff determination function for a specified area comprising a single AP or many APs. IEEE 802.21 or the media independent handover function (MIHF) is utilized for collecting the data that comprise the decision-making inputs.

1.1.3. Spectrum Handoff Based on Sequential Sensing

The technique also focuses at minimizing the number of handoff that takes occurred for every secondary user transfer. Rather of just conducting sequential sensing of all channels, candidate channels are chosen for every secondary user so that an idle channel that has no other secondary users competing for it may be identified with the least amount of overhead and processing complexity[5]. At initially, when the unlicensed secondary user transmits in the default channel, it is expected that the transmission that is presently occurring over the default channel would continue for a certain period of residual idle time of the current channel, which is predefined. When the idle time duration available for the present channel falls below a certain threshold, it indicates that the main user will use that channel in a short period of time and the secondary user will have to be ready for spectrum handoff.

1.1.4. MIH Standards-Based Handoff

IEEE 802.21 suggested media-independent handover (MIH) standards. This was intended at providing the required assistance for changeover across networks of various types by taking into account signal strength of an AP as its sole criterion for TAP selection [6]. In addition to the characteristics that are evaluated by the MIH standards, a few additional factors like the mobility of the node and network environment are taken into account by the approach. Data from the application layer and the link layer are utilized for determining choices about handoff and this dual layer information exchange is to maintain the MN connected at all times and to make the transition during handoff as seamless as possible. HD portion of the handover process is responsible for choosing the candidate AP from a list of possible TAPs. If there is just one network that is accessible, then the candidate is.

1.2.Horizontal Handoff Methods

Handoff that takes occur inside the same network is known as horizontal handoff. It is a lot easier than vertical handoff as it does not need to incorporate the complicated process of choosing the best candidate in an optimal network for handoff. Here, a few horizontal handoff techniques which were suggested are described.

1.2.1. Handoff Using Early Binding

Early binding technique for handoff in wireless mobile IPv6 (MIPv6) is suggested. MIPv6 were developed in order to improve the efficiency of MNs since they were usually constantly in a dynamically changing state or a highly mobile state. This enabled the nodes to interact much quicker without having to spend time in sending and receiving request–reply messages that authorized channels for communication[7]. Duplicated address detection (DAD), CoA, mobility detection and binding updates are the components of MIPv6. Early binding therefore helps the MN by providing it with greater amount of time for communications during its stay inside the border of the target cell. This guarantees that the slow-moving MNs need not rush since they have ample time for information exchange. Flags are utilized to determine whether the MNs are slow-moving or fast-moving and the AP can also recognize if the nodes are stationary or not by comparing the time required to cross the border of the cell with the amount of time it spent in the previous cell.

1.2.2. IPv6 VANET Handoff

To evaluate and forecast the approach of a TAP, a method called as angle of arrival (AoA) is utilized by the CAP. The AoA of the MN or other access points are computed by making use of a static infrastructure as the point of contact. To achieve a smooth handover, the network layer initially handed over to the TAP while the data link layer is still linked to the CAP [8]. The information at the router which is managing the CAP and the TAP is updated whenever a handoff happens. Then the emphasis is on the mobility handoff of the MN, between the two cells that are being addressed. When the MN approaches the border of the TAP, it pings an MN that is presently connected to the TAP about its approach and that MN in turn notifies its router about the approaching MN. Neighboring cars are utilized for adopting cost-cutting techniques and to minimize difficulties.

1.2.3. MIPv6-Based Handoff

A pinging packet or message known as the vehicular router solicitation (VRS) message is utilized like a proxy to notify the CAP if the MN is about to leave its boundaries. All of the AP IDs, MN IDs and the router IDs are provided in the form of handover assist information (HAI), which travels along with the proxy message. The appropriate TAP is then chosen based on the information which is provided by the HAI, resulting to efficient handoff [9]. A proxy advertising

message is then sent to the MN including the IP address of the TAP while the TAP gets a handover initiation message that includes the IP address of the MN to which it responds with a handoff initiation acknowledgment message. TAP starts to buffer the packets intended for the MN that are being routed by the CAP via a bidirectional route that is set up. Once the acknowledgment for the binding update request is received, to guarantee smooth transition, the MN detaches itself from the CAP's data connection layer and becomes connected to the TAP. The buffered packets that are held at TAP are now sent to the MN.

1.2.4. Handoff Using CoMP

A coordinated multiple point (CoMP) transmission inside femtocell networks is suggested in the technique from [42]. Femtocell networks are employed in the present technological environment in order to bypass the difficulties which ail traditional communication networks. These networks assist in smooth improvements over current networks and their components by offering better coverage, increased signal-to-interference plus-noise ratio (SINR) and optimum energy use. A moving train is regarded to be the fast-moving femtocell node in this situation. When the second compartment follows through and reaches the border of the servicing AP, it conducts handoff and becomes attached to the eNodeB to which the first compartment's transceiver is linked to. Thus, there is no need to spend time in looking for an appropriate eNodeB.

1.2.5. HMIPv6-Based Handoff

MIPv6 does not respond to the need for managing localized mobility in particular and instead makes use of the same method it uses for global mobility to solve the problem of handling local mobility [44]. A node known as mobile anchor point (MAP) is utilized as a local agent to assist in the handoff process within localized mobility. MAPs are used instead of the foreign agents in MIPv6 and they may be contained anywhere in the hierarchy of routers. Contrary to MIPv6, PMIPv6 is implemented by the network itself as it records the motions of the MN and regulate mobility management. The network topology learning method is made up of definitions and theorems which are based on the number of hops, the connections that exist between the nodes, the distance between the nodes, etc. When the distance between the forwarding server and the MN exceeds a pre-defined threshold, a new FS is chosen by the MN, which happens to be the nearest FS.

1.2.6. Proxy MIPv6-Based Handoff

Packet loss ratio (PLR) rises owing to a significant loss of data packets when frequent handovers occur in a mobile environment. This will also increase latency in the network. As shown in earlier approaches, making advantage of early binding changes may minimize latency and delay in handing over, thereby avoiding the loss of packets. A mobile access gateway (MAG) is responsible for managing a collection of IP addresses which are given by a network administrator. Once the target gateway has been identified, the source gateway will inform the target gateway about the incoming MN so that the next gateway may get ready for handoff by assigning a local IP address for the MN. At the local mobility anchor, a binding update entry will be made. An information request acknowledgement (IRA) will be issued by the gateway to the MN which is entering into its coverage area so that the MN may sync its IP address with that of the target gateway while remaining connected with the source gateway.

1.2.7. RFID-Based Handoff

This technique was developed since it was discovered that cars experienced zero breakdown in communication channels provided that the APs and the MNs remained static. Due to the extremely mobile environment of vehicle networks, it is essential for a system that conducts rapid handoff. Each vehicle's chassis is equipped with an RFID tag and is given a unique identifying number called the MAC address[10]. LVS includes information such as the MAC

address of the vehicles, the IP addresses of the cars and the AP IP addresses. Yet another server known as the global vehicle server (GVS) maintains information on the location of the cars, the IP addresses of the vehicles and the IP addresses of the access gateways. The home address of all MNs are allocated by the HA. GVS also maintains a second database known as the vehicle address relation table which contains the MAC addresses and the home addresses of the MNs.

1.2.8. Mesh Network Handoff

A home mesh router (HMR) is essentially the coverage area of a cell inside which a node sits. Whenever the node exits the HMR, the handoff procedure is initiated. The selection of a candidate router or the foreign mesh router (FMR), which is essentially any router that is not its home router, is dependent on the SINR values of that router. To become connected to any prospective FMR and to initiate communication, the node has to be verified by the FMR in question. Due to the time required for the FMR to verify the MN, latency and overall delay increase. Between a mesh client and a mesh server, a master key is produced and between chosen mesh routers, a group master key is generated to assist in quicker authentication procedures. All routers get tickets produced by servers for individual mesh routers. Whenever the roaming client or the MN is able to match the key it possesses with the publicly accessible key, handoff will be started.

2. DISCUSSION

Every technique described in this research follows a distinct strategy for conducting handoff procedures. Others of the techniques attempt to decrease the total latency, some try to minimize the amount of power used, still methods try to increase the speed with which connections are formed, while some others try to develop a system for choosing optimum networks from a list of accessible networks. The numerous techniques and the many characteristics they concentrate. We can also observe the approach each technique takes.

3. CONCLUSION

The study's aim is to examine different handoff techniques that were suggested by many scholars. Every technique described in this article has its own set of important characteristics and distinct methods to improve the handoff process. Identifying the essential characteristics of each process is what the article focuses at. The various approaches have been classified depending on the number of networks involved, viz. vertical handoff and horizontal handoff. It has been found that vertical handoff techniques are dominating in delivering seamless connection across various networks. Commercially viable applications are being developed based on the various vertical handoff methods available. Every technique has its benefits and drawbacks which may be seen from the preceding talks and outcomes. It may be observed that many approaches concentrate on improving a particular characteristic of the networks involved. Most the techniques make use of just a single characteristic such as signal strength, in order to conduct handoff when in fact, many variables play important roles in improving the handoff process. In the future presenting a handoff technique by selecting winning characteristics from a chosen few ways have to be done. Multi Attributes Decision Making (MADM) techniques may be explored in order to enhance the overall efficiency of a handoff procedure.

CACHE MEMORY STRUCTURAL DESIGN FOR HANDLING BIG DATA USAGES

Satendra kumar*

ABSTRACT

A cache is a hardware or software component in computing that stores data in order to serve future requests for that data more quickly; the data stored in a cache could be the result of an earlier computation as well as any copy of data stored elsewhere. The efficient execution of today's big data-based applications relies heavily on cache memory. Multicore processors are being used in the high-performance computer to support parallel execution of multiple applications and threads. Chip multiprocessors combine multiple multicore processors into a single chip (CMP). Each core has its own private cache memories, as well as the last-level cache is shared by all cores (LLC). When it comes to handling big data-based applications, LLC's performance is critical. This paper conducted a survey of the novel techniques proposed for efficiently handling big data-based applications in the LLC of CMPs in this paper.

KEYWORDS:*Big Data, Cache Memory, Multicore, Processing, Near-Data.*

1. INTRODUCTION

Cache memory is one of the most important components in today's processors. Multiple cores are packed onto a single chip (or die) in today's processors, which is known as a chip multiprocessor (CMP). Each core in CMP has its own cache memory, and all cores share a huge shared last-level cache (LLC). Each core has its own L1 cache, and as LLC, all cores share an L2 cache. Cache architectures must be modified to accommodate such large data-based applications as the data demand of the applications grows. Increasing the cache size is a straightforward way to deal with large amounts of data. However, boosting cache isn't easy. A big cache may enhance the number of hits in the cache, but it will also increase the time it takes to search for a block inside the cache, increasing cache access latency.

Many layers of cache are the answer, although such designs are outdated, and today's commercial processors all feature multiple levels of cache memory. As a result, more sophisticated technology is needed to deal with such problems. We conducted a review of current research efforts aimed at improving cache performance in this article. The LLC is the primary focus of this study. To enhance the performance of LLC, research has been conducted in

a variety of areas. Reduced cache access latency and lower miss rate are the two most significant goals. The number of hits in the cache increases as the miss rate decreases, improving the system's speed.

With such a low rate of cache misses, a data-intensive application with great temporal locality would benefit. Many methods have been suggested to decrease miss rates. Large-scale LLC access latency reduction is also a significant research topic. When a bigger cache is utilized to decrease the miss rate, the cache access latency rises. However, a lower cache size increases the incidence of misses. As a result, building a better cache architecture is difficult, and it is a significant research topic. The primary aim of providing a better LLC design is for the system's performance to improve. Cycles per instruction (CPI) or instructions per cycle (IPC) are often used to evaluate performance.

1.1. Cache Management

The majority of today's cache memories are set-associative caches, which have several sets with a fixed number of ways each. The set-associative cache is similar to a two-dimensional array in which the sets are termed rows and the ways are called columns. A cache block is stored in each array element. Based on the set index from its address bits, a block may always map to a fixed set. As a set index, certain bits from each block's address are reserved. The block may be put anywhere in the appropriate set (column). If the set is already full, the replacement policy chooses a victim block to replace with the new block. To search a block inside the cache, you must search all of the ways in the corresponding set at the same time.

1.2. Access Latency Reduction

Uniform access latency (UCA) was used to access cache memory at first[1]. When the cache is tiny, such a uniform cache works well; however, today's big caches (particularly LLC), such as UCA-based caches, cause delay overhead.

1.2.1. NUCA

The cache is split into several banks to minimize the latency overhead of UCA. Each bank functions as a stand-alone set-associative cache, and all of the banks are linked via on-chip networks. To communicate among the many on chip modules, the on-chip network, also known as network on chip (NoC), is utilized as an alternative to the bus. Figure 1 depicts a NUCA design in action. The graphic depicts a CMP with four cores and an LLC split into 16 banks. The remaining higher layers of cache memory, with the exception of LLC, are not shown in the image. The primary benefit of NUCA is that each bank can be accessed separately, and local banks can be reached considerably quicker than banks farther away. If the fourth core wants to access a block from bank-15, for example, it can do so considerably quicker than if it wants to access a block from bank-0. To access bank-0, some on-chip communication is needed. NUCA-based designs are used by the majority of today's LLC. The NUCA proposal enables the usage of high size LLC without incurring significant latency overhead, which is critical for executing big data-based applications.

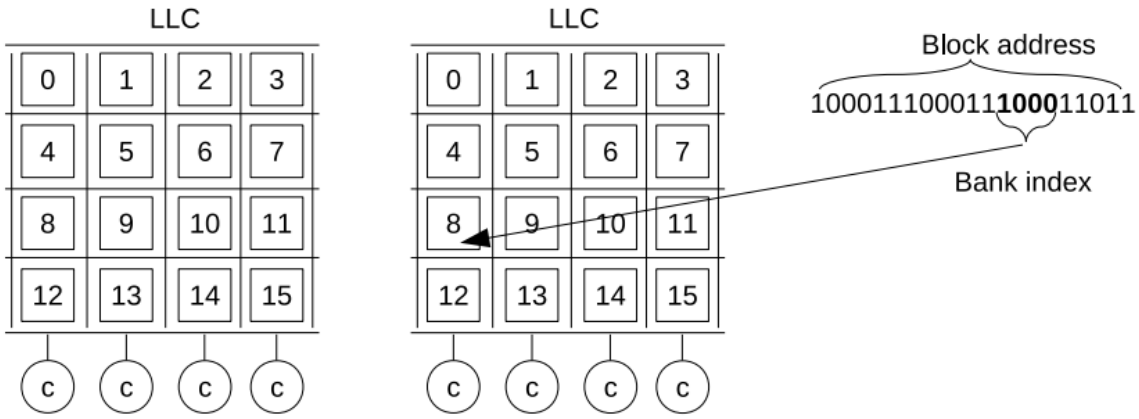

Figure 1: An example of NUCA as well as SNUCA

Static NUCA (SNUCA) and Dynamic NUCA (DNUCA) are the two kinds of NUCA architectures accessible (DNUCA). SNUCA and DNUCA have the same physical structure, but their data (block) management policies are different. A block can only be mapped to a specified bank using the bank index bits in SNUCA. Similar to the set index, certain bits from the block address are utilized for the bank index, and a block automatically maps to a fixed bank depending on these bits. The block in Fig. 2b, for example, translates to bank 8 using the bank index 1000. SNUCA is a basic and easy-to-use program. Because a block always maps to a specific bank, the block searching method is extremely simple. SNUCA is utilized by several technologies suggested because of its easy data management policy.

SNUCA's biggest flaw is that it can't transfer blocks from one bank to another. In Fig. 2a, the core requires more time to obtain data from bank-0 than from bank-15. If a block A in bank-0 is repeatedly requested by the core, then every time the block must travel via the on-chip network to reach the core, SNUCA must be used. It would be preferable if the block could be moved to a nearby bank. In SNUCA, such migration is not permitted. Banks may also exhibit additional non-uniform characteristics as a result of fixed mapping[2]. Data may be migrated from one bank to another via the DNUCA.

DNUCA divides the banks into many banksets. Each column in Fig. 2a, for example, may be regarded a bankset. Any bank inside the bankset may be used to put a block. As a result, a block may be transferred from one bank to another (within the bankset) as needed. Other non-uniform bank behaviors may also be removed using DNUCA-based design[3]. DNUCA's primary activities are as follows:

- Searching: To search a block, you must first search the whole bankset. DNUCA's block search is time intensive, and it has to be improved[4].

- Migration: A highly utilized block from one bank may be moved to a bank that is nearby. Despite the fact that DNUCA has been shown to be a superior design than SNUCA, effective implementation of DNUCA poses certain difficulties. Researchers are still working on speeding up the search process, lowering migration costs, and so on. The next section addresses the problems with DNUCA and some of the novel solutions suggested to address them.

1.2.2. Problems with DNUCA

The major problem with DNUCA is the time it takes to search for blocks. Because all of the banks in the bankset must be searched, a more efficient searching strategy must be employed. In DNUCA, there are three fundamental searching policies:

- Incremental: Go through the banks one by one, one by one. This method is less complex and requires fewer network communications. However, it may increase search latency; in the worst-case scenario, all four banks must be searched.

– Multi-cast search: In multi-cast search, all banks are searched at the same time. Although this method is quick, multi-casting may raise network communication overhead, causing congestion and excessive power consumption.

- Mixed: In a mixed search, certain banks are searched at the same time, while the other banks are searched one at a time.

1.2.3. Problems with DNUCA

There have been a slew of additional search methods suggested. A study proposes a clever searching method[5]. Instead of scanning all banks, the suggested method keeps a record (partial tag record) that allows it to search a smaller number of them. If the bankset includes eight banks, for example, the clever searching method may direct you to search just four of them. To keep the partial tag information of each block in the cache, such a clever searching method requires extra storage[6]. Each bank in NUCA is a set-associative cache, as previously stated. Each block in a setassociative cache must be assigned to its fixed set depending on its set index. The capability of DNUCA migration is limited by this feature of set-associative cache.

The frequently utilized blocks in DNUCA may be moved to a nearby bank. If a large number of such frequently used blocks map to the same set, placing all of the blocks to the closest bank is impossible. As a result, the set-associative cache rules restrict the power of migration in DNUCA. To address this problem, a number of novel approaches have been suggested[7]. The tag portion is kept close to the core, thus searching takes very little time. The information is kept in banks. Forward and backward pointers preserve the mapping between tag and data. The matching forward pointer indicates the position of the data after the tag is discovered. Because the mapping is done via forward/backward pointers, the conventional set-associative property is not needed to be maintained.

More blocks may be moved to the closest bank using this method. All of the suggested methods work on both single-core and multicore CPUs (CMP). DNUCA has several specific difficulties when it comes to CMP implementation[8]. The primary problem is migration; since a block may be requested by several cores, it may travel in various directions at different times without stabilizing. The author of [10] suggested an updated migration rule that enables a block to migrate after a certain amount of accesses. As the number of cores grows, so does the size of LLC and the number of banks. In CMPs, bankset searching introduces some additional problems. Multiple cores may now request the same bank at the same time, allowing multiple search operations for the same block to take place at the same time. Multiple miss requests for the same block may be produced if such simultaneous block searches are not handled properly. The author suggested HK-NUCA, a DNUCA-based CMP [9]. The creator of this design keeps a home bank for each block. The home bank is aware of the location of the bank's present location.

1.3. Replication of Data

It is occasionally advantageous to duplicate certain data in CMP when several cores share the same LLC. Due to the complexity of DNUCA's searching process, researchers are also attempting to enhance SNUCA's performance via data replication. The author suggested a method for storing a duplicate of the highly requested blocks in the local bank (or nearby bank)[3]. If an L1 miss occurs, the block will be checked first in its local bank, and if the block is not located there, the request will be sent solely to the home bank (bank where the block maps). It lowers the time it takes to connect to a distant bank. However, for replication, an extra coherence mechanism must be maintained.

1.4. Missed Opportunity Rate

For today's large data-based systems, lowering the miss rate (miss per instruction or miss per thousand instructions) is critical. With a lower miss rate, there are more hits in the cache, which increases system speed. Using a bigger size cache to decrease miss rate is not the ideal approach, as stated in Sect. 1. The LLC of today is already bigger in size. The effective usage of such LLC may further improve the miss rate. The writers found that the cache memory's full space is not being used correctly[10]. In the case of a set-associative cache, certain sets have a high miss rate, while others are almost inactive. The cache's usage factor is reduced as a result of this non-uniform distribution.

Cache miss rates can be reduced using better cache usage methods[11]. The majority of these studies are based on dynamic associativity management, which entails dynamically raising or reducing a set's associativity. Allowing a frequently utilized set to employ some of the methods of other idle sets increases its associativity. Another problem with usage is the banks' non-uniform load distribution. Some banks are overburdened, while others are almost inactive. Techniques to equally disperse the burdens across all the banks have been suggested. Cooperative caching is the most common method suggested[2]. A highly utilized bank may leak a block to its neighboring bank using this method.

The majority of these methods need the use of a costly centralized directory. The author of suggested a DNUCA-based Tiled CMP to transfer loads equally across various banks. Replacement policies and victim caches are also helpful in lowering miss rates [4]. Each set in a set-associative cache has its own replacement strategy. When a freshly acquired block has to be put in cache but there isn't enough room, the replacement policy chooses a victim block from the cache to replace it. Most conventional caches pick victim blocks from the cache based on the least recently used (LRU) criterion. The LRU policy is simple to implement, but it has several significant flaws, such as dead blocks and blocks that are never reused. If a block is never utilized again until its eviction, it is considered dead in cache. A block that is never reused and is only accessed once in cache.

Unnecessary cache space is squandered by such blocks. They can only be evicted in LRU if they become the set's least recently used block. Techniques for removing such dead blocks early have been suggested [1]. The use of victim caching may also help to lower the miss rate. The evicted block is kept in a tiny storage called the victim cache in this method. If the cache contains a miss, the victim block is checked before proceeding to main memory. An off-chip main memory access is prevented by a hit in the victim cache.

1.5. Processing of Near-Data

Near-data processing (NDP) is the most revolutionary method suggested for managing large data applications. In the age of big data, every application has a massive amount of data and must perform numerous costly and time-consuming computations[8]. As a consequence of these needs, dedicated systems for high-performance computing have been developed. Despite the fact that such high-performance and parallelized computers have been proposed, cache memory and computation remain a bottleneck.

2. DISCUSSION

The term "processing big data" refers to the act of performing an operation on a large amount of data. Searching, inserting, sorting, and other operations are possible. It could also be an arithmetic operation such as addition, subtraction, multiplication, division, or a bit operation, among others. SQL, which was created to handle large amounts of data, is one example of such a calculation. All such calculations are performed by the ALU of the cores in conventional computers. As a result, all of the data must be fed into the core before it can be computed. As

previously stated, CMPs with many cores have complicated internal architecture, including several cores, banks, and an on-chip network. It has been discovered that the data transmission cost is more important than the data processing cost in today's applications.

The cost of transferring a block from memory to the core via all levels of caches is referred to as the data communication cost. Congestion, delay, and power consumption all rise as a result of this kind of communication. As a result, even when several cores are used, the system's performance may not be as anticipated. To minimize such communication cost, researchers have suggested an alternate method termed NDP. Rather of transferring data to cores for processing, NDP moves the computing unit closer to the memory. Some simple computational units (SCU) are positioned near the memory units, such as main memory and LLC, to accomplish this.

These SCUs can only do a restricted number of tasks. Some SCUs, for example, can only do addition whereas others can conduct comparison. It should be noted that SCUs like cores are intended for a particular task and cannot be configured for general-purpose computing. Let's say you need to find a student's name in an 8-gigabyte file. If a customized SCU is placed in memory in NDP, the SCU may execute the calculation in memory, eliminating the need to transmit data to the cores. As a result of the near-data computation, the on-chip network overhead is reduced, and LLC performance is improved.

3. CONCLUSION

The efficiency of the last level cache (LLC) in today's high-speed computer must be improved for efficient execution of large data-based applications. Multicore processors, also known as chip multiprocessors, are utilized in such computers and combine many cores onto a single chip (CMP). Each core has its own private cache memory, while the LLC is shared by all cores. Many difficulties exist while designing an efficient LLC for CMP, such as latency overhead, usage overhead, and so on. We conducted a review of the novel methods suggested for the LLC of CMPs to effectively handle big data-based applications in this article.

ABSTRACT

Multiprocessors were developed using two main architectural approaches in the 1980s. The dominating design for modest numbers of processors (usually fewer than 16 or 32) was a single shared memory with numerous processors linked by a bus. Dispersed shared memory is an architectural concept that uses physically distributed memories to enable multiprocessors to support a single shared address space. For multiprocessors with moderate to large numbers of processors, hardware supported distributed shared memory is becoming the dominant approach. Cache coherence enables such systems to utilize caching to exploit locality in applications without affecting the programmer's memory model. The Stanford DASH multiprocessor, the first functional implementation of hardware-supported scalable cache coherence, is described. We cover the major advances that led to the invention of cache-coherent distributed shared memory. We then provide our take on such designs and explore some of the major technical difficulties that remain.

KEYWORDS:*Cache Coherence, Directory-Based Cache Coherence, Distributed Shared Memory, Multiprocessor Architecture, And Scalable Multiprocessors.*

1. INTRODUCTION

All processors have an equal connection with the centralized main memory, these machines are known as bus-based multiprocessors or symmetric multiprocessors (SMPs). For modest processor counts, bus-based, shared memory multiprocessors remain the most popular design. Designers dispersed memory across the machine and utilized a scalable connection to allow processor–memory couples to interact to expand to higher numbers of processors. Message-passing architectures, called after the mechanism through which processors interact, were the most common kind of multiprocessor until the early 1990s[1]. Message-passing architectures are sometimes known as multicomputer since they are made up of independent processing nodes that share nothing except the connection. These computers are also known as distributed address space architecture machines. In the 1980s, a limited number of architectures were created that had physically dispersed memory yet used a shared memory paradigm.

Each of these two primary approaches had its own set of benefits. The conventional programming paradigm, which viewed memory as a single, shared address space, was supported by shared memory architectures. Because the processors interacted via shared memory rather than a software layer, the shared memory machines had reduced communication costs. Distributed address space designs, on the other hand, offered scalability benefits since they were not limited by the limitations of a single, centralized shared memory or bus. Despite these scaling benefits, message-passing computers' success has been severely restricted, particularly at lower processor counts, due to the difference in programming paradigm from the prevalent small-scale, shared memory multiprocessors (e.g., less than 64 processors).

1.1.Distributed Shared Memory (DSM)

DSM is an architectural concept that aims to solve the scaling constraints of symmetric shared memory multiprocessors while keeping the shared memory communication and programming paradigm. DSM multiprocessors do this by using a memory that is physically dispersed but conceptually implements a single shared address space, enabling the processor to interact across the whole memory and share its contents. DSM multiprocessors are organized similarly to the devices shown in Figure 2. DSM architectures initially emerged in the late 1970s and early 1980s, in the form of three early multiprocessors: The Carnegie Mellon Cm, the IBM RP3, and the BBN Butterfly[2]. All of these computers used a common address space, which meant that the time it took to access a datum was determined by its location. As a result, such designs were given the term non-uniform memory access (NUMA) computers[3].

Although the actual time to access a datum in NUMA systems may vary depending on whether memory held the requested address, in practice there was a significant difference between addresses in local memory and addresses in distant memory. It was difficult to program these early DSM multiprocessors because access times might vary by a factor of 10 or more, and there were no easy methods to conceal these disparities. The usage of caches in uniprocessors hides the fact that memory access takes a lengthy time. However, as we'll see later, modifying caches to operate in a multiprocessor system is difficult.

1.2.The Cache Coherence Problem

Caching presents an extra issue when employed in a multiprocessor: cache coherence, which occurs when separate processors cache and update values of the same memory region. Adding caches without addressing the coherence problem complicates the programming model because the programmer must worry about memory views that may be inconsistent. To solve the cache-coherence issue in small-scale shared memory multiprocessors, a smart solution based on the bus connection was devised[4]. The fundamental concept is to enforce the condition that all other copies of a memory location, which may exist in other caches, are invalidated before it is written. As a result, when a memory location is read, the system permits many copies to exist, but only one copy when it is written. A block in the cache, typically 16–128 bytes, is the unit for enforcing coherence.

The bus is essential for implementing snoopy protocols, which are the most common coherence protocols. When a processor requests to write to a shared cache block, a snoopy protocol sends the request across the bus, and any caches that have a copy of the cache block simply invalidate it. Because the memory is always up to date in write-through caches, this is the only change to a conventional cache protocol that is required[5]. Because the most current copy of a data item may be in a cache, write back caches provide an additional complexity. If that's the case, read misses will have to go through the caches and potentially get data from another cache.

Snooping operations are implemented by placing the request on the bus and having all caches read the address and either perform an invalidation or supply data from the cache, depending on

whether the cache uses a write-through or write-back mechanism. When two processors attempt to write at the same time, the bus breaks the tie since all requests must be put on the bus, which can only carry one request at a time[6]. This serialization of all bus requests enforces an ordering on all writes (even those to the same location) and is necessary for preserving coherence. The bus-based connection utilized in small-scale shared memory multiprocessors and the snoopy cache-coherence methods work well together for three reasons. The cache-coherence scheme, for starters, makes the cache functionally transparent, allowing the system to cache both shared and private data without having to change the shared memory programming model. Second, using caches lowers the bus and memory bandwidth requirements, enabling the CPUs to share a single memory and bus. Third, the usage of a bus, which broadcasts all memory requests to all processor-cache modules, makes the snoopy coherence protocols very simple to implement.

Cache coherence's reduced programming complexity, combined with its low implementation cost, led to cache coherence being included in all small-scale, bus-based multiprocessors. Microprocessors have incorporated support for cache coherence and linking small numbers of processors (two to four) inside the microprocessor chip in recent years, lowering the cost of small-scale multiprocessors and boosting their popularity considerably. The snoopy schemes used in small-scale SMPs, however, do not scale[2]. The issue extends beyond the usage of a bus, since every possible memory request must be viewed and snooped by all of the system's caches. As a result, the designers of the early DSM multiprocessors did not try to cache shared data, forcing programmers to cope with lengthy access times for shared data stored in distant memory. The early DSM machines were no simpler to program than message-passing architectures because of this. Furthermore, the lack of cache coherence caused a split between the programming approaches used for small-scale cache coherent multiprocessors and large-scale shared memory architectures without cache coherence. The issue was solved by creating a coherence mechanism that could be easily applied to the DSM architectural approach.

1.3.Cache Coherence Based On Directory

Small-scale bus-based multiprocessors depend on snoopy cache coherence methods, which naturally utilize broadcast. However, such schemes were not the first cache coherence protocols devised. Directory-based protocols have been suggested before the snoopy methods were established. Directory-based methods depend on an additional structure known as the directory, which keeps track of which processors have cached each block in main memory[7]. The first directory schemes assumed a single, monolithic directory, and we use this assumption to explain the basic operation of directory coherence. A coherence protocol may utilize the directory to maintain a consistent picture of memory since it records which caches have copies of each given memory block. The status of each cache block is maintained in the cache, and extra information is stored in the directory for each block to ensure coherence. Each cache block can have three states in a simple cache coherence protocol.

Before enabling a cache block to reach the exclusive state, the protocol invalidates any caches that contain a copy of it, ensuring consistency. A directory protocol differs from a snoopy protocol in that the directory protocol obtains information about which processors are sharing a copy of the data from a known place rather than broadcasting to all processors. In a snoopy system, the directory also helps to serialize writes, much as a bus does. Consider what happens when two processors decide to write to the same block at the same time[8]. When requests serialize on their route to the directory under a directory system, the possible race is avoided. Because one request is processed before the other, the first request will invalidate the data of the other processor. After discussing an essential improvement, we'll go at the specifics of a directory protocol.

1.4.Protocols for Distributed Directory Access

The directory notion is used in cache-coherent DSM systems, but the directory is distributed in the same way as memory is spread. A memory location's directory information is stored in the directory associated with the memory that contains the location. The structure of a typical cache-coherent DSM multiprocessor[9]. Although the extension of the directory protocol to a distributed directory implementation is theoretically straightforward, the implementation is complicated by the fact that few of the protocol operations are atomic. Rather, the protocol is carried out by sending messages to:

- The local node, which is the requesting processor node;
- The home node, which has the address of the block that the local node wishes to read or write;
- A potential third node, known as the owner or distant node, which holds the cache block in the exclusive state.

We began investigating the concepts that led to DASH in the late 1980s on the basis of two assumptions. To begin with, shared memory machines would be simpler to build than message-passing machines since shared memory enabled programmers to exchange data structures in a variety of ways at various granularities. Second, cache coherence is essential for caching shared data in complicated applications. This second belief did not come easy to us. In fact, we began our research with the aim of having the compiler enforce coherence[10]. After much research, we came to the conclusion that the compiler would be unlikely to handle the coherence issue effectively across a broad variety of applications. While considerable progress has been made for well-organized scientific issues, effective software coherence for more dynamically structured applications or systems software is still a work in progress. As part of the DASH project, we included a substantial applications effort to test these assumptions. Our experience creating the SPLASH apps has backed up our theories, although in unanticipated ways.

First, we discovered that getting the best performance frequently required meticulous planning of distant data requests, even down to understanding the effect of cache line size. However, we discovered that the coherence methods often assisted in exploiting locality with little additional effort, and that when careful attention was required, the effort was frequently concentrated on a tiny kernel of the program[9]. We also discovered that, even when employing dynamic solutions methods, leveraging the natural locality of scientific issues was sometimes surprisingly simple. The greatest example is the n-body applications: the modeled system has inherent locality owing to underlying physical processes, but utilizing that locality needs fine-grain and time-varying communication. This is the sort of situation where the benefits of a cache-coherent shared address space are most apparent. As a side note, we often discovered constraints in many areas while expanding programs, including load balancing, restricted parallelism, synchronization, and data locality. Overall, we discovered that scaling up programs to utilize additional processors is more challenging than it seems.

Without this support, a single word is the natural unit of access for a load or store, which is very wasteful. To overcome this inefficiency and access several words without cache coherence, the compiler or programmer must ensure that obtaining a block of data rather than a single word is functionally valid. We think that the ability to buffer distant memory accesses in a functionally transparent manner is critical to designing shared memory machines in a way that is efficient in terms of both speed and programmer time.

1.5.Scaling Directory Structures Efficiently

Despite the fact that distributed directories theoretically alleviate the scaling issues that snoopy-based schemes have, DASH's original implementation utilized a non-scalable version of directories. DASH, in particular, utilized a bit vector with one bit per node. A 16-bit vector may

accommodate up to 64 processors since each node has four processors[10]. Aside from the technical challenges of dealing with a very broad bit vector for higher processor counts, utilizing a flat bit vector has a fundamental flaw: the amount of directory storage grows quadratic as a function of processor count. In reality, this problem isn't a problem for computers with less than 64 nodes, but it becomes a significant issue for machines with a high number of processors. To prevent inefficient scaling of directory memory, commercial DSM machines employ one of two methods: storing complete directory information only for blocks that are already in a processor cache, or utilizing a sparse representation of the directory information.

DASH employs a directory to keep track of the state of each memory block in a single, unique place, as well as the nodes that hold copies of the memory block in question. The amount of directory memory may be lowered to an amount that increases linearly with the number of processors by spreading the information for each currently cached memory block. Sparse methods decrease directory memory requirements by altering the way sharing information is represented or keeping track of just the blocks that are currently shared. The directory memory for sparse systems grows linearly with the number of processors. These more scalable methods, as compared to the simple bit vector approach, compromise either simplicity or performance, and frequently both.

2. DISCUSSION

There are many advantages of using a programmable controller. First, depending on the number of processors and the application, the controller may implement various scalable coherence protocols, including sophisticated protocols that are not appropriate for hardwired implementation. Second, MAGIC can combine high-performance message-passing protocols with coherence techniques. Third, replacing special-purpose hardware with a programmable processor lowers the number of components while maintaining flexibility that may be utilized for a variety of tasks, such as synchronization. Fourth, a programmable controller may have fault detection, encapsulation, and recovery functionality. Finally, at the heart of the communications route, such a controller may contain performance monitoring code. The main question we're addressing with FLASH is whether we can accomplish these advantages without making unjustifiable performance or cost compromises.

Several prominent bus-based multiprocessor manufacturers have already converted to DSM architectures. Cache-coherent DSM is expected to become the dominant architectural solution for multiprocessors with four or more processors in the near future. Moderate-scale DSM multiprocessors (16–64 processors) are expected to become one of the most significant designs for large-scale commercial computing, according to our research. These computers are capable of great performance, fault containment and recovery, and resource efficiency. The potential performance and functional benefits of a bespoke node against the cost advantages of a commodity two to four processor node will decide whether such multiprocessors are constructed using custom nodes or conventional two to four processor clusters.

3. CONCLUSION

The task of creating cache-coherent DSM has been fascinating. It was driven by a desire to address a problem, similar to previous engineering research initiatives, and has resulted in new knowledge of multiprocessor architecture and parallel software systems. While cache-coherent DSM was initially designed for large-scale parallel multiprocessors, further fast improvements in microprocessor speed, as well as the resulting pressure on memory bandwidth, have led to the conclusion that DSM methods will be utilized for lower numbers of processors.

Economic considerations will also be important in the development of extremely large DSM multiprocessors in the future. The main issue for such computers is whether the market is big

enough to warrant the technical effort required to create coherence mechanisms, interconnect, and operating system support for these massive multiprocessors. The technological problems relating to such multiprocessors seem to be very well known, and a large-scale integrated cache-coherent multiprocessor may be constructed today. Alternatively, using conventional off-the-shelf connectivity, extremely high processor counts may be obtained by connecting DSM nodes with 64 to 128 processors. Although such "clustered" multiprocessors are expected to be less expensive to develop and manufacture, they are likely to provide poorer performance, present major new performance problems, and require new operating system support. Finally, the requirements of applications and the financial resources available to invest in multiprocessors for these applications will likely determine how they are constructed.

ABSTRACT

This article describes in detail the directions of employment, the factors of unemployment. The employment and unemployment rate in the Republic of Uzbekistan, the dynamics of their change and employment are analyzed by industry. Proposals have also been developed to ensure employment and reduce unemployment. According to the Ministry of Employment and Labor Relations, today the number of labor migrants working in other countries in our country is 2.6 million. This figure is 7.5% of the total population and 13.6% of the total labor force. Due to the closure of many jobs and difficult living conditions during the pandemic, most labor migrants returned to our country. This has led to rising unemployment and declining incomes.

KEYWORDS: Employment, Labor Resources, Unemployment, Jobs, Labor Migrant, Self-Employment.

INTRODUCTION

Today, reforms and global projects are being implemented in any country to ensure employment. In particular, the International Labor Organization supports the technical, organizational and institutional capacity of countries around the world to ensure sustainable employment.

Among the countries withdrawing from the global pandemic, Uzbekistan is experiencing a decline in unemployment caused by the pandemic in 2020, and existing jobs are being restored. However, employment has not returned to pre-pandemic levels. The main reason for this is related to external migration.

According to the Ministry of Employment and Labor Relations, today the number of labor migrants working in other countries in our country is 2.6 million. This figure is 7.5% of the total population and 13.6% of the total labor force. Due to the closure of many jobs and difficult living conditions during the pandemic, most labor migrants returned to our country. This has led to rising unemployment and declining incomes.

Therefore, at the initiative of the head of our state, consistent measures are being taken to create new jobs by stimulating active entrepreneurship, improving the investment climate and business environment. In particular, the Resolution of the President of the Republic of Uzbekistan dated July 14, 2018 No PP-3856 "On measures to improve and increase the efficiency of work to ensure employment" [1]. In addition, the country is taking effective measures to implement the approved annual programs to ensure employment, improve the mechanisms of employment in vacancies and quotas, the development of effective forms of self-employment.

However, the labor market in the regions is still highly tense, the creation of permanent jobs, employment of young people, women, members of low-income families, especially in rural areas, as well as the regulation of external labor migration remain unresolved. This shows how relevant the topic is and the need for research in this area.

ANALYSIS OF THE LITERATURE

Employment has always been one of the most pressing issues. Especially in the context of the global pandemic, the issue of employment has once again shown to be a global problem and requires more scientific research in this regard. Including:

From foreign scholars, B.D. on solutions to existing problems in providing employment to the population. Breev [2], V.N. on informal employment and its impact on public finances. Salin and V.V. Narbuts [3], E.A. on Statistical Analysis of Employment and Unemployment. Dolgix [4], C. Krittanawong, A. Kumar, Z. Wang, U. Baber, and D.L. on the risk of cardiovascular disease as a result of self-employment and long labor. Bhatt [5], P.Ge, W.Sun and Z.Zhao [6] on the impact of demographic changes on employment [6] and J. Grashuis on the analysis of the duration and competitiveness of self-employment during the COVID-19 pandemic [7]. are conducting research.

Nasimov, D.A. from local scholars [8] to improve the methodological and methodological framework for the introduction of modern forms of employment in the digital economy, M.K. Abdullaev and D.B. Begalova [9] conducted an analysis of employment indicators in our country, S.A. Bozorova [10] described the state of the service sector in increasing the employment of the population, A.B. Irmatova [11] on the problems of women's intellectual labor, A. Tashpulatov [12] and Sh.R. Xolmuminov, B.X. Umurzakov, T.A. The Mahmudovs [13] have been studying the strategic socio-economic importance of reducing the employment of the rural population and their informal employment.

The results of these studies, in addition to their scientifically based proposals, practical recommendations and conclusions, provide a further scientific study of the organizational, economic and institutional aspects of solving the existing problems of employment and statistical analysis. as well as the development of innovative approaches.

RESEARCH METHODOLOGY

In this study, expert evaluation, comparison, comparative analysis and systematic approach, statistical tables and graphs and diagrams, as well as official statistics of the International Labor Organization, the State Statistics Committee of the Republic of Uzbekistan, the Ministry of Employment and Labor Relations and local and foreign scientists. research work has been widely used.

ANALYSIS AND RESULTS

International labor migration is expanding due to the integration of economies and the development of interstate socio-economic, strategic ties, as well as countries with stable or low population growth due to low birth rates (European countries, Russia, South Korea, etc.).

This process benefits every state. That is, if labor migrants contribute to the growth and development of the countries they go to, remittances and the experience they gain will greatly benefit their countries.

However, the management of the migration process, the protection of labor migrants, the regulation of migration and development relations, and international cooperation are among the most complex issues.

In countries with high population growth rates and most developing and underdeveloped countries, there are sufficient employment problems. These include, for example, lack of jobs, low wages, lack of professional skills and knowledge of the workforce.

There are five main causes of unemployment in the economy:

- Other structural changes in the economy associated with the introduction of new technologies;
- Economic downturn leading to a decline in demand for labor resources;
- Public policy, increase in the minimum wage and therefore decrease in demand for labor;
- Seasonal fluctuations in some sectors of the economy;
- Demographic change, ie the growth of the working age population.

Today, practical measures are being taken in our country to ensure employment. These include increasing employment through the full support of entrepreneurship and small business, family entrepreneurship and self-employment, as well as the creation of new jobs through the creation of favorable conditions for their development.

As of January 2021, the population of our country is 34.6 million. 17.5 million of them. in cities and 17.1 mln. one lives in rural areas.

The population density is 77,000 people per square kilometer in the country. However, the distribution of the population varies sharply by region, in particular, in the Republic of Karakalpakstan there are 11.5 thousand people per 1 sq. Km, in Andijan - 741.4 thousand, in Bukhara - 48.4 thousand, in Jizzakh - 66.5 thousand, in Kashkadarya - 116.7 thousand. 9.1 thousand in Navoi, 385.4 thousand in Namangan, 235.4 thousand in Samarkand, 133.4 thousand in Surkhandarya, 201.2 thousand in Syrdarya, 196.3 thousand in Tashkent, 565.1 thousand in Fergana, 312.9 thousand in Khorezm and in Tashkent. and 7874.1 thousand people. This indicates the strength of internal labor migration across regions with different levels of socio-economic development.

According to the analysis, the number of labor resources in the country is 19.1 million. people, which is 55.9 percent of the permanent population. Of the total labor resources, 19.01 mln. 0.9 million people, or 99.5% of the working age population. or 0.5 percent of workers younger and older than working age (Table 1).

TABLE 1 DYNAMICS OF LABOR FORCE STRUCTURE IN THE REPUBLIC OF UZBEKISTAN (THOUSAND PEOPLE)

Structure of labor resources	**2004**	**2008**	**2012**	**2016**	**2020**
Labor resources	14048,8	15685,7	17564,3	18488,9	19142,3
as a percentage of the permanent population	54,3	57,5	59,0	58,1	55,9
including:					
Able-bodied population of working age	13880,4	15474,6	17451,5	18371,7	19052,0
as a percentage of the permanent population	53,7	56,7	58,6	57,7	55,7
as a percentage of labor resources	98,8	98,7	99,4	99,4	99,5
Workers younger and older than working age	168,4	211,1	112,8	117,2	95,1
as a percentage of the permanent population	0,6	0,8	0,4	0,4	0,3
as a percentage of labor resources	1,2	1,3	0,6	0,6	0,5

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

77.3% or 14.8 mln. one of them is the economically active population. In addition, 13.2 mln. people or 69.2% of the labor force are employed in the economy.

According to the analysis, by 2020, the employed population will reach 3.6 million. or 26.9 percent in agriculture, forestry and fisheries, 1.8 million. or 13.5 percent in industry, 1.3 million. or 9.6 percent construction, 1.4 million. or 10.3 percent of sales, 0.6 million. or 4.7 percent of transportation and storage, 1.1 million. or 8.8 percent education, 0.7 million. health care and social services, or 4.9 percent. or 21.3 percent of other activities (Figure 1).

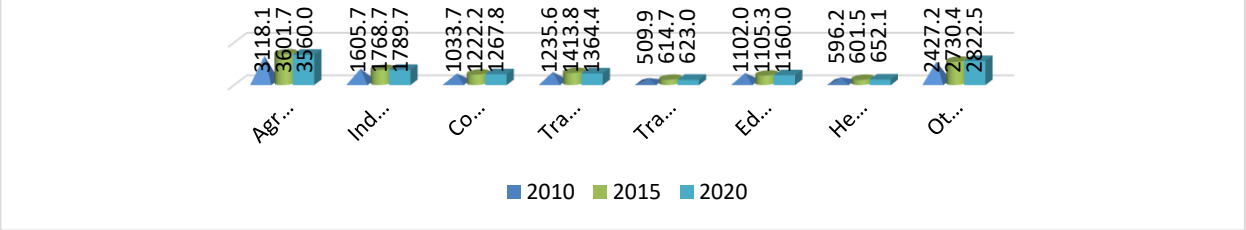

Figure 1. Structure of the employed population by type of economic activity (thousand people).

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

The analysis shows that in 2020, the employment rate increased by 113.9% compared to 2010 and 101.4% compared to 2015, while by type of economic activity, agriculture, forestry and fisheries increased by 114.2% and 98.8%, respectively, industry 111.5 and 101.2 percent, construction 122.6 and 103.7 percent, trade 110.4 and 96.5 percent, transportation and storage 122.2 and 101.4 percent, education 105.3 and 104.9 percent, respectively. , health and social services by 109.4 and 108.4 percent, and other activities by 116.3 and 103.4 percent, respectively.

Also, according to the analysis of the types of ownership of the employed population, in 2020 the number of employed in the public sector will reach 2.5 million. and 10.7 million in the private sector. formed a person. In recent years, the number of people employed in the public sector is increasing. In particular, the growth rate of banking in the public sector in 2012 (compared to 2010) was 98.0%, in 2014 (compared to 2012) was 98.4%, in 2016 (compared to 2014) was 100.2%, in 2018 (compared to 2016) 104.1 percent, an increase of 102.9 percent in 2020 (compared to 2018).

As of January 2021, the number of registered unemployed in the country amounted to 37.1 thousand people. Compared to 2010, this figure increased by almost 2.3 times, its growth rate was 0.4% in 2000, 0.4% in 2004, 4.9% in 2008, 4.9% in 2012 and 5.2% in 2016. and 110.5 percent in 2020 (Figure 3).

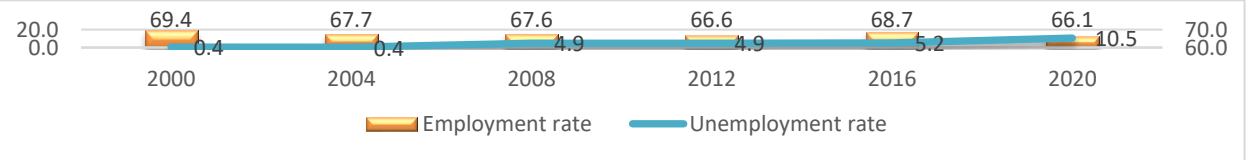

Figure 3. Rate of employment and unemployment (percentage).

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

The employment rate in the country compared to the working age population in 2000-2020 averaged 67.7%. In particular, it was 69.4 percent in 2000, 67.7 percent in 2004, 67.6 percent in 2008, 66.6 percent in 2012, 68.7 percent in 2016, and 66.1 percent in 2020.

CONCLUSIONS AND SUGGESTIONS

Based on the above, it is expedient to take into account the following in order to ensure employment and reduce unemployment in our country:

1. It is necessary to thoroughly analyze the problems of increasing employment from the bottom up and develop practical solutions and monitor their implementation.
2. In general, the shadow economy plays an important role in reducing unemployment. Therefore, the fight against the shadow economy should be organized not through bureaucratic means, but through the application of economic incentives.
3. In parallel with the demographic changes of the population, it is necessary to create new jobs and use the experience of developed countries in this regard.
4. In the process of digitization of the economy, the resulting unemployment rate will be higher than for emerging professions. Therefore, it is necessary to increase the number of low-skilled jobs in the public and private sectors, in particular, to further encourage self-employment.
5. Today, the database on vacancies is based on a number of online platforms among the non-governmental sectors. However, there is very little information on vacancies on public sector websites and most recruitment processes are closed and narrow. This has a negative impact not only on employment, but also on the productivity of these agencies. Therefore, it is necessary to create a single online platform with complete information on vacancies in the public and private sectors.
6. It is necessary to expand the activities of state and non-state agencies and strengthen control over those in need of social protection and those who have difficulty finding employment.

In conclusion, it should be noted that, first of all, it is necessary to provide the population with real and correct treatment. This will serve to increase the effectiveness of the results of analysis and research on population change and employment. It will also allow for the real development of promising strategies to ensure employment, reduce unemployment and improve living conditions. In general, the use of decent wage rates in the creation of new jobs not only has a positive impact on labor productivity, but also leads to an increase in socio-economic development.

ABSTRACT

This article discusses the adoption of a number of legal and regulatory documents in the last four years on the current priority of comprehensive development of the country through physical culture and sports during the years of independence of the Republic of Uzbekistan. The goals are analyzed and revealed in depth.The contribution of the first President of the Republic I. Karimov in this direction is enormous. "The culture of personal care should be instilled in young people through school, community, health care, physical education and sports" 'vati is noteworthy.

KEYWORDS: *New Uzbekistan", "Action Strategy", Physical Culture And Sports, Healthy Generation, Mass Sports, "Umid Nihollari", "Barkamol Avlod", "Universiade", Olympics, Healthy Lifestyle, Sports Selection, 5 Important Initiatives.*

INTRODUCTION

In the first years of independence, the country underwent serious reforms in economic, political and cultural processes, and new directions of historical significance in the field of physical culture and sports emerged. Improving the health of the population, educating the physical fitness of schoolchildren and students, improving the skills of talented athletes in accordance with modern requirements and international standards, as well as increasing the working capacity and productivity of the working population, intellectuals and, most importantly, prolonging life through a healthy lifestyle. , special attention will be paid to the upbringing of a healthy generation.

The contribution of the first President of the Republic I. Karimov in this direction is enormous. "The culture of personal care should be instilled in young people through school, community, health care, physical education and sports" 'vati is noteworthy.

At the initiative of the republic's sports organizations and associations, the former Soviet Union was one of the first republics to adopt the Law on Physical Culture and Sports in January 1992, which was revised in May 2000 and re-adopted by the Oliy Majlis in a new edition (Mirziyoyev:2019,P.36). In addition to guaranteeing the status of the physical culture and sports movement, the law imposes enormous tasks and responsibilities on governmental and non-

governmental organizations, public organizations, especially sports organizations, associations, ministries with educational institutions.

Taking into account the socio-educational, cultural and historical significance of physical culture, sports, travel (tourism) and national games, serious efforts have been made to promote them, build new sports facilities and create the necessary conditions. Special attention was paid to the national games in the development of physical culture and sports, football, wrestling, tennis and other sports in all segments and categories of the population. In this regard, a number of decisions of the Cabinet of Ministers of the Republic of Uzbekistan aimed at the development of football, wrestling and other sports are important(Karimov:1992, p.69-70).

The resolution of the Government of the Republic "On measures for the further development of physical culture and sports in Uzbekistan" has historically had a special place as a basic program of the movement of physical culture and sports (Karimov:1994,p.30).

It should be noted that in all types of educational institutions, physical education is taught as a subject on the basis of the state education system. In addition to classes, there are sports clubs, various sports competitions, on the basis of which it is clear that the content and essence of physical fitness is a priority in professional training. For this reason, prestigious multi-level sports competitions such as "Umid Nihollari", "Barkamol Avlod", "Universiada", which are directly related to the continuity of education, have become a tradition. One of the most important aspects is that the Presidential Decrees and government decisions related to the development of children's sports are important for the promotion of sports among schoolchildren, the selection of talented children, testing, educating them to become mature athletes. tibor is growing. Their specific goal is to protect the honor of our country at international sports competitions in the future, to take it to greater heights (Nazirov:2020,p.78-82).

Today, the competition between the countries of the world, the demonstration of strength is reflected in the demonstration of sports and intellectual potential. As the first President of the Republic of Uzbekistan IA Karimov said: “Sport is an ambassador of peace. Our goal is also peace, tranquility and, on this basis, cooperation with the people of the world.

Nothing can make a country as world-famous as a sport ” (Nazirov:1992). Indeed, the international prestige of Uzbekistan is growing for the successful participation of Uzbek athletes in the Central Asian and Asian Games, various international tournaments, world championships and the Olympic Games. These achievements in sports will help our people to develop a sense of identity, solidarity and patriotism.

MATERIALS ANDMETHODS

- The last four years in the Republic of Uzbekistan have been a period of radical changes and rapid development in terms of quality for our country and our people. All regions of the country have become an unprecedented construction site - modern enterprises based on the latest technologies, beautiful, well-equipped housing, wide and smooth streets are being built.
- The life of our people is radically improving, human rights and freedoms, the rule of law and social justice are being established. He introduced the term "New Uzbekistan" to the world in recognition of the fact that our country is changing for the better as a result of these changes and innovations. ” ("On Physical Culture and Sports":2000). Over the past four years, the implementation of specific programs in the field of physical culture and sports to strengthen the health of the population, the wide involvement of young people in sports, the national team of skilled athletes who provide high results in sports. In order to form national teams and create additional conditions for coaches, to form a comprehensively mature and

physically healthy generation with a high culture in the country, the following new measures in the field of physical culture and sports have been developed over the past four years. half normative legal acts were adopted, including:

Decree of the President of the Republic of Uzbekistan No. PF-4947 of April 7, 2017 "On the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021",

Resolution of the President of the Republic of Uzbekistan dated June 3, 2017 No PQ-3031 "On measures to further develop physical culture and mass sports",

Resolution of the President of the Republic of Uzbekistan dated August 10, 2017 No PP-3197 "On measures to further improve the activities of the Uzbek State University of Physical Culture and Sports",

Decree of the President of the Republic of Uzbekistan No. PF-5368 of March 5, 2018 "On measures to radically improve the system of public administration in the field of physical culture and sports",

Resolution of the President of the Republic of Uzbekistan dated March 5, 2018 No PP-3583 "On the organization of the Ministry of Physical Culture and Sports of the Republic of Uzbekistan",

Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated October 25, 2018 No 864 "On further improving the system of national sports competitions among schoolchildren and students",

Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated February 13, 2019 No 118 "On approval of the Concept of development of physical culture and mass sports in the Republic of Uzbekistan for 2019-2023",

Decree of the President of the Republic of Uzbekistan No. PF-5924 of January 24, 2020 "On measures to further improve and popularize physical culture and sports in the Republic of Uzbekistan",

The CONCEPT "Development of physical culture and sports in the Republic of Uzbekistan until 2025" was adopted.

RESULTS AND DISCUSSION

Adoption of the above-mentioned new normative legal acts in the field of physical culture and sports and their implementation will ensure that all segments of the population, especially the younger generation, are regularly involved in physical culture and sports. to create conditions, to strengthen the confidence of young people in sports with their will, strength and capabilities, to develop courage, patriotism, devotion to the motherland, to represent our country at the Olympic Games, World Championships, Asian Games and Achieving high results in championships and other prestigious international competitions, the implementation of large-scale work aimed at further enhancing the image of Uzbekistan in the world, the further development of physical culture and sports, opens the door to great opportunities for every citizen of our country (Resolution of the Cabinet of Ministers of the Republic of Uzbekistan:1996).

In conclusion, it should be noted that today in "New Uzbekistan" the attention paid to physical culture and sports, the conditions created for the regular participation of our youth in physical culture and sports, all this is the spiritual maturity of our youth. It helps them to grow up physically healthy, not to succumb to various foreign ideas, and to raise the Uzbek flag in the world. In his speech at the solemn ceremony dedicated to the 29th anniversary of state independence of the Republic of Uzbekistan, President Shavkat Mirziyoyev noted that the foundations of a new revival - the Third Renaissance - are being laid in Uzbekistan at a time

when the glorious power of our people is in full swing. The fact that the Third Renaissance in Uzbekistan was also aimed at improving physical culture and sports was explained by the fact that the aim was to increase this "vitality".

It is no coincidence that President Shavkat Mirziyoyev emphasized that “we will continue to attach great importance to the rapid development of sports, encouragement and support of athletes who have achieved high results in international competitions” (Resolution of the Cabinet of Ministers of the Republic of Uzbekistan:1999).

On March 19, 2019, the President of the Republic of Uzbekistan Sh. Mirziyoyev put forward 5 important initiatives to launch work in the social, spiritual and educational spheres in the country on the basis of a new system. the practical proof of this is that it is aimed at creating the necessary conditions for them to demonstrate their abilities in the field of sports. This is the basis for a healthy lifestyle in society - physical activity, exercise, regular sports.

CONCLUSION

There is no doubt that the athletes of "New Uzbekistan" will make a worthy contribution to laying the foundation for the Third Renaissance in our country indicates.

THE MEANING AND METHODS OF DETERMINING THE COMPOSITION OF THE HUMAN BODY

Bokhodirjon Yursinboyevich Khaydarov*

*Lecturer,
Faculty of Physical Culture,
Fergana State University, UZBEKISTAN
Email id: bahodir86xaydarov@mail.ru

ABSTRACT

This article provides information on modern research on the methodology of studying the compositional composition of the human body. The study of the composition of the human body is becoming increasingly important in medical practice and sports. Determination of body composition in clinical medicine is relevant for the diagnosis and prognosis of diseases. Various methods are successfully used in many fields of medicine - resuscitation and intensive care, cardiology and surgery. In sports medicine, the determination of the body composition of athletes is a way to control the physical activity of athletes, allowing them to effectively manage the training process. It has been proven that body composition is an indicator of a person's physical activity, his adaptation to environmental conditions, as well as his interaction with professional and sports activities.

KEYWORDS: *Sports Medicine, Determination Of Human Physique, Correlation Of Body Structure, Athletes.*

INTRODUCTION

First of all, knowledge of body composition allows us to assess the physical development of a person, which can be especially useful in pediatrics. In nutrition, the determination of the fatty component of the human body is used in the treatment of obese patients [4]. Identification of water sectors in the body in intensive care and intensive care for the control and planning of infusion therapy, in therapeutic practice - the choice of drugs, assessment of the development of metabolic syndrome, in cardiology and surgery - to determine the level of hydration, in urology - to determine urodynamics [5]. The study of body composition - bone mass - is of great importance for the prevention, diagnosis and evaluation of the effectiveness of treatment of osteoporosis.

The study of body composition in sports allows you to control the health of athletes, is a method of monitoring physical performance, allows you to effectively manage the training process, as well as control dietary loads [2], functional indicators [2, 6]. Dynamic studies of body mass components have been carried out by many scientists in different directions. It is known that

body composition changes under the influence of the different composition of proteins, fats and carbohydrates in the diet. An increase in the level of fat mass is observed with an increase in the ratio of the carbohydrate-fat complex in the diet; when the amount of fatty and carbohydrate foods is limited, adverse changes in body composition are noted [4].

A direct relationship has been established between indicators of body composition and the level of physical activity [7]. Intense physical activity leads to a decrease in the fat content and an increase in active body weight [1]. Body composition is greatly improved. This is especially important for the healthy growth and athletic performance of athletes, even at low levels with 9 or more hours of training per week. Studies have confirmed that the values of body mass components are associated with the manifestation of various physical qualities and the development of functional systems of the body: with indicators of strength, speed and flexibility - with individual aspects of training and integral ones. Indicator - ensuring physical activity with a certain physical capacity for work and direct or indirect sports results: aerobic and anaerobic indicators. Several studies have shown the crucial role of muscle volume in shaping the response of the cardiovascular system to physical activity.

The specificity of the values of body mass components is also determined by the types and qualifications of athletes. High level athletes have more muscle mass and less fat mass than less experienced athletes. Athletes involved in strong sports are characterized by the maximum values of muscle mass, endurance sports - by low muscle mass; and minimum fat content; For athletes involved in sports, intraspecific differentiation of the values of muscle and fat mass by role play is characteristic. Thus, in each sport, a unique morphological model of athletes is formed, the adherence to which is the main advantage of success and longevity in sports. The incompatibility of the model with the athlete's high motivation requires high activity of additional compensation mechanisms, which ultimately allows to achieve high results, reduces the likelihood of longevity in sports, is also a health risk factor and requires the strictest current control over the processes. ... Adaptation of the athlete's body to training influences. Today, the requirements for athletes are steadily growing, athletes can meet more and more complex criteria of the morphological model, change their physical data from general morphological norms in order to ensure optimal implementation of the biomechanical stereotype of sports, etc. They must apply specialized teaching methods. One of the most pressing challenges for athletes is new ways to maintain optimal body weight, lose weight, or maintain low body weight. Deliberately maintaining a low body weight or short-term weight loss can lead to serious health problems. All of this is becoming a common issue in many sports. An important step towards maintaining the health and performance of athletes has been the change in the rules and capabilities for determining the body composition of athletes, which today has become more accurate. and reliable. Calculation of fat mass, which is a metabolically active organ, is of great importance in sports, and its adequate level plays an important role in maintaining overall health [8]. Knowing the amount and distribution of muscle mass (bone and muscle) can be important in determining athletic performance. Fat during the competition It is undesirable to reduce the proportion of mass by 5-6%, and the mass of the musculoskeletal system - by 46%, which often indicates fatigue of athletes. In addition, changes in muscle and fat components under the influence of physical exertion reflect the direction and severity of flexion shifts at the structural level in the athlete's body and the predominance of energy supply, therefore, the labile morphological parameters of a person are markers. ... Adaptation to intense muscle activity. Controlling the water balance of athletes is not important in sports, because dehydration is difficult for the body, even if it is minor. Vigorous physical activity is accompanied by the loss of micronutrients, primarily sodium and potassium, as a result of sweating. Negatively affects the functional state of the cardiovascular system and neuromuscular regulation. Studies have shown that it is necessary to control the total water level in the body, the volume of intracellular fluid in elite

athletes when adjusting body weight before the start of the race, in order to prevent a decrease in strength.

In the last century, many methods were proposed for determining the composition of the human body, and today modern approaches allow us to study the structure of a biological system at all levels - elementary, molecular, cellular, and bodily. At the level of organ-tissue and the whole organism [4]. However, they all have their drawbacks, and currently there is no universally appropriate criteria or "gold standard" method for determining body composition. All methods used are divided into the following categories: reference methods, laboratory and field.

Guiding techniques include multicomponent models, computed tomography and magnetic resonance imaging. Laboratory methods: dual energy X-ray absorption, densitometry, hydrometry, ultrasound, 3D scanning. Field methods - anthropometry, bioimpedance, and body mass index [2].

Traditionally, two-, three-, four-component and five-level multi-component models are used. However, composite models (body density, body water, mineral body mass, total body protein mass) to estimate body composition require a lot of time and expensive special technology to measure the parameters. Cell mass). An example of a method for studying body structure based on an assessment of body density is hydrostatic densitometry. For this, body weight is measured in water and under normal conditions. The need for complete immersion of the body for measuring body weight reduces the possibility of using the method in children, as well as in the elderly and sick people. An alternative method for checking body density is air plethysmography. In general, there are technical difficulties in the implementation of hydrostatic densitometry and air plethysmography, stationary. There is also the problem of limiting their use at the individual level due to significant individual differences in the density of available lean body mass. Therefore, in the absence of data on the composition of lean body mass, these methods can only serve to describe significant changes in fat mass [5].

The reference methods for determining body composition at the tissue level are magnetic resonance imaging and computed tomography. X-ray computed tomography allows you to separately monitor the amount of subcutaneous and internal fat, as well as the mass of skeletal muscles and internal organs. Magnetic resonance imaging can be used as a reference method for determining skeletal muscle mass, as well as computed tomography. The advantage of the methods is their high accuracy and precision. The disadvantages are the high cost of research, the use of a source of radioactive radiation, the lack of regulatory criteria, the need for stationary research [4]. The most common method for determining body composition is dual-energy X-ray absorptiometry (DXA). Initially, this method was successfully used in medical practice for the diagnosis of osteopenia and osteoporosis. Currently, in addition to assessing mineral density, bone mineral mass, DXA is used to determine fat. The DXA method allows you to examine both the peripheral and axial parts of the skeleton. Built-in software automatically adjusts measurement results based on soft tissue density, is minimally invasive and does not require active patient involvement, and is relatively inexpensive. Analysis of the results of neutron activation using DXA, comparison with hydrostatic densitometry, showed the possibility of a fairly accurate assessment of BMI and lean body mass. Based on this, the DXA method is sometimes used to measure body mass index, as well as caliperometry and bioimpedance. used as a reference for validating prediction formulas based on etiology.

Bioimpedance analysis is based on significant differences in adipose tissue permeability and lean body mass. This method is characterized by optimal accuracy, mobility, relative cheapness of equipment and control, simplicity of the research process, simplicity of automatic data processing, complicates comparison and analysis. The advantage of individual models of this method is the simultaneous assessment of clinically important parameters, such as active cell

mass and basal metabolism, as well as the possibility of studying not only integral, but also local parameters of body composition [5].

One of the highly accurate methods for determining fat, muscle and other tissues today is the ultrasound method for checking body composition. Portable ultrasound devices allow research in this area [2]. Undoubtedly, the introduction of new technologies and research methods will increase the reliability and efficiency of the composition assessment. However, as already noted, new methods are expensive, the need to standardize their methods for practical application, as well as the development of normative indicators, is urgent. Anthropometric and calipometric methods for determining body composition have proven themselves well in sports and medical practice. The cheapest, easiest and most portable bodybuilding method in the field. However, conducting an anthropometric study requires a high qualification of the researcher and strict adherence to the examination protocol.

Among the field methods for studying body composition, body mass indices occupy a certain place. Unfortunately, the use of indicators of height and weight does not provide reliable information about the structure of the human body. The low content of the data of this method was determined to determine the fat mass in people of athletic constitution, whose activity was associated with physical labor or active physical training, which led to an increase in muscle mass [9]. Thus, the choice of a method for determining body composition largely depends on the intended purpose of the study and the availability of technology. Undoubtedly, when studying the population and in the outpatient practice of sports medicine, preference is given to relatively simple, portable and inexpensive methods - anthropometry, calipometry, bioimpedance analysis. The requirement for high resolution of the method is of great importance in scientific and clinical research.

In conclusion, we can say that in many respects the choice of a method for determining body composition depends on the purpose of the study and the availability of technology. Undoubtedly, in population studies and in outpatient sports medicine, preference is given to relatively simple, portable and inexpensive methods - anthropometry, calipometry and bioimpedance analysis. The requirement for high accuracy of this method is of great importance in scientific and clinical research. Of course, the introduction of new technologies and research methods can increase the reliability and efficiency of body composition assessment. However, as mentioned above, the importance of new methods, as well as the standardization of methods for their practical application, also requires the development of normative indicators.

ABSTRACT

In memory-related applications such as smart cards and biometric solutions, cache memory security is a significant concern. The goal of this study is to examine different cache memory vulnerabilities and provide countermeasures to prevent such attacks and ensure cache memory security. The information saved in cache memory may be retrieved at any time. The invader is at risk of gaining access to this information. According to statistical analysis, techniques such as side channel attacks, timing attacks, and power-based assaults are used to test the security of information in caches. Using methods such as code convertors, layered XOR operations, extended Hamming codes, and multi-bit clustered ECC, solutions such as secure cryptography-based algorithms, secure aware cache mapping, and low power cache architecture are discussed. The improvement and authentication of cache memory security will result in a variety of applications including smart cards and biometric applications where data secrecy is critical.

KEYWORDS: *Cache Memory, Power Based Attacks, Side Channel Attack, Timing Attacks.*

1. INTRODUCTION

Between the central processing unit and the main memory unit is a cache, which is a tiny and restricted memory. The cache is physically and logically closer to the main memory. Caches are divided into three levels: Level 1, Level 2, and Level 3. Each level is created and incorporated according to the requirements. There are two types of address fields in cache lines and blocks: dynamic (tag) and static (name) (index). The tag stores the upper address bits, whereas the index stores the lower address bits[1]. Lower order address bits are fixed, whereas higher order bits may be changed. Before being used, the contents of the cache are cleared. Memory in the cache is divided into parts.

When a certain piece of information has to be found, the central processing unit looks in the cache memory to see if it's there; if it is, it's called a cache hit; if it's not, it's called a cache miss. Hit latency and miss latency are terms used to describe the delays that occur in such situations. Various cache mapping methods are investigated. Caches are divided into two categories: data cache and instruction cache. High speed, low latency, quicker information retrieval, and quick

data access are just a few of the benefits of cache memory. When building cache memory, power consumption and space are also significant considerations.

1.1. Cache Memory Security Concerns

Covert channel is a basic notion of crypt analysis side channel attacks, and cache storage attacks deal with it. In embedded systems, a novel storage channel probing cache debug capability is used[2]. Interlock, threshold, and ordering methods are all used in storage channels. The state of variables, on or off, is used by the author to represent numbers and characters. The covert channel and the side channel cross paths. Micro architecture entails the use of software characteristics in the development of cryptographic systems for data transmission. For privilege bits, a new covert channel offers data cache filling per line. Covert channels, it has been discovered, do not use heuristic timings.

Internal and external interruptions of a group of words to be put into cache memory are handled by Cubic based set associative cache encoded mapping[3]. Processor speed is influenced by factors such as cache size hit and write policies, cache map methods, and cache depth level. With the cubic set associative method, set associate mapping remaps. Hash functions may be a good option. It is investigated the temporal and spatial location of reference. The goal is to investigate new associative mapping's temporal convolution. Physical memory is referred to as associative memory. Attributes include tag, block, and word. The process of creating a cubic cache map entails remapping the real reference with a standard scheme in a linear pattern. In this regard, Graceful Code (GC) is a likely case study. The need for a cutting-edge memory testing methodology is urgent.

Cubic one-to-one recursive mapping is an extension of unique one-to-one mapping. These technologies provide opportunities to improve cache design and protect against assaults. Side channel attempts to extract encrypted keys by software operations target cache-like architectures utilizing Instruction Cache and Data Cache, and therefore effective protection is lacking[4]. The author uses software random permutation to preload information. There is a tradeoff between hardware complexity and performance overhead. Information leaking is prevented by using a branch target buffer and an update policy. Power, heat, and electromagnetic radiation are all targets of the side channel. Instruction Cache is a component of shared architecture. Access-driven and time-driven software assaults aren't impossible to imagine.

AES and RSA are utilized as part of a software permutation technique. The square matrix multiply method is used in modular exponentiation. Branch Target Buffer (BTB) and other conditional branches should be avoided. Secret keys are required for instruction cache attacks. Protection methods against data cache assaults are brought about by combining software and hardware. All essential data is directed into cache by the exception handler. Set associative mapping based on cache controller is used to design cache memory using cache controller[5]. The reference point's spatial position is utilized. The cache miss ratio is investigated using the method. In relation to parallel accelerator processors, work is being done on four-way set associative mapping. In semi-conductor memory, they are accessible via a common L1 cache. It's utilized in embedded systems for power efficiency and excellent performance. They may be used in FPGA-based CPUs.

Cache controllers provide address range to microprocessors, which substitutes address range in cache tag memory. When side channel assaults are prevalent, the security of a secure cache architecture is manipulated. Dynamic memory is used for cache re-mapping based on eviction randomization in the new-cache method [6]. Better results may be obtained by tweaking the replacement algorithm slightly. Secret keys may be discovered via address memory exploitation. Various assaults must be kept an eye on. Prime and probe attacks have the potential to fill the whole cache area with bad material. In this case, a spy procedure that involves counting cache

hits will be effective. The Evict and Time attacks are used to determine the length of time it takes to encrypt data. Bernstein is the one who launched this assault. MTD (Moving Target Design) and LDM (Large Direct Map) are two options.

For the new cache, attacks have been altered. The algorithm for replacement may be improved. The new cache is ineffective against eviction and time attacks. The new cache must be enhanced. Remove the protected bit (P bit) from the tag array and place it in the index field. Randomization has been completed. On mobile devices, time-based cache attacks are common. These are involved in mobile devices that employ cache memory to protect and secure users' data. On Android mobiles, a T-table based AES implementation is tested. Applications linked to Bernstein's assault are being investigated as part of a time-driven attack investigation[7]. This kind has two phases: research and attack. The correlation step entails a lengthy key search. Time-based cache attacks are mitigated by using an algorithm that reduces key space.

Wide collisions are used to investigate energy leakage. The cache-coloring based technique for reducing leakage energy in multi-tasking systems deals with energy efficiency as a major issue. The amount of energy that leaks out of caches is constantly checked. An energy-saving algorithm has been developed and deployed. A comparison is made between the model and the Decay Cache Technique (DCT). The presence of an on-chip cache increases energy consumption, which is a critical factor. It's possible to see dynamic profiling with dynamic cache reconfiguration for the best memory subsystem for energy efficiency. Improving memory encryption performance in multi-processor systems8 takes into account the most trusted chip, which is susceptible to physical assaults.

Outside the chip, security methods like as confidentiality and integrity are critical. Unipolar encryption techniques that use xor padding are mathematical counter mode encryption methods. For better data protection in caches, One Time Password is recommended. By using the coherence protocol, a good method for counter cache coherence protocol improves the pace of hits put on counter cache while cooperating with transit cache. As previously mentioned, such techniques improve the overall performance of cache memory structures.

When side channel leaking information is detected, theoretical use of cache memory on a side channel based on crypt analysis is a possible solution[8]. Plain text encryption leaves up the possibility of data hacking. To hide hidden data in memory devices, methods of calculating power based on techniques such as basic and differential power analysis may be used. Timing attacks, electromagnetic radiation assaults, glitch and fault analysis-based attacks are some of the other side channel attacks. There is a risk of a cache memory attack on main memory. Important factors include cache hits, cache misses, and cache size. To prevent data theft, the cache must be turned off when the power is turned off.

Microprocessors have a lot of moving parts in their design. For big level 2 and level 3 caches, a new idea in cache designs offers minimal area over-head for error prevention. Different schemes are used in the architecture. The first method, which was devised as part of an error repair and protection protocol, entails filthy cache lines. For protection, cache lines are cleansed and a parity check is performed. The second strategy involves clearing filthy caches on a regular basis and writing the information to main memory without raising traffic. The general behavior of cache lines is kept track of. Cache lines that are dirty are decreased by almost half. Attacks are given with new cache designs that are simple to execute on a variety of systems[9]. This procedure does not need the use of any specific equipment. Furthermore, no additional processing power is needed.

A simple time measurement may be used to retrieve the secret key. In this study, two fundamental mitigating methods are observed. The first phase of research focuses on partitioning, with the goal of eliminating cache memory interference. The second method

ensures that cache interference is randomized. Partition Locked (PL) cache and Randomized Permutation (RP) are two new security-aware cache designs that protect against side channel attacks. The focus of the research is on minimizing cache interference and mitigation, which are the fundamental causes of such assaults. The methods described here offer hardware solutions using a theoretic approach based on mathematical rules.

Cryptographic side-channels obtained from low-power cache memory entails microprocessors concentrating on space and power consumption while ignoring physical security[10]. Power parameters are analyzed using methods such as basic power analysis and differential power analysis. Physical security is a target of side channel attacks, rendering it susceptible. Microarchitecture side channel assaults are the subject of research. A low-power cache memory design has been created. Cache memory with branch prediction based on BTB attacks is a unique kind of cache memory. It's been discovered that the RSA algorithm is vulnerable to a power analysis attack. On the algorithmic and architectural levels, defensive approaches based on the square and multiply methods provide critical answers. The flow inside the square and multiply algorithms is controlled by the use of a non-state low power cache memory maintaining level 1 data cache.

An induced cache miss and countermeasure are shown in this advanced encryption standard power attack. By flushing parts of the S-box from cache, traditional attacks attempt to break data. In the encryption step, a cache miss is generated, and power traces are utilized. It is not necessary to clear the cache before encrypting the data[11]. When the CPU performs AES, the fundamental concept is to force a cache miss. Cache size, block size, and an understanding of associative techniques are all needed in this scenario. Later, they are included into block ciphers. There is no requirement for randomization. Before the actual calculation begins, countermeasures on the insertion of a set of s-boxes in the encryption algorithm are carried out.

Cache security is enhanced by the Intelligent Web Proxy Cache Replacement Algorithm15, which is based on Adaptive Weight Ranking Policy through Dynamic Aging. ICN's Selective Placement of Caches16 for Hash-Based Off-Path Caching provides a superior cache placement method. Cache memory reliability utilizing identical tag bits, power reduction and cell stability based on dynamic isolated read static random success memory, and data scrambling based secured data authentication told in memories are all addressed in depth, providing possible answers. Cache parameter problems may be solved by designing an exclusive cache architecture20 that saves electricity. A potential method to provide cache security is to do a performance analysis21 of cache consistency management in a mobile context utilizing an agent strategy.

1.2. Caching methods are compared in terms of performance.

- Introduces a new storage channel that is based on the cache debugging facility. With cryptanalytic side channel attacks possible, At the time of Difficulty in cache debug facility in embedded microprocessors, the new covert channel method did not depend on heuristic timings.
- Cache depth level is targeted at the time of Cache remap in linear order fashion with set associative mapping remapped using cubic set associative method retaining Spatial and temporal ideas applied with Cache depth level is targeted at the time of Cache remap in linear order fashion[12]. Cache size and hit write policies are important things to consider while using the graceful code approach.
- Preloading information based on Secure Partition Locked cache and Random Permutation cache with Cache-like architectures can retrieve secret keys through software activities in order to create an integrated software and hardware protection

scheme against D cache attacks for a tradeoff between hardware complexity and performance overhead.

- Four-way set and spatial locality of reference are utilized to monitor cache misses. Because of this, associative mapping is utilized. Accessible through a shared L1 cache in the shared memory paradigm, there are security risks. Embedded systems using FPGA processors with low power and high performance face circuit complexity and power consumption challenges.
- Moving Target Design and Logical Direct Mapping methods were used5 to attack Address Memory, with the risk of secret key bits being discovered. Defects in access-driven attacks and failures in evict and time attacks have been improved with a new cache algorithm.
- Security risks to confidentiality and integrity outside the chip are addressed by the counter cache coherence protocol, which is used to improve hit rates on counter caches8. The MESI protocol, which is vulnerable to physical assaults, increased overall performance.
- A Fiestal network structure-based algorithm and a non-deterministic access ordering cache placement method were utilized to a cache-based attack on algorithm implementation in the CPU Attackers are confused by timing skews and fake operations. Algorithm for Cache Behavior Analysis on Hardware Targets
- When a processor executes to the extent of AES depending on cache size, block size S-box accessible in the encryption function before actual computation begins, a cache miss is forced. There is no requirement for randomization. Flushes s-box items from the cache.
- Approaches to mitigation based on partitioning and randomization methods in the direction Simple time measurements can recover key in the cache interference is minimized by mitigation methods that are simple to execute on most systems.

2. DISCUSSION

Size, access time, space occupied, power consumption, latency, and speed are some of the important factors to consider while building cache memory. When cache memory is targeted, it becomes insecure. Creating random vectors is tough. When the power is turned off, there is a risk of secret data being recovered. The selected AES algorithm is susceptible to a D cache attack. The temperature of the data is affected by its coolness. Hacking will become more likely when electromagnetic radiation is emitted. Secure data may be recovered and made insecure using a circuit design replica. Adding circuit complexity to prevent assaults increases design costs. Secure cryptography based algorithms, secure aware cache mapping, and low power cache architecture are among the proposed solutions.

It may be a better idea to change the encryption algorithm's design to use light weight encryption to fit the cache memory implementation. Data hacking may get more difficult as bit length increases. To enhance security, sub-key creation may be generated from the primary key. Data scrambling methods that are intelligent may be properly thought out and executed. Encryption and decryption are improved when code convertors are used. Nested XOR operations and error detection mechanisms, such as Hamming code implementation to identify single bit mistakes, are also worth considering. It is possible to see cache and D cache timing attacks across cache memory. The Sliding Window Exponential method may help to enhance cache security.

Some of the methods include using semantic array partitioning, using hash functions on skewed associative caches, and repeating many identical rounds including replacement, transposition, mixing rows and columns, and shifting them. On the cache, partitioning methods may be investigated. It is possible to estimate time. Also feasible are adaptive security quality controllers, contention-based attacks, reuse-based attacks, and dynamic remapping tables. The

prime and probe attacks, as well as the evict and time attacks, are all seen. It is possible to see supply voltage scaling for core processors and deep nanoscale architectures to decrease system energy usage. Extended hamming codes and multi-bit clustered ECC are two additional options.

3. CONCLUSION

Security of cache memory is a significant concern in memory-related applications such as smart cards and biometric systems, where data confidentiality is critical. To hack the content of integrated circuits, hackers utilize a variety of methods, most of them are based on side channel assaults. The mere knowledge of leaking power allows a hacker to break secret data, which becomes susceptible when subjected to electromagnetic interferences, and therefore the focus of this study is to identify different data assaults and provide countermeasures to ensure data security. Future research may focus on more secure data security methods, particularly for cache memory.

BETTER QUALITY CLASSIFIERS FOR SOCIAL MEDIA CONTENT: CROWDSOURCING WITH DECISION TREES

Rahul Rathore*

*Faculty of Engineering,

Moradabad, Uttar Pradesh, INDIA
Email Id- rahul.engineering@tmu.ac.in

ABSTRACT

A basic task in sentiment analysis is classifying the polarity of a given text at the document, sentence, or feature/aspect level whether the expressed opinion in a document, a sentence or an entity feature/aspect is positive, negative, or neutral. as social media use grows and increasingly becomes a forum for social debate in politics, social issues, sports, and brand sentiment; accurately classifying social media sentiment remains an important computational challenge. Social media posts present numerous challenges for text classification. This paper presents an approach to introduce guided decision trees into the design of a crowdsourcing platform to extract additional data features, reduce task cognitive complexity, and improve the quality of the resulting labeled text corpus. We compare the quality of the proposed approach with off-the-shelf sentiment classifiers and a crowdsourced solution without a decision tree using a tweet sample from the social media firestorm #CancelColbert. We find that the proposed crowdsource with decision tree approach results in a training corpus with higher quality, necessary for effective classification of social media content.

KEYWORDS:*Social Media, Sentiment, Classifier, Machine Learning, Decision Tree, Twitter.*

1. INTRODUCTION

Sentiment analysis (also known as opinion mining or emotion AI) is the use of natural language processing, text analysis, computational linguistics, and biometrics to systematically identify, extract, quantify, and study affective states and subjective information. Sentiment analysis is widely applied to voice of the customer materials such as reviews and survey responses, online and social media, and healthcare materials for applications that range from marketing to customer service to clinical medicine.

Precursors to sentimental analysis include the General Inquirer, which provided hints toward quantifying patterns in text and, separately, psychological research that examined a person's psychological state based on analysis of their verbal behavior. Advanced, "beyond polarity" sentiment classification looks, for instance, at emotional states such as enjoyment, anger, disgust, sadness, fear, and surprise. Subsequently, the method described in a patent by Volcani and Fogel,

looked specifically at sentiment and identified individual words and phrases in text with respect to different emotional scales[1]. A current system based on their work, called Effect Check, presents synonyms that can be used to increase or decrease the level of evoked emotion in each scale.

Many other subsequent efforts were less sophisticated, using a mere polar view of sentiment, from positive to negative, such as work by Turney, and Pang who applied different methods for detecting the polarity of product reviews and movie reviews respectively. This work is at the document level. One can also classify a document's polarity on a multi-way scale, which was attempted by Pang and Snyder among others: Pang and Lee expanded the basic task of classifying a movie review as either positive or negative to predict star ratings on either a 3- or a 4-star scale, while Snyder[8] performed an in-depth analysis of restaurant reviews, predicting ratings for various aspects of the given restaurant, such as the food and atmosphere (on a five-star scale)[2].

First steps to bringing together various approaches—learning, lexical, knowledge-based, etc.—were taken in the 2004 AAAI Spring Symposium where linguists, computer scientists, and other interested researchers first aligned interests and proposed shared tasks and benchmark data sets for the systematic computational research on affect, appeal, subjectivity, and sentiment in text.

Even though in most statistical classification methods, the neutral class is ignored under the assumption that neutral texts lie near the boundary of the binary classifier, several researchers suggest that, as in every polarity problem, three categories must be identified. There are in principle two ways for operating with a neutral class. Either, the algorithm proceeds by first identifying the neutral language, filtering it out and then assessing the rest in terms of positive and negative sentiments, or it builds a three-way classification in one step[3]. This second approach often involves estimating a probability distribution over all categories (e.g. naive Bayes classifiers as implemented by the NLTK). Whether and how to use a neutral class depends on the nature of the data: if the data is clearly clustered into neutral, negative and positive language, it makes sense to filter the neutral language out and focus on the polarity between positive and negative sentiments. If, in contrast, the data are mostly neutral with small deviations towards positive and negative affect, this strategy would make it harder to clearly distinguish between the two poles.

A different method for determining sentiment is the use of a scaling system whereby words commonly associated with having a negative, neutral, or positive sentiment with them are given an associated number on a −10 to +10 scale (most negative up to most positive) or simply from 0 to a positive upper limit such as +4. This makes it possible to adjust the sentiment of a given term relative to its environment (usually on the level of the sentence)[4]. When a piece of unstructured text is analyzed using natural language processing, each concept in the specified environment is given a score based on the way sentiment words relate to the concept and its associated score.

This allows movement to a more sophisticated understanding of sentiment, because it is now possible to adjust the sentiment value of a concept relative to modifications that may surround it. Words, for example, that intensify, relax or negate the sentiment expressed by the concept can affect its score. Alternatively, texts can be given a positive and negative sentiment strength score if the goal is to determine the sentiment in a text rather than the overall polarity and strength of the text. There are various other types of sentiment analysis like- Aspect Based sentiment analysis, Grading sentiment analysis (positive, negative, neutral), Multilingual sentiment analysis and detection of emotions.

Developing automated classifiers for social media content is an important problem for data scientists and privacy researchers. People are increasingly using social media to express opinions

on a wide range of issues spanning politics, social injustice, corporations, sports teams, and more. User's opinions can vary, ranging from support to opposition. Data scientists may apply automated classifiers to these data to understand public sentiment toward certain brands or social issues that are being debated online. Privacy researchers may be interested in using these classifiers to identify specific individuals within those online discussions to target key users or communities for influence interventions[5].

Developing automated classifiers to measure support and opposition is complicated by several factors to include short size of text, sarcasm, humor, political alignment, emoticons, among other factors. We investigate methods to overcome these issues using crowdsourcing and decision trees. Twitter is an online news and social networking service that allows users to post and interact with 280-character messages called "tweets".

As a result, Twitter's rich data can provide insight as to how the general public perceives a topic. With that value realized, a single tweet object can serve as a trove of metadata, including the tweet's content, the location it was sent from, and the time it was sent. Twitter provides a well-documented application programming interface (API) as a way to query Twitter data and fetch results in a standardized format, which can then be parsed for areas of specific interest.

Developing text classifiers for Twitter data using a supervised learning approach requires a gold-standard training dataset to develop and evaluate the veracity of potential classifiers. While there exist several off-the-shelf text classifiers for Twitter data, they may not be tailored to specific applications. We posit that the nature of an online firestorm (large, negative, online discourse) may be fundamentally different than the nature of discourse comprising the off-the-shelf training corpus. Furthermore, the performance of various off-the-shelf classifiers may differ and exhibit varied performance when applied to newly captured data. Finally, we posit that achieving agreement among humans classifying tweets in emotionally charged firestorms is highly problematic due to personal bias and conflation of sentiment, position, humor, sarcasm, and other challenges of assessing micro-blog data.

AMT is an on-demand crowdsourcing marketplace that allows individuals to request work from others online. This marketplace allows people to complete "human intelligence tasks" (HIT)—tasks that humans can currently do more intelligently than computers. It allows requesters to crowdsource data from tasks ranging from object detection in photos to text translation. The requester of the work specifies how many workers can complete a task, determines a monetary value to reward them with, and for the case of sentiment analysis of tweets, asking several workers to provide annotations for each tweet will improve the accuracy of the results. By having multiple annotators assess the tweets provided in the task, there will be random overlap of workers annotating the same tweet.

An important measure of quality in training data is the inter-annotator agreement (IAA). IAA is the level of agreement between raters (annotators), which is high if all raters consistently agree when independently labeling data and low when they disagree. Krippendorff's Alpha is best suited for this data because it can be adjusted for a variable number of annotators assessing different tweets, handles missing data, and is uniformly more powerful than competing methods[6]. Missing data will be an important consideration when using a decision tree approach, where annotators have the option of choosing "Not Applicable" when coding text labels.

In this paper, we propose a method to develop a high-quality, gold-standard training corpus tailored for firestorms. The proposed method utilizes crowdsourcing and guided decision trees to aid people in systematically labeling tweets. We contrast this approach with off-the-shelf classifiers and crowdsourcing without decision trees. We demonstrate that crowdsourcing with

guided decision trees improves the quality and feature space of the training corpus for developing automated classifiers.

2. LITERATURE REVIEW

This work contributes to the study of online firestorms. Firestorms are defined as "an event where a person, group, or institution suddenly receives a large amount of negative attention [online]"[7]. A firestorm can be characterized by an instance where sudden negative attention is in response to a recent action and arises without prior discussion. For the purpose of this research, the focus was placed on online protest and social debate—these events are often fast moving and often have part in influencing the public's perception of an issue.

The hashtag grew in popularity and ultimately made it on Twitter's list of trending topics for a nontrivial period, but it did not come without response from supporters of Colbert in defense of his comedic style. Because of this polarity, this firestorm shows the importance of detecting sentiment around a given hashtag, as individuals can tweet (using the hashtag) having strayed from the sentiment that the original author had hoped for. The data used in this paper are selected from a corpus of 80 firestorms presented by Lambda et al. [7].

Their data were obtained using Twitter's decahose, which represents an approximately 12% random sample of the Twitter content associated with the #CancelColbert firestorm. The additional 2% above the 10% of tweets is obtained by extracting retweet and mention messages from the 10% random sample of the corpus. Their #CancelColbert firestorm sample consisted of 10.1 MB of data and included 15,591 unique tweets. A sample of 200 tweets from this corpus was selected at random for use in an Amazon Mechanical Turk (AMT) experiment and in comparison with off-the-shelf classifier performance. While limitations of Twitter's sampling methodology are noted [8], these data represent a sufficient corpus for the purpose of evaluating construction of a gold-standard training set. Several off-the-shelf classifiers exist for assessing sentiment within Twitter data. AFINN, from Finn Årup Nielsen, is an English wordlist-based approach for sentiment analysis.

The AFINN lexicon assigns words with a score that runs between −5 and 5, with negative scores indicating negative sentiment and positive scores indicating positive sentiment [9]. The NRC Emotion Lexicon, from Saif Mohammad and Peter Turney, is a list of English words and their associations with eight basic emotions (anger, fear, anticipation, trust, surprise, sadness, joy, and disgust) and two sentiments (negative and positive). This lexicon categorizes words in a binary fashion ("yes", "no") if it fits into one of the emotion categories.

The Bing classifier, by F. Ceci et al., categorizes words in a binary fashion ("positive", "negative") [10]. When applied to a data corpus, however, each of the off-the-shelf sentiment classifiers differs somewhat in their assessment of sentiment. There are many potential reasons for this such as how classifiers treat the presence of sarcasm, humor, and colloquial symbols or text. Differences in classifier performance, however, bring into question the veracity of a given classifier for firestorm sentiment analysis. Developing a tailored classifier for firestorms requires the construction of a gold-standard training corpus.

3. DISCUSSION

The purpose of this project is to analyze the sentiment of politically, socially, and/or culturally charged tweets. Please try and identify them in this context. Keep in mind that you are to rate the Twitter user's sentiment or position, and that you are NOT rating the tweet based on your personal feelings on the subject. Please answer the following questions for a given tweet. Structuring the AMT crowdsourcing task in this manner allows additional features to be captured for the training corpus and is likely to screen out ambiguous sentiment in the cognition of the annotator. We posit that this will improve IAA. Ethics approval for this study was approved by

the Johns Hopkins University Institutional Review Board (IRB) for use of AMT workers in the crowdsourcing tasks. All AMT workers were presented with the background and purpose of the study and could opt-out at any time. AMT workers acknowledged informed consent prior to participation in the project.

It can be seen that all questions meet the Bayerl scale for good agreement and questions 1A, 2B, and 4 exceed the benchmark for excellent agreement. These questions require AMT workers to accurately assess tweet position, lack of sentiment, and humor, given that they accurately recognized whether a tweet expressed a position, sentiment, or humor. The guided decision tree allows the data scientist to effectively control for recognition when assessing IAA on coding/label assignment to twitter data. It is surprising that the IAA rate for the AMT experiment performs worse than the off-the-shelf sentiment classifiers. Consistency among off the-shelf classifiers with each other, however, does not mean that those classifiers are more accurate at classifying sentiment within this specific Twitter firestorm. It could represent a systematic bias. In any case, the best-case scenario still falls below established quality standards for use.

4. CONCLUSION

Constructing a Twitter training corpus using crowdsourcing with a guided decision tree appears to improve the quality of the corpus over off-the-shelf or simple crowdsourcing approaches. The decision tree effectively broke down a complex task into smaller problems that allowed AMT workers to achieve higher rates of agreement. It also provided a means for raters to remove bias when evaluating different types of tweets by first cognitively assessing the position and tone of the tweet prior to rendering a judgment. The ability to detect a positive, negative, or neutral sentiment remains a nuanced process, however, especially when language constructs such as humor and sarcasm are in play. Since these language paradigms are often difficult for a machine or artificial intelligence to detect, it is notable that AMT workers had a higher percentage of agreement when rating tweets for these factors in the guided decision tree approach. Arguably, linguistic factors such as humor and sarcasm are just as important (if not more important) as detecting sentiment, especially in a firestorm context surrounding a social debate. It is also notable that when AMT workers were not guided through a decision tree, the presence of humor and sarcasm degraded their IAA rating.

The AMT experiment was focused on a single firestorm corpus and utilized a random sample of 200 tweets. Future research may investigate additional firestorm corpora and may include random samples with more tweets. The required sample size estimation could be performed by investigating the sensitivity of IAA rating by randomly removing sampled tweets. Similarly, the same decision tree structure could be applied to different corpora to evaluate the sensitivity of the data corpus on the findings. Despite these limitations, this paper further demonstrates the inherent limitations of off-the-shelf classifiers. It highlights unique challenges for sentiment classification present within online protests. As Internet activism flourishes due to the immediacy of social media, the hasty spread of information, and political engagement; construction of high-quality training corpora becomes more important. These data challenges call for more work in classifying additional data features such as emotion, sarcasm, humor, polarizing positions, and even “hijacked hashtags”. The crowdsourced, decision tree approach presented in this paper has proven effective in developing a high quality gold-standard training dataset that outperforms off-the-shelf solutions.

ABSTRACT

Mobile cloud computing (MCC) is a recent technology used by various people in their daily lives. It is estimated that roughly 1.5 billion smartphone users and 640 million tablet users in the world use mobile cloud computing. Mobile cloud computing (MCC) is the blend of cloud computing, mobile computing and wireless networks that brings rich computational resources to mobile users, network operators, as well as cloud computing providers.Mobile Cloud Computing (MCC) is a recent technology used by various people worldwide. In 2015, more than 240 million users used mobile cloud computing which earns a profit of $5.2 billion for service providers. MCC is a combination of mobile computing and cloud computing that presents various challenges like network access, elasticity, management, availability, security, privacy etc. Here, the security issues involved in both mobile computing and cloud computing, such as data security, virtualization security, partitioning security, mobile cloud application security and mobile device security are considered extremely important. This paper presents a detailed study of security issues in mobile cloud computing and enumerates their preventive measures.

KEYWORDS: *Mobile Computing, Cloud Computing, Security, Virtualization, Privacy, Authentication, Storage.*

1. INTRODUCTION

The simplified definition of mobile cloud computing is: distributed computing is characterised as the pattern in which resources are given to a customer on an on-demand premise, for the most part by methods through the web[1]. Mobile cloud computing uses infrastructure as a service platform of the cloud for storage and processing, and cloud-based applications move the computational power and information storage into the cloud. MCC is a rich mobile computing technology that leverages unified elastic resources of varied clouds and network technologies towards unrestricted functionality, storage and mobility, and serves a multitude of mobile devices anywhere anytime through the Internet regardless of heterogeneous environments and platforms based on the pay-as-you-use principle. Mobile cloud computing is used by the user using various browsers available like Chrome, Firefox. UC Browser, etc. Mobile cloud

computing is one of the quickest developing segments of the cloud computing worldview. Apple and Google are the two playing the main role in the development of mobile cloud computing. By 2016, 60% of mobile development industries have used cloud services as pay-as-use that reduces resource deficiency and makes devices compatible to use cloud services in mobile devices.

1.1.Mobile Cloud Service Models

The concept of mobile cloud computing is categorized in different service models. Some of the prominent models of mobile cloud services are as follows.

- Mobile Cloud Infrastructure as a Service (MIaaS) This service model provides the cloud environment and storage facility for the mobile user. It is like the infrastructure as a service model of cloud which provides all the infrastructure for cloud. The example of MIaaS is Apple iCloud: it is Apple's own cloud-based storage system and initially, it gives 5 GB free storage. The other examples are Amazon Cloud, Dropbox, Google Drive, Microsoft OneDrive, etc.
- Mobile Network as a Service (MNaaS) This service model offers network infrastructure to users for creating a network. In other words, we can say that mobile network as a series is used to create a virtual network and for connecting mobiles with servers. The example of MNaaS is OpenStsck: it is used to create virtual networks. The other examples are CoreCluster, OpenVZ, SmartOS, etc.
- Mobile Data as a Service (MDaaS) This service model provides database service so that mobile cloud users can perform data management and other operations to their data. Example: CloudDB-Cloudbased database made for mobile cloud computing. Oracle's mobile cloud data as a services.
- Mobile Multimedia as a Service (MMaaS) This service model offers a platform to access or run the multimedia in the cloud environment, like playing high-memory capacity required games, playing high-definition videos, etc.
- Mobile App as a Service (MAppaaS) This service model provides a platform to users for executing the app, and the using app also manages the apps using the wireless network. Examples: Apple App Store, Google Play Store, etc. 2.6 Mobile Community as a Service (MCaaS) This service model offers the facility to mobile users to create a community network or social network and to manage all such networks and get the services needed for them.

1.2.Generalized Security Requirements

International Telecommunication Union (ITU) and US National Security Agency [8, 9] have defined and laid down certain generalized security requirements of mobile cloud computing. They are as follows.

- Confidentiality is a fundamental requirement because mobile users' data are processed through the public network and is also stored in public servers. So there is a high chance of unauthorized access to mobile users' data, owing to which the issue of confidentiality is a big challenge to mobile cloud service providers.
- Availability means cloud service is always available for users 24/7 when they need the service. There are various attacks that affect availability, but mobile cloud computing service providers need to prevent them and always ensure the service is available for mobile users.
- Authentication and Access Control means identifying the valid user of the system by some login patterns or any other mechanism called authentication. Giving access to limited resources to authenticate users of the system as they want to do some task is called access

control. Actions performed by users like reading, writing, updating, erasing data, etc. are all controlled in access control.

- Integrity means prevention of data loss or data modification while transmitting it through the public network. Integrity deals with consistency and accuracy of user data.
- Privacy is the security of mobile user's personal data while communicating in the cloud, achieved through confidentiality, integrity and authentication.

1.3. Challenges in Mobile Cloud Computing

Mobile cloud computing is a service of cloud computing used in smartphones or in tablets. Mobile computing and cloud computing combine together to form mobile cloud computing and give services of cloud to mobile computing users like on demand self-service, resource pooling measured services, elasticity, broad network access. Mobile cloud computing uses wireless communication technology to communicate between mobile and cloud. Owing to the combination of mobile computing and cloud computing and use of wireless communication, we face many challenges in mobile cloud computing, such as limited resources for mobile devices, stability challenge occurring due to limitation of wireless network, cost of network access going high various times in mobile cloud computing, elasticity challenge, security and privacy challenge, bandwidth of channel, energy efficiency, quality of service, etc. This paper is divided into four sections. The introduction section throws light on the journey of mobile cloud computing, its various definitions, statistics, service models and security requirements of mobile cloud computing and challenges it faces. The second section discusses the security issues of mobile cloud computing. The third section presents preventive measures relating to security issues, and the fourth section gives the conclusion (Figure 1).

1.4.Data Security Issues

In mobile cloud computing mobile user's data are available and stored in the cloud and the processing of that data is also done in IaaS of the cloud. Many attacks are executed on data of mobile cloud computing like data loss, data breach, data recovery from damage, data locality, data correctness, etc. In data loss, user's data are mossed while performing any computational task; for example, while transmitting data through public network. In data breaches, an authorized user's data are accessed by an unauthorized person by injecting into the cloud or by getting it using any unwanted activity. In data recovery from damage issues, a user should get valid data of his own while recovering due to damage of system or mobile device. Cloud stores the data in any data centre; so the location of that data not known to anyone. So the challenge is that the user should know where his important data are stored. Data management is done in the service providers' premises and they need to maintain confidentiality and integrity.

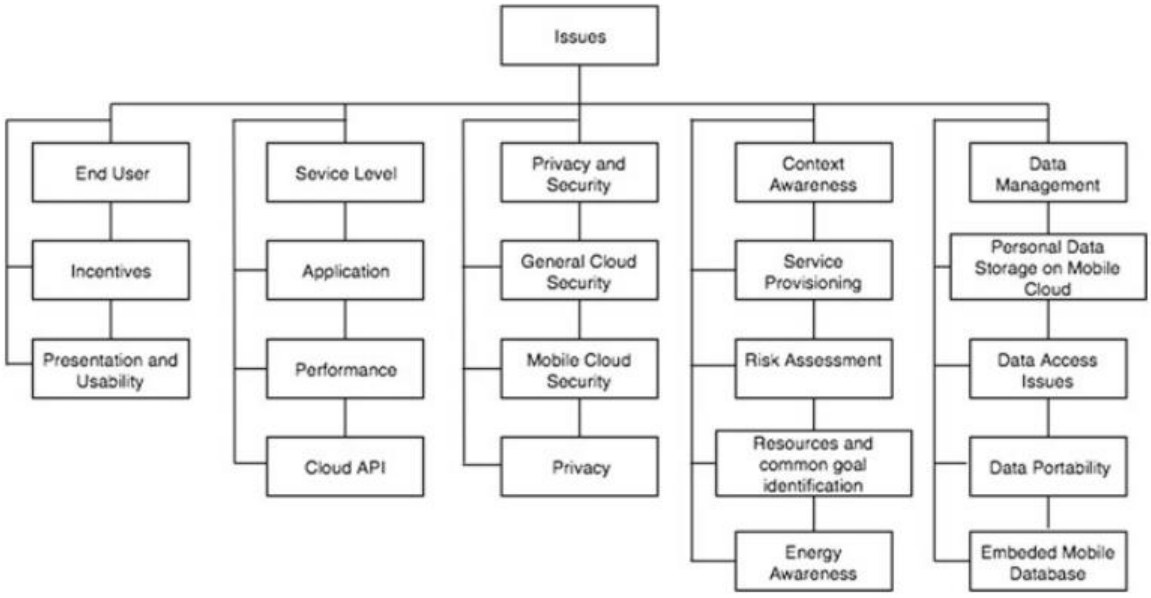

Figure 1: Issues in Mobile Cloud Computing with Respect to Other Computational Activities.

1.5.Virtualization Security Issues

Cloud services are provided to mobile users using virtualization. A virtual machine of mobile is re-installed in the cloud, which is called as mobile clone, and this cloud based virtual machine does all the processing. The main advantage of using a virtual machine is that it creates instances of various machines and this is achieved through the hypervisor. But the challenges to the virtual machine used in cloud computing are unauthorized access to the main machine through virtual machine, root attack, VM to VM attack, communication in virtualization and confidentiality of data while being processed through hypervisor.

1.6.Offloading Security Issues

Offloading means transformation of the task to an external platform. Mobile cloud computing requires wireless network for offloading in the cloud, but precisely because of this, unauthorized access of data is possible during offloading. The main issue in offloading is availability which happens because of the jamming of the mobile device while the offloading is taking place. Also, while offloading of data if it contains any malicious content, then it affects the confidentiality and privacy of the mobile user.

1.7.Mobile Cloud Applications Security Challenges

Various mobile cloud applications are affected by various malware, worms, Trojan horse, botnet, etc., which in turn affect the confidentiality and integrity aspects. These malwares are run in mobile devices and bind themselves in the application and mutate, which cause very serious issues to mobile cloud computing.

This is the most ubiquitous issue in mobile cloud computing occurring due to theft or loss of the mobile device. Here, the main loss is of the user's data. If the attacker gets access into any mobile device then unauthorized access to data and application occurs. The device can also be used to do some unwanted tasks like botnet: to carry out DoS or DDoS attack through mobile device. A new attack related to power consumption is carried out on mobile devices when the device is connected to the wireless network; then its power consumption increases to discharge device battery fast. Mostly, a mobile device stores user's personal information into internal storage; but when the user uses mobile cloud computing then all data are synchronized to cloud

and there the security of user's personal data becomes insecure. In mobile computing, malware and viruses constitute the very old methods of attacks but they are effective and work in mobile devices.

2. LITERATURE REVIEW

Liang et al. have given a technique to secure virtual machine deployment, which uses mandatory access control technique to control resources and gives powerful isolation from guest virtual machines[2]. Hao et al. invented a new SMOC technique which gives permission to make a copy of operating system and application of mobile to a virtual machine on the cloud for data security[3]. Paladi et al. developed cloud infrastructure which includes virtual machine launching and data protection protocol[4]. Virtual machine launching is used before a guest virtual machine and data protocol ensure confidentiality using the cryptographic technique.

Mollah et al. have given data sharing and searching technique for mobile devices for sharing and searching data in the cloud securely through public and private key encryption and digital signature[5]. He introduced the remote data audition method which verifies and stores data integrity in the cloud. He also developed a divide and conquer table (DCT), which updates at the block level.

Odelu et al. proposed a technique to access control and outsourcing computational process from cloud to mobile[6]. Here, two schemes are developed: Secure and lightweight CP-ABE (SL-CP-ABE) and CP-ABE-Constant size type text and secret key (CPABE-CSCTSK). Li et al. developed secure accessing in cloud platform 2SBM (Inter-crossed Secure Big Multimedia Model), which is based on ontology access recognition and matching algorithm[7]. Alqahtani and Kouadri-Mostefaou designed the framework based on distributed multi-cloud storage, encryption and data compression, in which data are divided into segments, then the encryption of segments takes place and then these encrypted segments are compressed[8].

Jin et al. developed (hardware-assisted secure virtual machine (H-SVM) technique which secures guest virtual machine from infected hypervisor by memory virtualization [9]. This technique is very useful and it is less vulnerable. Vaezpour et al. developed a SWAP technique for phone clone. This technique is based on two other techniques: first, securing mobile clone to lessen the threats for data leakage from the virtual machine and second, migration of clone when the threatened virtual machine is at high-level risk[10].

3. DISCUSSION

Application offloading technique in which users' private information is kept within the mobile while offloading is being performed. Owing to this, unauthorized access and integrity security problems do not occur. This technique preserves privacy and also saves energy. This technique consists of three steps: in the first, data are divided into sensitive and non-sensitive segments, in the second, sensitive data processing takes place on the device and in the third, non-sensitive data processing takes place in cloud. Profiling and decision-making are used for dynamic partitioning to reduce power consumption and decrease security issues. Offloading engine is used to offload app to cloud for processing. Cloud manager-based re-encryption scheme (CMReS) cryptographic method which protects offloading. This method uses encryption, decryption and re-encryption of data for more security while offloading and, additionally, it is under the control of client organization.

Application program interface (API) model consisting of three factors: first, authentication with user registration with storing passwords, second, security mechanism like encryption, decryption, digital signature and third, API with backend services. Secure mobile cloud (SMC) developed an application to confirm the security of data communication in the cloud as well as in mobile device. It measures the integrity of application when interacting with a mobile device. In

application integrity, first verification of application takes place, and then its signature is matched with the original application signature for finding any attachment in it. In this application, six different managers are used: mobile manager, mobile security manager, cloud security manager, optimization manager, application manager and policy manager.

4. CONCLUSION

In the first section of this paper, mobile cloud computing is explained in detail, which includes definition, history and security introduction about MMC. Various security issues are available for mobile cloud computing. However, the issues discussed in this paper are basic and very important. The prevention measures enumerated are very recent solutions to security issues of mobile cloud computing. A technique for authentication of the user by using biometric features. In this technique, biometric includes the hand movement of a user grasping the mobile which generates patterns and those patterns are used for identification of authorized and unauthorized users. In authors discussed Google device policy application. This application is very much useful when the mobile device is stolen or lost user can clean his data online and also enables device token (unique key) which ensures the notification security. the approach of OpenFlow in which OpenFlow switch is integrated with mobile to do the job of redirection, while communication of mobile and all cloud data is passed through OpenFlow, so that the data are secure while being transmitted.

Great history does not disappear without a trace.

It is kept and reproduced in genetic code

Of people, in their historic memory and deeds.

Its mightily power lies in this.

Retention and studying the historical heritage,

Transfering it from generation to generation

Is one of the most important?

Priorities of our government

Sh.Mirziyoyev

Prezident of the Republic of Uzbekistan

INTRODUCTION

We know that today's wool music teachers must work hard be creative and respect children.The concept of "competence" is a psychological study in the field of educationas a result. Competence is based on "the ability of a specialist to behave in unusual situations, in unexpected situations, to communicate, to communicate with competitors, to perform uncertain tasks, to use

information from conflicts, to develop more and more consistently".Special knowledge by a professional competence specialist.

Competence requires constant enrichment of professional knowledge, learning new information, understanding of important social requirements, and the ability to search for new information, process it and apply it in their work.

Educator as a specialist: - Improving the pedagogical process on the basis of a clear goal, aspiration; - increase the efficiency of the pedagogical process, its activity; - Assimilation of pedagogical knowledge, which is constantly updated; - be aware of advanced technology, methods and tools; - effective implementation of the latest scientific and technical innovations in its activities; - professional skills and competenciesimprovement; - His practical actions in the search for measures to prevent and eliminate negative pedagogical conflicts represent his work on himself.It is useful for educators to be project-oriented in their consistent, effective work. It is desirable that they be able to form the following model on the basis of a project approach. The model records the stages of self-study and the tasks to be performed at each stage. The effective solution of the tasks set for each stage allows to move to the next stage. Once the tasks of a certain stage are solved, the educator notes this situation in a separate paragraph.The ability of the educator to self-analyze is also important in gaining professional competence. Self-analysis is the study of the essence of one's own practical actions organized by the educator in professional activity. Through self-analysis, the educator is able to make an objective self-assessment. After all, it is important for educators to have the qualities of professional competence, as well as their self-assessment skills.Self-Assessment (OEA) - through self-analysisself-esteem. Self-assessment of the subject's personal capabilitiescalculation, self-assessment, self-satisfactionprovides.

THE MAIN PART

Self-assessment is the manifestation of one's abilities in one's own strengthyou need help. Self-assessment, but directly to the individualcan be prepared.A number of factors affect the ability to evaluate effectively. SelfEffective evaluation factors:

1. Self-understanding (having clear information about oneself).

2. Awareness of self-worth as a person (positive about oneselfdata collection).

3. Self-control (of personal opinion about oneselfconforming to the value given to him by those around him.

The level of self-esteem is one’s self-satisfactionunsatisfactory. In this case, the indicators of self-esteem are the individualcapacity. Self-increasing or decreasingdisplay leads to inaccurate self-assessment indicators.In a number of studies, the specialist, including the educator himself. The "Individual Development Program" is said to be useful in the development ofthe Individual Development Program (IRD) is for each individuala certain quality in the specialist himself, BKM, professional competencedeveloped based on the needs of formation and developmentprogram of personal-practical character.Like any specialist, the educator is personal-practical for himselfto develop an "Individual Development Program" of a character. It is necessary to organize pedagogical activity on the basis of educator's individual development program - as a specialist. The teacher individually has this or that professional-pedagogical quality, formation of knowledge, skills, abilities, qualities of professional competenceand personal-practical developed based on development needscharacterprogram“Individual development.

The program consists of the following elements:

1) Pedagogical knowledge

2) Psychological knowledge;

3) Specialty knowledge;

4) Didactic skills;

5) Skills of organization of educational work;

6) Professionally important features of the psyche and personal qualities;

7) Goals of self-development;

8) Assignments for self-development.

In the science of music, Farobi was not only a theorist but also a practitioner. He is also a well-known musician, a great musician and composer, and an inventor of new musical instruments. Reflecting on the amazing magical power and miraculous effects of music, Farobi writes in On the Origin of the Sciences: In particular, in the national culture, music reveals a world of high emotions, pleasure - exciting ideas. It brings people to a level of spiritual richness, pure perfection. The child can still feel the music without knowing how to hold a pen and read and write. Often these first impressions influence the formation of attitudes towards music. Therefore, music education has also been included in the main directions of the reform of general education schools. Music, first and foremost, softens children's emotions. Like the sense of musical works, it evokes many human qualities in them. Of course, literature, history, sports and other fields play an important role in the development of human qualities. Therefore, poetry and music always live side by side. The sense of music is born under the influence of nature, and is formed in kindergarten and school. Music lessons educate students not only in terms of sophistication, but also in a broad sense, spiritually and morally. It would be good if our songs, which have been passed down from generation to generation, and which have withstood the ravages of time and embodied the dreams, aspirations, thoughts and aspirations of the people, should be included in the curricula of all types of educational institutions.The world-famous writer ChingizAitmatov writes in his novel "Kunda": "... life, death, love, passion and inspiration are all sung by music, because we achieve the highest freedom through music, for this freedom from the time when our minds were enlightened.We've struggled all our history, but we've only achieved it through music. " The masterpieces of music created by our people are to a certain extent reflected in every activity, every second - in education, work, and social relations. National music teaches to perceive and appreciate the beauty of the surrounding events, armed with delicate taste and free thought, and expands the spiritual world.

In the activity of singing, a musical worldview, musical taste is formed. In this type of activity, children sing based on their musical knowledge. To do this, they assimilate information relevant to the piece of music. In the process, they develop a musical outlook and musical taste. In music literacy activities, musical thinking, imagination and musical worldview are formed. In this type of activity, children learn about the history of music, the means of expression of music - rhythm, meter, register, measurement, mode, tempo, note path and writing, length and pitch of sounds, music creators, performers, as well as their musical thinking. This in turn takes children into the world of music and shapes their musical worldviews.

Musical worldview, musical taste, musical thinking, musical perception, musical sense of rhythm and musical memory are formed in children in the process of accompaniment on musical instruments. In this type of activity, almost all musical psychological features are formed in children. In this activity the child thinks independently (musical thinking), as a result of which his musical worldview is formed. At the same time, it should be noted that music, regardless of the type of activity, helps to form all the psychological aspects of the person. It should be noted that each of the musical activities has its own influence, albeit partial, on the formation of all the

listed psychological features. In particular, it shapes musical emotions, musical worldview, musical perception, musical thinking, musical imagination, and musical ability. So, they also have an impact on the formation of children's general musical culture, aesthetic worldview. This is one of the most important aspects in the development and upbringing of a harmoniously developed person. The pedagogical nature of music has a great impact not only on the individual or the individual, but on society as a whole. Because music has a special significance as it has a spiritual effect on people's hearts. Therefore, academician Said Shermuhammedov connects this process with artistic and aesthetic activity. That is, "The experience of the development of literature and art, the whole artistic culture, - says the scientist, - shows that the ideal of the creator is embodied in the content of the work on a universal scale, brightly individualized - in vivid unique images, humane spiritual, artistic-aesthetic, moral-spiritual If it is high in terms of quality, it will be such a huge contribution to the treasury of world culture."So, considering the impact of music on the human heart, we see that the above ideas are directly related to the art of music itself. The educational nature of music is manifested in a number of aspects in the relationship between science - man - society - natures. Therefore, the attention paid by our state to music, literature and art shows that its influence is enormous.

First, music shapes and strengthens a healthy lifestyle. Nowadays, the penetration of music therapy into medical science is a new direction in science, which is giving its effective results in the treatment of human diseases with music, through music. Second, it eliminates some of the flaws in people's behavior and the mentality of nations. That is why music is called "philosophy without language". After all, the acquisition of musical knowledge is closely linked with the spiritual world of the individual In conclusion, it should be noted that future educators are stillprofessional, individual competence is underdeveloped. Self-assessmentand in assessing the level of pedagogical competence for themserves as the main criterion. Every educator is constantly on their ownshould go its own way. This is their future mature staffprovides.In any case, it takes a lot of work to be proud of the profession of music teachers, because music gives people kindness and peace.

INTRODUCTION

The role and importance of the mahalla in the socio-political, economic, spiritual and ideological life of Uzbekistan is enormous. The mahalla is a social institution that reflects the character, lifestyle and content of the Uzbek people, and usually unites, organizes, directs and encourages the nation to act on a community basis.

During the Soviet dictatorship, the ruling system and political ideology did not officially recognize the mahalla as a national social institution, but instead treated it as a remnant of antiquity, a remnant of "medievalism." Under Soviet ideological pressure, the Uzbek Supreme Legislature banned all financial and economic activities in the mahalla in 1961. However, such conflicts did not negatively affect the place, role and importance of the mahalla in Uzbekistan. The neighborhood continued to function as an independent self-governing entity, and people made no secret of the fact that they needed his help in solving their problems.

Emphasizing the importance of the issue, the first President of the Republic of Uzbekistan I.Karimov said: we see that the essence is growing day by day. Therefore, the role of the mahalla in our life is high, its legal framework is developing in all respects, the more we strengthen this institution as an integral part of the political, economic and spiritual life of our society, the lower management system, create all the material and financial conditions. , I think this will be a big step towards achieving the lofty goals we have set for ourselves ”[1-P.109].

Taking into account the fact that the mahalla is an influential socio-political, economic, spiritual and ideological institution, Article 105 of the Constitution of the Republic of Uzbekistan states that “ (elder) and elects his advisers [2-P.29].

In September 1993, the Law "On Citizens' Self-Government Bodies" was adopted. According to him, the mahallas had their own legal status and became part of the local government. This means that mahallas, as an important pillar of the state on the ground, as a legal entity, have their own property, financial budget, bank account-fund. Thus, in the context of achieving state independence and political sovereignty, there is a growing desire to restore the national form of statehood, to make fuller use of national traditions and customs in the social life of the peoples of Uzbekistan.

The Law “On Citizens' Self-Government Bodies” [3-P.189] defines the mahalla, the duties and responsibilities of its chairman. In particular, Article 22 provides for public control over the protection of the interests of citizens in public authorities and administration bodies, courts, enterprises, institutions, care for the welfare of the neighborhood, assistance in improving trade and communal services, providing a culture of service to citizens. to assist in monitoring the sanitary condition of settlements, water supply sources, housing, schools and other institutions; it has been established that it has a number of powers, such as making proposals for the improvement of living conditions ”[4-P.12].

Given the growing prestige of the mahalla since the early days of independence, the Uzbek government has begun to pay special attention to it. On September 12, 1992, the Decrees of the First President of the Republic of Uzbekistan I.Karimov "On the establishment of the Republican Charitable Fund" Mahalla “and on October 8, 1992" On the allocation of funds to the Republican Charitable Fund "Mahalla” were issued.

On October 17 this year, the resolution of the Cabinet of Ministers “On the organization of the Republican Charitable Fund”“Mahalla” was published. The resolution identifies the following main areas of the Fund's activities:

- Wide promotion of historically formed national and spiritual values, popularization of the best customs and traditions of our people, the organization of cultural and educational work among the population of the republic;

- Carrying out active propaganda and advocacy work on humanity and compassion, mutual understanding between people and the explanation of the ideas of good neighborliness;

- Comprehensive social protection of the rights of low-income families, the disabled, the elderly and children living in each specific area;

- Holding various traditional ceremonies;

- Free financial assistance to needy families and individuals;

- Beautification of mahallas;

- Coordination of work to improve the activities of local mahalla committees of the republic [5-P. 36].

In Kashkadarya and Surkhandarya regions, serious and exemplary work has been done to increase the place and role of mahallas, their role in social protection. It should be noted that the difficult economic situation in Uzbekistan in the early 1990s, the breakdown of existing economic mechanisms, unemployment, certain difficulties in the part of the population in need of social protection required the Uzbek government to take serious action in this regard.

In particular, in accordance with the Decree of the first President of the Republic of Uzbekistan I.Karimov "On measures of social protection in connection with the liberalization of prices" on December 29, 1997, the minimum wage was increased 5 times and increased from 70 to 350 soums [6-P. 75].

Supporting the lonely elderly was especially important during this period. There are 30,573 of them in the country, of which 1,717 were from Kashkadarya and 1,861 from Surkhandarya region [7-P. 120].

In the activities of neighborhood funds, priority was given to the issues of social protection of lonely elderly people, lonely citizens in general, large families with minor children. On August 23, 1994, the Decree of the First President of the Republic of Uzbekistan "On measures to strengthen the social protection of low-income families" began the participation of citizens in the performance of state functions of local self-government [8-P. 120].

According to the decree, special funds were established to provide financial assistance to citizens of castles, villages, auls and mahallas - low-income families in self-government bodies, the main sources of which are the republican and local budgets, extra-budgetary sources - public and charitable funds, enterprises, farms and citizens. organized voluntary donations. Also, from October 10, 1994, low-income families were instructed to make monthly payments from the funds of these funds.

Low-income families were determined based on the recommendation and opinion of the neighborhood committee. That is, low-income families include low-income families and single citizens who, for objective reasons, are unable to meet the basic needs of the family (large families with minor children, families with chronic disabilities, families of the unemployed, single pensioners and others in dire need). families) and provided monthly financial assistance.

Financial assistance to low-income families is determined by the decision of the citizens 'assembly of the village, village, aul, urban mahallas, and if it is not possible to convene a meeting, the meeting of citizens' representatives of castles, villages, auls, streets, settlements , 1.5 to three times the current minimum wage, the allocation and unused budget funds to self-government bodies to be spent on the improvement, gasification and water supply of housing, as well as other social problems, according to the decision of the citizens' assembly the need for [9-P. 150].

The issue of providing financial assistance to low-income families was one of the most difficult, complex issues, because it was necessary to solve the problem only from the point of view of justice, objectively. It should be noted that this was a manifestation of democracy, its practical solution.

Given the fact that the Uzbek people are a nation with many children and its role in creating certain difficulties in the social protection of the population, the government has paid great attention to the issue of financial support for families with children. In this regard, it is worth noting the Decree of the first President of the Republic of Uzbekistan I. Karimov dated December 10, 1996 "On further strengthening the state support of families with children." According to him, from January 1, 1997, benefits for families with children are appointed by citizens' self-government bodies - towns, villages, auls, mahallas, and the need for such pensions is taken into account. According to the above, families with 1 child will be paid 100% of the

minimum wage, families with 3 children - 140%, families with 4 or more children - 175% [10-P. 150]. The decree emphasizes the need to adhere to the principles of social justice, ensure wide openness and transparency, and achieve targeted and effective use of allocated funds when making decisions on benefits for families with children. By the second half of the 90s of the last century in Uzbekistan there was a formation of the mahalla as a socio-political, economic, spiritual and ideological institution and an independent entity. They provide a just solution to human problems, protect the economic, social, spiritual and legal interests of families, provide social protection to low-income families, the elderly, war and labor invalids, orphans, victims of natural disasters, beautification and comprehensive assistance to them. as an organ has gained an influential reputation in society.

In this regard, a lot of positive work has been done in Kashkadarya region. In 1998, there were 1 city in the region, 14 districts had branches of "Mahalla" funds, which included 368 mahallas with legal status. Of these, 180 were reorganized in urban and district centers, and 188 were reorganized under rural citizens' assemblies. 226 mahallas operated on a community basis in the villages. 368 mahalla elders and as many secretaries were paid from the local budget in the khokimiyats.

The regional branch of the Mahalla Foundation has done a lot of good work. In 1997 alone, food products worth 35,000 soums were distributed to 50 families on the occasion of Navruz. On the eve of the Independence Day of the Republic, clothes worth 36,000 soums were donated.

The activists of the mahalla regularly supported the activities of entrepreneurs and businessmen in the region in the field of social protection. Gulchehra Pirimkulova, chairman of the Karlugbogot mahalla in Karshi, Tora Mansurov, head of the Mansur ota private teahouse, Samad Nasrullaev, head of the Ali Salim teahouse, and Ahmad, head of the Rohat Ahmad teahouse in Kasan district. Dozens of entrepreneurs, such as Hoji Nasriddinov, spent part of their income on neighborhood improvement, social protection of low-income families [11-P. 2].

It should be noted that the task of the mahalla was not only to solve the material and economic problems of the population. The neighborhood has become the center of socio-political, spiritual and ideological life of the people. Attention was paid to such issues as increasing the social activity of the population, raising the legal culture, political level.

As a result of the work carried out, the trust of the population in the neighborhood committees has increased. The reason for this is that the mahallas have begun to move to the practice of purposeful work among the population in the organization of their social protection.

For this purpose, the needy population of Surkhandarya region was analyzed and a system of material and economic assistance and charity was developed. In particular, in 2005, financial assistance and benefits were provided to 5 categories of the population. These were:

- large families;

lonely senior citizens;

families and orphans who have lost their breadwinners;

families with disabilities;

other categories of needy families.

In providing material and economic assistance and charity to this category, neighborhood committees were not limited to the use of budget funds. In general, such assistance was provided by the Mahalla Foundation, the mahalla citizens' assembly and other sponsors. For example, in the third quarter of 2005 alone, sponsors provided $ 55.2 million to large families in Termez.

soums, 23.2 mln. soums for Sherabad district. soums, for Qizirik district - 41.4 mln. soums, 42.5 mln. soums for Angor district. UZS were allocated [12-P. 27].

Such a sponsorship movement gradually gained momentum during the study period. Due to the gradual strengthening of economic stability in the country, the improvement of market relations, the development of business and entrepreneurship, the opportunities to support the most vulnerable segments of the population have also expanded.

At the same time, the efficiency of neighborhood committees has increased. For example, in 2005 there were a total of 651 mahalla committees in Surkhandarya region. They had 642 consultants. In general, since 2003, the establishment of consultative positions on religious enlightenment and spiritual and moral education under the mahalla committees has become a great event. Such counselors could easily penetrate into the population, especially in the process of working with women, they would get acquainted with their problems, and ultimately give clear advice.

As a result, the work in this direction began to bear fruit. According to 2005 data, 1824 different events on various topics were held in Surkhandarya region. Neighborhood committees have also begun to pay special attention to the employment of the population, especially women. In 2005 alone, 1,323 women were employed in Surkhandarya region.

In Kashkadarya region, the movement of kindness to the population has expanded. According to 2006 data, the total number of low-income families in the region was 21,075. 16,500 of them received financial assistance. The volume of provided financial assistance amounted to 20256.1 mln. soums. Mercy Aid of Entrepreneurs has expanded. For example, in Kasbi district 10 families were given one head of cattle, in Mirishkor district 4 families were given 4 head of cattle, in Karshi families in need were given 10 carpets, 6 TV sets [13-P. 21].

During this period, the Surkhandarya regional branch of the "Mahalla" Fund received a total of 721 applications and complaints from various organizations and citizens. In particular, 193 applications were registered in 2002, 93 in 2003, 97 in 2004, 104 in 2005, 111 in 2006, and 123 in 6 months of 2007. These statistics show that the number of applications and complaints has been increasing year by year. The reason for this can be understood in two ways. On the one hand, in some places there are violations of established procedures. Second, citizens have increased confidence in neighborhood committees, which have viewed this body as an institution that can express their concerns and receive support.

At the same time, new initiatives have emerged in the activities of a number of mahallas. In 2006, the Surkhandarya regional branch of the Mahalla Foundation held a regional competition to promote the activities of advanced mahallas. According to him, N.Azamov from Boysun district, Navruz from Angor district, Rabatak from Qizirik district, Yangi Hayot, Uchkun from Termez, Alpomish, Mehnat-rohat from Jarqurghon district, Ismoiltepa, Kumkurgan district. It was recommended to popularize the activities and experience of “Dustlik”, “Polvontosh” in Shurchi district, “Navruz” in Denov district, “Yangiabad-1”, M.Ulugbek in Sariosiya district, “Yangi guzar” in Uzun district, “Navbahor” in Bandikhan district.

In 2002-2007, the regional, city and district branches of the Mahalla Fund received 1,560 million soums. Of this, 822 mln. soums from charitable hashars, 598 mln. UZS are funds received from sponsorship charitable donations.

Neighborhood committees used various methods and tools to provide material support to low-income families. In 2007, the Fund and sponsors provided 43.4 million soums to 2,560 children from low-income families and boarding schools in Surkhandarya region. soums worth of clothes were given. In particular, the Mahalla Fund provided 6 million soums to 511 children from low-

income families at the expense of regional branches and divisions. Assistance in the amount of 300 thousand soums was provided.

In connection with the holiday "Navruz" at the expense of funds received from the charity hashar and sponsors 2151 low-income and large families received 24.4 million soums for children and the disabled. UZS were provided. In Termez, at the initiative of the city administration and the foundation, sponsors organized special charitable events under the program of the Year of Social Protection, which provided assistance to 27 needy families. In particular, 4 TV sets and 40 carpets were given as gifts [14-P. 28].

The role of mahallas in the social protection of citizens, the improvement of the material and economic situation of low-income families, the needy population has been growing. Due to the growing activity of local self-government bodies in the Republic of Uzbekistan, efforts to build civil society, the rights of neighborhood committees have expanded. Now it has become difficult to hold any serious event without the recommendation of this social institution.

In 2008, 27,271 small businesses and private entrepreneurs operated in Surkhandarya region at the initiative of mahalla committees. In the first 9 months of 2008, 29.8 billion soums were allocated for their financial support and business start-up. soums were allocated. In addition, 14,449 young families received 4.7 billion soums from commercial banks. Mortgage, consumer and microcredits were allocated in the amount of UZS [15].

On the recommendation of the neighborhood committees, 68,000 people in Karshi alone were involved in small business.

The role of the neighborhood in supporting young families has also increased. In 2007, the regional branch of Asaka Bank in Kashkadarya region issued mortgage loans worth 1,068,000 soums to 31 young families. During the first 5 months of 2008, 34 young families received loans worth 852,500,000 soums.

In 2012, 59% of the total state budget expenditures were directed to the social sphere, ie to meet the needs of the population, real incomes increased by an average of 17.5%, salaries, pensions and stipends increased by an average of 26.5%. need to do.

In 2013, the increase in real incomes, including salaries, pensions, social benefits and stipends, increased by more than 23%.

In accordance with the state program "Year of the Healthy Child" in 2014, weddings of more than 700 children from low-income families were held.

In 2015, 2 trillion 246.5 billion soums and 229.6 million dollars were allocated for the implementation of the State Program. The “Strategy of actions on five priority directions of development of the Republic of Uzbekistan” [18], adopted on February 7, 2017 under the direct initiative and leadership of President Shavkat Mirziyoyev [19], also ushered in a new era of development in the life of our people. The announcement of 2017 in our country as the "Year of dialogue with the people and the interests of man" also has great significance. “The main goal of these reforms is to ensure a decent standard of living and quality of life for the population. The main priority is to consistently implement the noble idea that "human interests take precedence over everything else."

Today, the main goal of our life, which is reflected in our Constitution, is to ensure the full protection of human interests. In order to ensure the interests of the people, first of all, it is necessary to communicate with people, with the people, to know their worries, dreams, problems and needs. "People should serve our people, not government agencies, and this fact should be well understood by leaders at all levels."

The scope of positive work carried out in the framework of the state program "Year of dialogue with the people and the interests of man" in 2017 was also very wide. In his speech on the occasion of the 25th anniversary of the adoption of the Constitution of the Republic of Uzbekistan, President of the Republic of Uzbekistan Shavkat Mirziyoyev spoke about this work. ”[20]. In addition, in 2017, 24,000 modern high-rise buildings were built in rural areas and 187 in urban areas on the basis of new standard projects, which is an example of the attention paid to ensuring the well-being of our people.

In addition, 1,207 women with disabilities in need of housing were provided with affordable housing ”[21].

In accordance with the Decree of the President of the Republic of Uzbekistan Shavkat Mirziyoyev "On radical improvement of activities in the field of support of women and strengthening the institution of the family" from April 1, 2018 instead of advisers on religious enlightenment and spiritual and moral education In 2000 and more civic gatherings, the position of specialist in working with women and strengthening spiritual and moral values in families was introduced ”[22].

At the same time, the fact that the service houses of the mahalla supervisors are located in the mahalla and they are given a car at a discount is an example of the great attention paid to the mahalla.

In 2019, it can be observed that the following tasks have been implemented for the further development of the social sphere.

- The procedure for full payment of pensions to working pensioners has been introduced. The amount of benefits for people in need and in need of social assistance has been doubled.

-More than 116 billion soums were paid to 5,000 low-income families in need of improved housing, including women with disabilities, to purchase affordable housing on the basis of mortgage loans.

In 2020, 5.5 thousand women will be provided with soft loans worth 100 billion soums for small business projects. In addition, 1,576 women received an initial payment from the budget to acquire new housing.

Training of our sisters in need of social protection in Women's Entrepreneurship Centers was organized in short training courses within the framework of 5 important initiatives.

Thus, the role and place of the mahalla in the social protection of the population has increased.

In addition, mahalla committees have become an influential force in ensuring social stability, ideological unity in the region, regulating the living conditions of the population. Most importantly, the population's confidence in the mahalla committee and its activists has grown. The population began to look for the satisfaction of their interests in the neighborhood. Adherence to the principles of social justice in the neighborhoods has intensified.

ABSTRACT

Wireless sensor networks (WSNs) play a key role in data transmission based on the locations of sensor nodes (SNs). WSN contains base station (BS) with several SNs, and these SNs are randomly spread across the entire region of monitoring. The BS aggregates the data received from several SNs for meaningful analysis-deployed environment. Energy conservation is the major challenge in the WSN. Since SNs are battery-operated over a period of time, SNs drain their energy in sensing the region of interest and passing on the same to the BS. The consumption of energy depends on the distance between SNs and BS. The SNs are clustered with some certain criteria, and by choosing the cluster head (CH) to aggregate the gathered information by SNs along with determining the optimized path from CH to BS by efficient routing protocol are the innovative techniques in enhancing the lifetime of WSN by optimizing the energy consumption. In this work, an efficient clustering and routing algorithm for WSN using glowworm swarm optimization (GSO) and kinetic gas molecule optimization (KGMO) techniques are reviewed. The GSO-KGMOWSN technique is applied to enhance the lifetime of WSN by effectively reducing the unnecessary data transmission between SNs and BS. This in turn reduces the dead SNs over the period of time which results in enhancing the lifetime of WSN.

KEYWORDS: *Clustering, Glowworm Swarm Optimization (Gso), Optimization, Routing, Wireless Sensor Networks.*

1. INTRODUCTION

WSNs are one of the popular areas in the networks due to the constant innovations in the field of wireless technology and embedded system. Their application includes monitoring, tracking, event detection, surveillance, disaster management, and preventive maintenance. WSN comprises spatially dispersed autonomous devices called SNs having sensor to monitor environmental or physical conditions with the capability of transmitting the same through wireless technology. A WSN system includes a BS that delivers gathered data to the outside world either by wireless or by wired technology. The work of SNs to send the sensed data to gateway is called as BS.

In this process, SNs' battery will be drained due to the transmission of data. Researchers proposed many techniques to conserve energy in WSN[1]. One such technique is clustering; here all SNs are divided into many groups based on certain criteria and elect the CH among these grouped SNs. The SNs in that group send data to CH, and the CH will consolidate these data and transmit to the BS. Since the CHs transmit the data to the BS, significant energy is conserved in routing data to BS. This reduces a lot of energy consumption of individual SN. Traditional schemes for energy-efficient clustering and routing are concerned with only improving the network lifetime. But lots of problems were aroused due to the premature death of CHs and holes.

The proposed method uses a class of meta-heuristic algorithms called bio-inspired algorithm which is more suitable to the large-scale application like energy conservation in WSN, where traditional method predominantly fails due to the several conflicting criteria in optimization. The KGMO converges faster and especially suitable for such complex optimization problems[2]. The swarm-based algorithms play a vital role in solving complex real-world problems, so GSO and KGMO are used for optimized cluster formation and efficient data routing.

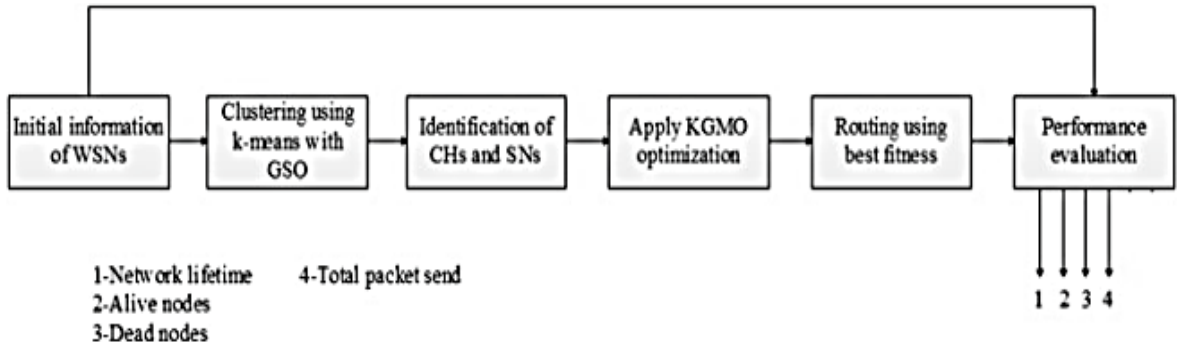

Figure 1: Block Diagram of GSO-KGMO-WSN Method

The GSO-KGMO-WSN method is to provide the energy-efficient clustering and optimized path to transmit the data packet from SNs to the BS over the network. In this method, after deploying SNs, initial clusters are formed using K-means algorithm, clusters are optimized, and CHs are elected through GSO algorithm. The data aggregated by the clustering is transmitted to the BS trough the CH by multi-hop routing involving various CHs. The routing path is optimized through KGMO algorithm. The energy-efficient process of clustering and routing is illustrated schematically in Figure 1.

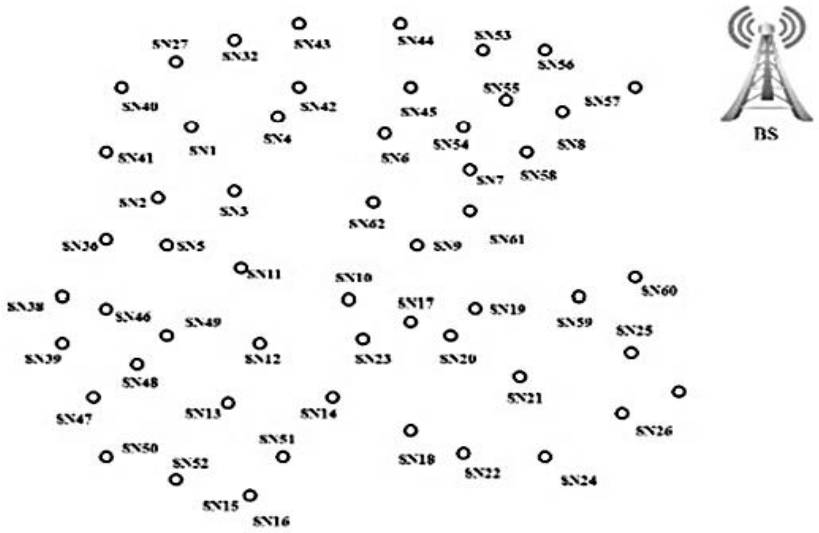

Figure 2: Random Sensor Deployment in A Network Based on the Requirement of the Application.

1.1. Creation of WSN:

Sensor network is a collection of large number of heterogeneous SNs which are having different processing capabilities, energy level, sensors, and transmission range. These SNs are randomly deployed in a network based on the requirement of the application. The inter-SN distance plays a vital role in determining the lifetime of the network. The position, energy level, type, and identifications (IDs) are communicated to the BS to provide the deployment information of the SNs. The creation of WSN is shown in Fig. 2.

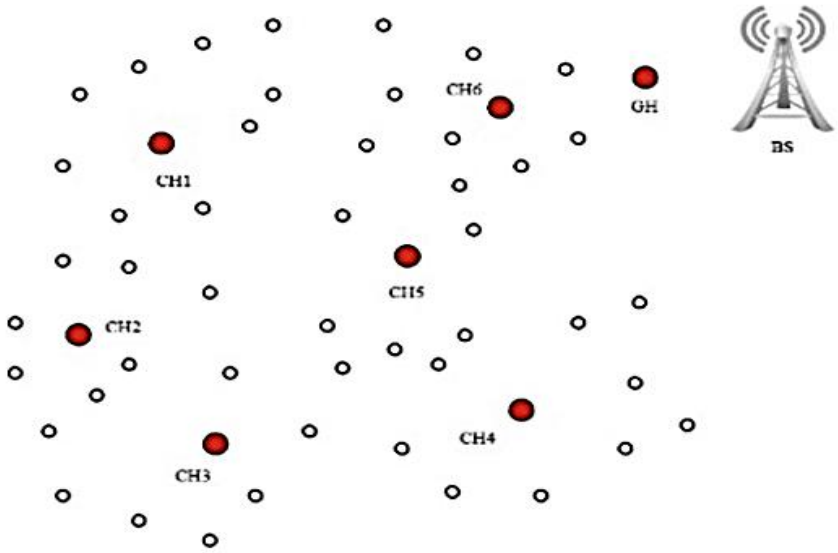

Figure 3: Cluster- Set Formation of the K-Clusters of SNS by K-Means Clustering Technique.

1.2. Identification of Cluster Head:

In the process of creation of WSN, the SNs send the complete information to the BS. The BS initially forms the K-clusters of SNs by K-means clustering technique. The clusters are formed

based on the energy level of SN and the distance between SNs. The K-clusters are formed, and a CH is elected in each cluster. The clusters formed are further subjected to GSO algorithm for optimized clustering. Here, SNs are considered as glowworm (GW), and each GW contains luminance quantity called as luciferin intensity. The intensity of luciferin is determined by residual energy of SN, its distance with CH, and total number of SNs associated with the CH. In the process, each GW is attracted towards neighbor GW based on the luciferin intensity. The SN with highest luciferin intensity will be elected as a CH as shown in Figure 3.

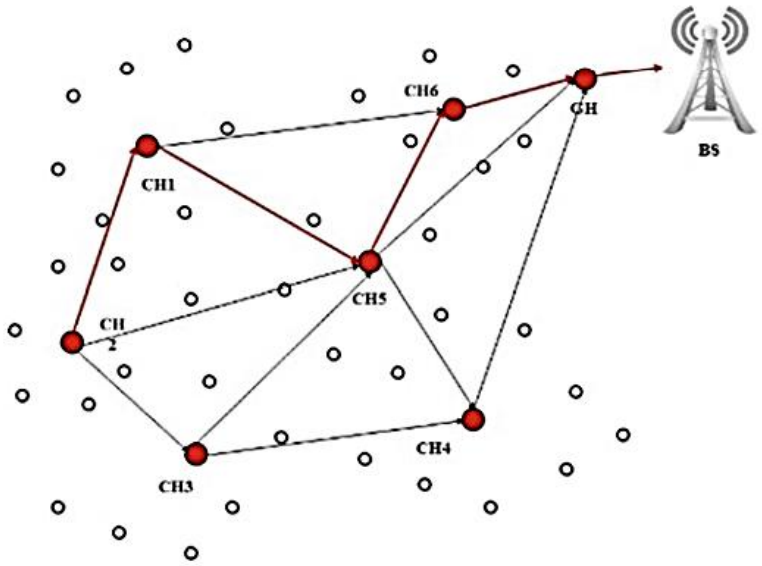

Figure 4: Data Transition of Energy, The Sn Will Be Declared as Dead SN in The Optimized Route in Any Network.

1.3. Routing Process:

After identifying the CHs, the KGMO is used to optimize the routing policy between the CHs and BS. The fitness function of SN determines the intermediate SN to be preferred during the routing process. The fitness function is validated at each iteration process to choose the candidate SN for routing. In this process, the SN with less residual energy will be automatically eliminated in the optimized route. The fitness function of KGMO routing process is determined by the residual energy of each SN the inter-cluster distance, and the density of route.

F (Fitness function) = e + d + n.

where e is the residual energy of each SN, d is the inter-cluster distance, and n is the number of hops. The fitness function determines the optimized route. In this process, the CH with the less residual energy will be automatically eliminated from the optimized path at each round. When the SN reaches a threshold value of energy, the SN will be declared as dead SN as shown in Figure 4.

1.4. Performance Evaluation:

In order to determine the optimized clustering and efficient routing in WSN, the parameters are residual energy, Received Signal Strength (RSS), distance and type of sensors. The residual energy and distance are the factors that affect the lifetime of the WSN. Lifetime/rounds, total no. of active nodes, the dormant nodes, and packet transfer ratio are the metrics for the performance evaluation. The cluster quality determines the energy consumption of the WSN. The efficient routing enhances the lifetime of the network. In general, better the cluster quality and the shortest path determines the efficacy of algorithm.

The algorithm GSO-KGMO-WSN governed by the fitness function and the parameters of fitness function comprises the residual energy, the intra-cluster distance, and the number of hops. The major parameters of the fitness function are also the factors of the performance evaluation. The proposed algorithm is compared with popular energy-efficient algorithm PSO-PSO-WSN and previously reported work PSO-GSOWSN [3]. The outcome of the performance evaluation depicts that having a better control on the fitness function will lead to efficient load balancing among the CHs in optimal routing and energy conservation in forming the compact clusters which in turn lead to the improvement of network lifetime.

2. LITERATURE REVIEW

In WSN, the SNs' limited battery power can be managed by the clustering technique Heuristic Algorithm for Clustering Hierarchy (HACH) was proposed. The HACH algorithm has two main phases such as sleep scheduling and CH selection[4]. The HACH algorithm balances and minimizes energy utilization by choosing distributed nodes with high energy as CH to increase network lifetime, but fails to explain the concept of heterogeneity in terms of energy levels at WSN [5]. The key parameters that play a significant role in lifetime of WSN are energy and computational feasibility where the SNs are resource constrained. Energy consumption primarily depends on age of WSN and the distance from BS and SNs. The distance results in unbalanced usage of energy.

The formation of clustering and intelligent routing concept was introduced through genetic algorithm (GA)[6]. The low-energy adaptive clustering hierarchy (LEACH) is one of the early clustering algorithms for SNs in WSN. The LEACH does not support the random selection of the CHs. The several innovative techniques such as updating of CH at the end of round of data transmission were introduced to improve the lifetime of WSN, but fail to address the issue of end-to-end packet delay [7]. Since WSN functions in the energy-constrained environment, optimized data routing will play a major role. In improved routing algorithm for WSNs using ant colony optimization (ACO), the issue of optimized routing is addressed.

The ACO algorithm was compared with the energy-efficient ant-based routing (EEABR) and leach-ant algorithm to prove the minimum energy consumption, but the major issue of packet delivery ratio was not addressed[8]. The ring communication topology was the early and efficient routing technique in wired network, and the same concept was extended for a heterogeneous WSN to conserve energy in WSN. The energy-efficient heterogeneous ring clustering (E2HRC) algorithm guarantees better average energy consumption. The algorithm is compared with the original IPv6 routing protocol, Low-Power and Lossy networks (RPL).

The issue related to the lifetime of the network was not discussed [9]. The energy consumption and load balancing problems were addressed by introducing the improved routing protocol (IRPL). Here the routing topology control model has been segmented into rings of equal area for better load balancing and balanced energy conservation. The issue pertaining to the packet delay was not addressed [10]. The concept of clustering for data aggregation among SNs and efficient routing data between CHs for energy conservation has not been addressed comprehensively by any of these techniques. The GSO-KGMO-WSN methodology addressed the issue of clustering and routing issue as a cohesive problem through bio-inspired GSO and KGMO concepts.

3. DISCUSSION

The GSO-KGMO-WSN was experimented with 300 sensor nodes and 30 gateways for generating the effective clustering and routing process in WSNs. Assume each sensor node has the initial energy up to 0.5 J. GSO-KGMO-WSN algorithm is verified and illustrates the experimental results for both routing and clustering. For knowing the effective results of the GSO-KGMO-WSN method, it is compared with two existing methodologies (i) PSO-PSO-WSN

and (ii) PSO-GSOWSN. To execute this methodology, the values of the gamma, beta, step size, luciferin decay constant, luciferin enhancement constant.

GSO-KGMO-WSN with two existing methodologies: (i) PSO-PSO-WSN and (ii) PSO-GSO-WSN. Figure 2 displays the alive nodes which are greatly increased compared to two methodologies such as (i) PSO-PSO-WSN and (ii) PSO-GSO-WSN. The network lifetime and the number of transmissions are increased by the maximization of alive nodes.

the total packet sent, compared to an existing method the GSO-KGMO-WSN method transmits the high amount of information at the same time. The PSO-PSO-WSN and PSO-GSO-WSN algorithms have high end-to-end delay so that the amount of transmission becomes small. By increasing the no. of alive nodes and decreasing the number of dead nodes, we directly see that the residual energy is maintained for longer duration compared to other methods. This results in conserving more energy and thus maximizing the network life.

4. CONCLUSION

In this paper, the GSO and KGMO algorithms are introduced; this has improved the performance of clustering and routing in WSNs. Using K-means clustering, centroids are identified which are further optimized by GSO algorithm. The elected CHs are subjected to the KGMO methodology, whose fitness function is based on the residual energy, distance, and the number of hops in a network. The optimal route is established only based on this fitness function. By assigning a minimum threshold for each sensor node, the failure of nodes is eliminated in routing at each iteration. The failure of nodes creates the packet drop among WSN, and it degrades the performance of desired the network. Network lifetime is increased by minimizing the energy consumption among the network and the alive nodes, which is present in the network is increased as well as the amount of packets received by the BS also increased. From obtained results, we conclude that the GSO-KGMO-WSN methodology guarantees better efficiency compared to the other two algorithms: PSO-PSO-WSN and PSO-GSO-WSN.

AUTOMATIC DEBUGGING APPROACHES FOR FIXATING FAILED SYSTEM PROGRAMS

Gulista Khan*

ABSTRACT

Fixing broken computer programs entails performing two basic debugging tasks: first, the programmer must recreate the problem; second, the programmer must identify the source of the failure. As a consequence of testing, software debugging is the act of identifying and fixing erroneous statements in a defective program. It takes a long time and costs a lot of money. The word "debugging" relates to the process of locating, analyzing, and correcting faults. Automated methods for locating and correcting erroneous statements in a program may substantially decrease software development costs while also improving overall quality. The methods of fault localization, program slicing, and delta debugging are discussed in this article. It recognizes statistical fault localization tools like Tarantula and GZoltar, as well as others like dbx and the Microsoft Visual C++ debugger, which give snapshots of the program state at different break locations along an execution path. Finally, we should mention that most software development firms devote a significant amount of time and money to testing and debugging. More research is needed to completely automate the debugging process, lowering software production costs, speeding up development, and improving quality.

KEYWORDS: *Automated Debugging, Execution Synthesis, Fault Localization, Program Slicing.*

1. INTRODUCTION

When a computer program fails, a programmer must debug it in order to resolve the issue. This is accomplished by performing two basic debugging tasks: first, the programmer must recreate the problem; second, the programmer must determine the reason of the failure. On the one hand, both duties may result in laborious, time-consuming, and monotonous work, and on the other side, they can be a factor that substantially increases expenses and hazards. The goal of automated debugging is to make finding failure reasons easier.

Software flaws, often known as bugs, pose a significant threat to system stability and dependability. Debugging efforts to identify flaws after a software failure are usually time-consuming and non-trivial. The practice of identifying and fixing erroneous statements in a

defective computer program is known as software debugging. Debugging a program is halting it under certain circumstances and then inspecting the state of the program stack and the values stored in program variables. Breakpoints in your program are used to halt the execution of your program. Breakpoints may be unconditional, stopping your program whenever they are met, or conditional, stopping your program only if a test condition you provide is true.

When software fails, Parnin&Orso identify three tasks that must be completed. Fault localization, which entails locating the program statement(s) that caused the failure, Fault understanding, which entails determining the underlying cause of the problem, and Fault repair, which entails determining how to change the code to eliminate the root cause. The word "debugging" relates to the process of locating, analyzing, and correcting faults[1]. Debugging, according to He & Gupta, is a costly and difficult task that requires a thorough knowledge of the software and is often performed manually by programmers[2]. The cost of software development may be substantially reduced by using automated techniques to identify and fix erroneous statements in a program.

Debugging software in the real world is difficult, tedious, and usually requires a thorough understanding of the code[3]. As a result, researchers have put a lot of work into creating automated methods and tools to help with different debugging chores. The majority of current automated debugging methods simply pick a collection of suspicious statements that may cause failures and rank them in order of suspicion. This article identifies and analyzes the following tools from the literature, concluding with a state-of-the-art in automated debugging.

1.1.Localization of the Fault

The activity of locating the precise site of software defects is known as fault localization[4]. It's a costly and time-consuming procedure. Its success is determined on the developers' knowledge of the program being debugged, their ability to make logical decisions, previous program debugging expertise, and how suspect code is recognized and prioritized for analysis of potential problem sites. One of the costliest, time-consuming, and time-consuming tasks in program debugging is software fault localization [5]. As a result, automated fault localization methods that can direct programmers to the sites of problems with little human involvement are in great demand.

Dbx provides you full control over a program's dynamic execution, including data collection on performance and memory consumption, memory access monitoring, and memory leak detection. Dbx allows you to: Examine a core file from a crashed application; Establish breakpoints; Take a look at your software; Take a look at the call history; Determine the value of variables and expressions; Runtime checking may be used to identify memory access issues, memory leaks, and other issues. Fix-and-continue allows you to change and recompile a source file without having to rebuild the whole program.

The dbx debugger may be used through the command line, the Oracle Solaris Studio IDE, or a separate graphical interface known as dbxtool. Microsoft Visual C++ is a debugger with a graphical user interface (GUI) that enables interactive debugging from the editor window of the Integrated Development Environment (IDE). One of the main drawbacks of this method is that it forces users to devise their own ways to prevent wasting time analyzing too much data. Another major drawback is that it is unable to limit the search domain by prioritizing code based on the probability of harboring errors along a particular execution route.

Measures are dynamic calculation formulae whose output varies based on the situation. Measures are used in reporting when several characteristics are utilized to combine and filter model data, such as in a Power BI report or an Excel PivotTable or PivotChart. The DAX formula bar in the model designer is used to construct measures. Standard aggregation functions,

such as COUNT or SUM, may be automatically generated by utilizing the Autosum feature, or you can build your own formula using the DAX formula bar. Measures with names may be used as arguments in other measures.

A Tooltip feature provides a preview of what the results might be for the total in the present context when you create a formula for a measure in the formula bar, but the results are not immediately produced anywhere else[6]. Because the outcome of a measure cannot be determined without context, you won't be able to view the (filtered) results of the computation right away. A reporting client application that can provide the context needed to obtain the data relevant to each cell and then assess the expression for each cell is required to evaluate a measure. A PivotTable or PivotChart in Excel, a Power BI report, or a table expression in a DAX query in SQL Server Management Studio may all be clients (SSMS).

For each cell in the results, a separate query is performed, regardless of the client. That example, in a PivotTable, each combination of row and column headings, or each selection of slicers and filters in a Power BI report, produces a distinct subset of data over which the measure is computed.

1.2.Slicing of Programs

Program slicing is a method for concentrating on the portions of a program that may have caused the failure. This method produces a program slice—a portion of the program execution that is important for a particular state or action. Slices are made up of assertions that are dependent on each other: If S1 can affect the program state accessible by S2, a statement S2 is dependent on a statement S1[7]. A program slice is formed by the transitive closure over all dependents starting with a statement. When troubleshooting a failed statement, calculating the backward slice returns all statements that may have affected the failure. The difference between static and dynamic slicing is critical. A static slice applies to all potential runs and is therefore calculated without any assumptions about a specific (failed) program run, while a dynamic slice only applies to the failing run and is thus more accurate. CodeSurfer, a commercial tool for conducting static slicing on C programs, is an example of a program slicing tool.

CodeSurfer is a tool for deciphering C and C++ source code. CodeSurfer analyzes a program's semantics and offers advanced queries to help you understand it. It allows you to automatically recognize and explore your program's deep structure: the semantic threads that show how your program operates. CodeSurfer is a software that may be used interactively or programmatically. Indus is another useful tool. At the moment, Indus is made up of three components. Indus is a module that contains the implementation of algorithms and data structures that are common to analyses and transformations that are or will be part of Indus[8]. This module provides interface definitions that are common to most analyses and transformations, allowing different implementations of analyses and transformations to be easily coupled to create systems. The StaticAnalyses module is a collection of static analyses such as object-flow, escape, and dependency studies.

Software development companies use third-party software to supplement their own development to reduce time to market and costs. In reality, at least 90% of businesses utilize third-party software, and 95% of proprietary or bespoke software programs they develop use third-party components[9]. Modern software development programs, in addition to the bespoke application or product development component, draw on a variety of resources to reduce time to market and supplement skills or competencies they may lack. This third-party software comes from three different places:

Open-Source Software (OSS) is software that is developed in an open manner and is released with the source code. COTS (commercially available off-the-shelf) software is software that is

bought from a vendor. These are often bought without needing to be customized. If open source is utilized in this program, the licensee is likely unaware of it. The data is sent in binary format.

The analyses in this module utilize common Indus interfaces and implementations, and new interfaces/implementations unique to new analyses may be defined/provided. Object-flow Analysis (OFA), a points-to analysis for Java, is one of the existing analyses. Escape Analysis is a set of dependency studies that are needed by analyses/transformations such as program slicing and partial evaluation: entry-based control, exit-based control, identifier-based data, reference-based data, interference, readiness, synchronization, and divergence. Side-Effect Analysis, which offers method-level information on side effects; A monitor analysis is a basic analysis that gives information on the monitor/lock graph for a particular system. Atomicity Analysis gives information on atomicity in the given system, whereas Safe Lock Analysis conservatively determines whether a lock (monitors) will not be kept forever [10]. The Java Program Slicer module includes the main implementation of the Java program slicer, as well as adapters that let the slicer to be used in other programs like Bandera and Eclipse.

1.3.Debugging Deltas

Each bug in the database explains a complicated situation that leads to the failure of software. Because they may include a lot of useless information, a lot of bug reports may be the same. Delta debugging is an automated method for turning a test case that produces a problem into basic test cases in which every element of the input is important in recreating the failure, resulting in simplified bug reports[11]. By just examining an output file, it is generally difficult to determine the true reason of the problem. It would be extremely useful in locating the problem if you could simplify the input file and still get the same failure. This method of repeated attempts for decreasing input is automated using the delta debugging technique.

1.4.Synthesis of Execution

According to Zamfir and Candea, debugging actual systems is difficult, time-consuming, and needs a thorough understanding of the code[12]. Developers are compelled to seek for an explanation of how the program might have gotten at the reported failure point since bug reports seldom offer enough information. Execution synthesis is a method for automating this kind of investigation: given a program and a problem report, it generates an execution of the program that results in the reported bug symptoms automatically. It “synthesizes” a thread schedule and other necessary software inputs that cause the issue to appear using a mix of static analysis and symbolic execution[13].

2. DISCUSSION

There are two main stages to fault localisation. The first step is to detect suspicious code that may contain software vulnerabilities using a technique. The second step requires programmers to analyze the indicated code in order to determine if it includes problems. Fault localization has been a hot topic in research, with tools like Tarantula and GZOLTAR being developed to help with the initial step of fault localization. The methodology underlying the described tools, Spectrum-based Fault Localization (SFL), is a statistical debugging technique that depends on code coverage information. Other debugging tools, like as dbx and the Microsoft VC++ debugger, enable users to specify break points throughout the execution of a program and inspect variable values and internal states at each break point. At different break points along an execution route, these tools give a snapshot of the program state. dbx is a source-level interactive command-line debugging tool. It may be used to control the execution of a C or C++ program and to examine the status of a halted program.

The analyses in this module utilize common Indus interfaces and implementations, and new interfaces/implementations unique to new analyses may be defined/provided. Object-flow

Analysis (OFA), a points-to analysis for Java, is one of the existing analyses. Escape Analysis is a set of dependency studies that are needed by analyses/transformations such as program slicing and partial evaluation: entry-based control, exit-based control, identifier-based data, reference-based data, interference, readiness, synchronization, and divergence. Side-Effect Analysis, which offers method-level information on side effects; A monitor analysis is a basic analysis that gives information on the monitor/lock graph for a particular system. Atomicity Analysis gives information on atomicity in the given system, whereas Safe Lock Analysis conservatively determines whether a lock (monitors) will not be kept forever. (3) The Java Program Slicer module includes the main implementation of the Java program slicer, as well as adapters that let the slicer to be used in other programs like Bandera and Eclipse.

We must first define the process before we can explain the algorithm. In general, the delta debugging method is used to deal with situations where a change in one variable may result in a change in program behavior. The term "variable conditions" refers to all of the programs and environments potential behaviors. Delta debugging may also be used to identify failure-causing code changes in programs. If you have two versions of a program, one that works and the other that doesn't, you may use the delta debugging method to find the modifications that caused the failure. Delta debugging may also be used to isolate failure-inducing thread schedules, according to Choi & Zeller, 2002. The delta debugging method can narrow down the differences between two thread schedules and identify the places where a thread transition causes the program to fail given a thread schedule for which the concurrent program works and another for which the program fails.

In a normal debugger, such as GDB (the GNU DeBugger), the synthesized execution may be played back deterministically. It's used to troubleshoot code that's been compiled using GCC (the GNU Compiler Collection). It's an extremely capable debugger that can debug even the most complex applications. This is very helpful for troubleshooting concurrency issues. Because our method does not need any runtime tracing or program changes, it has no runtime overhead and is suitable for usage in production systems. We test ESD, a debugger based on execution synthesis, on popular software (e.g., the SQLite database, ghttpdWeb server, HawkNL network library, and UNIX utilities): ESD reproduces many genuine concurrency and memory safety issues in less than three minutes, beginning with only bug reports.

3. CONCLUSION

Debugging is described in this article as laborious, time-consuming, dull, and costly. It is noted that, despite all efforts and scientific advancement, contemporary software still includes flaws that cause not only minor inconveniences but can have a negative economic effect. As a result, methods to aid in the debugging of software systems are still required. Both recreating the failure and locating the fault may be a difficult and dangerous task. The goal of automated debugging is to make finding failure reasons easier. Most software development firms devote a significant amount of time and money on testing and debugging. More research is needed to completely automate the debugging process, lowering software production costs, speeding up development, and improving quality.

ABSTRACT

Indoor air quality is a phrase that describes a building's air quality, with a focus on the health and comfort of its inhabitants. It describes the characteristics of the conditioned air that flows throughout the space/area in which we work and reside. Microbial pollutants (molds, fungus) that are mainly reliant on the room's temperature and humidity, gaseous contaminants (such as carbon monoxide, carbon dioxide, volatile organic compounds, and so on), and dust particles or aerosols may all have an impact on IAQ. Building occupants may be exposed to pollutants that are harmful to their health. To avoid such negative consequences, an air quality management system is critical. It also includes a critical examination of microcontrollers utilized in system architecture as well as difficulties in developing real-time monitoring systems. For researchers, this article also offers some fresh concepts and possibilities in the area of IAQ monitoring.

KEYWORDS: *Air, Dust, Indoor, Pollution, Sensor, Health Care, Contaminants, Awareness.*

INTRODUCTION

In various areas of the globe, air-conditioning systems are utilized. Most systems are designed to offer thermal comfort and an acceptable level of indoor air quality for occupants. Occupants are demanding a more pleasant and healthy indoor environment as their quality of life rises. People spend 80-90 percent of their time inside, and the indoor environment has a significant impact on human health and job performance. The interior environment is mainly influenced by temperature, humidity, air exchange rate, air movement, ventilation, particle pollutants, biological pollutants, and gaseous pollutants. According to recent study, the incidence of sick building syndrome (SBS) in buildings with air conditioning systems rose by 30 percent to 200 percent when compared to buildings with natural ventilation systems. Legionnaires' disease has also claimed the lives of people in air-conditioned buildings. Furthermore, both of these mishaps are indicative of indoor air quality problems caused by AC systems. Even if current standards can be fulfilled, many air-conditioned and mechanically ventilated buildings still have problems with the interior temperature[1].

One of the consequences of the global energy crisis of the 1970s was the public awareness of the need of energy conservation. Since then, buildings have become more airtight, and insulation materials have been used to minimize energy loss through the building envelope. Fresh air is restricted in air-conditioning systems in order to reduce energy usage. Meanwhile, synthetic materials and chemical products are in demand. Many researchers have looked at IAQ management techniques in order to reduce indoor pollutants' concentrations and improve IAQ[2]. This article will cover recent research on air-conditioning systems and indoor air quality management for human health. Indoor air settings must satisfy thermal comfort and indoor air quality (IAQ) requirements. Thermal comfort is influenced by a number of factors, including air temperature, air humidity, air velocity, mean radiant temperature, human apparel, and activity levels. Air conditioning is widely used, which helps to improve thermal comfort, but poor IAQ-related health problems are increasingly common[3].

Indoor Air Quality

Indoor particle pollution sources may be classified into two categories: indoor pollution sources and outdoor pollution sources, with varying concentrations and compositions of indoor particle pollutants. Particles produced by indoor pollution sources (e.g., cooking, smoking) in residential buildings were mainly fine and ultra-fine particles, accounting for approximately 80% of the particles in terms of particle counts. The main components of PM2.5 and their mass proportion within dwellings include organic carbon (40-60%), nitrate (13-14%), trace elements (11-12%), ammonium (8%), elemental carbon (6%), and sulphate (6%). (4 percent). The main composition of PM2.5 and mass percentage at schoolroom locations is organic carbon (26-50 percent), nitrate (20 percent), trace elements (22 percent), elemental carbon (6-7 percent), and sulphate (6-7 percent). According to the results, organic carbon is the biggest contributor to PM2.5 and has the greatest impact on the features of organic carbon-containing PM2.5.PM2.5, which not only permits but also encourages the spread of germs. The degree of damage caused by particle pollutants to the human body is determined by chemical characteristics, diameter size, and quantity. The chemical characteristic of particle pollutants is the most important factor to examine since it determines the degree and rate of biochemical processes engaged and disturbed by particulate pollutants in the human body. The majority of particle pollutants in the air are extremely fine. They have a hard time relaxing without being discovered. Inhaled air, on the other hand, allows them to easily reach deep into the respiration channel. Furthermore, the surface of particle pollution may collect harmful chemicals, fluids, and germs, increasing the harm to the human body[4].

Primary Gaseous Pollutants:

CO, CO2, SO2, NOX, O3, radon, and VOCs are the most common primary gaseous contaminants. Chemical compounds have lately become quite popular inside. Chemical goods may release a variety of chemical contaminants at room temperature, with VOCs being the majority of these chemical pollutants. VOCs may produce a variety of symptoms, including headaches, eye, nose, and throat irritations, dry cough, dizziness and nausea, and fatigue. VOCs can have negative effects on the respiratory, cardiovascular, and neurological systems. Furthermore, VOCs have the potential to cause cancer[5]. The physical and chemical properties of VOCs have piqued the interest of many academics, and they have become a focus of research. Indoor emission sources of VOCs include mainly construction materials, decorative materials, and items used inside[6].

Secondary Gaseous Pollutants Include The Following:

As a result of chemical reactions, the mix of contaminants in interior environments may be altered. Reaction Indoor secondary pollutants such as free radicals, aldehydes, ketones, alcohols, carboxylic acids, and fine particulate matter are produced by the reaction of ozone with certain

unsaturated hydrocarbons. Many studies on indoor secondary pollution caused by ozone interacting with limonene have been performed in recent years. The importance of radical hydroxyl in indoor changes has been confirmed. The hydroxyl radical is a byproduct of the ozone/terpene interaction that reacts with other substances. The hydroxyl radical is generated by a significant percentage of oxidized materials, including some products, and cannot be produced only via ozone routes. Chemical reactions that take place on indoor surfaces. Such reactions may have a larger impact on IAQ than those that occur in the gas phase due to the high indoor surface to volume ratio. The impact of secondary pollutants on building occupants. In evaluating the impact of secondary pollutants, the inability to quantify many of the reaction products is a major drawback. Sensory measurements may assist identify changes in indoor chemistry and alterations that aren't detected by the analytical techniques that are often used to assess indoor air. Secondary pollutants in the home have a significant influence on human health and comfort, but the extent of the impact and frequency of occurrence are unclear at this time. Furthermore, many secondary pollutants cannot be estimated owing to the complexity of the composition, therefore it is critical to raise the measurement standard[7].

Monitoring Of the Environment

The circumstances of environmental monitoring in houses have been examined. The author proposes a monitoring paradigm based on a mix of ubiquitous distributed sensing units, data aggregation information systems, and reasoning and context comprehension for temperature, humidity, and light intensity. The sensor data accuracy seems to be promising. Many monitoring methods have lately been suggested for environmental pollution management. Meanwhile, some of the control systems are specifically designed for CO2 monitoring. A monitoring system is being created to provide information on carbon dioxide concentrations in distant locations. The temperature, humidity, and light intensity of the outside detection range are also reported by the system. Similarly, the author proposed an urban CO2 monitoring system in. The technology is used outdoors in a 100-square-kilometer metropolitan area. The first is severe pollution, which has resulted in atmospheric deterioration, climate change, stratospheric ozone depletion, biodiversity loss, changes in hydrological processes and fresh water supplies, land degradation and food production system stress, acid rain, and global warming. Lung cancer, pneumonia, asthma, chronic bronchitis, coronary artery disease, and chronic pulmonary illnesses are all known to have risen as a result of some of these chemical pollutants. As a result, environmental pollution monitoring is becoming more popular[8].

Gas Sensors:

The whole front interface of experimental IoT systems is made up of these. And those are the state's so-called "Products." Their primary function is to gather environmental information about the environment (sensors) or to transmit data to the environmental. Low-cost microchip sensors are suitable for use in an array for low-cost environmental pollution monitoring systems. With more temperature, pressure, and relative humidity sensors, quite an array may be extended to detect pollutant concentrations as well as other physical characteristics, with better gas sensor calibration. Nevertheless, there have been no gas sensors that can detect a single gas with 100% accuracy. As a result, procedures that categorize gases using analytical techniques must be employed. Instruments such as Fourier transform infrared (FTIR) analyzers, gaseous chromatographs, and mass spectrometers are samples. The circumstances of environmental monitoring in houses have been examined. The author proposes a monitoring paradigm based on a mix of ubiquitous distributed sensing units, data aggregation information systems, and reasoning and context comprehension for temperature, humidity, and light intensity. The sensor data accuracy seems to be promising. Many monitoring methods have lately been suggested for environmental pollution management. Meanwhile, some of the controllers are specifically designed for CO2 monitoring[9].

IAQM (Indoor Air Quality Monitoring) Systems Are Used To Monitor The Quality Of The Air Within A Building:

The growing health problems caused by IAP are now a hot topic among academics all around the globe. Some experts proposed IAQ monitoring systems for a better living environment using sophisticated sensor networks and communication technology. It is impossible to evaluate all current and planned IAQ monitoring systems in this article since researchers are actively researching in this area to enhance building health. Nonetheless, research based on the most important IAP characteristics are included in this section. We chose monitoring systems that provide online access to recorded environmental variables or produce SMS-based warnings since automated alert systems are essential in our hectic schedules.

Although many methods for real-time monitoring have been developed, the Wireless Sensor Network and Internet of Things-based models were chosen to be evaluated due to their growing importance in the Industry 4.0 revolution. Created a low-cost ZigBee sensor network architecture for real-time IAQ monitoring Installing four sensor nodes in an indoor setting and collecting data for more than four weeks is conceivable. The ambient data was then transmitted to a ZigBee communication protocol for analysis[10]. The authors of this study looked at CO2, benzene, NOx, and ammonia levels in the kitchen while cooking, while additional sensors gathered data from the bedroom, living room, and workplace. It offers real-time monitoring of all variables that contribute to indoor air quality; nevertheless, there are still a few improvements that may be made to this system, such as lowering power usage and increasing the accuracy of measured data.

Systems based on WSN

The majority of researchers in the last few years have worked on WSN-based designs using ZigBee as the most reliable communication protocol, according to the trends in the development of IAQ monitoring systems. The real-time data gathering is handled by the AT mega microcontroller; however, the Raspberry Pi is another popular option for setting up a sensor network in the target area. WSN stands for Wireless Sensor Network, and it is a kind of Ad Hoc Network in which sensor networks use a lot of energy while sending data across many hops. It was discovered that sensors take a long time to transmit a signal to the monitoring device. Researchers have to concentrate on battery power management in these circumstances to enhance overall system performance. However, just a few academics have used WSN architecture to build energy- and cost-saving monitoring systems. Most WSN-based IAQ monitoring systems utilize web servers as data access platforms, which necessitates extra effort to produce real-time warnings on user cellphones to avoid dangerous situations.

Iot Based Systems

IoT monitoring systems are thought to be the most dependable options for IAQ measurement because to their long battery life and reliable one hop connectivity capabilities. These systems need less maintenance work due to their reduced latencies and low energy consumption. Smart systems are IoT-based real-time monitoring systems; as a result, most academics and industrial manufacturers are drawn to this design. According to experts, the IoT system for monitoring a huge variety of factors while maintaining system performance. With effective IoT architectural design, studies carried out provided IAQ monitoring systems a new edge. However, relatively few academics have focused on prediction algorithms in the area of IAQ monitoring in recent years. According to studies, combining IoT monitoring systems with machine learning and deep learning networks makes it much simpler to make accurate prediction choices. For new age researchers, it is a major field of study.

Other Technological Innovations

Some researchers experimented on architectures other than WSN and IoT, however few characteristics indicate their poor performance when compared to the real-time monitoring capability of IoT systems. The most important drawback of the C-Air platform given by Furthermore, these researchers focused on low-cost sensors where calibration is a big problem, resulting in a lack of overall design performance. Similar limitations were discovered with the method used, which included solely studying the system on breadboards in a controlled lab setting. Attempts to construct a prediction model with a CAN interface were made, but the research was once again restricted to PM levels alone; the effect of additional contaminants was not taken into account. A useful research using FOOBOT monitors, and they took into account various IAQ parameters for real-time analysis, however sensor calibration was once again a significant problem to guarantee desired results.

DISCUSSION

The main need at this time is to conduct real-time monitoring of IAQ parameters and provide warnings to building occupants in order to prevent dangerous situations. The Internet of Things method offers a lot of promise in this area since it uses less power, has less time delays, and has a greater capacity to connect with the real environment. The increasing cost and huge power consumption of sensor nodes are two major issues in the development of IAQ systems. When it comes to real-time IAQ applications, sensor units are often found in industrial settings, as well as within homes, workplaces, and outdoor locations. However, the design of the sensor unit in all of these situations necessitates a greater emphasis on size, design cost, power consumption, network protocols, and performance sensitivity to temperature and humidity changes. Future researchers will face the most difficult issue in ensuring reliable real-time monitoring: sensor calibration. Although, as compared to optical and electromechanical sensors, Metal Oxide Semiconductor sensors are less expensive.

CONCLUSION

Air quality was monitored in real time using commercially available WSN motes, gas sensors, and dust monitors. In Java, a sensor data collection module and a toolkit were created. It gathers raw sensor data, parses it, extracts the IAQ data, and saves it in a sensor database. IAQ parameters are published in the Context Aware Setting so that the HVAC control application may obtain the information by subscribing to the IAQ parameters in question. The Air Quality Index was created to identify the health effects of air pollution on the environment. Experiments were conducted utilizing the existing indoor air quality monitoring system under different climatic conditions. The gadget operated in accordance with the circumstances and gathered sufficient amounts of data on air quality in real time.

ON THE ISSUE OF THE CLASSIFICATION OF INTERNATIONAL STANDARDS OF JUSTICE (PRE-TRIAL STAGE)

S.E. Ibragimova*

*UZBEKISTAN

ABSTRACT

The article discusses the issue of the possibility of classifying international standards of justice at the pre-trial stage. The views and opinions of various scientists on this topic are critically analyzed, outlining the author's position on this issue, which causes certain disagreements in the scientific community. An attempt is made to classify the aforementioned international standards on its own.

KEYWORDS: *International Standards of Justice, Pre-Trial Stage, Classification.*

INTRODUCTION

The issue of the classification of international criminal justice standards, in our opinion, has been studied by legal researchers from various positions, sometimes very contradictory ones.

Thus, an attempt at such a classification was made by N.V. Spesivov, who differentiates international standards according to several main features.[1]

We believe it is possible to agree with the opinion of the mentioned author, who notes: "... international standards of criminal proceedings ... are organically linked to general international standards for the implementation of criminal procedural activities, correlate with them as a part and a whole, and cannot be considered in isolation, in isolation from each other"[2].

At the same time, however, the classification of such international standards proposed by N.V. Spesivov seems to be unacceptable in some part.

So, this researcher suggests: "... depending on the obligatory source, it is possible to single out international standards for the implementation of criminal proceedings ... contained in mandatory international acts and contained in international advisory acts"[3].

Accordingly, this author refers to the first group the standards enshrined in bilateral and multilateral treaties (conventions, pacts, agreements, treaties), the customs of international law, as well as the orders of international bodies created on the basis of international treaties (for example, in the resolutions of the UN Security Council) ...

In addition, N.V. Spesivov includes the Convention on the Rights of the Child, the provisions of the International Covenant on Civil and Political Rights, other international multilateral treaties concluded by the UN, as well as other regional multilateral treaties among such binding international acts.

At the same time, the aforementioned researcher himself, contrary to the previous statement, indicates that "The standards of individual rights contained in these acts, which in their essence perform the function of general principles of international law, are inherent in the main declarative nature"[4].

Thus, since the declarative nature of an international act presupposes the absence of its imperative and binding nature, the classification of international standards according to this principle does not seem entirely justified.

Moreover, this differentiation, according to the author of this study, contains an incorrect initial premise: it implies the obligation, imperativeness of international acts. Meanwhile, as we indicated earlier, such views lead to infringement of the basic principles of state sovereignty, provide for the likelihood of interference in the internal affairs of the state[5].

Accordingly, the classification of international standards of justice on this basis seems to be incorrect.

Likewise, since legal custom does not have a written form (tacitum pactum), the inclusion of its provisions in the proposed classification seems more than doubtful.

It seems a contradiction to N.V. Spesivov's assertion that the established international legal custom, which is not enshrined in a clearly defined contractual form, can give rise to obligations of states[6].

We believe it is possible to agree with the proposed by N.S. Yermishina differentiation of international standards of the rights of participants in criminal proceedings by scope, dividing them into universal and regional international standards[7].

In this case, universal standards are understood as treaties concluded between states located in different regions of the world. Most often, such treaties are concluded in the form of conventions open for accession.

In turn, as the name implies, regional international standards of individual rights are formed between states that are historically and geographically close to each other.

As an example of such regional standards, one can cite the standards of the CIS member states, European, Inter-American, etc.

The point of view of N.V. Spesivov that "... it is inappropriate to classify international standards for the implementation of criminal proceedings ... into the standards of trial and pre-trial proceedings is controversial. ... Everything that is obligatory for the court is also obligatory during the preliminary investigation"[8].

It seems that international standards of trial and pre-trial proceedings, for all their similarity, overlap, but still do not coincide in full.

In particular, of the six indicators provided for, for example, the Bangalore Principles of Judicial Conduct[9], five directly relate and apply to the activities of the relevant state bodies at the pre-trial stage of the criminal process: objectivity, honesty and incorruptibility, observance of ethical standards, equality, competence and diligence.

However, the question of the independence of such bodies in the exercise of their powers seems to be controversial.

So, if for the court the issue of independence is a cornerstone, the absence of which makes the very meaning of judicial consideration to nonsense, then for the bodies carrying out preliminary investigation (for the Republic of Uzbekistan, not only inquiry and preliminary investigation, but

also pre-investigation check are seen as such), staging the question of such independence would, in our opinion, not be entirely correct.

First of all, granting the aforementioned bodies full independence would imply denying the possibility of proper control over their activities (including judicial), which, given the specifics of their activities, would give rise to the likelihood of arbitrariness and violation of individual rights.

Similarly, the difference between international standards of trial and pre-trial proceedings is seen from the Basic Principles on the Independence of the Judiciary, adopted by the Seventh United Nations Congress on the Prevention of Crime and the Treatment of Offenders, held in Milan from August 26 to September 6, 1985, and approved by UN General Assembly Resolution 40 / 32 dated November 29, 1985[10].

In addition to the already mentioned main difference - the independence of the courts, this international legal act also provides for a special procedure for punishment, dismissal and dismissal of judges.

So, clause 19 of the Basic Principles reads: "All procedures for punishment, removal from office and dismissal should be determined in accordance with the established rules of judicial conduct"[11].

A similar procedure is established in the Guidelines on the Role of Prosecutors adopted by the Eighth United Nations Congress on the Prevention of Crime and the Treatment of Offenders.

In particular, paragraph 22 of the Guidelines directs that “Disciplinary proceedings against prosecutors guarantee an objective assessment and an objective decision. It is produced in accordance with the law, the Code of Professional Conduct and other established standards and ethical norms, and in the light of these Guidelines"[12].

In practice, this means a special procedure for resolving such issues, most often - by the judicial authorities themselves. In the Republic of Uzbekistan, these issues are resolved by the Supreme Judicial Council. Thus, article 6 of the Law of the Republic of Uzbekistan "On the High Judicial Council", among the main tasks of the Council are also "... taking measures to prevent and early detection of corruption among judges; consideration and principled assessment of each revealed fact of corruption in the judicial system; ... consideration of the issue of bringing judges to disciplinary responsibility, as well as giving an opinion on bringing them to criminal liability"[13].

Of course, one of the most important signs of the difference between trial and pre-trial proceedings is publicity. This feature is almost always characteristic of judicial proceedings (for rare cases stipulated by the criminal procedure law) and to a lesser extent relates to the activities of state bodies at the stage of pre-trial proceedings, which is due to their specifics.[14]

Thus, we believe that it is possible to differentiate international standards for the implementation of criminal proceedings into the standards of trial and pre-trial proceedings.

The next criterion for the possible classification of international standards for the implementation of criminal proceedings is their differentiation depending on the degree of distribution.

In particular, according to this criterion, it is possible to divide international standards of justice into general and special ones.

Of course, general and specific standards are closely related; the elements that make up their content intersect. At the same time, the content of general standards is filled with individual, special content, made more specific in relation to which minor participant in the process this standard is applied to.

It is difficult to agree with the point of view of O.V. Gladysheva, who classifies international standards of justice, limiting herself to only two features: I) recognition, protection and protection of the rights and freedoms of the individual, understood by the international community as fundamental; 2) restriction of fundamental rights and freedoms of the individual in criminal proceedings only according to special rules recognized by the international community as admissible[15].

Such a formulation of the question seems to be unreasonably general, which does not allow revealing the essence of the phenomenon under study.

Also, the classification proposed by E.V. Skoba is assumed to be quite general, which, when classifying international standards, actually focuses only on the sources of international law: "... 1) generally recognized international principles, norms and standards concerning criminal proceedings; 2) the norms of universal and European treaties to which the Russian Federation is a party; 3) norms of agreements adopted within the framework of the CIS; 4) norms of bilateral interstate, intergovernmental and interdepartmental treaties of the Russian Federation" [16]

The point of view of A.A. Kovalev is not entirely acceptable and gives rise to serious doubts: "The very meaning of the system of international human rights standards is that the fundamental rights and freedoms of the individual should prevail over national sovereignty"[17].

As we have already noted more than once, such a formulation of the question is not entirely definite and its free interpretation in the direction of infringement of the sovereignty of states is possible.

Accordingly, in attempts to systematize and classify international standards in the field of human rights in general and in terms of the administration of justice at the pre-trial stage of the criminal process in particular, in our opinion, possible differentiation on the basis of imperativeness should be excluded.

So, in this regard, the position of the American scientist D. Donelli, who singles out four groups of standards depending on such a criterion of imperativeness, seems to be insufficiently correct; binding standards; standards that allow states to make exceptions, for example when signing treaties with reservations; various kinds of recommendations that are optional; national standards that apply in the absence of prepared international standards[18].

Accordingly, according to the classification of this author, the free expression of the will of states is possible only in the absence of general standards or the assumption that they are not imperative on the part of some abstract supranational law, which, in our opinion, is unacceptable. Similarly, the German author T. Bonacket is guided by the existence of "universal regimes in the field of human rights." At the same time, according to this researcher, the importance of such "regimes" is important for the so-called symbolic integration of various states into the world community, which is understood as the process during which unification takes place on the basis of a common interpretation and understanding of human rights.

According to T. Bonacket, the evolution of the international community leads to a change in the doctrine of unlimited sovereignty, the emergence of the concept of a general social order[19].

Brütsch goes even further, arguing that the "universal" provisions of international law (standards) act as "objective law", which is formed as a universal desire and will of the international community, focused on the operation of such norms as a law to which the state can only actually obey ... At the same time, as a strict requirement, it is formulated that even if this norm is not embodied in national legislation, the state will have to follow this standard, "tolerate" this standard. Accordingly, this researcher proclaims the emergence of a new type of law - law beyond the state[20].

The American researcher D. Forsyth says that the basic standards in the field of human rights represent the transformation of innate human rights into the norms of international law, which should seriously affect national legal systems and, in general, global politics[21]

In our opinion, the point of view of A.V. Stremoukhov is interesting, who classifies general international human rights standards into six groups: 1) innate (inalienable, elementary, natural, inalienable), 2) civil, 3) political, 4) economic, 5) social and 6) cultural rights. These human rights groups are proclaimed and enshrined in three major international legal acts: the Universal Declaration of Human Rights of December 10, 1948, the International Covenant on Economic, Social and Cultural Rights of December 16, 1966 and the International Covenant on Civil and Political Rights of 16 December 1966[22].

Considering the named groups of rights in relation to the Universal Declaration of Human Rights, this author notes that the first group - innate human rights and freedoms, the Universal Declaration includes: the right to life, liberty and security of person, the right to freedom from torture, the right to protection the law against interference in the privacy of a person and from encroachments on the inviolability of his home, the privacy of correspondence or on honor and reputation, freedom of movement and choice of residence, the right to leave any country, including one's own, and return to one's own country.

This correlation raises certain doubts. So, while agreeing with the inclusion in this list of such rights and freedoms as the right to life, liberty and security of person, the right to freedom from torture, it still seems that other rights included in this list can hardly be attributed to innate rights. and freedom.

We believe that the concept of "born", understood as "inalienable", implies in practice the impossibility of their limitation both by other persons and by the state.

Meanwhile, the rights to inviolability of home, privacy of correspondence, freedom of movement and choice of place of residence, the right to leave any country, can be lawfully limited by the state.

S.M. Yagofarov singles out a group of international standards, which can be characterized as development standards, "... the main purpose of which is to correct the directions of development of the criminal procedural legislation of states on the basis of existing standards and to overcome possible contradictions associated with their varied application based on the creation of a common concept"[23].

Special international standards, in our opinion, are aimed at establishing rules of conduct in relation to certain groups of participants in the criminal process at its pre-trial stage.

In particular, such standards can be established (and for the most part are established) in relation to ensuring the protection of the rights and freedoms of persons suspected and accused of committing a crime; in relation to persons who have suffered material or moral damage (victims) by a crime; in relation to representatives of judicial and other state bodies (courts, judges, prosecutors, investigators and interrogators).

Separately, one can single out international standards of justice in relation to vulnerable groups of the population: minors, women, persons with disabilities, etc., for which special, separate rules for participation in the criminal process can be established, especially at its pre-trial stage.

Thus, we believe it is possible to conclude that international criminal justice standards can be classified into several groups:

- By field of activity: universal and regional;

- By subjects: applicable to all participants in the process (general) and to their individual groups (special);

- By stages of the criminal process: related to the trial and pre-trial stages.

ABSTRACT

The following article is devoted to the problem of declining speech culture among the youth. Here, the most frequent mistakes occurring in speech are discussed and ways to eliminate them are proposed. Particular attention is paid to the issue of improving the speech culture of schoolchildren, as especially during this period, the formation of the personality takes place, the concept of human culture is formed, and speech patterns of the individual's behavior are worked out.

KEYWORDS: *Speech Culture, Good Speech, Correctness and Purity, Appropriateness and Logic of Speech, Norms of the Literary Language, Language Errors, Orthoepic Deviations, Accentological Errors; Lexical Errors.*

Man is born with inclinations
Which the teacher should develop
Mark Fabius Quintilian

INTRODUCTION

The language of the people is its historical memory, it is its genetic code, which has found its expression in the word. The centuries-old spiritual culture, the entire treasury of Russian literature from oral folk art to classical and modern works of art, the entire life of the Russian people are contained in the word. Accordingly, the word is the reflection of the culture of the nation, by which the whole nation and its representatives are judged.

Speech culture in its traditional sense is the degree of knowledge of the literary language (orthoepic, word-formation, morphological, lexical, syntactic, stylistic norms) in order to make the most comfortable and effective communication in various circumstances. Undoubtedly,

every educated person should be able to evaluate speech behavior - his own and the interlocutor's, correlate his speech with a specific situation during communication.

However, especially now, when there are all opportunities for mastering the norms of the literary language competently, when speech culture is represented by a colossal richness of expression, the question of the disadvantage of speech culture is being raised more and more severely. Fictional works of classical literature are considered out-of-date, among young people there is an opinion that these works are boring, irrelevant, that they are morally and historically outdated and cannot teach anything. Consequently, there is no need to read them (if there is an urgent necessity to familiarize themselves with these works, schoolchildren can resort to watching the film adaptation of this or that work or reading its plot on the Internet). The literate speech of different individuals is sometimes perceived as aggressive behavior towards the rest of the class of society, ignorance of the norms of the native language is not perceived as something bashful. People of the older generation sometimes do not understand young people at all, whose speech is replete with distorted words, abbreviated constructions, and modern borrowings. Different generations are increasingly disconnected, as they lose the ability to communicate with each other. Especially for this reason, today the urgent problem is to increase the speech culture and the development of the communicative aspect of youth. Since the degree of proficiency in speech culture determines the level of our literacy, speech can be called the business card of a person, showing the society who is in front of him: a child or an adult, a person with or without higher education, a professional in his field or an incompetent worker.

Unfortunately, it should be admitted that the current linguistic environment surrounding us does not meet the standards of the literary national language. Internet, mass media, numerous talk shows cannot be examples of exemplary texts of the Russian literary language. Today's youth is in such a speech environment when there is no need to refer to dictionaries, reference books, encyclopedias, to the texts of works of art that make up the golden fund of world culture. They can find all the information they need in “ready-made homework assignments”, “Russian literature in a summary”, “a compilation of the best cheat sheets for preparing for the Unified State Exam (ЕГЭ)”, etc.

Many linguists note the linguistic degradation of modern schoolchildren, since the speech supply of the younger generation is becoming more and more scarce, statements are becoming more simple, constructions are less and less figurative, associative rows are getting poorer and more monosyllabic.

Statements mentioned above lead to the need for a new approach to the selection of material for work in the classroom.

Working on the development of speech culture uses different groups of techniques and types of speech exercises, including vocabulary work, work on a phrase and a sentence, logical work and training in nature. Various types of essays are used.

The usage of vocabulary work and various types of speech exercises develops the speech activity of students, enriches word stock, students' essays become more expressive and emotional. The development of students' speech will be more effective provided that all kinds of speech exercises are systematically and purposefully used in Russian lessons.

The modern system of work on the development of the students’ speech culture singles out as the main task the formation of the ability to perceive and reproduce the text, as well as create their own statement in oral and written form consciously. In order to solve this problem, it is recommended to create speech situations that are as close as possible to the natural conditions of communication. In this case, the speech activity of student’s increases, their high motivation in learning is ensured.

When improving the speech of students, great attention should be given to such aspects as logic, accuracy, clarity, expressiveness and correctness of speech. Accuracy of speech presupposes the ability not only to skillfully convey the facts of observation, but also to find the best language means.

The most important conditions for successful work on the development of speech culture in the lessons of the Russian language, literature and after school hours, in our opinion, are as follows:

- A variety of methods used to develop oral and written speech;

- The implementation of a consistent connection between educational and extracurricular activities for the development of students' speech, both in the content of the studied material and in the ways of its presentation;

- Systematic enrichment of the students' vocabulary.

Through activating students' interest in the subject as a whole, developing speech literacy in the classroom and in extracurricular activities, as well as purposefully and systematically using various ways of developing oral speech, it is possible to qualitatively improve the level of students' speech culture, particularly, good speech.

Good speech is, first of all, correct speech. The correctness of speech is assessed in terms of its compliance with modern language norms. To promote familiarization of students with the current language norms, to educate them with the necessary speech skills in this regard is one of the urgent tasks of language teaching at school. The correctness of speech is a mandatory, but not the only indicator of its culture. Along with the task of writing and speaking competently, correctly, as the given cultural environment dictates and demands, there is another task - to write and speak skillfully, masterfully. Skillful speech is characterized by such features as clarity, accuracy, consistency, stylistic consistency, expressiveness.

There are different degrees of speech proficiency. Undoubtedly, it is difficult to educate from every student an incomparable master of the word. However, possession of a certain level of oratory is not only available to anyone, but is also necessary in order to be a full member of society, actively participating in social activities and comprehensively manifesting oneself as an individual. This level presupposes the ability of the addressee to select linguistic means, taking into account a exact speech situation, the ability to avoid ambiguity, tautology, complicated constructions, which are hardly perceived by the addressee, and also take into account the degree of perception of information by the addressee.

Education of oral speech culture is one of the directions in the general system of work on the development of speech. It is carried out with the help of methods of observation and analysis of linguistic phenomena and independent work of students in the form of a variety of exercises. Among teaching methods, the followings are the most effective: using a reading and pronunciation pattern; phonetic-spelling and phonetic-stylistic analysis of oral performances of students from the point of view of expressiveness and orthoepic correctness.

So, for example, when studying the spelling of vowels in the stressed and unstressed position, students can be observed and asked the following questions-tasks: how is the vowel "***О"*** pronounced in the words "***ТОЛПА"*** и "***ТОЛПЫ"***? What's the difference? How is the vowel ***А*** pronounced in the words "***ШОКОЛАД", "ОСТАНОВКА", "АКВАЛАНГ"?***

After a series of similar exercises, students come to the conclusion that an unstressed "***О"*** in the position before the stressed syllable is pronounced in the same way as the vowel "***А"***, and in the position after the stressed syllable it can reduce the sound to zero. In the process of exercises that require the establishment of a vowel in an unstressed position in these words, the correct

pronunciation of this vowel sound, the ability to apply the rule is consolidated, the skill of correct pronunciation of words is developed as well.

One of the common problems with pronunciation acts is the lack of knowledge of the pronunciation rules for hard and soft consonants in specific words. When studying the way to designate the softness of consonants in writing (using the letters "***Е", "Ё", "Ю", "Я", "И", "Ь"***), lexemes with variable pronunciation of hardness or softness should be included in the exercises, for example: ***"ДЕКАН", "ТЕРРОР", "СЕССИЯ"***. It is expedient to mention that the subsequent letters "***Е", "Ё", "Ю", "Я", "И", "Ь"*** do not always denote the softness of the pronunciation of a consonant sound ("***КОМПЬЮТЕР", "СВИТЕР", "ЖЁЛУДЬ", "ЖЮРИ", "ЖИЗНЬ", "ТУШЬ"*** etc.).

Sometimes, mistakes are made in the process of pronouncing voiced and voiceless consonants, more often this happens during the initial study of the Russian language or the study of Russian as a non-native learner. Attention should be paid to the process of voicing or stunning such sounds in individual words and the discrepancy between their pronunciation and writing ("***ПРОСЬБА", "ВОКЗАЛ", "СДАЧА", "ГОД", "ГРИБ", "МОЛОДЕЖЬ"***, etc.). It is also necessary to clarify the cases of inconsistency in the spelling and pronunciation of the letter "***Г"*** when declining an adjective, a numeral, a pronoun in genitive and accusative cases (**"*БОЛЬШО[В]О", "СИЛЬНО[В]О", "ПЕРВО[В]О", "МОЕ[В]О",*** etc.).

According to practice, a sufficient number of students do not know the pronunciation norms of the combinations ***"ЧТ", "Ч"*** ;, the combination required for pronouncing "***ШТ", "ШН"*** in particular words ("***[ШТ]О", "КОНЕ[ШН]О", "ЯИ[ШН]ИЦА", "СКУ[ШН]О"***) seems strange or funny for them. When working out this rule, that are an exception to this rule should be included in the exercise of words (***НЕЧТО, ЧТЕНИЕ, БУЛОЧНАЯ, ЧТОБЫ***).

Accentological norms represent a special problem of speech impairment. It is no secret that stress in Russian is free, for this reason, mistakes associated with stressing words are quite common.

A very productive way to consolidate the skills of correct pronunciation is the use of specialized dictionaries ("Orthoepic Dictionary", "Russian Literary Pronunciation and Stress", "Dictionary of the Difficulties of the Russian Language"). The words in which accentological errors are often made **("*КРАСИ́ВЕЕ", "ПОЗВОНИ́Т", "СРЕ́ДСТВА*" "СВЁКЛА", "ВОДОПРОВО́Д", "ЖАЛЮЗИ́", "ФИЛИ́СТЕР", "НАЧАЛСЯ́", "БА́РМЕН",** etc.), must be included in the material of exercises and assignments, create speech situations using these lexemes.

In the lessons on the development of speech, the development of the culture of pronunciation is carried out through the analysis of the text, in the process of conversation, in the analysis of the performed exercises of a creative nature (essays, compositions). At the same time, the main method of teaching is imitation of models and analysis of the noticed shortcomings in the speech of students.

The upbringing of a pronunciation culture is associated with teaching expressive reading. Expressive reading is reading aloud in compliance with the orthoepic and rhythmomelodic norms of speech (intonation, lowering or raising the voice, setting logical stress, speech pauses, etc.). Teaching expressive reading is included in the content of the lessons of the Russian language and literature, since the study of any of the topics of these subjects contains rich opportunities for this. For instance, the study of the topic of homogeneous members of a sentence is associated with the intonation of the enumeration, and it is necessary to ensure that when reading the exercises performed, the presence of homogeneous members in the sentence is emphasized by means of the intonation of the enumeration. When studying separate members of a sentence, students can be offered to pick up sentences with isolated members and read them so

that listeners can determine which of the members of the sentence is isolated and the reason of it. The students select such sentences and practice expressive reading.

The content of the lesson can also be a competitive performance of previously prepared poems or prose excerpts. Along with the prepared texts, unfamiliar texts can also be offered in order to test the speed of students' orientation in the content of the passage, in finding the expressive means of the language.

A particular attention should be paid to the purity of speech. Purity of speech is the absence of unnecessary words in it, the so-called parasitic words. Unfortunately, the speech of the overwhelming majority of schoolchildren is replete with such similar examples: ***"ЭТА", "КАК БЫ", "ТИПА", "ВОТ", "В ОБЩЕМ", "ЗНАЧИТ"***, etc. Such a speech makes a very unpleasant impression on the listener, since parasite words do not carry a semantic load and do not have information content, they simply clog up speech and distract attention from the content of the statement. Besides, these words can distort the meaning of what is said.

Another problem of modern speech is that schoolchildren actively use slang words. Slang is not only an indicator of belonging to a particular group, but also a certain hallmark of an individual. Slang words and expressions used in speech make it possible to pass the identification of "own or strange", to show the hierarchical place of the student among peers, to increase the degree of steepness, to convey their attitude to the subject of discussion more vividly and succinctly, to be on the same wavelength with the latest language changes. The speech of many young people is literally "full" with similar words and expressions: ***"ПИПЕЦ", "КЛЕВЫЙ", "ЖЕСТЬ", "КЛАССНЫЙ", "СУПЕР", "КАЙФ", "ЛОХ", "АТАС", "ШУХЕР", "ПАЛЕВО"*** and so on. Here, the borrowings that have undergone a certain pronunciation and derivational transformation can be included such as: ***"ФЕЙК", "ЛАЙК/ЛАЙКАТЬ", "ХАЙП/ХАЙПАНУТЬ", "БАН/БАНИТЬ/ЗАБАНИТЬ", "НА ЧИЛЕ/ЧИЛИТЬ", "РЕСПЕКТ", "МЕССЕДЖ", "ЛУК", "ДРАЙВ/ДРАЙВОВЫЙ", "ЭКШЕН"*** and others. Truncated words also violate the purity of speech such as: "***ЗДРАСЬТЕ", "ДНЮХА/ДР"***(birthday), ***"УНИВЕР", "КАРОЧ", "КУРСАЧ"*** (course paper), ***"ПЕД"*** (pedagogical institute / university), ***"МЕД"*** (medical institute), ***"СТЁПКА/СТЕПУХА"***(scholarship) ,***"ППТ"*** (Power Point Presentation). Such lexical units at this time are already the norm in the speech of young people.

The use of abusive words and expressions by schoolchildren is of particular concern. In ancient times, people believed that demons penetrate into a house where people scold, and good spirits and angels leave such a dwelling. In ancient Russian literature and in the folk tradition, the prohibition on swearing was associated with the idea that obscenities offend "Mother Earth" and a person's own mother. Now, mate among young people acts as an indicator of a certain adulthood of a child, a kind of marker of freedom and the degree of emancipation. There is an opinion that mate allows you to establish a certain contact in a group, unites children. It is no secret that when studying a foreign language, memorization of abusive and obscene words by schoolchildren occurs faster than the study of literary words. The teacher's task is to explain to students that such words, neither in their native Russian nor in the foreign languages studied, are not a measure of maturity, that these are offensive expressions that humiliate the speaker himself, to tell in general terms about the origin of swear words and the reasons their vitality in the language.

Thus, the problem of reducing the speech culture of the Russian language should be solved from an early age, from an early school age, children should be introduced to the use of normative vocabulary. Correcting the speech of young people, instilling respect and love for the language is a task that should be solved systematically and everywhere, both at school and at home.

Young people should be able to speak competently and clearly, logically expressing their thoughts in oral and written form, should know the signs of good speech, be able to realize and feel these signs in literary texts. In the mind of the student, concepts such as the speech culture and a cultured person should be correlated. All this, in turn, will lead to an increase in the general culture, to the development and multiplication of spirituality, as the language is the soul of the people.

ABSTRACT

The carbohydrate composition of Phlomoides canescens grown in Uzbekistan has been studied. The carbohydrate complex was isolated, the monosaccharide composition was established, and the IR spectra were studied (WSPS-C, WSPS-H, PS, HMS-A, HMS-B). The presence of water-soluble polysaccharides was established and it was shown that they are heterogeneous polysaccharides of the arabinogalactan type.

KEYWORDS: *Water-Soluble Polysaccharides, Pectin Substances, Hemicellulose, IR Spectroscopy, Neutral Sugars, Uronic Acids.*

INTRODUCTION

Currently, the world pays great attention to determining the species composition of medicinal plants, studying their biological properties, assessing their cenopopulations, identifying natural resources, scientifically substantiating population changes as a result of external influences and analyzing the causes of decline, as well as improving conservation and reproduction. In recent years, the growing demand for natural medicinal herbs has led to a reduction in plant stocks.Based on the foregoing, in order to identify and assess carbohydrates of the *Phlomoides canescens* species common in the Shohimardon region of the Fergana region, in april-may 2021, field studies were carried out in the villages of Iordon of the Shohimardon region. Distributed areas of the plant were identified and samples were taken from the vegetative and generative parts of the plant to study its composition (1-Figure). To isolate and evaluate the complex of carbohydrates from plant samples, the goal was to isolate them using IR spectra: WSPS-C,WSPS-H, PS, HMS-A, HMS-B methods.

Modern concise classification of plants.

Phlomoides canescens belongs to the genus *Phlomoides* Moench of the Lamiaceae family. Central Asia, the mountainous regions of Iran (Iran and Afghanistan) and the Mediterranean are

the main centers of species diversity. In the flora of the Earth there are 150–170 species of this genus, in the flora of Central Asia there are 59 species, including 43 species in the flora of Uzbekistan [1,2].

Bibliography. *Phlomoides canescens* (Regel) Adylov, Kamelin & Machmedov in Opred. Rast. Sred. Azii 9: 104 (1987). - *Phlomis canescens* Regel in AHP. 9 (2): 582 (1886); Popov in Bull. Univ. As. Type. TAJIKISTAN: Iskander - Kul, 16.06. [1870] O. Fedchenko (LE, lectotype, designated Rechinger 1982: 315) [5].

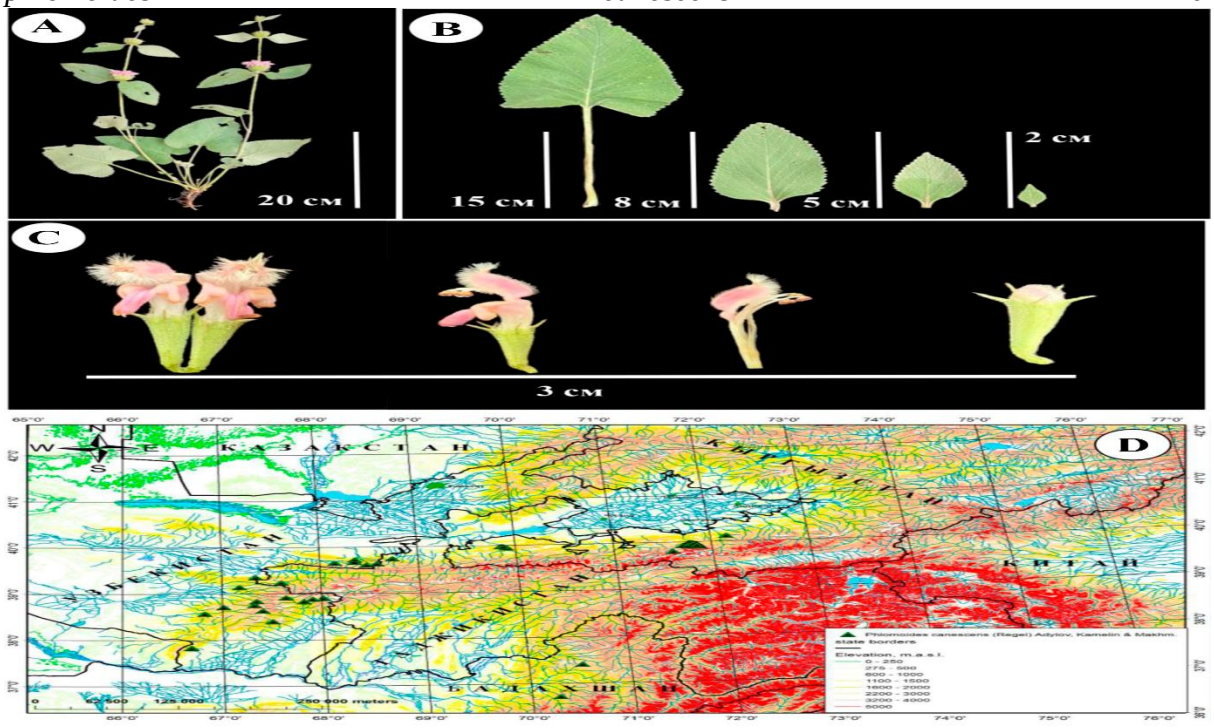
Life form and phenology. Hemicryptophytes, polycarpic Blossoms in june - july, bears fruit in july - august. [3].

Habitat. *Juniper* thickets, alpine subalpine meadows, thorny associations, middle and upper mountain belts, 1.600-2.800 m above [5].

Note. This species is close to *phlomoides oreophila*, characterized by leaves with stellate hairs at the top. The density and character of stellate hairs varies within the range of this species, therefore specimens with a low number of stellate hairs on the upper surface of the leaf cannot be distinguished as a separate species of *phlomoides tytthaster*. Intermediates to *phlomoides oreophila* are found both at the edge and within the distribution area. They can be obtained as a result of continuous hybridization in areas of contact with *phlomoides oreophila* and the very recent invasion of more eastern and northern species of *phlomoides oreophila*into the *phlomoides canescens* range



1-Figure. A- Phlomoides canescens species, B, C- Leaves and phenological organs structure,
D- GIS distribution map.

The purpose of this work is to study the carbohydrate complex of *Phlomoides canescens*, to establish their monosaccharide composition.

Research methods. Field studies conducted as part of the tour were carried out in april-may 2021 in Shohimardon district of Fergana region (Uzbekistan). The total area of the tour was determined on the basis of international electronic databases Plants of the World Online (www.plantsoftheworldonline.org), Global Biodiversity Information Facility (www.gbif.org). The addresses given in the samples of existing herbarium holdings (LE, TASH, FRU, TAD, MW) were derived from the geographic coordinates of Google Earth, and a GIS map showing the general distribution of the species was prepared using ArcGIS 10.0.

Experimental part.

Inactivation of raw materials. 100 g of dried and crushed raw materials (usimlik nomi) were twice treated with boiling chloroform for 2 hours at a hydromodule of 1: 4 to remove dyes and low molecular weight substances. Then, alcohol-soluble sugars were extracted twice with boiling 82 ° ethanol (1: 4, 1: 3). The alcoholic extracts were separated by filtration, combined and evaporated to a small volume, and analyzed by paper chromatography (PS) in a 6: 4: 3 butanol-n-pyridine-water system. To identify spots, acidic aniline phthalate (1) was used to identify hexose and a 5% alcohol solution of urea (2).

Isolation of WRPS-H. The remainder of the raw material was extracted twice with cold water at room temperature for 1.5 h at a hydromodule of 1: 4, respectively. The extracts were separated by filtration, evaporated to a small volume, and precipitated with a threefold volume of ethyl alcohol. The precipitate that formed was centrifuged (5000 rpm, 10 min), washed, and dehydrated with alcohol. Output WSPS - 1 g.

Then the remainder of the raw material was twice extracted with water at a temperature of 80-85° for 1.5 hours at a hydromodule of 1: 3, 1: 2. The extracts were combined, evaporated and precipitated with alcohol. The formed precipitate was treated as described above. Output WSPS-g 1.2 g.

Isolation of pectin substances (PS). After the isolation of the total WSPS, the meal was twice extracted with an equal mixture of 0.5% solutions of oxalic acid and ammonium oxalate at a temperature of 75° C; the extraction was carried out at a hydromodule of 1: 4, 1: 3. The extract was separated by filtration, dialyzed against running water, evaporated, and precipitated with a threefold volume of alcohol. The precipitate was processed in the same way as described above. Output PS 6.2 g (from air-dry raw materials).

Isolation of HMS-A and HMS-B. After isolation, PS was treated twice with 5% KOH solution at room temperature, for 1.5-2 hours, with a hydromodule of 1: 3. The extracts were separated by filtration, neutralized with CH_3COOH, centrifuged to obtain a HMS-A precipitate with a yield of 1.0 g, the lagging solution was evaporated until thick and precipitated with a three-fold volume of alcohol. The precipitated HMS-B precipitate was separated by centrifugation, washed and dried with alcohol, yield 4.4 g.

Complete acid hydrolysis of polysaccharides. Samples of WSPS were hydrolyzed with 1N H_2SO_4 at 100°C, 8 hours, PS,HMS-A and HMS-B 2n H_2 SO_4, 100 ° C, 48 hours. The hydrolysates were neutralized with barium carbonate, deionized with KU-2 (H^+) cation exchanger, and evaporated. The high-quality monosaccharide composition of PS was studied by BH using known witnesses on Filtrak FN-12 paper, in the system of butanol-pyridine water 6: 4: 3, developer 1.2. GC analysis of the samples was carried out on a Shimadzu GC-2010 chromatograph with a flame ionization detector, a Shimadzu Rxi-624Sil MS quartz capillary column 30mx0.25mmx1.40μm), the mobile phase rate (N_2) 1.5 ml / min, injector temperature 260 ° C, detector temperature 280 ° C and column temperature 230 ° C. The samples were taken in the form of aldononitrile acetates [2]. The IR spectra of the samples were recorded on an IR Fourier spectrometer, System 2000 (Perkin-Elmer) in KBr pellets. Number of scans 100.

RESULTS AND THEIR DISCUSSION

We sequentially isolated various polysaccharides from (nomi plants): alcohol-soluble sugars (ASS), water-soluble polysaccharides (WSPS), pectin substances (PS), hemicelluloses (HMS). SRS according to HR data (system 1, developer 1.2) are represented by glucose and fructose. Water-soluble polysaccharides (WSPS) were isolated in two ways: extraction of raw materials with cold water (WSPS-x), i.e. at room temperature and hot water at a temperature of 80-90 ° C (WSPS-g). Pectin substances (PS) were isolated with a mixture of 0.5% solutions of oxalic acid and ammonium oxalate, hemicellulose (HMS) - with a 5% KOH solution. The yield of polysaccharides and their monosaccharide composition are shown in Table 1.

TABLE 1. CONTENT OF VARIOUS GROUPS OF PHLOMOIDES CANESCENS POLYSACCHARIDES AND THEIR MONOSACCHARIDE COMPOSITION

Carbohydrate type	Output, %	Ratio of monosaccharide residues, GC						
		Rha	Ara	Xyl	Man	Glu	Gal	UAc,%
WSPS-x	1.0	3.0	25	7.0	4,3	10	30	25
WSPS-g	1,2	3.0	27	5	3	12	25	27
PS	6.2	-	16	2	-	7	15	60
HMS-A	1.0	7	30	3	-	-	20	40
HMS-B	4.4	2	25	10	-	-	18	45

As can be seen from Table 1, among the polysaccharides, PS are dominant (6.2%), with the HMS content being 5.4%, and the WSPS content in smaller amounts - 2.2%. WSPS are light beige amorphous powders, readily soluble in water. Monosaccharide compositions of WSPS did not differ sharply qualitatively, but the difference was in the quantitative ratio. The main monosaccharides of WSPS-x are Gal, Ara and Glu, and in WSPS-r- Ara, Gal; other monosaccharides are present in smaller amounts. Aqueous solutions of WSPS give a negative reaction to starch. The ratio of monosaccharides suggests that heterogeneous polysaccharides with a predominant content of glucans constitute the basis of WSPS-x, while both glucans and galactoarabinans may be present in WSPS-g.

In the IR spectra of WSPS-x and WSPS-g, the main absorption bands were found: 3339-3418cm^{-1}(OH-groups), 1599-1613 cm^{-1} (HOH), 1415-1418 (C = O), 1074-916, 1018-911cm^{-1}(α-glycosidic bond). Pectin substances are an amorphous cream-colored powder that partially dissolves in water to form a viscous solution.

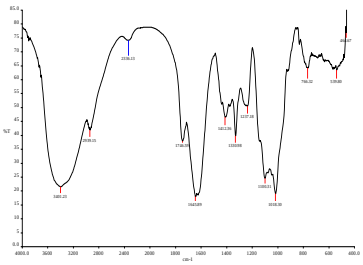
In the IR spectra of PS (Fig. 2), absorption bands were found: 3434cm^{-1} (OH-groups), 1748cm-1 (C = O free and COO- esterified carboxyl groups), 1434cm^{-1} (vibrations of ionized carboxyl), 1365cm^{-1} (-OCH_3), 827cm^{-1} (α-glycosidic bond) [3,4].

The monosaccharide composition is represented by neutral and acidic monosaccharides. The largest amounts are found for arabinose and uronic acids, the content of the latter according to the carbazole method is 72% [5]. According to the IR spectrum, PS is an esterified polysaccharide. To determine the degree of esterification, titrimetric analysis was carried out, the results of which revealed the content of carboxyl and esterified groups: Kc (free carboxyl groups) - 8.1%, Ke (esterified carboxyl groups) - 9.0%. The data obtained correspond to the degree of esterification - 52.6%, which makes it possible to classify the studied PS as highly esterified pectins [6].

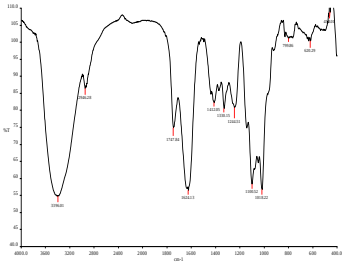
HMS-amorphous powder of light cream color, partially soluble in water, completely in dilute alkali solutions.

In the IR spectra of HMS, absorption bands were found: 3640 cm-1 (OH-groups), 1742 cm^{-1} (C = O), 1078 cm^{-1} (pyranose ring), 1588 cm^{-1} (COO^-), 850 cm^{-1}(α -glycosidic bond) (Fig. 2).

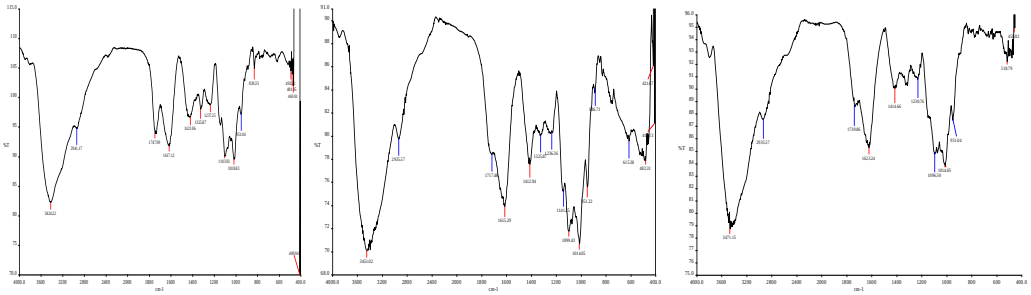
Based on the results obtained, it can be seen that the WSPS of *Phlomoides canescens* consist mainly of the following polysaccharides: arabinogalactans.



2-Figure. IR spectra - WSPS –x



3-Figure. IR spectra - WSPS –g



4-Figure. IR spectra - P5-Figure. IR spectra - HMS-A6-Figure. IR spectra - HMS-B

CONCLUSION

Alcohol-soluble sugars, water-soluble polysaccharides, highly esterified pectin substances and hemicelluloses were isolated from Phlomoides canescens. Their qualitative and quantitative characteristics are given. The isolated polysaccharides were analyzed by IR spectroscopy.

ABSTRACT

The Internet of Things (IoT) is producing a massive amount and diversity of data that has never been seen before. However, by the time the data reaches the cloud for processing, the chance to act on it may have passed. This white paper describes a new paradigm for evaluating and acting on IoT data for IT and operational technology experts. Edge computing or fog computing are two terms for the same thing. Instead of transmitting huge quantities of IoT data to the cloud, analyzes the most time-sensitive data at the network edge, near to where it is produced; acts on IoT data in milliseconds, depending on rules; Sends chosen data to the cloud for longer-term storage and historical analysis. In certain IoT applications, it's critical to speed up data processing in order to obtain real-time results. CISCO developed fog computing, a next-generation networking technology, to achieve this goal. It's similar to the cloud, but smaller, and it serves the network's edge from a closer geographical location. It has the potential to increase the yields of ubiquitous smart networks and is a step toward a smarter world. The goal of this article is to explain the fundamental idea of fog computing technology and compare it to other comparable technologies. The difficulties of this technology are addressed, as well as current work done to solve them.

KEYWORDS: *Cloud Computing, Fog Computing, Internet Of Things, Mist Computing.*

1. INTRODUCTION

The Internet is the age of the twenty-first century. It provides very valuable data to industries such as health care, education, business, and electricity. This information gold mine is uncovered by analyzing massive quantities of data generated in these industries. In recent years, the use of ubiquitous networks of smart objects to get information and control over the environment has grown in popularity. The Internet of Things (IoT) is a network that links smart things (other than

computers or laptops) by using a standardized protocol framework to create communication among them, regardless of their physical locations[1]. Every day, these networks (which include wearables, routers, security cameras, aircraft data recorders, and other sensors) generate enormous quantities of data.

These data are transmitted to the cloud, where they are analyzed for improved decision-making. The collected insights are utilized to control the actuators in question. Fog computing technique performs processing tasks with temporary data storage at the network's edge. Figure 1 depicts a broad perspective of a fog computing architecture. It facilitates the storing, processing, transmission, and administration of prioritized data generated by sensors[2]. It makes use of decentralized processing, which basically eliminates the cost of responding to actuators late. It provides real-time reaction to apps and information derived from data to the cloud.

The cloud does further processing on the fog's processed and filtered material and returns wisdom to the fog for improved discernment. It takes use of cloud and edge resources and improves coordination between them in order to achieve low latency, high throughput, and scalability[3].Real-time reaction based on data provided by monitoring equipment is prized in industries such as health care. Hazardous situations may be identified or anticipated and dealt with quickly utilizing a fog computing technique. Its fields of application include smart car management, smart traffic control, real-time gaming, and augmented reality, all of which need low latency computing. In latency-sensitive sectors, it outperforms the cloud by[4],

- Reducing the amount of time, it takes to transmit large amounts of data produced by IoT devices across vast distances,
- Decreasing data's vulnerability to cyber-attacks and
- Decreasing the distance traveled by the actuation command.

1.1.Fog In Comparison To Other Similar Technologies

Through next-generation networking technologies, there are new paradigms that provide services remotely display dispersed resources. This section compares and contrasts a few of these paradigms, as well as establishing the role of fog in the image. Cloud computing refers to a vast collection of resources that provide platform (PaaS), infrastructure (IaaS), and software (SaaS) as a service on a pay-per-use basis. It uses distant data centers and clustered server computers to store and analyzes data, which takes a long time to generate insights. It is incompatible with certain systems that need a quicker reaction time[5].

A cloud service for mobile devices is known as mobile cloud computing (MCC). Mobile devices may outsource their processing tasks to cloud servers, saving energy, processing, and storage resources[6]. The Mobile cloudlet is created by a cluster of devices. A device that is rich in a particular resource type may serve the network with that resource type, whereas another device can serve the network with other resource kinds, and so on. It reduces unloading time and provides high-quality service to mobile device users. The calculations are carried out using mist computing technology inside the sensors and actuators. It transmits data to the server only when the server requests it. By decreasing data transmission, it saves energy and bandwidth.

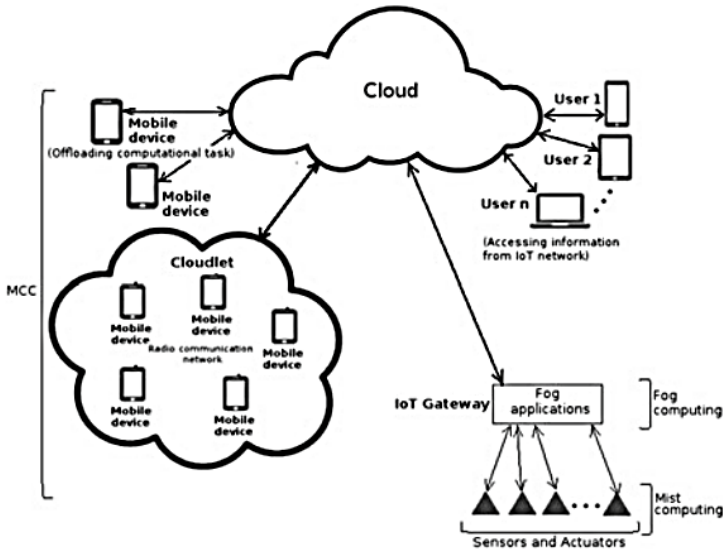

Figure 1: Depiction of Cloud, MCC, Cloudlet, Fog and Mist Architecture

Fog is a still-maturing new technique for processing IoT data with the goal of meeting the needs of the growing number of smart mobile devices. It is being improved and advanced by a number of researchers and corporations. A review of the difficulties is given, as well as some current research efforts that address them.

1.2.Real-Time Resource Management

It is necessary to manage resources efficiently in order to achieve lowest latency and maximum throughput while using the least amount of energy and bandwidth. The job is carried out by the edge devices and the server in the real-time fall detection algorithm based on accelerometer data. This provides Stack4Things, a framework for Smart City Cyber Physical Systems solutions that spans the IaaS and PaaS levels. This method makes use of existing fog and cloud resources to provide large-scale offloading applications with a resource management and job scheduling strategy[7]. This work dynamically pushes programs to devices for data pre-processing. End devices, edge networks, and data centers are used to create a congestion-free, speedier network. The MMOG offers a cloud-fog architecture for rendering game videos and processing other user requests on devices other than the users' own.

1.3.Problems With Performance

It's difficult to get excellent performance out of IoT networks with limited resources, such as fast data aggregation, quick resource provisioning, and node mobility. In an e-Health solution called Fog CAMA is deployed, and the results are compared to Cloud CAMA. A dynamic video stream processing method for urban traffic surveillance near the recording equipment was suggested in the article. (drone camera). The overloaded cloudlets in the architecture transfer work to fog servers placed on buses to provide a higher QoE to mobile users[8]. This article uses fog to identify and resolve people based on their biometric ID, which is a smart provisioning of limited resources. It offers a load balancing method for a cloud-fog-based architecture that emphasizes consistent load distribution over a larger number of edge nodes and closer proximity. It uses a smart watch to gather clinical speech data, conducts processing and storage work between the sensor and the cloud, and then transmits the processed data to cloud storage. It presented a fog-

based smart-grid architecture and described its advantages, such as reduced latency, increased security, and dependability[2].

For these bandwidth-constrained networks, network management is also a problem. Modern technologies, such as software-defined networking (SDN), may help to improve network control. This method compares and implements multiuser clustering of radio access points in both controlled and decentralized levels[7]. It provides a bandwidth prediction model, a fog infrastructure load balancing method, and a dynamic edge node selection mechanism for improved QoS. Fog radio access networks (F-RAN) are presented in this study to alleviate the high load of large-scale radio signal processing in the centralized baseband unit pool.

The implementation of security and privacy in fog networks, which include resource limited, diverse, and dispersed nodes linked via numerous service providers, is a difficult job. Multicast authentication using public key infrastructure (PKI)-based technologies is a potentially viable approach. Tolerance for Mistakes Another essential factor to consider is fault tolerance. It's also a problem since the system must be built in such a manner that it can withstand the failure of some of its components. The fault-tolerant and real-time system is provided by the time-triggered distributed architecture. It moves a software component from faulty hardware to functioning hardware in an instant. Other critical concerns include scalability, platform dependency, and interoperability[7].

The following are some of the benefits of fog computing:

- Reduce the amount of time it takes for something to happen. Keep analysis near to the data source to avoid cascade system failures, manufacturing line shutdowns, and other significant issues, particularly in verticals where every second matters. The capacity to perform real-time data analysis implies quicker warnings, less risk for consumers, and less wasted time.
- Make the most of your network bandwidth. Many data analytics activities, including important studies, may not need the scalability provided by cloud-based storage and processing. Meanwhile, linked gadgets produce an increasing amount of data that may be analyzed. Fog computing removes the need for much of this enormous data to be sent, freeing up bandwidth for other mission-critical activities.
- Lower your operational expenses. Lower operational expenses are achieved by processing as much data locally as feasible and saving network bandwidth.
- Increase the level of security. It is critical to safeguard IoT data while it is being sent or stored. To offer improved cybersecurity, users may monitor and defend fog nodes using the same controls, rules, and procedures implemented throughout the whole IT system and attack continuum.
- Boost your trustworthiness. Because IoT devices are often deployed in hostile environments and during crises, circumstances may be severe. Under these circumstances, fog computing may enhance dependability while lowering the data transmission load.
- Deepen your understanding without jeopardizing your privacy. Instead of transferring sensitive data to the cloud for analysis and risking a data breach, your team may analyze it locally on the devices that gather, analyze, and store that data. As a result, the nature of fog computing's data security and privacy provides better choices for more sensitive data.

- Boost your company's flexibility. Businesses can only react to client demand swiftly if they know what resources they need, where they need them, and when they need them. Developers can create fog apps quickly and deploy them as required thanks to fog computing. Fog computing technology also enables users to provide more tailored services and solutions to their clients, as well as place data and data tools where they can be processed most effectively, all while using current computer capabilities and infrastructure.
- One of the most difficult aspects of fog computing is the significant dependence on data transmission. The introduction of the 5G network has helped to alleviate this problem, although there are still problems such as restricted availability, slower speeds, and peak congestion. Other possible problems that need to be addressed at fog nodes are speed and security.

1.4.Platform And Applications For Fog Computing

- Fog computing may be used to create a smart electricity grid. Smart cities must be able to react to increasing and decreasing demand, lowering output as necessary to remain cost-effective. Smart grids, therefore, require real-time electricity consumption and production data. These smart utility systems often collect data from a large number of sensors and must withstand distant installations. Fog computing architecture is an excellent option in any case.
- Another use of fog computing is smart transportation networks. On this type of grid, every connected car, traffic gadget, and even street produces a stream of data. Obviously, a massive quantity of real-time data processing is required to prevent accidents, and a fog computing method is required to share the limited mobile bandwidth available.
- Fog computing and IoT in general is a burgeoning field. Fog computing may also be used in connected industrial equipment with cameras and sensors, as well as systems that utilize real-time analytics.

1.5.Fog Computing's Operation

Fog computing is implemented by developing or porting IoT applications for fog nodes utilizing fog computing software, a package fog computing program, or other tools at the network edge. Edge nodes, or nodes closest to the edge, collect data from other edge devices such as routers or modems and route it to the best place for analysis[9].Administrators will determine which data is the most time-sensitive when integrating fog and cloud computing networks. Within validated control loops, the most important time-sensitive data should be evaluated as near to where it is produced as feasible.The system will then send data to an aggregate node that may be examined later. The features of fog computing essentially state that based on the eventual objectives of the analysis, the kind of data, and the user's immediate requirements, each type of data decides which fog node is the best place for analysis[10].

2. DISCUSSION

Fog computing can be used to describe a cloud computing alternative. By putting some resources and transactions at the network's edge, this strategy capitalizes on the twin issue of the proliferation of computer devices and the opportunity provided by the data such devices produce. Rather of creating in-cloud channels for usage and storage, users aggregate bandwidth at access points such as routers by placing them closer to devices. As a result, less data may be sent away from data centers, over cloud channels, and over long distances, lowering total bandwidth

requirements. Another significant distinction between cloud computing and fog computing is data storage. Because less data requires immediate cloud storage in fog computing, users may instead subject data to strategic compilation and distribution procedures that increase efficiency and save costs.

It is simpler to leverage on the current processing capacity in devices by shifting real-time analytics into a cloud computing fog situated closer to them. This enhances the user experience while also lowering the cloud's overall load. Devices linked to the internet of things benefit from fog computing the most (IoT). Fog computing and cloud computing vary mostly in terms of decentralization and flexibility. Fog computing, also known as fog networking or fogging, is a decentralized computer architecture that sits between the cloud and data-generating devices. This adaptable framework allows users to optimize performance by placing resources, such as programs and the data they generate, in logical places.

The structure's aim is to provide fundamental analytic services closer to where they're required, at the network's edge. This lowers the distance over which users must send data over the network, resulting in improved performance and overall network efficiency. Users gain from fog computing security concerns as well. The fog computing paradigm can divide bandwidth traffic, allowing users to increase network security by adding extra firewalls. Fog computing retains some of the characteristics of cloud computing, from which it evolved. While utilizing a fog computing paradigm, users may still store apps and data elsewhere and pay for not just offshore storage, but also cloud updates and maintenance for their data. Their teams will still have remote access to data.

3. CONCLUSION

The benefits and implications of fog computing technology in developing network topologies are the subject of this research. It also compares fog computing to other comparable technologies in order to determine its significance and effectiveness in the area. Fog computing, it can be argued, is a new technology that effectively solves the latency sensitivity problem in IoT networks. It's a new technique; therefore there are a few unanswered questions that need to be addressed by academics and developers. The cloud enables consumers too quickly and easily access computer, networking, and storage options, but it is a centralized resource. Data and devices situated distant from the centralized cloud may experience performance problems and delays as a result.

Another way to look at the distinction between edges computing and fog computing is to see fog as the standard that allows for repeatable, structured, and scalable performance inside the edge computing framework. Data is produced, processed, and stored close together in edge computing, which a kind of fog is computing. Edge processing, as well as the required infrastructure and network connections for data transmission, are all part of fog computing. This is due to the fact that both fog and mobile edge computing seek to decrease latency and increase efficiency, yet they process data in somewhat different places. Edge computing occurs when sensors are connected to equipment and data is collected—there is a physical connection between the data source and the processing site. Fog computing reduces the distance between the processing site and the data source by performing edge computing operations inside an IoT gateway or fog node with LAN-connected processors or within the LAN hardware. As a consequence, the processor and sensors are physically separated, yet there is no extra delay.

ABSTRACT

In today's technology era, programming is more essential than ever. Python and C++ are the most widely used programming languages. Python, the most popular programming language of the twenty-first century, is a higher-level object-oriented language, while C++ (the language that powers most operating systems) is a lower-level object-oriented language. Python and C++ are compared in this article. This book covers an introduction to various languages, memory management techniques, and reasons for their program execution speed. Furthermore, this study looked at the execution time and memory requirements of a variety of algorithms in both languages, comparing the best, average, and worst situations in each language. Furthermore, they are compared in terms of their benefits and drawbacks. C++ is faster than Python in terms of execution speed, according to the findings, but Python is a better option for beginners due to its simplicity. Aside from that, the language should be selected depending on the project type in order to get the best results. Programmers play a crucial role in computing. C/C++, Python, and Java are the most common languages. Beginning programming classes often utilize C++ and Java. Python has grown in popularity as an introductory programming language due to a variety of reasons. As an entry-level programming language, C, C++, Java, and Python were compared. More students selected Python over C++ because of its better pseudo-code syntax, simpler learning environment, and greater abstraction.

KEYWORDS: *C, C++, Java, Memory, Programming Languages, Python.*

1. INTRODUCTION

The majority of programmers and computer scientists are well-versed on the benefits and drawbacks of different programming languages. We aim to provide objective information by

comparing C, C++, Java, and Python. The same software was used to meet the requirements of each language. Because the comparison is limited yet homogeneous as a consequence, each programming language is also subjected to a study of many alternative implementations by different programmers. It has two benefits. By utilizing a single implementation per language, programmers' difficulties may be reduced. The variety of program features produced by various languages may also be analyzed and compared in this research.

Each language is compared on many levels, including program length and effort, as well as runtime and memory efficiency[1]. Languages are also examined individually and in groups. CSS and other scripting languages, at least during the software development phase, have a propensity to be interpreted rather than compiled, and therefore do not need variable declarations. Typed variable declarations are needed in traditional programming languages such as C, C++, Java, and Python since they are compiled rather than interpreted. Because Java is inefficient, C, C++, Java, and Python are often lumped together.

In the past, standard methods were not utilized to compare the performance of various programming languages. Programs for the Sellers algorithm, the Neighbor-Joining tree construction technique, and a parsing algorithm for file outputs were written in C, C++, Java, and Python. The implementations written in C/C++ were the fastest and used the least amount of memory. These languages' programs tend to contain more lines of code. Java and C# were formerly thought to be a compromise between the versatility of C, C++, Java, and Python and the performance of C/ C++. There was no significant difference in relative performance of tested languages in testing comparing Windows and Linux[2].

1.1.Statistical Methods and Plots

The multiple boxplot presentation was used as the primary evaluation tool in this research. A subset of data appears to the left of each line, with its name at the start. Each small circle represents a unique data value. The graphic may be used to compare two or more such data subsets visually. This data covers the 25 percent to 75 percent quartiles in the middle portion of the data, as shown by the shaded box[3]. The "whiskers" on the right and left indicate the data's lowest and highest 10 percent. The fat dot inside the box represents the median (50 percent) quartile within the box. The arithmetic mean and standard error of the mean are denoted by M and the dashed line around it (plus and minus one).

It's used to quantitatively characterize the variability within a set of numbers in the bad-to-good ratio: Assume the data is split into two halves, with the bad-to-good ratio equal to the median of each halves' median divided by the median of each halves' median. The median in a boxplot is the difference between the values at the box's right and left borders. In comparison to a measure of variability like the standard deviation, the bad-to-good ratio is more resistant to outliers.

The plots are an excellent method to highlight the most essential points. It did, however, do statistical studies just to be sure. The medians are compared using the Mann-Whitney U test (also known as the Wilcoxon rank sum test). It's possible that the reported differences across samples are just coincidental, and that the underlying populations have no difference or vary in the other way. The p-value is the result of each test.

1.2.Validity Of The Comparison

It's only fair to compare programming languages using real-world examples if the programmers' skills are comparable. In our case, it is not essential for the programs to be comparable on an

individual basis. According to a recent research, several factors jeopardize the comparability of 80 programs in the study. The programs are available from two different sources.

The Java, C, and C++ apps were created by computer science master students during a controlled experiment performed in 1997 and 1998[4]. Many volunteers replied to a "request for programs" posted on different forums by writing code in C, C++, Java, and Python in a variety of situations. As a result, these subjects' origins and experiences are more varied. A public call for programs, for example, may only attract experienced programmers, thus scripted applications may have higher average programmers' skills than non-scripted equivalents[5]. According to two observations, this discrepancy is not a problem. Students that developed the non-script apps were also highly competent and accomplished in their respective areas of study in a few instances approved. Non-script programmers are less competent in their language than C and C++ programmers, owing to Java's relative infancy in 1997 and 1998. When it came to programming, the Perl topics may have performed better than the others since Perl programmers, in my opinion, are more competent than the others.

1.2.1. What Is The Difference Between C And C++?

The performance of C and C++ is quite comparable. You may not be surprised to learn that C++ is an extension of C. It came close to matching the results of building a C program using the C++ compiler. However, we noticed some minor deterioration while utilizing C++ standard libraries (such as character strings). Tokenization was two times quicker than regular expressions for the identical BLAST file, although it took longer to build the program using tokens.

1.2.2. C/C++ Vs. Java

C# seems to need less RAM than Java to store strings in memory while reading DNA sequences from a file[5]. In C#, this kind of file was likewise simpler to comprehend. In the global alignment trial, Java was somewhat quicker, but considerably slower in the NJ program, which is a bit unexpected. Regular expressions seem to be implemented better in Java than in C#. This difference was not caused by Cinability #'s to handle big files, since it reads them faster than Java. Java took 3.2 minutes to read the same file, whereas C# took just 2.8 minutes.

1.2.3. Linux Vs. Windows

The relative performance of the tested languages on Windows, on the other hand, did not differ, but the overall performance did[6]. Only C, C++, Java, and Python were consistently faster on Windows. As demonstrated in Figure 2, every implementation of the global alignment program performed better in the Windows environment. In both the NJ and BLAST parser instances, C and C++ were slower on Windows, while Java and Perl were faster in the NJ example but slower in the BLAST parser example. The comparison between Linux and Windows must be viewed with caution due to variations in compiler implementations and the operating system that executes them. Finally, since the user is looking for performance in the apps rather than the OS or compilers in general, speed and memory use are the most significant factors.

1.3.The Programming Issue

The program must find a string of words with characters that exactly match the numbers in the phone number. All possible answers should be found and printed. The program generates the answers word for word. If a dictionary term cannot be provided at any moment, a phone number digit may be substituted. The program must maintain a list of partial responses while processing

each number. For simple access, the dictionary should be stored in a supporting data structure, such as a binary digit tree.

However, data indicates that the script group's average work time is also quite accurate: In general, the number of lines written per hour is unaffected by the language[7]. It's even better that the same data shows that the script group's programmers don't have superior abilities. The non-script group, for example, was given instructions emphasizing correctness as the main goal, while acceptance testing required high reliability and at least some efficiency. It's also conceivable that the average programmer's ability to program in two distinct languages varies somewhat. Tiny differences across languages should be ignored for a variety of reasons, including the possibility that they are due to data deficiencies. Large disparities, on the other hand, are almost always justified.

1.4.Structural Language Implementations In Different Operating Systems

All of the programs in this article were written by a single programmer with different degrees of experience in Java, Perl, and C++. As a consequence of the learning process, additional languages have been implemented. Because the semantics of C, C++, Java, and Python are similar in certain ways, but their philosophies are different, and applications should be designed according to the language paradigm[8]. Perl programmers prefer arrays and hash tables over loops, which are more frequently used in C. Keep in mind that adding a new value to a hash function may be costly if the amount of memory allocated is more than an array with the same number of components. Because of the additional cost of adding the key-value pair, a hash table should be avoided when a programmer must examine all of the data in a hash table sequentially.

The array version of the Perl NJ technique was proven to be faster and more memory efficient than the hash table version. As a consequence, this test did not utilize a hash table. There is a trade-off to be made between performance and convenience. In Perl or Python, a single command may read and load a file into memory. The operating system may begin to transfer memory out, causing the machine to slow down[9]. When building things, it's essential to take precautions and reduce the number of items as much as possible. Immutable objects, such as the String object in Java, should be avoided wherever possible, particularly when temporary objects are created in frequently used methods, to prevent memory leaks or heavy applications. Because of their capacity to reflect, objects written in C, C++, Java, and Python take up more memory than those written in other object-oriented languages like C++.

Reflection is a powerful method for these languages that adds to their flexibility. Reflection method calls incur a substantial performance cost, making the code harder to understand, and errors are discovered at runtime rather than compile time, thus this feature should be utilized with caution. The speed of any language is affected by how objects are fetched and stored in memory. C, C++, Java, and Python store objects as blocks of data that can be retrieved by constant offsets, as opposed to Python's hash table-based object storage approach[10]. Object generation in Perl may be done in a number of ways. Despite the fact that arrays are faster, prevent attribute collisions, and need less memory than hash tables, most programmers prefer hashes. NJ's Perl implementation has been significantly improved by converting each sequence to an array rather than utilizing the subset function on the string of characters to calculate the Similarity Matrix, as was previously done. Despite a 10% increase in program performance, the program's memory footprint increased by tenfold.

1.5.The Programming Code's Expressiveness

The number of lines in a program is determined by the programmer's choice for brevity over readability. It's critical to emphasize that expressiveness and stage performance have nothing in common. However, a significant difference was seen, particularly when regular expressions were used. A Java programmer must first create a Pattern object, which contains regular expressions in compiled form, according to the Java documentation. The programmer must next create a Matcher class, which parses a Pattern object and performs match operations on character sequences.

This article does not cover all programming languages. The degree of programming and the intensity of typing are only two features of a programming language, and there are many interesting languages that can't be cleanly categorized as system programming or scripting languages. Scripting languages, in contrast to system programming languages, provide a distinct set of trade-offs. In comparison to system programming languages, they trade execution speed and typing strength in exchange for much higher programmer productivity and software reuse. This trade-off becomes more reasonable as computers become faster and cheaper than programmers. System programming languages thrive at managing data structures and algorithms, while scripting languages excel at gluing programs together, where the complexity lies in their connections. Scripting will become a more important programming paradigm as gluing tasks become more prevalent in the twenty-first century.

2. DISCUSSION

Those who learnt Python had no previous programming expertise, while students who studied C++ did. As a result, students who had never coded before started studying Python, while those who had previously studied C++ continued to do so. When comparing the following data, this is an important aspect to consider.

Students found Python's algorithm design and functions to be more difficult than C++, which is reasonable given that majority of the students were new to programming at the time they studied Python. It was difficult to think about problem resolution and create an overall strategy without any previous knowledge. User-defined modules (UDMs) were first introduced in Python. This may affect a student's capacity to study as well as their perspective of view. Another reason may be that during the first semester, students were creating small and rudimentary programs and didn't understand why functions were required. It's the same thing with lists. Lists are likewise taught early in the Python course, however after about half of the course has been covered in C++, lists are introduced. Furthermore, some of the students had previous programming expertise, and C++ was the only language available as an option in their previous education.

More constructs in C++ constructions result in a higher score. As a consequence, prior experience may have aided certain students. When it came to loops and conditional expressions, students appeared to enjoy Python's clarity and logic. This is in line with a previous research [16], which showed that students felt writing comments or documentation for small programs was useless, and they likely feel the same way about writing documentation. They didn't appear to like this job, maybe because they were young and used to generating comprehensive documentation and hadn't yet acquired the necessary skills. Because C++ did not include file management, there was no way to compare the two.

3. CONCLUSION

The programming language used for a beginning programming course is crucial. Our results suggest that the programming language a student chooses may have a major impact on their learning, survival, and growth in the area of computers. The main assumption of students in a beginner language is that it would be simple to learn. Despite the importance of other languages such as C, C++, Java, and Python, Python is a very powerful and practical option for a beginning programming education. Students prefer Python over C++ because they think most of the language's features, such as loops and conditionals, are easier to understand.

Students majoring in computer science must be able to program. Most teachers begin by teaching traditional programming languages like as C, C++, Java, and Python, which are effective for creating real-world applications and therefore popular in industry. The complex grammar of these languages, on the other hand, is a barrier to learning for novices. The most popular learning programming language, Python, is compared against Java in this poll. Python's simple syntax and high-level data structures make writing small applications a breeze. Students may use Python's numerous paradigms to learn various elements of programming languages. As a consequence, Python is gradually displacing other languages as the preferred language for learning.

In the end, the likelihood of either language being chosen was about equal in both instances. C++ is a well-known programming language with a strong reputation for ensuring a bright future for its users. Python, on the other hand, is attractive because of its multi-paradigm nature. Its growth hasn't slowed, and it continues to recruit programmers from the private sector. When it comes to choosing C++ as the best option for future projects, 52 percent of students in our study feel more confidence now that they've been taught C++. They are also enrolled to study object-oriented C++ in the next term after completing the C++ class. While 64% of students believe they will be able to continue to utilize Python as they progress, the remaining 32% are uncertain. Python is regarded not just as a method to educate beginners to programming, but also as a tool for the future, as shown by the enormous number. It's worth noting that the majority of C++ voters were experienced programmers, while the majority of Python voters were beginners.

Ph.D. at the NIPI "NEFTEGAS" Institute of the State Oil Company,
Republic of Azerbaijan, UZBEKISTAN

ABSTRACT

The activities of the Uzbekneftegaz industry are aimed at maximizing the opportunities for a significant increase in hydrocarbon production, supplying them to the domestic market, deepening the technological processes of oil and gas processing for the production of products with high added value, the production of import-substituting products and access to the export oil and gas markets, creating favorable conditions to attract foreign direct investment in the oil and gas industry.

KEYWORDS: *UzbekneftegazIndustry, Hydrocarbon Production, Domestic Market, Oil, Gas, Foreign Direct Investment.*

INTRODUCTION

The improvement of the management structure of the oil and gas industry is always based on:

- Decree of the President of the Republic of Uzbekistan dated 11.12.1998 No. UP-2154 "On the transformation of the national corporation of the oil and gas industry "Uzbekneftegaz "into the national holding company "Uzbekneftegaz "",
- Resolutions of the Cabinet of Ministers of the Republic of Uzbekistan dated December 15, 1998 No. 523 "On questions about the organization and activities of the national holding company "Uzbekneftegaz",

- Resolutions of the Cabinet of Ministers of the Republic of Uzbekistan dated October 21, 2003 No. 460 "On improving the management structure of the national holding company “Uzbekneftegaz”,
- Decree of the President of the Republic of Uzbekistan dated 21.08.2006 No. PP-446 "On measures to improve the organization of activities of the national holding company “Uzbekneftegaz”,
- Resolutions of the President of the Republic of Uzbekistan dated June 30, 2017 No. PP-3107 "On measures to improve the management system of the oil and gas industry",
- Resolution of the President of the Republic of Uzbekistan dated July 9, 2019, goal No. PP-4388 "On measures to provide the economy and the population with energy resources, financial recovery and improve the management system of the oil and gas industry.".

At present, “Uzbekneftegaz” JSC acts as the legal successor for all rights and obligations of “Uznefteprodukt” JSC, “Uzburneftegaz” JSC, “Uzneftegazmash” JSC, “Uzneftegazdobycha” JSC, “Mubarekneftegaz” LLC, “Shurtanneftegaz” LLC, “Gazlineftegaz” LLC , LLC “Ustyurtgaz”, LLC “Mubarek” GPP, LLC “Neftegazinvest”, LLC “Neftegazexport” and LLC “Uzneftegazgeologiya” [1].

The main objectives of the Society are:

To meet the needs of the economy and the population of the republic in oil products and gas;

Determination of the strategy and prospects for the development of the oil and gas industry, in terms of tactics and solution of problems the Company facing.

General management of the activities of joint-stock companies included in its composition, as well as enterprises and organizations that are part of the structure of the Company.

In accordance with the goals set, the Company solves the following tasks:

To pursue a unified technical policy in the field of production and processing of liquid hydrocarbons and gas, to increase the industrial potential of the oil and gas industry, mainly through the development of modern and successfully applied international technologies, to further increase the competitiveness of manufactured products, to ensure on this basis the sustainable development of the oil and gas industry, growth of export potential and the fullest satisfaction of the needs of the economy and population of the republic in oil and gas products;

Develop current, mid-term and long-term forecasts, target scientific, technical, economic and social programs for the development of the oil and gas industry;

To carry out a set of measures, including an increase in the volume of production, production and sale of oil, gas, gas condensate and products of oil and gas processing;

Attract direct investments, strengthen the role of shareholders in the course of strategic management of joint stock companies, and ensure openness of joint stock companies' activities and their attractiveness for potential investors;

To deepen the level of localization of production, to expand intersectoral industrial cooperation based on the use of mainly domestic raw materials and resources, to ensure import substitution and saturation of the domestic market with the necessary products and components;

Expand the volume and range of export supplies, assist exporting organizations in this industry, promote products to new external and regional markets, actively implement energy efficiency and energy saving standards;

To widely introduce modern information and communication technologies and software products, to ensure, on this basis, an increase in management efficiency and a reduction in production costs, transparency of the financial and economic activities of the organization.

The implementation of the set goals and the solution of the tasks allowed to prepare for development of new fields and put them into operation, as a result new prospects for the development of the industry were opened.

An alternative direction for the development of the industry is the production of synthetic oil based on high-speed pyrolysis technology. JSC "Uzbekneftegaz" plans to implement a significant number of investment projects in the coming years. Therefore, special attention is paid to attracting foreign investors to the country. Among the most important investment projects are projects implemented jointly with “Gazprom” and “Lukoil” (Russia), “CNODC” (China), “PetroVetnam”(Vietnam), “KNOC” (Korea), “SASO”L (South Africa), “Aral Project” Consortium and others.

In connection with the adoption of the resolution of the President of the Republic of Uzbekistan, significant changes were made to the structure of JSC Uzbekneftegaz [1]. Certain joint-stock companies left its structure (“Uztransgaz” JSC, “IGIRNIGM” JSC and a number of others), many enterprises lost their status of legal entities and came under direct subordination to the departments of “Uzbekneftegaz” JSC. In this regard, to ensure comparability, we analyzed the indicators of financial statements for 2019 (tab. 1 - 4) [2,3,4,5]

TABLE 1 - CONSOLIDATED BALANCE SHEET (MILLION SOUMS)

№	Balance sheet items	2018	2019
	ASSETS		
	1.Long-term assets		
1	Fixed assets	30 073,5	28 644,9
2	Intangible assets	2 135,9	67,5
3	Long term investment	6 679,8	4 234,6
4	Equipment for installation	260,3	433,6
5	Capital investments	6 318,0	21 904,4
6	Long-term receivables	42,5	4 813,0
	Total for section 1	**45 510,0**	**60 098,0**
	2.Current assets		
1	Inventory	9 997,6	2 090,1
2	Kelajakdagixarajatlar	32,5	21,5
3	Deferred expenses	275,7	558,8
4	Debtors	17 792,3	19 795,1
5	Cash	2 122,4	1 435,4
6	Short-term investments	1 690,4	342,0
7	Other current assets	366,3	5,0
	Total for section 2	**32 277,2**	**24 247,9**

	Total asset balance	**77 787,3**	**84 346,0**
	PASSIVE		
	1. Sources of own funds		
1	Authorized capital	14 415,5	14 629,1
2	Added capital	92,6	92,6
3	Reserve capital	1 537,1	8 863,5
4	Repurchased own shares	- 0,6	
5	Retained earnings (uncovered loss)	- 1 553,9	- 518,0
6	Minority share	- 141,7	1 071,8
7	Targeted receipts	12 797,6	12 740,3
	Total for section 1	**27 146,6**	**36 879,3**
	2.Liabilities		
1	long term duties	24 692,2	39 159,0
	incl. Long-term bank loans	19 156,4	37 214,7
	Long term loans	5 389,9	412,8
2	Current responsibility	25 948,5	8 307,7
	incl. Current payables	22 363,7	7 435,9
	Total for section 2	**50 640,7**	**47 466,7**
	Total liabilities of the balance	**77 787,3**	**84 346,0**

Based on the reporting data, it can be seen that by the beginning of 2020, the assets of Uzbekneftegaz amounted to 84 346 million soums. Of their total, long-term assets amounted to 60,098 million soums or 71.3% and increased by 32% over the year. Among them, more than 47.5% were fixed assets and 36.4% - capital investments. Thus, the structure of long-term assets can be recognized as efficient enough.

Current assets for the reporting year decreased by almost a quarter and amounted to 24 247.9 million soums. The decrease was mainly due to inventories and including production inventories, work in progress and goods by 7,907.5 million soums, or almost 80%, and cash by almost a third, or 667 million soums.

At the same time, the main share in current assets is still occupied by accounts receivable (81.6%), the volume of which increased by 11.3% over the year and reached 19 795.1 million soums. This, in essence, is the mortification (abstraction from active circulation) of financial resources.

The assets of the company are secured by its capital, which amounted to 47 466.7 million soums at the beginning of 2020 and decreased by 6.3% over the year. In the total amount of capital, 43.7% are borrowed by own funds and, accordingly, 56.7% are borrowed funds.

A positive point is that during the analyzed period, own funds increased by almost 36% or by 9,732.7 million soums), and borrowed funds decreased by 6.3% (by 3,174 million soums). The increase in own sources of funds was mainly due to an almost 6-fold increase (by 7 326.4 million soums) of the reserve capital. A positive moment is a significant decrease in current liabilities by 68% (by 14,127.8 million soums), of which almost 90% are current payables.

The growth of long-term liabilities is almost 2 times associated with the attraction of long-term bank loans for 18,058.3 million soums.

Analysis of the consolidated statements of financial results (Table 6) in conjunction with the data of the Statement of Equity (Table 7) showed that in the reporting year, profit before income tax amounted to 1,371.3 million soums with a loss admitted in the previous year in the amount of 654.7 million soums.

TABLE 2- CONSOLIDATED STATEMENT OF FINANCIAL RESULTS (MILLION SOUMS)

№	The name of indicators	2018 y.		2019 y.	
		Income	Expenses	Income	Expenses
1	Net proceeds from product sales	23715,0		15198,9	
2	Cost of products sold		20497,7		8842,9
3	Gross profit from product sales	3217,3		6356,0	
4	Period expenses - total		10859,9		3560,9
	incl. Implementation costs		*909,2*		*823,6*
	Administrative expenses		*587,1*		*240,7*
	Other operating expenses		*9363,6*		*2496,6*
5	Other income from operating activities	7630,0		985,8	
6	Profit (loss) from operating activities		12,5	3780,9	
7	Income from financial activities	6910,0		6136,3	
8	Financial expenses		7552,2		8545,7
9	Profit (loss) from general business activities		654,7	1371,5	
10	Profit (loss) before income tax (income)		654,7	1371,5	
11	Income tax (profit)		494,9		334,3
12	Other taxes and fees on profits		1441,1		0,1
13	Net profit (loss) of the reporting period		2590,6	1037,1	

TABLE 3 - STATEMENT OF EQUITY CAPITAL (MILLION SOUMS)

Indicators	Charter capital	Added capital	Reserve capital	Undisclosed profit(loss)	Repurchased own shares	Minority shares	Targeted receipts	Total
Balance at the beginning of period	14415,6	92,6	1537,1	-1553,9	-0,6	-141,7	12797,6	27146,6
Retained earnings (loss)				1035,9		1,2		1037,1
Other sources of equity financing	213,5		7326,4		0,6	1212,3	-57,3	8695,6
Balance at the end of the period	14629,1	92,6	8863,5	-518	0	1071,8	12740,3	36879,3

Financial assessment by types of activity of “Uzbekneftegaz” is concentrated in the Statement of Cash Flows. It can be seen from this form that “Uzbekneftegaz” JSC approached 2020 with a negative cash flow.

TABLE 4 - CONSOLIDATED STATEMENT OF CASH FLOWS (MILLION SOUMS)

The name of indicators	Income	Expenses
Operating activities		
Cash receipts from product sales	18 166,2	
Cash payments to suppliers for materials, goods, works and services	0,2	9 600,7
Cash payments to and on behalf of staff		725,8
Other cash receipts and payments from operating activities	5 554,2	4 353,0
TOTAL net cash inflow / outflow from operating activities	**9 041,1**	
Investment activities		
Purchase and sale of fixed assets	159,0	246,6
Purchase and sale of intangible assets	1,5	1,0
Purchase and sale of long-term and short-term investments	167,9	828,4
Other cash receipts and payments from investment activities	198,2	16 875,5
TOTAL net cash inflow / outflow from operating activities		**17 424,9**
Financial activities		
Interest received and paid	29,5	1 090,6
Received and paid dividends	110,9	0,7
Cash receipts and payments on long-term and short-term loans and borrowings	18 064,1	3 316,5
Other cash receipts and payments from financial activities	4 427,3	5 020,0
TOTAL net cash inflow / outflow from financial activities	**13 309,0**	
Taxation		
Income (profit) tax paid		355,3
Other taxes paid		4 478,8
TOTAL taxes paid		**4 834,1**
TOTAL net cash inflow / outflow from financial and economic activities		**91,1**
Foreign exchange balance from revaluation of cash in foreign currency	622,5	0,0
Cash at the beginning of the year	**721,7**	
Cash at the end of the year	**1 435,4**	

Operating activities made it possible to ensure a net cash inflow in the amount of 9,041.1 million soums, mainly due to proceeds from the sale of products and even subject to settlements with suppliers and personnel.

Investing activities brought an outflow of funds in the amount of 17 424.9 million soums.

Financial activities were more efficient and ensured an inflow of cash in the amount of 13,309 million soums, due to the attraction of long-term loans from banks for 18,064.1 million soums.

However, due to a significant amount of taxes to the budget (4,834.1 million soums when receiving profit before taxes in the amount of 1,371.5 million soums), in general, for "Uzbekneftegaz" JSC, the net cash outflow from financial and economic activities amounted to 91.1 million soums.

Thus, making a conclusion, it can be noted that there is still a lot of work to be done both to improve the structure and to eliminate factors that adversely affect the activities of the industry. Special attention should be paid to accounts receivable, the proportion of which remains high as before. Also, to improve the structure ofcapital (increase own funds) to improve the qualifications of personnel by stimulating the process, improving professional training.

ABSTRACT

The article contains a clip from the works and works of Russian composer, pianist, pedagogue, public figure. Classical music of the 20th century. People's Artist of Russia, Hero of Labor Dmitry Dmitrievich Shostakovich. Dmitry Dmitrievich Shostakovich's mother was an elementary piano teacher. Under his leadership, the future composer and his two sisters studied music. Her sister later became a professional musician. His childhood coincided with the events of a major historical century: the First World War, and the Great October Socialist Revolution. From the age of 9 to 11, he learns to compose music at home.

KEYWORDS: *Petersburg, Leningrad, Oratorio, Symphony, Allegro, Sonata.*

INTRODUCTION

Dmitry Dmitrievich Shostakovich is one of the most famous and victorious composers in the world, who is imperceptibly absorbed in modern classical music. Shostakovich was born on September 25, 1906 in St. Petersburg. Although his father was an engineer-chemist, he was a music lover, and his mother was a pianist and a gifted student at the conservatory."I grew up in a family that loved music" said the composer. "My mother, SofyaVasilevna, studied at the conservatory and was a good pianist. My father, Dmitry Boleslavovich, loved music and had a great voice. There were a lot of music fans among our family acquaintances and friends. They also took an active part in home music evenings".

Dmitry Dmitrievich Shostakovich's mother was an elementary piano teacher. Under his leadership, the future composer and his two sisters studied music. Her sister later became a professional musician. His childhood coincided with the events of a major historical century: the First World War, and the Great October Socialist Revolution. From the age of 9 to 11, he learns to compose music at home.

After studying at one of the private schools for some time, in 1919 at the age of 13 he entered the Petrograd Conservatory, majoring in piano and composition. Composer Alexander Konstantinovich Glazunov advises Shostakovich to choose the field of composition, to seriously deal with composition. (Glazunov was the director of the Petrogad Conservatory at that time.) Studied. When Shostakovich's father died in 1922, the family situation worsened. Glazunov provides a special scholarship for a gifted student. After the death of his father, Shostakovich was forced to find a job. Thus, he began working as a music illustrator at the cinema "Pariziana" on NevskyProspekt. This profession was very common in the era of voiceless cinema. He played the piano and gave a musical background to the movies that didn't come out. Later, this experience blinded the composer. In 1923, Shostakovich graduated from the conservatory with a degree in piano, and in 1925 with a degree in composition. While studying at the conservatory, Shostakovich created a number of works. Romances, piano pieces, symphonic scores. The largest of these is his first symphony. Symphony No. 1 was Shostakovich's dissertation. As you know, symphony is the most complex genre of instrumental music. Not everyone is fortunate enough to write a symphony at the age of 18-19. Therefore, on May 12, 1926, the first performance of the symphony took place. The symphony was recently performed in the United States under the direction of Bruno Walter and Otto Klemperer in Germany under the direction of Stokowski and Tuscany.

After graduating from the conservatory, the composer hesitates: whether I will be a pianist or a composer; had initially mastered both areas. In the second half of the 1920s, he came out as a pianist with solo concerts. Chopin, Tchaikovsky, Prokofiev performed concerts for piano and orchestra. In 1927 he participated in the Chopin International Competition in Warsaw and was awarded an honorary diploma. After a while, the musician decides to give up his career because his job was interfering with the composition. The composer's Second Symphony and Symphony III, written in 1929 for the October Revolution, are dedicated to May 1. From the music for the 1932 film The Encounter, UtrennyaPesnya (Dawn Song) became the brightest example of Soviet popular song. At the same time, Shostakovich wrote the opera "Nas" based on the satirical story of Nikolai Vasilevich Gogol about Major Kovolyov, who lost his nose (National Encyclopedia of Uzbekistan:2000, p.25).

In 1931, the ballet Bolt was staged. Shostakovich composed music for a number of films. He will meet Mayakovsky at the Meyerhold Theater. In this theater, Shostakovich directed the musical part. The music for the comedy "Klop" was very popular with V. Mayakovsky, but stopped with the untimely death of V. Mayakovsky. In addition, Shostakovich wrote music for performances at the Workers' Youth Theater. During 1930-1932, Shostakovich created the opera "Mrs. Macbeth of Mtsensk County" based on the work of Nikolai Leskov. On the stage of modern theaters, the opera will be renamed "Katerina Izmailova" and the genre of opera - tragedy satire. In January 1934, the opera was staged for the first time at the Small Opera House in Lelingrad and at the Musical Theater named after VI NemirovichDanchenko in Moscow. After a while, the opera was unfairly criticized and removed from the repertoire. And again in 1962. During these years, D. Shostakovich created a number of musical works, including 24 preludes for the piano. Dramatic ideas were reflected in symphonies 4, 5 and 6, written in the mid-1930s. Symphony No. 5 will be performed on November 21, 1937 in the hall of the Leningrad Philharmonic under the direction of conductor Yevgeny Mravinsky. Symphony No. 5 continues the traditions of Beethoven and Tchaikovsky (Gruber: 1953, p.54).

In addition to the symphony, the composer also works on chamber works. The first string quartet; He creates quintet works for piano, 2 violins, viola and cello. He was awarded the State Prize for quintet. In 1939, Shostakovich turned 33, when he became a professor at the Leningrad Conservatory. In his class, future composers such as Sviridov and Levitin took lessons. When he moved to Moscow in 1943, Karayev and Gali studied in his class. Thus, the Shostakovich school appeared. On June 22, 1941, the Great Patriotic War began. Shostakovich writes his 7th symphony The symphony was composed in July-December 1941(Musical aesthetics of the Western European Middle Ages and the Renaissance: 1965,p.74).

3 parts were recorded in the besieged city of Lelingrad, and the finale was completed in Kuibyshev. He leaves his hometown in obedience to the evacuation order Symphony No. 7 was performed first in Kuibyshev, then in Moscow, and then in the besieged Leningrad. Then abroad. In the summer of 1942, Symphony No. 7 was performed in New York under the direction of Tuscany (Rosenshild:1969, p.52).

Two years later he composed his 8th symphony. Symphony No. 8 is a tragic poem about the war. In the post-war years, the composer was engaged in public affairs. He worked in the Union of Composers of the USSR, first as a deputy to the RSFSR, and then to the Supreme Soviet of the USSR. In 1949, Shostakovich became a member of the Soviet Peacekeeping Committee. In 1954 he was awarded the International Peace Prize by the World Peace Association (Trigulova: 2008, p.39).

In the same year he was awarded the title of People's Artist of the USSR. In 1956, on his fiftieth birthday, he was awarded the Second Order of Lenin.

In 1966, he was awarded the title of Hero of Socialist Labor. From year to year the fame of the composer grows. Works of the 40s and 60s During the 25 years (a quarter of a century) after the war, the composer created many works in various genres. In 1947-1948, he gave a concert for violin and orchestra dedicated to David Oystrakh, with vocals for soprano, contralto and tenor accompanied by a piano entitled "From Jewish Folk Poetry". In 1949, E. Dolmatovsky wrote an oratorio "Song of the Forest" (Song of the Forests). In the early 1950s, "24 Preludes and Fugues" and "10 Choral Poems" were written on the poems of Russian revolutionary poets. One is for the piano and the other is for a working-class revolutionary song. The contrast of the centuries he created is typical of Shostakovich. In the 1930s and 1940s, he used revolutionary Russian songs in his music for films. This feature is later observed in symphonic music as well. In particular, in the music of Symphony No. 11, written in 1957, the symphony has a programmatic title, "1905," dedicated to the first Russian revolution.

4 parts have separate names, they are:

1) "Dvortsovayaploshad" (palace area).

2) "January 9"

3) "Eternal memory" (eternal memory)

4) "Nabat" (Bong).

Dedicated to the 22nd Congress in 1961, Shostakovich composed the 12th Symphony. Its name: "1917" is dedicated to the memory of VI Lenin. Symphony No. 13 is based on Yevtushenko's words and was written for a male choir and orchestra. Symphony No. 14, written in 1969, is for soprano, bass and chamber orchestra. One of the most philosophical works of the composer. His

last 15 symphonies were composed during the summer of 1971. He wrote poetry and humorous songs from Crocodile magazine (a publication similar to Mushtum). He was sometimes called a musical columnist. Shostakovich's lyrical and philosophical qualities are reflected in the quartets. The vocal series, written in the words of Alexander Blok, celebrates the eternity of creativity and beauty.

Dm. Dm. Shostakovich died on August 9, 1975.

7-symphony. C-stop.

Shostakovich is the author of 15 symphonies. This genre is extremely important in his work.Shostakovich is a master of orchestral writing. He thinks like an orchestra. Symphony No. 7 is one of the greatest works. The symphony was written in 1941. Most of it was written in Leningrad. The symphony premiered in August 1942 in Leningrad. In the besieged city, people were tired of playing the symphony. The remaining 15 people on the radio committee needed at least 100 people to perform the remaining symphony! Then, inviting all the artists in the City, the former musicians found army and navy orchestras and performed on August 9 at the Philharmonic Hall. The symphony orchestra was conducted by Karl IlichEliasberg. The score of the symphony includes a dedication written in the author's name “Named after Lelingrad”. Symphony No. 7 is compared to documentaries about the war. The symphony is called a “chronicle” or a “document” because it deeply illuminates the spirit of the time. The symphony is set against two opposing themes: creation, creativity, the world of reason, and the world of destruction and ignorance.

Good and Evil.

Part I is written in the form of an Allegretto-sonata. The main party theme is heroic and magnificent. It sounds like a do-major on stringed instruments. The accompanying part is played in a lyrical verb in the tone of the left major, the melody is performed by violins, the harmony is performed by the bass and cello. At the end of the accompanying party, the flute plays the piccolo solo and the trumpet violin. Development begins after exposure. The development begins with the attack of the famous Nazi invaders. This is an impressive picture of the power of destruction. The invaders start with a remote-controlled combat drum method. The whole record is written in the form of a variation on a single unchanging theme. The drum method also always beats. Orchestral timbres, registers, texture thickness, and dynamics change from variation to variation. New polyphonic sounds will be added. The verb of the subject is covered by all these means. The number of variations is 11. The sound of variation I is emphasized by the low-register flute timbre with a cool sound. Variation II plays the same flute with a piccolo flute at a distance of 1.5 octaves. Variation IV repeats each phrase played by the goboy by copying the bassoon one octave below. Variations IV-VII The fighting spirit of the music intensifies. Musical instruments (trumpet, trumpet, etc.) are included. The VI-variation theme begins to resonate in the forte nuance, expressed in parallel trinities. VIII-variation resonates in the nuance of the frightening fortissimo of the main theme. It is performed on a low register with 8 horns, wooden drums and stringed instruments. The xylophone, along with other instruments, now beats the automatic figure, which has been copied from Variation III. Variation IX The high-pitched tubes of the trombones add to the loud sound motif of the subject to the iron sound.

The last 2 variation themes have a ceremonial verb. It is as if an iron creature is moving (approaching) towards the right listener with a deafening noise. But suddenly there is a change of tone, consisting of trumpets, horns and trombones. Variational development, moving to the

development of processing, depicts an incomparably intense symphonic battle scene. The reprise begins. Both themes change significantly in the reprise. The theme of the main party resounds in the minaret, and its marching style takes on the significance of a mourning procession. The melody rises to the level of a powerful recitative. This is a speech aimed at all people. The accompanying part is at first clear, bright and lyrical, and when it comes to reprise, it is performed sadly in a low voice in a special minor lad (II and IV reduced lad lad). In the code of the first part, the theme of the main party returns again. He still plays the major, in violin. At the end a distant drumbeat and the theme of aggression are heard. The war continues. In Parts II and III, the destructive power of fascism is contrasted with man's spiritual wealth, the depth of his thinking, and his powerful beliefs.

Part IV. The exhausting final is full of attacking enthusiasm and confidence in the imminence of victory. Shostakovich's Leningrad Symphony deserves to be called the Heroic Symphony of the 20th century. In his works, Shostakovich always praises his love for his country, as well as his devotion to it. we can recognize him as a great person who encourages new directions by being attentive.

DmitriyDmitrievich Shostakovich's list of major works.

1.15 symphonies (including VII "Leningrad", XI "1905", XII "1917", XIII for bass, choir and orchestra dedicated to the memory of VI Lenin.

2. "Katerina Izmaylova" opera, "Nas opera".

3. Vocal-symphonic poem "KaznStepanaRazina" (execution of StepanRazin).

4. Oratorio "Song about the forests".

5. Concerts for violin, cello, piano and orchestra.

6. 15 string quartet.

7. Quintet for piano, 2nd violin, viola and cello.

8. A trio for piano, violin and cello.

9. 24 preludes and fugue for piano.

10. 24 preludes for piano.

11. Vocal series, songs (including "Song at the meeting", "Song of the world").

12. Music for movies. ("Meeting", "The Man with the Gun", "The Young Guard", "Hamlet", "Karl Marx" and others.

ECONOMIC ANALYSIS OF THE DEVELOPMENT OF MAIN SECTORS OF AGRICULTURE

Jumaev Q. X*

*Assistant Professor,
Candidate of economic sciences,
Institute of Staff Training and Statistical Research,
UZBEKISTAN

ABSTRACT

The article presents the role of the agricultural sector in the country's economy, economic analysis of their main sectors in terms of economic activity, as well as the main problems and directions for the development of the sector.Effective implementation of these tasks requires the assessment and efficiency of agricultural economic activity of the regions, further improvement of the system of statistical indicators in agriculture, the study and forecasting of economic development of the industry in the regions by special statistical methods.

KEYWORDS: *Agriculture, Farming, Animal Husbandry, Farms, Cluster, Smart Farm.*

INTRODUCTION

Today, a number of scientific studies on improving the efficiency of agricultural production, improving the system of their economic and statistical indicators, a comprehensive economic and statistical analysis through averaging indicators, including statistical assessment of intensive agricultural development through the implementation of a systematic approach, and extensive multidisciplinary statistical analysis of quality. One of the priorities in world practice is to improve the methodology of agricultural statistical accounting and reporting systems, including the use of systematic statistical analysis, statistical assessment and forecasting of factors affecting the development of production of basic agricultural products.

In recent years, Uzbekistan has taken targeted measures to structural changes in agriculture, in particular, the development of agriculture on a multi-sectoral basis, financial support, development of the sales system. The Decree of the President of the Republic of Uzbekistan dated February 7, 2017 PF-4947 "On the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021" pays special attention to the modernization and accelerated development of agriculture. In particular, "… reduction of areas under cotton and cereals, planting of potatoes, vegetables, fodder and oilseeds on vacant lands, as

well as further optimization of arable lands through the placement of new intensive orchards and vineyards; creation of favorable conditions for the promotion and development of diversified farms engaged in the processing, preparation, storage, sale, construction and provision of services, as well as the production of agricultural products; implementation of investment projects for the construction of new processing enterprises, reconstruction and modernization of existing ones, equipped with the latest high-tech equipment for deep processing of agricultural products, production of semi-finished and finished food and packaging products; Priorities such as storage, transportation and sale of agricultural products, further expansion of the infrastructure for agrochemical, financial and other modern market services" (Decree of the President of the Republic of Uzbekistan PF-4947).

Effective implementation of these tasks requires the assessment and efficiency of agricultural economic activity of the regions, further improvement of the system of statistical indicators in agriculture, the study and forecasting of economic development of the industry in the regions by special statistical methods.

ANALYSIS OF THE RELEVANT LITERATURE

The issues of assessing the socio-economic development and prospects of the agricultural sector have been studied by many scientists. In particular, in the research work of K.R. McConnell (McConnell:2003, p.399).A.Zabutyy (Zabuty:2012, p.25) and others, the socio-economic development of the agricultural economy was carried out on the basis of a conceptual approach, based on the characteristics of one or another country, V.N. Afanasev (Afanasyev:2003), A.P.Zinchenko(Zinchenko:1998, p.345), P.K.Kundius (Kundius:2010,p.570), B.I.Bashkatov (Bashkatov:2001,p.87), A.I.Gozulov (Gozulov:1967,p.267), Yu.E.Gaabelar (Gaabe:1964,p.502). In his work, he paid special attention to improving the statistical methodology and database of agriculture. Also in the assessment of economic development and structural changes in agriculture in Uzbekistan Berkinov (Berkinov:2007,p.23), T.Kh.Farmonov (Farmonov :2004,p.30), O.Z.Zokirov (Zokirov:2003, p.265), K.D.Mirzaev (Mirzaev:2011, p.200). In the scientific researches of N.Saidova (Saidova :2016,p.56), BTSalimov (Salimov:2004,p.22-23) and others the cultivation of the main types of agricultural products, the development of agriculture and animal husbandry in the regions, the factors influencing them, the potential and prospects of the regions are not studied statistically.

RESEARCH METHODOLOGY

Methods such as system analysis, statistical observation, averages, statistical aggregation and grouping, dynamic series, correlation and regression analysis, statistical modeling and forecasting were used in the research process.

ANALYSIS AND RESULTS

In order to achieve the main goal in agriculture, a variety of products are grown, works, services are performed, which are distributed and sold in order to meet demand. These processes, which take place at the level of enterprises, associations, industries (district, region, republic), are carried out on the basis of free market relations.

Agricultural products represent the total volume of agricultural production, determining the total value of agricultural and livestock products produced in the reporting period on farms, dehkan (personal assistant) farms and organizations engaged in agricultural activities.

According to our analysis, the highest growth rates of agricultural, forestry and fishery products (services) in the regions are Surkhandarya (105.6%), Fergana (104.8%), Namangan (103.8%), Kashkadarya (103.4%), It was registered in Navoi (103.2%) and Samarkand (103.1%) regions. In Syrdarya (100.2%), Jizzakh (101.0%) and Bukhara (101.6%) regions, on the contrary, growth rates were lower (Data of the State Statistics Committee of the Republic of Uzbekistan:2020).

Of course, the volume of agricultural products and services in the regions is directly affected by the area under agricultural crops. That is, as shown in Table 1 above, the sown area of all agricultural crops for the harvest of 2020 is 3373.4 thousand hectares (101.9% compared to the same period last year), including 1619.8 thousand hectares of cereals and legumes. (102.6%), technical crops 1105.8 thousand hectares (100.6%), including cotton 1050.7 thousand hectares (100.0%), potatoes 93.2 thousand hectares (103.9%), vegetables 224.2 thousand hectares (101.9%), food melons 60.6 thousand hectares (113.6%), fodder crops 269.0 thousand hectares (100.5%), fruits and berries 341.1 thousand hectares(101.3%), vineyards covered 126.0 thousand hectares (104.8%) (State Statistics Committee of the Republic of Uzbekistan:2021).

Of course, the volume of agricultural products and services in the regions is directly affected by the area under crops. In other words, Kashkadarya, Jizzakh and Samarkand regions have the highest area of all agricultural crops sown in the country for the harvest of 2020 (3373.4 thousand hectares), respectively, 455.8 thousand hectares (13.5%), 340.7 thousand hectares (11, 0%) and 371.6 thousand hectares (10.1%), while the lowest rate was 89.7 thousand hectares (2.7%) in Navoi, Namangan and Syrdarya regions, respectively, except for Tashkent (87 hectares). 185.4 thousand hectares (5.5%) and 193.4 thousand hectares (5.7%), respectively. Compared to the previous year, Tashkent, Syrdarya and Samarkand regions are leading with 108.4%, 106.5% and 103.9%, respectively, while Navoi and Fergana regions and the Republic of Karakalpakstan are 96.8% and 99.2%, respectively. and is in last place with 98.6% (Table 2).

According to the categories of farms, ie all agricultural crops planted for the harvest of 2020 in the sown area (3373.4 thousand hectares) 2563.3 thousand hectares (75.98%), respectively, of farms, dehkans (personal assistants) and agricultural organizations, 473 , 4 thousand hectares (14.03%) and 336.7 thousand hectares (9.98%).

In terms of regions, the highest area of all agricultural crops planted on farms for the harvest of 2020 (2563.3 thousand hectares) is 345.7 thousand hectares (13.5%), 322.9 thousand hectares, respectively, in Kashkadarya, Jizzakh and Samarkand regions. (12.6%) and 269.3 thousand hectares (10.5%), while the lowest rates were in Navoi, Syrdarya and Namangan regions - 71.7 thousand hectares (2.8%), 130.8 thousand. hectares (5.1%) and 146.2 thousand hectares (5.7%).

In dehkan (personal assistant) farms, Kashkadarya, Samarkand and Surkhandarya regions have the highest rate in terms of the area under all crops planted for the 2020 harvest (473.4 thousand hectares), respectively, 68.4 thousand hectares (14.4%), 61, 8,000 hectares (13.1%) and 49.3 thousand hectares (10.4%), while the lowest rate was 11.3 thousand hectares in Tashkent (87 hectares), Syrdarya, Navoi and Namangan regions (respectively). 2.4%), 14.6 thousand hectares (3.1%) and 29.1 thousand hectares (6.1%).

According to the analysis, in 2020, all categories of farms will produce 7566.6 thousand tons (101.7%) of cereals, 3143.5 thousand tons (101.7%) of potatoes, 10459.5 thousand tons (102.4%) of vegetables. , 2134.4 thousand tons (103.2%) - nutritious melons, 2 864.0 thousand tons (104.0%) - fruits and berries, 1639.2 thousand tons (102.2%) - grapes (Data of the State Statistics Committee of the Republic of Uzbekistan:2020)..

When we analyze the total volume of agricultural, forestry and fishery products (services) grown in the leading sectors in 2020, the share of agricultural products amounted to 49.5%, or 123.6 trillion. soums or 103.4% compared to the corresponding period of 2019. The share of livestock products in the total volume of agricultural production amounted to 50.5%, or 126.2 trillion soums. soums or 102.1% compared to the corresponding period of 2019 (Data of the State Statistics Committee of the Republic of Uzbekistan:2020)..

Consistent implementation of measures to increase the domestic capacity of the livestock sector, as well as the provision of systematic state support to them has allowed to increase the number of livestock, to fill the domestic consumer markets with livestock products. Therefore, in 2020, 2526.2 thousand tons of live weight by all categories of farms. meat (2.1% more than in 2019), 11009.9 thousand tons. milk (an increase of 2.8%), 7825.0 million eggs (an increase of 0.7%), 35.7 thousand tons. wool (1.5% more) was grown and 144085 t. fish (18.4% more) were caught (Data of the State Statistics Committee of the Republic of Uzbekistan:2020).

To date, the total number of cattle in the country (as of January 1, 2021) has reached 13,188.7 thousand. Compared to the corresponding period of 2020, the number of cattle in all categories of farms increased by 239.0 thousand (1.8%). Of these, the total number of cows reached 4744.3 thousand. Compared to the corresponding period of 2020, the number of cows in all categories of farms increased by 80.8 thousand (1.7%). The total number of sheep and goats reached 22498.6 thousand. Compared to the corresponding period of 2020, the number of sheep and goats in all categories of farms increased by 591.7 thousand (2.7%). The total number of horses reached 254.0 thousand. Compared to the corresponding period of 2020, the number of horses in all categories of farms increased by 6.9 thousand (2.8%). The total number of birds reached 90,131.8 thousand. Compared to the corresponding period of 2020, the number of poultry in all categories of farms increased by 2272.1 thousand (2.6%) (Data of the State Statistics Committee of the Republic of Uzbekistan:2020).

As of April 1, 2020, the number of birds was 83.4 million, while as of April 1, 2021, the number of birds was 84 million (an increase of 100.4%).

Today, 8 million young chickens (from 1 to 90 days) are reared in large poultry farms in the country after rehabilitation, which are not recorded in statistical reports.

Due to a decrease in egg production in Tashkent region - by 5%, in Syrdarya - by 4%, the price of eggs in these regions increased by 7%, and in the country - by 3.6%.

Another factor in the decline in egg production is the cold winter days. The breeding temperature of the bird should be 20-22 degrees, and on severe cold days of winter, egg production decreases due to the decrease in temperature, and this is a natural process.

For information, we can say that 45% of the republic's poultry farms are poultry farms, 55% of the population.

The cost of everything comes from the cost, the cost of the product increases due to the cost of food, supplements, utilities and salaries. It should be noted that 15 types of poultry products are imported, and the price of eggs has risen due to rising prices abroad.

For comparison, as of May 19, 2021, the price of 10 eggs in the markets of Uzbekistan was 8,000-14,000 soums, in neighboring Kazakhstan the price of an egg (in our soum) was 3,000 soums, in Kyrgyzstan 2,000 soums and in Russia 2,500 soums. formed.

In 2020, a total of 7.8 billion consumer eggs were produced (the norm was 208 eggs per capita, 227 eggs were produced), and in 2021 this figure will reach 8.1 billion eggs (236 eggs per capita). 103.8 percent).

It is planned to establish 3 breeding farms in Kashkadarya and Surkhandarya regions, where 60,000 mother chickens will be raised ”(20).

About 500 clusters and cooperatives have been set up in fruit and vegetable growing, grain growing and animal husbandry. As a result, $ 1 billion worth of fruits and vegetables were exported despite the negative impact of the pandemic.

In general, "... the most effective factor in reducing poverty and increasing the income of the rural population is a sharp increase in productivity and efficiency in agriculture."

At the same time, the priority is to increase the income from each hectare of land from the current average of $ 2,000 to at least $ 5,000. To do this, we need to widely introduce the most advanced technologies in agriculture, water-saving and biotechnologies, advances in seed production, science and innovation.

The level of public services in rural areas, as well as transport and information and communication links, remains low. A comprehensive strategy and program development is required based on a detailed assessment of local needs and taking into account competitive advantages.

The main goal of agricultural development is to increase the volume and quality of agricultural products using the existing potential, increase the share of exports and strengthen the direction of their processing on an industrial basis.

“It is estimated that from the third year onwards, 5-10 million hectares of vegetables will be grown in such areas. It will be possible to earn around UZS. This figure is 2-3 million soums for fodder crops and oilseeds, 8-10 million soums for orchards and intensive orchards, and 25-30 million soums for growing fruits and vegetables in greenhouses through the use of alternative energy sources other than natural gas. soums.

In such areas it is recommended to cultivate fodder in most districts (6760 ha or 85.5% of the total area). This will increase the volume of livestock production by improving the supply of fodder in these areas.

It is planned to allocate 1,085 hectares or 13.7% of the total area for orchards and vegetable crops.

The main directions of agricultural development: viticulture; fruit growing; cultivation of tomorrow's agricultural products; cultivation of oilseeds; animal husbandry; beekeeping; fishing

Adopt a clear plan for the development of agricultural and food statistics; collection, comparison and publication of data on economic indicators of production of the main types of agricultural products (cost, income, profit, profitability); Development of a state program for the

development of "smart agriculture"; publication of a reference book (farm directory) containing the efficiency of production, state support of industries, labor legislation, taxation, lending and other necessary information; publication of a catalog of information and data on major domestic producers and processors; publication of the annual report of Agriculture (Agriculture annual report), which includes the measures taken and the results achieved in the field, as well as promising measures of state policy; active participation in information exchange platforms and international forums for the development of national systems and services in the field of agriculture and food; conducting agricultural registration (Agriculture census); introduction of a system of identification of farm animals, observation and monitoring of their movement.

Deciding on the type / breed of farm animals (defined quality and quantity indicators) on the basis of the use of necessary digital technologies in the introduction of "smart farm" technologies and the use of "digital herd" technologies, control and management of livestock, pasture proposals and recommendations for the introduction of new electronic reporting forms for monitoring traffic processes have been developed.

To ensure the compliance of the system of statistical indicators in the agricultural sector with the statistical laws and requirements, it is necessary to include: compliance of the system of indicators with the goals and objectives of economic and statistical research; ensuring that system performance is comparable; the existence of a single methodology for their calculation; logical interdependence of system indicators; the complexity and completeness of the reflection of the object of study. As the country's agricultural economy changes, so does the system of statistical indicators.

Monthly, quarterly and annual reports on the state of agriculture in national statistical practice; annual reports of agricultural enterprises; special registrations and accounts; Selective inspections of different categories of agricultural producers - sources of livestock statistics are used. The study developed scientific proposals for improving statistical reports in the field of agriculture and animal husbandry and their transfer to the method of selective monitoring.

CONCLUSION

As a result of scientific research, the following conclusions were drawn:

1. The main tasks of the economic and statistical study of the agricultural sector of the republic in the context of a pandemic should be: development of a program for statistical monitoring of the sector; identification of a system of statistical indicators describing the results of agricultural activities; analysis of the absolute level and intensity of changes in the scale of production of the main types of agricultural products; modeling and forecasting one-dimensional series of dynamics describing the results of agricultural activities; statistical analysis of various factors affecting the results of agricultural activities; modeling, forecasting of multidimensional series of dynamics.

2. A comprehensive assessment of the state and development of the agricultural sector is carried out on the basis of a system of economic and statistical indicators. These indicators reflect the status, development and sustainability of consumption of agricultural products at different levels of time and space. They allow to obtain a description of individual events and processes, their group states, and a description of the individual units

in the general complex.

3. Obtaining and comprehensive analysis of agricultural statistics is carried out at the regional, social and sectoral levels. The completeness and level of coverage of an objectively existing system of indicators depends on the level of management of the material and other capabilities of its study, the need for information and analytical tasks.

4. Decide on the type / breed of farm animals (established quality and quantity indicators) on the basis of the application of necessary digital technologies in the introduction of "smart farm" technologies and the use of "digital herd" technologies, control and management of livestock, proposals and recommendations for the introduction of new electronic reporting forms for monitoring the movement processes in pasture grazing.

5. To ensure the compliance of the system of statistical indicators in the agricultural sector with the statistical laws and requirements, it is necessary to include: compliance of the system of indicators with the goals and objectives of economic and statistical research; ensuring that system performance is comparable; the existence of a single methodology for their calculation; logical interdependence of system indicators; the complexity and completeness of the reflection of the object of study. As the country's agricultural economy changes, so does the system of statistical indicators.

6. The basis of economic and statistical research of agricultural activity is information that reflects changes in the number and composition of agricultural goods, livestock reproduction, agricultural production and industry efficiency indicators. Qualitative information that accurately reflects the state of the network allows you to make effective management decisions, both within each business entity and across the entire network.

7. The study used the method of economic indices in the process of assessing the interrelationships of the agricultural sector in the regions. Using the method of these indices, a multi-factor statistical analysis of the development in the network, the main trends and the factors influencing them was made.

8. In order to study the interrelationships in the field of agriculture at the regional level, it is necessary to use the method of correlation-regression analysis. These analysis methods have made it possible to objectively assess and analyze the relationship between outcome traits and factor traits in agriculture in the regions.

ABSTRACT

Energy agricultural production may take up to 60 million hectares in the United States, according to estimates. Biomass crop will most likely be grown in marginal farmland, which is often extremely erodible, due to economic concerns. Soil erosion must be addressed as a result of herbaceous as well as woody biomass agricultural crops. Even with continuous biomass extraction, perennial grasses offer year-round soil cover, preventing erosion. By increasing soil organic matter, soil structure, and soil water as well as nutrient-holding capacity, vigorous perennial herbaceous stands decrease water runoff and sediment loss and promote soil development processes. When compared to methods requiring more frequent or extensive tillage, minimum tillage management of row crops lowers erosion. Water erosion is reduced by woody biomass plantings because their roots and leaf litter improve water filtration, decrease water droplet effects, intercept rain or snow, as well as physically stabilize soil. When planted as shelterbelts, shelterbelts decrease wind erosion and enhance soil organic matter, soil structure, and soil moisture in their leeward zone, lowering soil erodibility. Increased erosion may accompany the harvesting of woody biomass plants. Clear-cutting in the forest, particularly on steep slopes, frequently leads in a significant increase in water erosion. As a consequence, even though it may result in increased harvesting costs, it is critical that hardwood biomass plantations be planned for rotational harvesting.

KEYWORDS: *Bio Mass, Energy Production, Soil Erosion.*

1. INTRODUCTION

The International Panel on Climate Change (IPCC) estimates that if measures are not done to limit the release of greenhouse gases into the atmosphere, global air temperatures would increase 0.38 degrees Celsius each decade and sea levels will rise 6 centimeters per decade. Because the

gases produced during biomass energy utilization were just recently withdrawn from the environment, the emission of CO2 from biomass energy utilization would not add to net world CO2 levels. With biomass values for energy generation of $30(US) Mg1 or less, it seems that biomass crops would only be competitive on marginal farmland, such as those now utilized for grazing and hay production or idled under government programs. A large portion of this terrain would be classified extremely erodible. It is thus critical to evaluate the effect of biomass production on soil erosion while evaluating its potential[1].

1.1.Biomass Land Resources Include:

There are about 200 million hectares of forest land in the United States, 140 million hectares of farmland, 47 million hectares of marginal cropland/pasture, and 32 million hectares under government programs.

In the United States, Robertson and Shapouri3 calculated that up to 60 million hectares might be converted to biomass production, the majority of which would be marginal land. Before converting ecologically sensitive regions to biomass energy generation, the systems' long-term viability must be determined. High erodibility or a history of cultivation that resulted in substantial erosion losses often lead to the classification of land as marginal. The lack of knowledge on the sustainability of biomass production on marginal land was identified as a significant restriction to the evaluation of biomass's involvement in global warming at a national workshop[2].

1.2.Effects Of Erosion On Soil Production

- Soil erosion has resulted in the loss of 430 million hectares of farmland globally, accounting for 30% of the global agricultural base.
- Soil loss has a detrimental impact on agricultural production parameters such as water holding capacity, soil nutrients, soil density, soil organic matter, and others.
- Furthermore, materials lost during water erosion accumulate in rivers, lakes, and reservoirs, causing future economic losses.

The reduction of soil water holding capacity is a major factor in decreased production. Slightly eroded soil retained 14 percent more water in the top 1 m than severely eroded soil, while maize on slightly eroded soil had substantially greater evapotranspiration levels when plant-extractable water dropped to 55-60 percent of total water holding capacity under moisture stress conditions. Soil formation takes a long time. It is predicted that the development of 2.5 cm of topsoil will take 100 years. On 39 million hectares of farmland in the United States, soil loss may surpass the recommended maximum sustainable rate of ca 11 Mg ha1 yr1. 8 According to Illinois estimates, soil erosion is excessive over 42 percent of the state's 10 million hectares of farmland. 9 Erosion decreases soil production in the long run. Due to variations in topsoil depth, subsurface composition and depth, the crop being produced, and other factors, the actual impact varies significantly. 10, 11 the rate of water erosion increases as the slope rises. 12 A Minnesota soil's long-term productivity loss due to erosion was estimated to be 5%, although it was higher on soils with a slope of >6%.13 in other instances, soil erosion may have a minor effect on production. Daniels et al. 11 evaluated yields of maize, barley, and soybean on mildly and severely eroded soils for 34 field years in North Carolina's Piedmont soils (Typic Hapludults) and found that average yield losses were just 0.1 Mg ha1 across all crops. The average annual crop value loss due to erosion was $4.44. (U.S.)[3].

1.3.Erosion Susceptibility Of Land:

Farmland susceptibility to erosion is one of the factors evaluated in the categorization of cropland in the United States. Only around 3% of the land in the United States is suitable for continuous cultivation with low erosion risk. About 40% of the rest of the land has row crop potential, however there are constraints to continuous planting, the most common of which is erosion risk. Conservation Reduced tillage techniques will be required on 22 percent of Class IIe land and all of Class IIIe and IVe land in Kentucky to comply with existing US agricultural policy compliance components. 14 There are about 5.5 million hectares of potential farmland (Classes IVI) in Kentucky's overall land area of 10 million ha. 15 However, more than 90% of this farmland is classified as Class II or III, with crop appropriateness and cropping patterns restricted. On about 75% of property in classes II–VI, erosion is the main issue. Drought and wetness are the major constraints on the remaining land[4].

The universal soil loss equation is used to calculate a site's vulnerability to water erosion (USLE). Soil loss is calculated using the equation:

Soil lossy = RKLSCP

R stands for Rainfall erosion index, K for soil erodibility, L for slope length, S for slope steepness, C for cover and management, and P for cropping practice. R values for predicting raindrop and runoff effects in the United States vary from 100 to 200 in the North Central area to 200 to 400 or more in the Southeast. The C factor is determined by the amount of canopy or mulch on the soil, and it has a significant effect on soil loss estimations. C values drop from 1 with no canopy cover to 0.15 with 100 percent canopy cover when there is no mulch. Raindrops are intercepted by plant cover, which lowers the power with which they strike the surface. Herbaceous Biomass is a kind of biomass that comes from plants[5].

Depending on production costs, crop value, and other variables, herbaceous biomass crop cultivation may be a viable land use choice on a significant portion of the 214 million hectares of arable and pasture land in the United States.

18 Keeney and DeLuca19 evaluated biomass energy production alternatives in the midwestern United States and found that ethanol from maize grain would not be a major source of energy in the United States because of the large energy inputs needed in its manufacture. Cellulosic feedstocks derived from woody species, agricultural wastes, or herbaceous energy crops may generate up to 28 EJ of energy, which is 818 times more than the energy produced by the US maize crop. In most systems, the greatest energy expenses were fertilizer and gasoline. 20 Reducing N fertilizer, herbicides, and tillage inputs in traditional corn production methods may result in a positive energy balance for corn. In Virginia's minimal tillage systems, the inclusion of legumes in mixes and crop rotations decreased energy inputs per unit of maize output. The next discussion will concentrate on the erosion potential of row crops and perennial sod crops for biomass generation[6], [7].

1.3.1. Crops Grown In Rows:

Tillage causes soil macroaggregates (>2 mm) to be disrupted, resulting in a loss of soil organic carbon. Tilled soils have a faster carbon turnover rate. The susceptibility of soil to separation by raindrops is linked to bulk density and varies with soil type and strength. Soil particles are separated by smaller, lower-energy raindrops in coarse grained, sandy, and lower bulk-density soils than in heavier, clay-type soils.

Sod crops that are perennial Surface water runoff is well controlled by plants that offer permanent cover, and soil erosion is almost non-existent. Browning29 cites data that demonstrate the benefit of sod crops in preventing soil erosion. Soil erosion and water runoff were far lower with sod cover than with conventionally tilled row crops, and soil loss was much lower than tolerable for long-term production[8].

1.4.Biomass Of Wood:

Plantings for riparian or other types of stabilization Trees have been planted to decrease water erosion by establishing a living buffer zone next to water courses, catching silt from eroding soil, boosting water infiltration, and physically stabilizing stream banks with their roots. Van Kraayenoord43 lays forth New Zealand's suggestions for poplar anti-erosion plantings. On slick slopes, particularly the sides of actively developing gullies, poplar plantings are suggested. They're utilized at the bottoms of gullies to keep the water flowing and create a silt and debris trap. To preserve streambanks, they are also suggested on the outer corners of meandering watercourses where the stream flow is greatest.

1.5.Plantations Of Biomass Blocks:

Forests are well known for protecting the soils on which they develop. After clear-cutting, severe water erosion may occur on steep slopes, particularly on shallow soils underlying rock48. This erosion not only lowers soil productivity, but it also causes greater sediment deposition and higher stream flows, which may result in downstream channel erosion. Rainfall-induced runoff and stream flow are reduced in block plantings owing to enhanced evapotranspiration and soil infiltration. The 20 percent decrease in water flow in a radiata pine-forested catchment relative to a pastured watershed with which it was paired was mainly owing to increased evaporation rates from wetted forest canopies, according to Fahey and Watson[9].

1.6.Shelterbelts

Shelterbelts are a kind of biomass plantation that is frequently planted on farmland for soil and crop protection, with additional goals of timber or biomass production and wildlife protection. In certain areas, wind erosion is a significant issue on exposed soil under annual farming. 66 Wind may transport soil particles in three different ways, according to research.

- Suspension: the clay fraction and organic materials may be physically broken down into such tiny particles that they get entrained in the windstream at high enough wind speeds.
- Saltation: Silt and sand particles, as well as tiny aggregates, travel over the soil surface via bouncing.
- Larger aggregates and sand particles slide over the soil surface, causing surface creep.

Shelterbelts protect the soil in their leeward zone from wind erosion. This is mostly owing to the fact that wind speed is decreased for up to 30 times the barrier height, and wind force at ground level is reduced, resulting in less dirt being carried. Because there is more soil organic matter in the protected region, the intrinsic erodibility of the soil is likewise decreased in the leeward zone of the shelterbelts. Due to better crop growth conditions and greater soil moisture in the protected zone due to winter snow treatment and decreased evapotranspiration during the summer, this has been built up over many years.

Shelterbelts are often used for winter protection and are regarded as an efficient method of catching blowing snow in regions with harsh winters. When shelterbelts are installed on sloping terrain, water erosion caused by melting snow in the spring has been seen near the shelterbelt. When snowmelt melts quickly and the surface soil is wet or frozen, surface runoff occurs. Snowmelt runoff patterns for a shelterbelt were studied for two years in a Saskatchewan research. Despite the fact that the snowdrift adjacent to the shelterbelt was almost similar in both years, the underlying soil characteristics resulted in drastically different flow patterns. When the soil became saturated in the autumn and froze, a significant part of the meltwater escaped, resulting in minor surface soil erosion. There was no runoff or erosion in the spring of the year when the soil was dry in the autumn[10].

2. DISCUSSION

Energy crop production may take up to 60 million hectares in the United States, according to estimates. Biomass crops will most likely be grown in marginal farmland, which is often extremely erodible, due to economic concerns. Soil erosion must be addressed as a result of herbaceous and woody biomass crop development. Even with continuous biomass extraction, perennial grasses offer year-round soil cover, preventing erosion. By increasing organic matter in the soil, soil structure, and soil water and nutrient-holding capacity, vigorous perennial herbaceous stands decrease water runoff and sediment loss and promote soil development processes. When compared to methods requiring more frequent or extensive tillage, minimum tillage management of row crops lowers erosion. When assessing the utilization of land and water resources for biomass power crops, potential effects on soil erosion and soil productivity sustainability must be addressed. With proper care, herbaceous perennial plants, especially grasses, provide year-round protection and minimal soil erosion. The development of these species enhances soil productivity by increasing soil organic matter, improving soil structure, and increasing soil water and nutrient-holding capacity.

3. CONCLUSION

Potential impacts of biomass energy cropping on soil erosion and soil productivity sustainability must be considered when evaluating the use of land resources for biomass energy cropping. Herbaceous perennial plants, particularly grasses, offer year-round protection and little soil erosion with appropriate management. Soil productivity is often improved by the growth of these species, which increases soil organic matter, improves soil structure, and increases soil water and nutrient-holding capacity. Tillage for the development of annual plant crops exposes sensitive soils to significant erosion risk; nevertheless, as compared to systems requiring more frequent or extensive tillage, minimal tillage row crop systems may significantly minimize soil erosion. Woody biomass crops are typically justified more on the basis of their soil conservation advantages than their commercial potential since they reduce soil erosion by wind or water. Soil erosion may occur in woody biomass plantings in certain cases. As a result, this potential must be considered in plantation design or site selection.

ABSTRACT

With the introduction of sophisticated communication technology, the idea of e-learning came into reality. Most of the e-learning systems are functioning in client server and distributed system settings. The activity of e-learning remained limited to specified requirement owing to the absence of appropriate dynamic software architecture of modern technologies. With the introduction of service-oriented architecture (SOA), an appropriate and superior solution framework has been suggested for e-learning. Different functions of e-learning system are implemented as stand-alone web services. The strength of the method adopted in this article is reusability and interoperability. To accomplish the new functionality in e-learning system, the construction of appropriate stand-alone web services is needed to make the system completely capable of interactive services making electronic teaching learning possible. Web service composition is a SOA-based methodology to create a composite web service using existing stand-alone or other composite services. In this article, we propose a full-fledged e-learning system with the assistance of web services and their construction as per SOA standard.

KEYWORDS: *Composite Web Service, E-Learning, Moodle,Service-Oriented Architecture (Soa), Web Service.*

1. INTRODUCTION

Nowadays, e-learning is the most needed service in the universities as well as in businesses to offer the training to their workers at their own location and at any moment of the users' choosing. From the developer point of view, the structure of these e-learning systems is extremely complicated. Previously, e-learning systems were client server based; later, it moved to distributed environment, and now, with the introduction of SOA, they are moving towards service-oriented architecture (SOA) (SOA). There is a further growth of cloud services in single

cloud and multicloud; nevertheless, the scope of the article enables to proble construction of web services in SOA. In SOA-based E-learning system, each feature is built as stand-alone web service, and their compositions offer increased capacity of the system [1]. But composition of web services is still a challenge since still there is no common standard owing to multi-vendor service incompatibility.

Web service composition is a highly significant service-orientated concept and is also known as service assemblies. Composition offers new capabilities by building new services from current and dispersed services all across the web. Basically, web services are software platform-independent programs that export a description of their capabilities and make it accessible using standard protocols. Web services interact utilizing open protocols and are self-contained as well as self-describing. By utilizing web services, one may plug in and instantly utilize new components as simply as if the capabilities are accessible in software libraries. SOAP, UDDI and WSDL are the fundamental components of the web service implementation. It may be found using UDDI [2]. UDDI (Universal Description, Discovery and Integration) is essentially a search engine for web services and is itself a web service. Web service provides the possibility to the execution of business on dispersed network and may be accessible via standard interfaces and protocols.

Web service composition offers additional capabilities, created by merging pre-exiting services. But the difficult problem is the assembly of these services to offer additional functionality. There are various methods for fulfilling such goal. Some offer semi-automatic tool [3]. In this article, we describe a SOA-based e-learning web services composition built using ASP.NET, as an example. These services are registered in the local Universal Description, Discovery and Integration (UDDI) as per publish–subscribe scheme of SOA. The compilation of these services is done using the address and the availability of relevant services from previously set UDDI.

1.1. E-Learning Web Services Publish and Subscription

E-learning system consists of a variety of online services; some of them are main web services and others are secondary. But both main services and secondary services are equally essential. The distinction is brought out in their usage and functioning. Primary services are those which are utilized for the coordination of other such like UDDI service and compatibility checking service. Secondary services comprise completely functioning stand-alone services such as registration service, online examination service, virtual courses[4]. In e-learning system, local UDDI is really set UDDI for service in Microsoft Web Server 2008.

Registration service, computer programming service (lectures in text form), computer programming service (lectures in audio/video form) and virtual courses are built on various systems as services then registered with the service provider's name to UDDI via publish service of UDDI. UDDI service needs providers name and the services WSDL file for its publishing in UDDI registry. The client system looks for necessary services and determines their location via UDDI which has previously been setup. Searching e-learning online services in UDDI is usually bound by the selection of terms related to the web services, e.g. identity management, authentication, digital certificate, etc. Web services may be searched in UDDI by their keywords as described above. Search function of UDDI provides the service provider name, service location with other information, which comprises of WSDL detail as shown in Figure 1.

Figure 1: Users Dealing with the System

E-Learning Web Services Composition Methodology Web service composition methodology is worked out with the help of a limited number of services of e-learning. Four types of e-learning services are offered to users: – Computer programming service (lectures in text format) – Computer programming service (lectures in audio/video format) – Online examination service – Virtual classes. Each of these services is stand-alone and is totally independent service from others. Besides these services, there is one more service called registration service. This is also a stand-alone and independent service but provides authorized and authenticated service. The registration service is required to be composed with the services mentioned above (Figure 2).

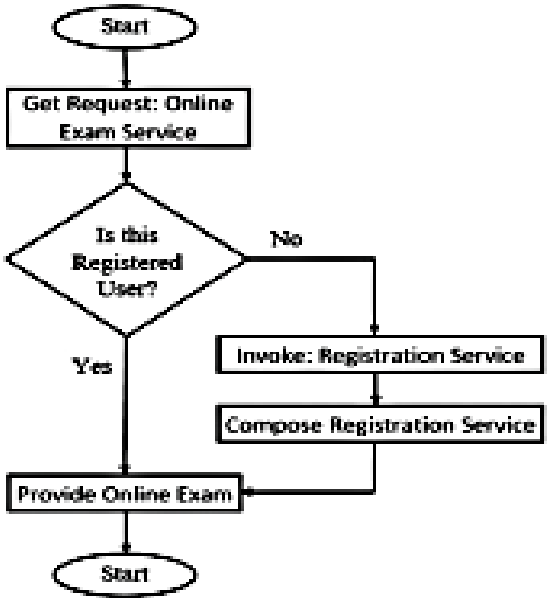

Figure 2: Providers Dealing with The System

1.2. Online Examination Service Composition with Registration Service

As soon as user chooses the online examination service, user is routed to registration service. Registration service verifies the user. If the user is already enrolled, registration service enables user to go back to online examination service. Otherwise, if user is not previously registered, then it is sent to registration procedure. After obtaining successful registration, customer returns back to online examination service. As soon as the user completes the test, outcome of the examination is shown on the screen[5]. At server side, when server receives the request for online examination service, it sends user for his registration service, if user is registered, then server again redirects the user to online examination service where he is permitted to write the examination. If the user is not registered, then it calls the registration service and combines it with online examination service.

2. LITERATURE SURVEY

With the advent of cloud services, there are a variety of service delivery models of e-education system rather than an e-learning system. But for theoretical and research-related tasks, e-learning mechanism produces productive outcomes. In reality, the point occurs to be one of our reasons to build up composition of web servicesin e-learning. Sbitneva et al. used an onto semiotic approach for investigation into applications of theoretical constructs and techniques to analyze the learning process in the e-modality of linear algebra course[6]. The exercises are designed to create deeper understanding for the topic.

Pattnayaka and Pattnaik made an effort for the integration of online services in order to create a knowledge society[7]. Web 3.0 has been utilized for such addition to information base. Group work, question and answer sessions have been included as web 3.0 is capable of using artificial intelligence (AI) method speeding up teaching learning. However, such initiatives cannot proceed without a baseline of security.

A powerful e-learning service using Moodle platform is GakuNinMoodle. The service delivery paradigm was created and built with appropriate security measure in Japan by Ueda and Nakamura[8]. In reality, the document supports security awareness education. These latest implementations of learning management systems (LMSs) in Moodle platform and creation of models for test and train indicated a revived interest in the use of web services in e-learning. Systems based on web services are primarily utilized in the area of e-commerce. Travel and tourist systems and financial systems are some of them.

Client server-based LTSA framework like stand-alone service components does not own any obligation towards providing themselves for preparation of composite services. The composition compatibility of services simply comes as an afterthought in this architecture making it a restricted service architecture[9]. Learning content provider (server) may not be able to resolve concurrency. Replication of provider owing to various modifications may make data inconsistent. A full-fledged e-learning-based online services and their composition are yet to emerge. To enable web service composition, there are a variety of models and frameworks each having its advantages and drawbacks. IEEE LTSA is a highly appropriate model for such purpose, since it has previously been modified according to the e-learning web service need.

Composite services may be accessible via a registry under popular publish–subscribe system. Types of e-learning include synchronous and asynchronous e-learning method. The expanded IEEE LTSA's characteristics are as follows[10]:

- The e-learning online services exist on various places on separate serverson different servers.
- These web services are registered in UDDI (web services location may be discovered at UDDI) (web services location can be found at UDDI).
- A client may utilize these web services via the UDDI and can contact these functions anywhere to create an e-learning system with the assistance of these services even if these services are in various physical locations.
- In this architecture, provider/operating server is at application layer handling services composition as well as service compatibility.

SOA-based extensible platform is built on model-driven architecture (MDA) and SOA. MDA is classified into three abstraction layers such as CIM, PIM and PSM. Computation-independent model (CIM) provides comprehensive information about business use case, company structure and business processes. Platform-independent model (PIM) comprises of analysis and design which defines services in technology independent way. Platform specification model (PSM) is used to create the major portion of the code.

Service bus offers the required communication infrastructure. It also offers centralized administration for services. Service bus platform on SOA includes business modelling procedures. It combines modelling tools and business process-based development platform to design and build information management system. A framework for the semantic composition of web services managing user constraints may be described as the procedure that defines how to choose, combine and execute a collection of accessible web services to get a composite service which fulfils the users' demands. The system is built on networked architecture, on semantic uniform ontology and on community service descriptions. Community services having the same ontology are regarded as an integrator of services. Business Process Execution Language (BPEL) offers a framework for formalism of the system. Web service definition is expressed using UML in the form of message sequence charts and converted into a finite-state process (FSP) (FSP). Labelled Transition System Analyser (LTSA) is used to verify whether a web service composition meets the specification highlighting discrepancy, if any. However, most of these related formalisms (BPEL, UML, FSP and LTSA) have been separately developed, and there is no obvious relationship between them.

3. DISCUSSION

The user chooses more than two services and wishes to utilize services in succession. Let the user choose computer programming and online examination service. Next, he utilizes login or registration service to access them in a series. If the first service (computer programming) is unsuccessful, then the second service is not called by the server and an error message will be shown to user by frontend service. Each of these services is stand-alone and is completely separate service from others.

Besides these services, there is one additional service called registration service. This is likewise a stand-alone and autonomous service but offers approved and authenticated service. The registration service is needed to be constructed of the services listed above. If user is not able to access, then, to study computer programming, he is regarded unprepared for writing the examination of computer programming. The pseudocode of second situation is expressed as follows:

Data Structures being any e-learning composition represents a class of services. It also utilizes a flag. The flag indicates whether the service is successfully called or not; true value signifies service is called successfully; and in case of any error, it is assessed as false.

4. CONCLUSION

The expanded IEEE LTSA e-learning framework in SOA offers enormous potential for different services composition; even on a cross-platform, cross-service provider scenario may be used. Integration of a number of services is feasible only on Semantic Web. This article offers a peek into service composition of two or three services in ASP.NET that are compatible. The idea of forward and backward compatibility would deal with the composition in a fine-grained way that has been chosen as the future path of study. The implementation of idea needs further expansion of the existing model in Semantic Web-based paradigm. With the advent of cloud services, services composition takes a new assemblage with third-party agency service. There are a lot of cloud agents or brokers offering whole or part a service. Such mechanism requires an investigation in future direction of work.

CONSTITUTION: NATIONAL ELECTION LEGISLATION AND INTERNATIONAL STANDARDS

Khojiakbar Aslitdinovich Muxamadiyev*

*Head of the Department of "Popular and Future Sciences",
Jizzakh Regional Law Technical School, UZBEKISTAN

ABSTRACT

This article organizes national use and international measurements at the beginning of an election. Compliance with the Constitution and the Electoral Code of the Republic of Uzbekistan on fundamental international principles and measures in the field of suffrage has been thoroughly studied. The great founders are considered on the example of separate relevant models of the Constitution and the Electoral Code of the Republic of Uzbekistan. It also provides information on international universal instruments on the basis of elections and the principles of international electoral law. The importance of the Electoral Code in another new edition is highlighted.

KEYWORDS: *Constitution Of The Republic Of Uzbekistan, Electoral Code, National Electoral Legislation, Electoral Law, International Legal Documents, Implementation, International Principles And Standards, New Uzbekistan, Political Rights, Civic Position, Democracy, People, Citizen, State Power, Electoral And Electoral Rights , Electoral Principles, Openness And Transparency, Legal And Political Culture, Political System, Development.*

INTRODUCTION

Electoral processes play a special role in the study and analysis of the democratization of the state. Because "suffrage" is one of the political rights of citizens and plays an important role in the formation of state power. This is stated in Article 32 of the Constitution of the Republic of Uzbekistan "... citizens of the Republic of Uzbekistan have the right to participate in the management of public and state affairs directly and through their representatives".[1] This norm is also stated in Article 6 of the Electoral Code, including "The President of the Republic of Uzbekistan, deputies of the Legislative Chamber, deputies of local Councils are directly elected by citizens".[2] In this regard, the modern suffrage in our country is an important constitutional institution that clearly demonstrates the power of the people. This is stated in Article 7 of the Constitution of the Republic of Uzbekistan, which states that "the people are the sole source of

state power".[1] The democratic elections associated with the formation of which have become an integral part of the political system.

The basis of the electoral legislation of our country fully complies with the universally recognized principles and norms of international law, which constitute a set of international electoral standards for free and democratic elections. As noted in the preamble to the Constitution of the Republic of Uzbekistan, this country recognizes the "supremacy of the universally recognized rules of international law".[1]

MAIN BODY

It is known that since the second half of the twentieth century, the issue of suffrage and freedoms of citizens has become a serious issue for influential international organizations. Currently, there are more than 20 international regulations in the field of human rights and freedoms.[3, Pp.19-33.]

Principles and standards in the field of suffrage are enshrined in a number of international universal instruments of the United Nations, in particular Article 21 of the Universal Declaration of Human Rights (December 10, 1948)[4] and Article 25 of the International Covenant on Civil and Political Rights (December 16, 1966)[5], Article 5 of the International Convention on the Elimination of All Forms of Racial Discrimination (December 21, 1965) [6], Article 6 of the UN Declaration on the elimination of all forms of racial discrimination (November 20, 1963) [7].

Regional international organizations also have their own European Convention for the Protection of Human Rights and Fundamental Freedoms (1950) [8], American Convention on Human Rights (1969) [9, p. 58], African Charter for Human and Peoples' Rights (1986) [9, p.94] international legal instruments such as reflected. In particular, the main figures in the field of democratic elections in Europe, the organization for security and cooperation (OSCE), in particular, are reflected in the Copenhagen document on human criteria (1990).[10, p.8]

The following principles in the field of suffrage are recognized in modern international law:

- Universal suffrage;
- Equal suffrage;
- The right to vote directly;
- Election by secret ballot;
- Regular and mandatory elections;
- Open and transparent elections;
- Free elections;
- Real elections;
- Fair elections;
- conduct of elections by independent election commissions;
- State financing of elections and election campaigns of candidates, political parties;
- Informational support of elections and campaigning by the state;

- Participation of national and international observers in the elections;

- Complaints of citizens about violations of their voting rights and freedoms, for which appropriate liability is provided;

- Measures that are not considered discriminatory.

All of these principles and rights, together, constitute international electoral standards.

In our country, too, the electoral legislation has been improved in accordance with national experience and international standards, in line with the reforms. To date, in addition to the norms enshrined in the Constitution of the Republic of Uzbekistan in the field of elections, about 10 more unified legislative acts of the Republic of Uzbekistan have been adopted. It is noteworthy that the improvement of electoral legislation has been based on electoral practice, and in turn, electoral legislation has also given a major impetus to the development of electoral practice. However, electoral legislation is such an area that it needs to be constantly updated in line with the times.

In this regard, the President of our country Sh.M.Mirziyoev in his first Address to the OliyMajlis on December 22, 2017 put forward the initiative to develop and adopt the Electoral Code of the Republic of Uzbekistan. In order to fulfill this important task, a special working group was set up in the Central Election Commission to draft a code. It should be noted that during the preparation of the draft Electoral Code, the Electoral Codes and laws of France, the Netherlands, Canada, Italy, Sweden, Belgium, Poland, Albania, Belarus and Azerbaijan were studied. Analyzes have shown that the Electoral Code has now been adopted in more than 40 countries.

On June 25, 2019, the Electoral Code of the Republic of Uzbekistan was adopted. The Electoral Code systematizes the national electoral legislation into 5 existing laws, namely, "On Elections of the President of the Republic of Uzbekistan", "On Elections to the OliyMajlis of the Republic of Uzbekistan", "On Elections to Regional, District and City Councils of People's Deputies", The laws "On the Central Election Commission of the Republic of Uzbekistan", "On guarantees of citizens' suffrage" and a number of legal acts were mutually unified and stated in a unified manner. In addition, more than a dozen international election documents were analyzed in detail, and their main ideas and standards were reflected in the Electoral Code. In general, the Constitution of the Republic of Uzbekistan and the Electoral Code has implemented all the basic international electoral standards.

First, the Electoral Code strengthens the guarantees that ensure the free expression of the will of citizens of the Republic of Uzbekistan. [Article 2, 1] these rights and freedoms were guaranteed in the Constitution of the Republic of Uzbekistan. In particular, Article 117 of the Constitution of the Republic of Uzbekistan states that "... every voter has one vote. The right to vote, equality and freedom of expression of the will are guaranteed by law"[1] is the basis of the organization. **Second,** citizens of the Republic of Uzbekistan have the right to elect and be elected to representative bodies of state power.[Article 117, 1] these rights are enshrined in the Constitution of the Republic of Uzbekistan. In the new electoral code, all the procedures for exercising these rights are systematized. That is, this Code regulates relations related to the preparation and conduct of elections of the President of the Republic of Uzbekistan, deputies of the Legislative Chamber of the OliyMajlis of the Republic of Uzbekistan, members of the Senate of the OliyMajlis of the Republic of Uzbekistan, deputies of regional, district and city Councils of people's deputies.[Article 1, 2]*Thirdly*, the electoral legislation of Uzbekistan enshrines the

principles of international suffrage on the basis of universal, equal and direct suffrage by secret ballot. According to the Constitution of the Republic of Uzbekistan, citizens of the Republic of Uzbekistan over eighteen have the right to vote. [Article 117, 1.]

Elections of the President of the Republic of Uzbekistan, deputies of the Legislative Chamber and deputies of local Councils are general.

Citizens have equal suffrage regardless of gender, race and nationality, language, religion, social origin, beliefs, personal and social status, education, type and nature of occupation. [Article 4, 2.]

Every citizen participating in the election will have one vote.

Citizens, who have been declared incompetent by a court, as well as persons detained in places of deprivation of liberty by a court decision, may not be elected.

Citizens, who have been declared incompetent by a court, as well as persons detained in places of deprivation of liberty for the commission of serious and very serious crimes, shall not participate in elections. [Article 5, 2.]

The President of the Republic of Uzbekistan, deputies of the Legislative Chamber, and deputies of local Councils are directly elected by citizens. [Article 6, 2.]

The election will be free and secret ballot. It is not allowed to control the will of the voters.

Secret ballot is ensured by creating appropriate conditions that preclude the possibility of any control over the will of the voter. [Article 7, 2.]

Fourth, the principle of openness and transparency in the preparation and conduct of elections in the Electoral Code is also of particular importance. According to him, the preparation and conduct of elections will be carried out by election commissions in an open and transparent manner.

Election commissions inform citizens about their work, formation of constituencies, precincts, composition of election commissions, their location and working hours, voter lists, lists of political parties participating in the elections, the President of the Republic of Uzbekistan, deputies of the Legislative Chamber, local Councils. Information on candidates for deputies, as well as on the results of voting and elections.

The media will cover the preparations for the election and how the election is going.

Meetings of election commissions shall be open. Decisions of election commissions shall be published in the mass media or made public in accordance with the procedure established by this Code.

In all events related to the preparation and conduct of elections, as well as on election day in the polling stations and counting of votes, observers from political parties, citizens' self-government bodies, media representatives and other countries nominated by candidates for President of the Republic of Uzbekistan, deputies of the Legislative Chamber , observers from international organizations are eligible to participate. [Article 8, 2.]

Fifth, the legal framework for the conduct of elections in our country on the basis of democratic principles has been created and improved. The basis of the electoral legislation is the Constitution of the Republic of Uzbekistan. The Electoral Code, which consists of 18 chapters

and 103 articles, regulates relations related to the preparation and conduct of elections of the President of the Republic of Uzbekistan, deputies of the Legislative Chamber of the OliyMajlis of the Republic of Uzbekistan, members of the Senate, regional, district and city Councils of People's Deputies. Establishes guarantees that ensure the free expression of the will of the citizens of the Republic.

CONCLUSION

Elections determine the free will of the people and ensure its direct implementation. The electoral legislation of Uzbekistan allows voters to freely choose and elect candidates. The current elections in Uzbekistan are based on political pluralism, diversity of ideas and multiparty system. As a full member of the international community, our country recognizes the above-mentioned international standards on elections, the rights and freedoms of citizens in elections and is taking consistent measures to further strengthen the rights and freedoms of elections in the country.

Most importantly, the implementation of the Electoral Code legally guarantees the introduction of new, advanced practices that will ensure a more democratic and transparent electoral process in our country. This, in turn, is an important factor in further democratization of the political system of the country and deepening the process of political modernization.

Therefore, the time has come to realize that in today's Uzbekistan, through the active participation of citizens in elections, they are given the opportunity to choose their own future. As our President ShavkatMirziyoyev said, “In the election process, first of all, our worldview, political and legal culture, our civic position will be reflected once again”.[11] This legal and political culture of citizens, their position in life ensures the democratization of the state and society. After all, the main idea of the new state of Uzbekistan is that government agencies serve the interests of the people. The political interests of our people are guaranteed in our national legislation in accordance with international standards. Only our citizens will be able to contribute to the further development of our country, effectively using the rights and freedoms guaranteed by our state, the opportunities created.

ABSTRACT

This article describes the methods of coating polymer coatings and the work efficiency of the coating coated details. Polymeric coatings are made of polymeric materials and can be applied on a number of substrates using a variety of methods such as extrusion/dispersion and solution casting techniques. Polymeric coatings provide excellent adherence to and protection from the environment.

KEYWORDS: *Polymer, Coating, Corrosion, Property, Matrix, Environment, Surface.*

INTRODUCTION

In today's fast-paced time, synthetic raw materials are replacing natural materials. In particular, polymerized polymer materials have become the main raw material for the manufacturing industry. Polyethylene, polypropylene, phenol-formaldehyde and other types of polymers are widely used in industry. The advantage of thermoplastic polymers is that they can be recycled. We can also see this process in the production of film and fiber. Coatings made of thermoplastic polymers, especially films, which protect the metal surface from corrosion and the external environment are very important.

METHODS AND OBJECTS OF RESEARCH

The word polymer is derived from a Greek word, where "poly" means many and "mers" means particles. So, polymer can be described as a combination of identical molecules called mers. Polymers are composed of repeat units of small compounds called monomers. Different polymers show different properties, depending upon how the monomers are linked with each other. Some polymers are hard, such as bakelite and glass; whereas some are soft, such as biopolymers, silk, and rubber. Polymers are found to have several and the use of both natural and man-made polymers is widespread in applications our society. The natural polymers include proteins and polysaccharides, and the man-made polymers include synthetic plastics and fibers.

Their applications range from households to industries such as transportation, aviation, and pharmaceuticals. Their extensive use is in the area of medical devices, food packaging, decoration, transportation, $[-CH_2-CH_2-]_n$ information technology, and so on. Polymers are represented by repeating structural units called monomer. For example, a simple and long-chain polymer polyethylene, with ethylene as a repeat unit and n as its number of repetition, is expressed as follows:

The dissolution of polymers is different from the low-molecular-weight compound. Long dissolution time and enhanced viscosity of their solution make them unique. To obtain homogeneous solution, one can make use of solubility parameters and predict the solubility of polymer in the solvent. When these data are not available, trials with various solvents would be needed.

Polymeric coatings are made of polymeric materials and can be applied on a number of substrates using a variety of methods such as extrusion/dispersion and solution casting techniques. Polymeric coatings provide excellent adherence to and protection from the environment. They are so designed that they adhere well to the substrate and not peel off easily, nor degrade due to heat, moisture, salt, or chemicals. Coatings are made up with different ingredients such as solvent, additives, and thinners. Different ingredients play different roles in coatings, such as additives enhance the functional properties. Similarly, thinners reduce the viscosity of the mixture, making the final coat appear smooth and without any defect.

Coatings are mainly used in the following sectors:

- **Transportation**: The coatings provide protection from weather such as heat/ light, corrosion, and scratches from accidents such as dents.
- **Household**: The coatings provide finishing to kitchen appliances, such as Teflon coating and anti heating properties to utensils.
- **Medicines**: The coatings are used to coat drugs and thereby reduce contact with viruses and bacteria.
- **Industry**: In industries, coatings provide protection to equipment such as pipelines from weathering, extreme heat/light, and corrosion; in membrane industry, coating is used for the selective separation of gases.
- ***Cosmetics***: Coating is widely used in creams, glasses, nail paints, etc.

• ***Energy***: In this sector, coatings act as a protective barrier against extreme heat and light, enable easy dust removal, serve as an O2 barrier, such as in wind energy and solar energy panels, and so on.

The use of coatings have increased extensively in automobile, aerospace, aircraft, marine, membranes, magnetic media, storage devices, and food industry. They are also used in the oil and gas industry for corrosion control, encapsulation of electronic circuits, textile industry for making breathable clothing, and surface engineering industry for manufacturing of multilayer coatings that are used in various transportation and infrastructure applications, implantable devices, and materials for protection from the weathering conditions.

Polymeric coatings are prepared with or without solvents. Coatings of one polymer and one solvent are called binary coatings. Multicomponent coatings have more than one polymer/solvent. Polymeric coating chemistry is different from that of polymers. The coating includes polymer matrix or binder: the polymer phase that holds all the constituents together. In polymeric coatings, we add fillers, pigments, surfactants, plasticizers, and binders to impart hardness/flexibility, strength, weather protection, color, gloss, and reflectance. The interface plays an important role in the performance of polymeric coatings. The main types of interfaces are substrate (bottom), coating air (top), and additives (internal). Other interfaces that also play a role are solid–gas, solid–liquid, and gas–liquid interfaces (e.g., in drying paints). Flow and leveling properties greatly influence the appearance and performance of coatings. The polymer phase present on the surface and its chemistry is far different from the bulk polymers. The interesting characteristics of polymer coatings are that they are easily spread and handled. They can be applied as liquids as in the case of paints, and various additives may be added to enhance their properties. Some other properties such as flexibility, drying, and self-healing are the ones where molecular mobility plays an important role. The advanced polymeric coatings are thermosetting in nature, despite that a large majority of polymeric materials are thermoplastics. It is easy to predict the molecular mobility of thermoplastic polymers because their entangled macromolecules are still largely independent. However, in thermosetting polymers, the network structure strongly hinders the molecular mobility.

Wether it concerns electricity poles, coils, gas canisters or drilling platforms, they all have to withstand the elements or frequent handling. This requires metal coatings with exceptional performance and Stahl delivers just that. Our polymer technologies protect metal products and outdoor constructions against damage and corrosion, while meeting safety standards and regulation.

Anti-Corrosive, Resistant and Safe Coating Technologies

One of the main challenges for metal surfaces is preventing corrosion. Stahl Polymers provides resins that are alkylphenol epoxylates (APEO)-free. This enables alternative solutions that protect metal products and constructions from the oxidizing effects of water and humidity. This ensures their long-time high-performance functionality. At the same time, metal or metal-coated products face a lot of heavy-duty handling. Think of gas canisters or bottles or industrial drums, which require a hard, scratch-resistant coating. Water-based acrylic polymers are a vital component of chemical resistance properties required for industrial coatings that also retains their flexibility. We even design polymeric solutions that withstand the extreme conditions of a marine environment. Thanks to the versatility in polymer technologies we offer, compatibility and easy formulating, we can provide resin solutions with excellent results. Resins that offer

protection for metal surfaces with high gloss, high scratch and abrasion resistance, with high flexibility and extremely high chemical resistance.

Working With Stahl as Partner for Metal Coating Solutions

Stahl's expertise in responsible chemistry has helped us become a rapid market leader in the field of metal coatings with a portfolio of acrylics and polyurethanes that are leading in performance. Additionally, we provide direct technical service to even our small-scale clients as we value each equally and understand their pressing needs for the right fit technologies. With first class resins, we can help formulate coatings that create hard surfaces with resistant film that leaves no cracks and holes, ensuring durable and long-term protection. As we produce locally, we can also provide fast services.

Key Benefits of Stahl's Metal Solutions

There are numerous advantages to opting for Stahl Polymers when it comes to resins for metal surfaces. In addition, we can create solutions tailored to your precise needs in performance and legislative requirements.

Key benefits:

- Excellent adhesion on metal
- Very good corrosion resistance
- Solvent-free and low VOC
- High hardness
- Excellent chemical resistances
- From high gloss to satin/matt formulations

Metal solutions portfolio overview

Description	Solids (%)	MFFT (°C)	Features benefits and uses
Styrene-acrylic emulsion	40.0	50	Outstanding corrosion and blister resistance.
Styrene-acrylic emulsion, OH functional	47.5	37	For oven bake systems with melamine. Outstanding hardness and chemical resistance on metal surfaces. High gloss properties.
Styrine-acrylic emulsion	50.0	32	Outstanding corrosion and blister resistance. Direct to metal (DTM) coatings.
Solvent-free aliphatic polycarbonate PUD.	35.0	74	For use in metal pre-treatment and fingerprint coatings. Excellent heat and corrosion resistance.
Solvent-free aliphatic cationic polycarbonate PUD	35.0	50	For use in metal pre-treatment. Excellent stability at low pH. High hardness.

CONCLUSION

In conclusion, it should be noted that the speed and quality of production will increase as the manufacturing industry improves polymeric materials that replace natural materials and metals. films and fibers are used in all fields of machinery. This article describes the methods of production and modification of films and fibers using modern methods, as well as coating the detail surface with polymer coatings.

ABSTRACT

It was shown mother's toxic anemia during gestation and lactation resulted in decreasing of number of erythrocytes and hemoglobin contents in fetus and offspring. The effect of mother's anemia more expressed during lactation than during lactation. The administration of drugs that cause toxic anemia in pregnant and lactating rats during the reproductive cycle causes significant changes in red blood cell counts in the mother and offspring. These changes were manifested in a decrease in the number of erythrocytes and the amount of hemoglobin relative to the control in rats in the experimental group. The effect of phenylhydrazine anemia on blood counts in the maternal-hereditary system was more pronounced than that of lead acetate anemia.

KEYWORDS: *Rats, Toxic Anemia, Erythrocytes, Hemoglobin, Phenylhydrazine Hydrochloride, Lead Acetate.*

INTRODUCTION

Due to the industrialization of industry and agriculture, there is an increasing number of various substances in the environment that have a negative impact on the body, including heavy metal salts, phenolic derivatives, mineral fertilizers and other toxicants. Most of these toxic substances enter the blood circulation through the protective barriers in the body through drinking water, food, respiratory organs and skin [3, pp. 182-192; 8, pp. 48-53]. The effects of certain xenobiotics (e.g., lead ions, phenylhydrazine, etc.) on the cardiovascular, digestive, renal, nervous, blood and other systems have been shown to be dangerous for both mother and child, especially in the first trimester [9, pp. 383-395]. It has been shown that the effects of phenylhydrazine [1, p. 23] and lead ions [4, p. 23] on blood counts depend on the concentration of harmful substances.

THE MAIN FINDINGS AND RESULTS

Escribano (1997) showed that in megacities, the human body receives 140 mg / kg of lead ions per day, which has its effect. Gurber (1997) noted that in industrial regions, up to 1000 mg / kg of lead ions can pass into the human body overnight.

Many toxicants trigger the formation of active radicals by disrupting calcium homeostasis in the cell by disrupting energy metabolism. It is these radicals that cause the breakdown of cell membranes by altering the processes of protein synthesis and division in the cell, the structure of membranes [2, pp. 32-34; 6, p. 203].

The effects of lead, phenylhydrazine, and other anemic pollutants have been shown to be associated with hemolysis of erythrocytes, impaired heme synthesis, and changes in hematologic classification today [6, p. 206].

Although the effects of lead ions and phenylhydrazine on blood classification have been shown [1, p. 23; 10, pp. 396-402], these hemolytic toxins have not been seen simultaneously at different stages of the reproductive cycle in the mother and offspring. There is also no general information on the classification of red blood cell changes in mother and offspring.

The Purpose of the Work

To study the effect of certain ecotoxicants (lead acetate and phenylhydrazine hydrochloride) on the state of erythrocytes in the mother and offspring during gestation and lactation, which affect blood parameters?

MATERIALS AND METHODS

The experiments were carried out on pedigree rats and growing rats bred in the vivarium of the National University of Uzbekistan. Rats were divided into two experimental and one control groups. In rats in the experimental group, 2 different toxicants (organic and inorganic substances) were used to induce hemolytic anemia.

The first experiment used an organic compound - phenylhydrazine hydrochloride as a hemolytic poison for rats in the group. Phenylhydrazine hydrochloride was administered at 14 days of gestation (80 mg / kg) to induce toxic anemia in pregnant rats, [7, p. 200] and to induce anemia during lactation, the drug was administered to mothers at the same dose on day 3 of lactation.

In experimental rats in the second group, the mother was given 0.01% lead acetate solution instead of drinking water during the third trimester of gestation, as well as throughout lactation, to induce lead acetate anemia.

Biochemical analyzes were performed in mothers and fetuses on the 21st day of gestation, and on the mother and offspring during lactation - on the 12th day of postnatal life. That is, blood counts were determined in both mother and offspring at the same time.

The amount of hemoglobin in the blood (g / l) and the number of erythrocytes (T / l) were determined by general clinical methods [5].

The results were analyzed by Student using the Excel program. Statistical reliability was assessed on the basis of R and t indicators. When R <was less than 0.05, the results were considered statistically reliable.

RESULTS AND DISCUSSIONS

The results showed that during gestation and lactation there were significant changes in toxic anemia of mother rats and red blood counts in their offspring (Table 1, 2).

TABLE 1 CHANGES IN BLOOD COUNTS OF MOTHER RATS DURING GESTATION AND LACTATION UNDER THE INFLUENCE OF TOXIC ANEMIA (M ± M; N = 6)

Animal group	Gestation (21 days)		Lactation (12 days)	
	Hemoglobin (g / l)	Erythrocyte (T / l)	Hemoglobin (g / l)	Erythrocyte (T / l)
Control	148,3±3,1	9,8±0,31	148,3±3,1	9,83±0,31
Experiment1	93,3±3,3	6,00±0,37	91,7±3,1	5,67±0,33
R	<0,001	<0,001	<0,001	<0,001
Experiment2	98,3±4,8	6,50±0,43	95,0±4,3	6,17±0,48
R	<0,001	<0,001	<0,001	<0,001

In maternal rats administered organic hemolytic substance, phenylhydrazine hydrochloride, hemoglobin content decreased by 37.0% and 38.1%, respectively, and erythrocyte count decreased by 39% and 42.3%, respectively, during gestation and lactation. When inorganic toxicant, i.e. lead acetate, was used, the amount of hemoglobin in pregnant rats decreased by 33.7% and the number of erythrocytes by 33.7%. In mammals, hemoglobin decreased by 35.9% and erythrocytes by 37.2%.

In the next phase of our study, we also identified red blood cell counts in offspring born to a mother rat with toxic anemia.

TABLE 2 CHANGES IN THE AMOUNT OF HEMOGLOBIN AND ERYTHROCYTES IN THE FETUS AND OFFSPRING OF MATERNAL TOXIC ANEMIA DURING GESTATION AND LACTATION (M ± M; N = 6)

Animal group	Fetus (21 days)		Generation (12 days)	
	Hemoglobin (g / l)	Erythrocyte (T / l)	Hemoglobin (g / l)	Erythrocyte (T / l)
Control	86,7±6,7	2,7±0,3	106,7±6,7	3,7±0,33
Experiment1	65,0±5,6	2,75±0,2	86,7±4,2	2,4±0,20
R	<0,05	>0,5	<0,05	<0,02
Experiment2	73,3±4,2	2,3±0,2	95,0±3,4	2,83±0,31
R	>0,10	>0,1	>0,10	>0,10

The table shows that the amount of hemoglobin in the fetus in mothers anemic using phenylhydrazine hydrochloride decreased by 25.0%, and the number of erythrocytes remained at a control level. When the same type of anemia was introduced in lactating mother rats, the amount of hemoglobin decreased by 18.7% and the number of erythrocytes by 35.1%.

When a rat is given a solution of lead acetate instead of drinking water, and the amount of hemoglobin and erythrocytes in the fetus decreases, this decrease is not statistically significant. Even during lactation, a drop in lead acetate in drinking water did not have a significant effect on red blood cell counts in the offspring, i.e., 12-day-old rats.

Thus, according to the data obtained, there is a shift in red blood cell counts under the influence of some toxicants in the environment, the concentration of which is above normal, in particular phenylhydrazine and lead acetate. The administration of anemic agents to pregnant and lactating rats during the reproductive cycle causes significant changes in red blood cell counts not only in mothers but also in offspring. These changes were manifested in our experimental observations in the reduction of red blood cells and hemoglobin in the offspring of mothers with hemolytic anemia during gestation and lactation.

It should be noted that regardless of the nature (organic or inorganic) of the reagent that causes toxic anemia in the mother, the amount of red blood cells and erythrocytes in the fetus is reduced. During lactation, the effect of phenylhydrazine was more pronounced than that of lead acetate salt.

It has been noted that mothers with iron-related anemia are more likely to have anemia in their offspring [6, p. 203]. This means that the toxicants that cause hemolytic anemia in the mother cause negative shifts in the red blood cells in the child as well as in the whole organism. This is due to the fact that changes in hematological parameters, changes in the respiratory, nutritive, protective and other functions of the blood and are reflected in the functional systems of the whole organism [9, pp. 383-395].

Therefore, it is expedient to improve measures to reduce the impact of ecotoxicants on the population in environmentally polluted areas, especially in women of the reproductive cycle.

CONCLUSIONS

1. When phenylhydrazine hydrochloride and lead acetate are administered to mother rats during gestation and lactation, the amount of hemoglobin and erythrocytes decreases.

2. Experimental toxic anemia in the mother during gestation and lactation leads to negative shifts in red blood cell counts in the offspring.

THE NEED OF THE METAL FOR THE STUDY OF SOCIAL STRATIFICATION

ABSTRACT

One of the most widely studied topics in mortuary archaeology is the connection between an individual's social standing and the presence of metal grave goods. Our research raises questions regarding the existence of other societal status indicators, which may also be important bearers of social data. The participants in this research were individuals from the Wicina cremation cemetery (n = 355) who died between the late Bronze Age and early Iron Age and whose age at death was determined. The existence of wood grave chambers (GCh) as well as the base number of vessels (MNV) per burial were regarded as social separation mediators. Tests were completed to see whether these grave lists distinguished the probability of survival of individuals of different ages, and to identify the lists that had the most predictive power with regard to death age. The social division was mirrored in the probability of endurance: individuals who lived with a higher social stratum had a greater chance of surviving for a longer period of time, and vice versa. The presence of metal objects has no effect on the probability of endurance, according to our findings.

KEY WORD: *Bronze, Iron, Metals, Stratification.*

INTRODUCTION

Urn fields spanned a large area of Focal and Western Europe throughout the Bronze Age and Iron Age, and suffered from the fourteenth century BC onwards. In light of archeological evidence obtained from Central Europe, it was discovered that the majority of urn field societies share at least three primary characteristics: the predominance of incineration, a significant increase in the number of both graves and large graveyards, and the consolidation of earthenware production in funerary customs [1].

Before the urnfield era, none of these features were abundant in the archeological record. During this time, several jars filled with human cremains became a popular symbol of the end of the Bronze Age and the beginning of the Iron Age in various parts of Europe. Perhaps the most researched study areas in antiquarianism are studies on the observable evidence of possible social demarcation based on grave developments and grave goods. However, the unthinking application of some basic concepts, such as prestige, glory, and social position, has also been highlighted [2].

The meaning of ‘renown things,' which were made of crude materials that were significant as well as uncommon (as determined by contemporary judgment), introduced complex structures, and at times exemplified advancements regarding their material, methods of assembly, and so on, from which they inferred the majority of their dowry, was primarily focused on the funerary setting[3].

(They are usually presented in archeological literature in opposition (whether absolutely or definitely) to items of private use that are simple, pragmatic, and less ornamented (. Studies on social division in the Bronze Age are typically based on the evaluation of metal items, such as their quantity, quality, and variety of structure and material – for example, gold versus copper (for stores, see Duty, 1979), and the comparison of these factors to anthropological data obtained from entombments. For a long time, a typical inspection technique has been searching for markers of 'luxuriously' and 'inadequately' equipped graves and then comparing the results with the sex and age (two words regarded as natural classes) of the deceased. Ceramics, in contrast to metals, have seldom been thought of as a social status symbol [4]. Fig 1 shows the Open villages (black), fortified settlements (green), and cemeteries (blue) at Wicina; the presenting site is indicated with a yellow arrow

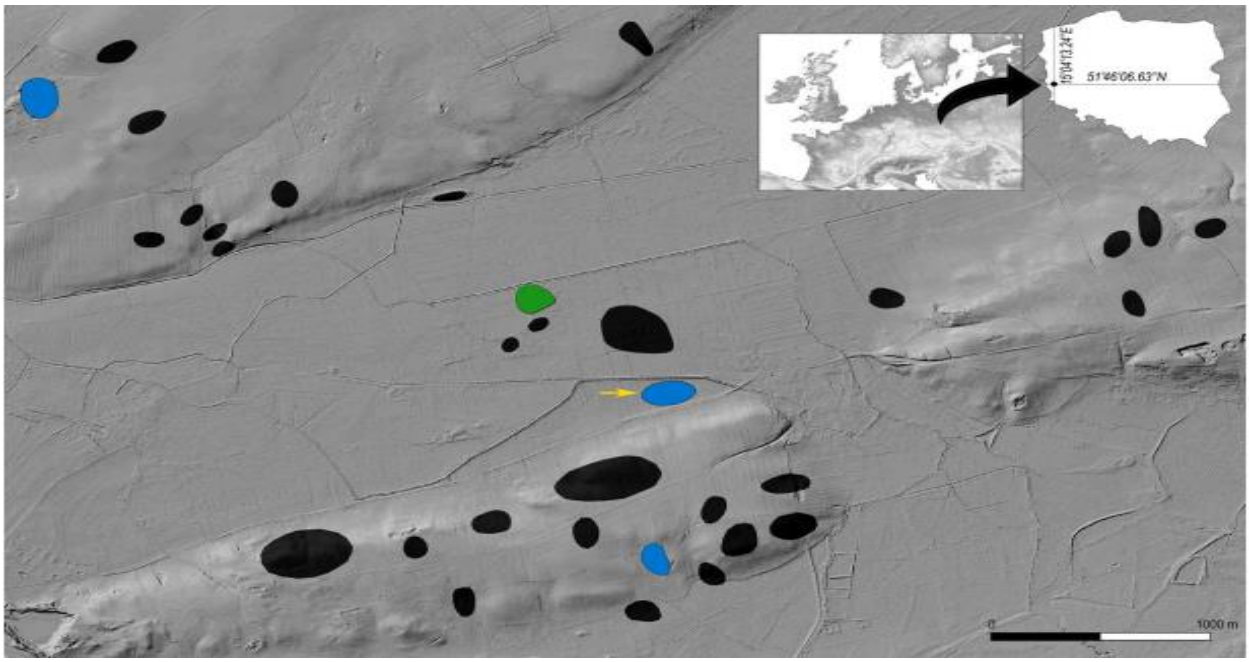

Fig 1: Open villages (black), fortified settlements (green), and cemeteries (blue) at Wicina; the presenting site is indicated with a yellow arrow.

The Wicina Burial Ground is located in a densely populated small area with a number of archeological sites dating from the Late Bronze and Early Iron Ages. The location's point of

confluence is a well-known long-term settlement in the Lussa stream's broad basin, which was discovered for the first time in the 1920s. The site covers about 22,000 m2 and is clearly visible in the landscape, with the tallest of its bulwarks reaching a height of 4 m [5].

Furthermore, it is constantly flooded, allowing the discovery of wonderfully protected, gigantic wooden constructions that may be accurately dated to between the ninth and sixth hundreds of years BC using dendrochronological methods. However, certain timber components dating from the tenth or ninth centuries BC have been discovered to be reused materials from a more seasoned habitation at the same location. The settlement was suddenly destroyed by the Scythians sometime after 571 BC, as shown by Scythian weapons, layers of devoured structures, and human remains, mostly of women and children [6].

From 1965 through 1978, extraordinary hands-on effort, involving surface investigations, exploratory channels, and ordinary unearthings, revealed the last remnants of open communities, burial sites, and metal-storage areas. The urnfield, which included 502 burials and 574 entombments, was the cemetery of a neighborhood local area that lived first in the open settlement and then in the maintained settlement.

The term "social stratification" refers to a system in which a community assigns a hierarchy to families of individuals. In the United States, it is undeniable that certain groups have more prestige, power, and money than others. Social stratification is the consequence of these disparities. The classification of individuals into socioeconomic strata in a society is based on their profession and income, wealth and social position, or derived power. The Figure 2 shows the various components of the social stratification.

Figure 2: The Various Components of the Social Stratification.

After the town collapsed, the area was desolate, indicating that the cemetery was not used after the Scythian attack. Archeological excavations covered approximately half of the area in the 1970s, but surface surveys revealed additional burial sites[7]. Because of the significant variation in the quantity of vessels present in the graves, the existence of lumber developments, and the immaterial use of polished metal objects as burial commerce, the unearthing's revealed interesting data regarding entombment traditions observed during the use of the cemetery [8]. Fig

3 shows the estimated probability of survival according to MNV[9].Fig 2 shows the estimated probability of survival according to MNV.

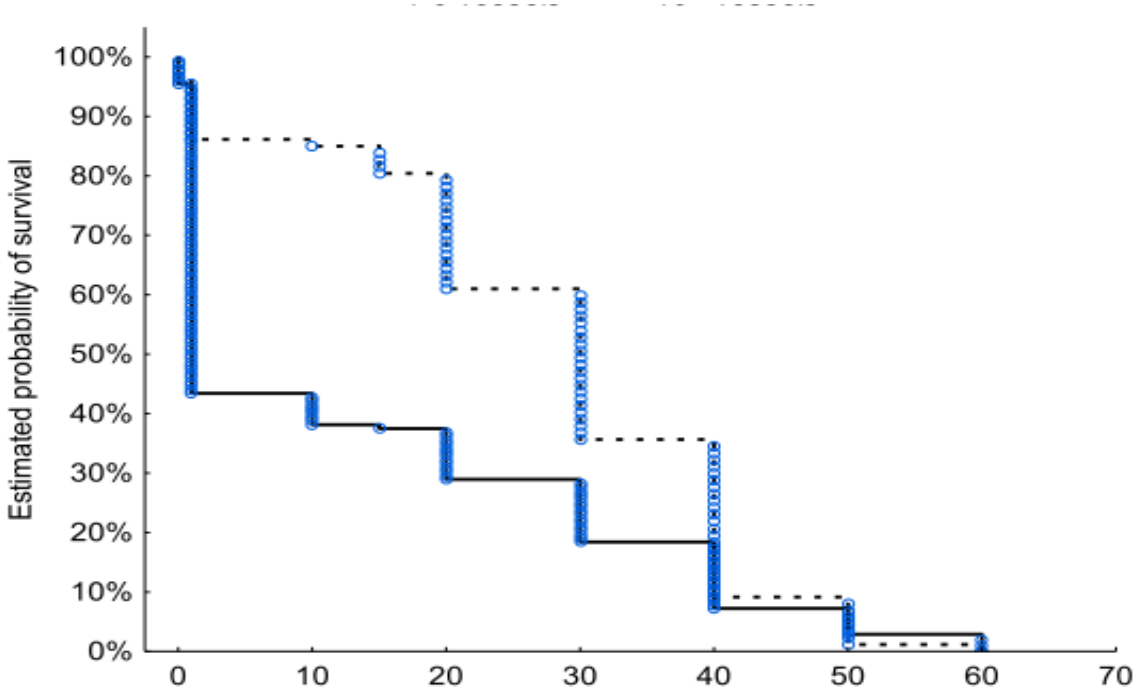

Fig 3: Estimated probability of survival according to MNV

DISCUSSION

Surprisingly few studies from the urn field period integrate natural and archeological data, and they attest to the ongoing quest for recurring instances in the selection of appropriate graves, such as material indications or the deceased's sex and age. On the other hand, research on the connection between social status and wellbeing in ancient populations is inconsistent and produces conflicting findings. Higher-ranking groups (also known as privileged societies, elites, or aristocrats) were taller, better-fed, and better-cared-for in ancient times, according to a few studies, and therefore lived longer than their less fortunate counterparts. The skeletal remains of individuals from higher and lower social positions did not differ much, according to several researchers. In a case study from Pontecagnano, Robb et al. examined the link between skeletal diseases and grave goods. Their findings suggested that the link between people's health, mobility, and social status as shown in grave goods was unexpected, and that, although the study focused on a divided society, the upper and lower classes may have faced similar health risks. Wilkinson and Norelli sought to evaluate the natural and social relationship between the instances in their study on the skeletal remains of high- and low-status individuals from the Monte Alban site in Oaxaca, Mexico. The lack of a significant difference between these two meetings in terms of sex proportions, measurement, and nonmetric variables suggested that they were not entirely unique in terms of natural status records. By contrast, it seems that societal inequalities were represented in the pointers of wellness crafted by Peck on two Center Iron Age burial sites in East Yorkshire, Northern England.

During the Bronze and Iron Ages, urn fields covered a vast region of Focal and Western Europe, and deteriorated from the thirteenth century BC onwards. The majority of urn field societies

share at least three primary characteristics, according to archeological evidence from Central Europe: the predominance of incineration, a significant increase in the number of both graves and large graveyards, and the consolidation of earthenware production in funerary customs.

A system in which a society assigns a hierarchy to families of people is referred to as "social stratification." Certain groups in the United States have undeniably more status, influence, and money than others. These inequalities have resulted in social stratification. Individuals in a society are classified into socioeconomic strata based on their occupation and income, wealth and social status, or derived power.

None of these characteristics were common in the archeological record prior to the urnfield period. Several jars containing human cremains were famous symbols of the end of the Bronze Age and the start of the Iron Age in different regions of Europe at this period. Studies on visible evidence of potential class demarcation based on cemetery changes and burial goods are among the most studied subject topics in antiquarianism. However, the haphazard use of certain fundamental notions such as prestige, grandeur, and social status has been emphasized.

The meaning of ‘renown things,' which were made of crude materials that were both significant and uncommon (according to contemporary judgment), introduced complex structures, and at times exemplified advancements regarding their material, methods of assembly, and so on, from which they inferred the majority of their dowry, was primarily focused on the funerary setting.

They are typically portrayed in archeological literature in contrast (whether explicitly or implicitly) to basic, pragmatic, and less decorated objects of private usage (. The evaluation of metal items, such as their quantity, quality, and variety of structure and material – for example, gold versus copper, and the comparison of these factors to anthropological data obtained from entombments, are typically used in studies on social division in the Bronze Age. For a long time, a standard inspection procedure has been to look for markers of 'luxuriously' and 'inadequately' furnished graves, then compare the findings to the deceased's sex and age (two natural groups). Ceramics, in contrast to metals, have seldom been thought of as a social status symbol

CONCLUSION

In the pale history of the Late Bronze Age and the early Iron Age, the principle center has been around tip top graves (for example Schumann and Van der VaartVerschoof, 2017), which were tremendous and richly outfitted with extraordinary items, however moderately not many when contrasted with the huge number of comparable, unobtrusive graves found in huge pieces of Europe. We demonstrated that these graves have research potential and ought not to be viewed as it were as an immaterial foundation to the examinations on ancient networks. Our exploration demonstrated that straightforward archeological and anthropological information created by the exhuming of a generally non-breathtaking graveyard can be a helpful logical device to contemplate the chance of social separation that is communicated in manners other than the presence of modern metal items. The urn field networks are regularly viewed as libertarian because of the presence of thousands of comparative graves (particularly before the rise of the strengthened settlements between the ninth and eighth hundreds of years BC), which appears to be far-fetched as the battle for power and different sorts of social rivalry is a natural trait of generally over a significant time span social orders. The Wichita locale, with its huge braced settlement situated in the wetland and encompassed by many open settlements and burial grounds are not an exemption. Taking into account certain interpretive alerts, it very well may be inferred that social definition in the little yet complex local area investigated through the

utilization of certain grave records could be reflected in the likelihood of endurance and the age at death.

ABSTRACT

Safety, catastrophes, and emergency circumstances will be faced by all communities, whether rural or urban. In these circumstances, communication systems are put under extra strain to ensure that they are completely functional. Given the present state of Public Safety and Disaster Recovery, dependable wireless mobile communications that allow real-time information sharing, continuous availability, and interagency interoperability are critical in an emergency. Wireless Mesh Networks have gotten a lot of press recently as a broadband access option for a variety of industries, including metro, emergency, public-safety, carrier-access, and residential. This article discusses the technological needs for emergency and public-safety communications systems, as well as some of the technical implications of wireless mesh networks. The Man-portable, Interoperable, Tactical Operations Center communication system, which was sponsored by the US Department of Homeland Security, is described in this article. It's a cutting-edge mobile communications network that's ideal for public safety and disaster recovery.

KEYWORDS: *Architecture, Emergency Communications, Disaster Recovery, Public Services, Wireless Mobile Communications.*

1. INTRODUCTION

Disasters of unprecedented scale have lately struck the globe, claiming hundreds of thousands of lives, destroying millions of homes and businesses, and completely destroying vital infrastructure. Personnel are sent to the field in the event of an emergency, such as a chemical spill, storm, or other natural or man-made catastrophe, to assess the situation, prepare a reaction, and execute and monitor that response. Depending on the size and type of each catastrophe, emergency preparation and response/recovery methods differ from one event to the next. The interoperability, coverage, and adaptability of first responder communication systems are among

the most pressing concerns raised by such incidents. Current and future broadband multimedia public safety applications need a network solution that can provide high-speed, high-throughput, low latency, and high resilience over an entire access area, which may include several jurisdictions. Communication systems for crisis management and disaster recovery must be very dependable and resilient, as well as capable of operating in potentially hostile situations. The Department of Homeland Security's SAFECOM program has released a Statement of Requirements (SoR) for public safety wireless communication [1].

The following is a summary of the most significant functional criteria for public safety communication that the SoR study mentions, Support for Mobility Integration of voice and data connections across local, regional, and national organizations

1.1. Standards Design

Wherever feasible, use commercially available equipment Support for Unicast, multicast, and broadcast communication Security (Privacy, Integrity, and Access Control) On-the-spot access to response guidelines and the current condition of local assets

- Ability to modify, update, and manage field-generated material
- real-time data sharing for cross-jurisdictional and cross-agency cooperation
- Extensibility and Scalability
- Access to ugliness and assistance

Only a few towns in the United States have accomplished more than one or two of these technology-based characteristics in reality, particularly at the on-scene incident command level. There is concrete evidence of deployment-ready, integrated, cheap, and multifunctional technologies to assist emergency management and crisis response only in large cities like New York and Los Angeles. Typically, one or more of these information technologies are accessible at a permanent Emergency Operations Center (EOC) in a major city or in extremely big, costly, road-bound command posts the size of a tractor-trailer or recreation vehicle (RV). Mobile command posts are usually best suited for national agencies and the military[2], but small urban and rural towns in the United States are unlikely to have any capabilities beyond the conventional call and dispatch centers for law enforcement, fire, rescue, and ambulance services.

The PSDR communication solutions that are currently available lack critical functionality. They are very vulnerable since they depend on a fixed infrastructure and lack self-organization skills, and they do not support multimedia applications that need high-quality connections and/or large amounts of bandwidth. The traditional disaster relief communication system is mainly based on Terrestrial Trunked Radio (TETRA), which is intended for voice and status messages and has data speeds ranging from 2.4 to 7.2 kbps [2]. These data rate limitations are inadequate to provide firefighters with access to a building's structural information or to transmit video footage. While these restrictions have been eased with the introduction of TETRA-II, the fact that TETRA is based on a fixed network architecture of base stations makes it vulnerable to large-scale catastrophes. The federal government is investing billions of dollars in this field, and several states have either adopted or are in the process of implementing state-wide public safety communications networks. The conceptual vision of the national public safety communications network has made some development[3].

This article provides a review of current wireless technologies as well as their PSDR application possibilities. The PSDR communications requirements are discussed, and we demonstrate that wireless mesh networking technology is a reliable network for emergency and public safety situations[4]. The article then goes on to explain the MITOC's capabilities and design, which were sponsored by the US Department of Homeland Security for disaster management and crisis response.

1.2. Communications Systems for Public Safety and Disaster Recovery

Wireless communication is undeniably a popular service, as shown by the explosive development of cellular and wireless local area networks (WLANs), particularly those that adhere to the IEEE 802.11 family of protocols, often referred to as Wi-Fi. However, these two fundamentally different methods handle just a limited range of connection requirements, and wireless connectivity may help a wide variety of additional applications. Current cellular networks, including third-generation (3G) cellular networks such as Enhanced Data for GSM Evolution (EDGE) and Universal Mobile telecommunication systems (UMTS), provide wide-area coverage, but at a higher cost and with lower data rates than WLANs 802.11 a, b, and g[5].

WLANs, on the other hand, have a relatively small coverage area and mobility. A cable backbone linking numerous access points is also needed to expand the coverage regions of WLANs by adding additional access points. WMANs (for example, the IEEE 802.16 family of protocols) help to bridge this gap by providing high data rates and assured quality of service to a potentially vast client base (up to tens of kilometers from the base station) [6]. The major disadvantage of WMANs is their (present) lack of mobility support and the need for a clear line of sight (LOS) to the WMAN base station: customers who do not have a clear LOS to the WMAN base station are unlikely to get service. Because of the LOS requirement, more than half of the clients in areas with a high density of obstacles (high-rise buildings or trees) cannot be serviced. Furthermore, base stations are often complicated and costly. Wireless communications nowadays include a wide range of networks, devices, and formats[7].

Wireless communications, which evolved from analog and digital radio, may now offer users with a smooth, integrated means for high-speed wireless transfer of voice, data, video, and more. Designing a system that meets all of the PDSR criteria is very difficult. The communication infrastructure must be dependable and constant, and it must, if required, work with the devices of current responders' organizations[8]. New high-speed wireless networks are now available that are up to 1000 times faster than the majority of wireless systems presently utilized in PSDR applications. The systems listed below are examples of wireless technology solutions with public service and application possibilities.

1.3. Satellite Communications Systems

Satellite communication has been suggested and researched for application in catastrophes and public safety situations for high-speed data transfer and video conferencing [9]. Satellite IP network services utilizing very small aperture terminals (VSAT) have grown popular in mostly rural regions as satellite communication technology has advanced. VSAT has been investigated as a means of delivering interactive real-time data for applications such as telemedicine. However, VSAT satellite network connection services have a number of significant drawbacks, including unequal transmission rates, the weight of VSAT equipment, and the fact that VSAT is not permitted to be used for PDSR in at least one nation, and perhaps more.

1.4. WMN

A mesh network is a local area network that uses either a full mesh or partial mesh connection architecture. Each computer equipment in a complete mesh network is linked directly to each other, allowing the LAN to be supported by numerous connection tunnels. Some devices in a partial mesh network are connected to all others, while others are only connected to the devices with whom they share the most data[6]. The mesh network is especially well suited for municipal government services that are typically delivered in the field, such as public health and safety operations and disaster response, because it automatically determines the best access path for each device and adjusts on the fly for failed connections. In the event of a catastrophe, a complete mesh network offers the best chance of maintaining operations. It provides the most redundant connection points to a building or distant user, allowing data packets to be routed via alternative paths if one or more connection points fail[10].

2. DISCUSSION

2.1. Wireless "Bubble" from MITOC

The ability to offer a "bubble" of protected wireless Internet access is a key feature of MITOC. Authorized users may access all MITOC programs through this wireless network using wireless enabled PCs, laptops, or PDAs. This enables for on-the-spot cooperation through instant messaging, which helps to reduce radio traffic. For the wireless network, early MITOC versions utilized a Cisco 2.4 GHz broadband wireless router. The wireless technology is used in current versions for improved security, range, and coverage flexibility. Small, robust, battery-powered access points are used in this system, which may be dispersed across an emergency situation. Because employees had to operate within a few hundred meters of the MITOC electronic equipment suite, the original operating concept and technology restricted the usage of the MITOC wireless bubble. While this offered a considerable capacity, it could not assist responders operating at the immediate site of the incident in the case of dangerous circumstances such as fires or chemical spills. The idea of mesh wireless networking and its widespread adoption have drastically altered the scenario. A key new feature is the capacity for an incident commander in a command post and a responder working in the local vicinity of a danger to share a network-enabled, shared operational picture. The novel idea and technology enables video surveillance data, sensor data, text messaging, Internet access, and other operational information to be shared via common wireless mesh network architecture, in addition to conventional voice communications.

2.2. Operational Scenario Example

MITOC systems have been used to support and deploy a variety of real-world missions, including security operations at the Kentucky Derby and a large-scale train accident with a hazardous spill and fire, with up to six Breadcrumbs deployed to expand the MITOC wireless bubble. A railway accident and hazardous material leak would be the starting point for a conventional deployment of MITOC and the WMN. Our research team is summoned to assist and react to the operation. The incident command post will be positioned upwind a mile or more from the event in a hazardous hazmat scenario, with intervening terrain or buildings to protect the command post from any fire or explosion hazards.

MITOC offers the responders with a complete range of global voice and data communications at the command post in the event that power and communications are interrupted or unavailable.

Hazardous materials team personnel in full protective gear will go to the incident site from the command post, turning on and dropping off Breadcrumbs along the way. The team members will interact with the command post through voice and text messages from the spill site, using the deployed Breadcrumbs. The incident commander at the command post will get vital data from the surveillance cameras and chemical sensors they install on the site through the Breadcrumbs. After identifying the nature of the spill, hazmat team members will use the Internet connection provided by the Breadcrumb WMN and MITOC to obtain instructions for neutralizing the spill on their PDAs and laptops without leaving the site.

2.3. System Manufacturing and Distribution

Twelve MITOC systems have been ordered, with eight having been built and delivered to date. The majority of the first MITOC orders came from state and municipal governments, as well as energy and utility corporations, who will utilize their MITOCs to assist continuity and service recovery activities. Research workers at Murray State University are presently assembling production MITOC devices. The research team provides system documentation, training, and support in addition to hardware customized to each customer's specifications. While there is currently no commercial manufacturing plant in place, a business partner focusing on sales and marketing has been formed. This commercial partner is anticipated to establish a manufacturing facility and take over training and support duties in the future.

3. CONCLUSION

All PSDR communications rely heavily on terrestrial communication infrastructure, including landline and cellular telephone, as well as infrastructure-based Land Mobile Radio (LMR). When catastrophe hits, having access to dependable communications is critical to disaster relief and recovery activities, because fast reaction means lives saved and negative economic consequences are minimized. The significance of communications networks, such as telecommunications, broadcast, cable, and satellite systems, becomes apparent during local, state, and national crises.

In the absence of current infrastructure, mobile mesh networking allows broadband wireless communications, making it suitable for first-responder scenarios. In large-scale crises when tactical communications are best served by networking on the fly provided by a mesh network solution, it provides the interoperability, scalability, and dependable performance needed. There is no denying that wireless mesh has obstacles. The difficulties are mostly specific to WMNs, and more study has to be done before they can achieve their full potential. The wireless communications industry's potential and achievements, on the other hand, greatly exceed the difficulties.

For an emergency incident commander, MITOC offers a highly competent, field-tested, and cost-effective mobile operations center. Our study is only getting started on the difficulties and possible advantages of using wireless mesh networking to expand the MITOC communications infrastructure from the incident command post to the actual site of the emergency or danger. Preliminary findings suggest that WMN is a technically sound yet cost-effective strategy with substantial potential payoffs. Our ongoing study is not aimed at proving the viability of current WMN methods or inventing new ones. Our study will be focused on identifying, documenting, and sharing the creative methods to emergency management and crisis response developed by first responders as a consequence of utilizing sophisticated information technology during training and real-world operations.

Candidate of Technical Sciences,
Termez State University, UZBEKISTAN
Email id: quziyev@tersu.uz

ABSTRACT

The article presents the analysis of the development and problems of the transport sector and transport communications, new requirements to it in a growing economy.As well as the issues of posing challenges and the development of models of assimilating goods traffic in the best use of the means of automobile and rail transport and transport networks and their development taking into account the perspective growth of goods traffic, making analysis of the criteria for the optimal solution of transport network development.

KEYWORDS: *Transport, logistics, security, automobile, railway, network, multiset, development, road scheme, optimal, criterion, mathematical model, freight traffic.*

INTRODUCTION

The growth of the manufacturing sector in our country in promising areas of great practical and strategic importance, the rapid formation and launch of international joint ventures on the basis of foreign investment will increase the demand for transport. This requires the development of technical and technological capabilities of the transport system, and the various vehicles and industries to effectively meet the needs of consumers in the volume of traffic in a timely manner. The dynamics of the volume of freight traffic by types of transport over the years (Figure 1) is given *(Taken from the State Statistics Committee of the Republic of Uzbekistan).*

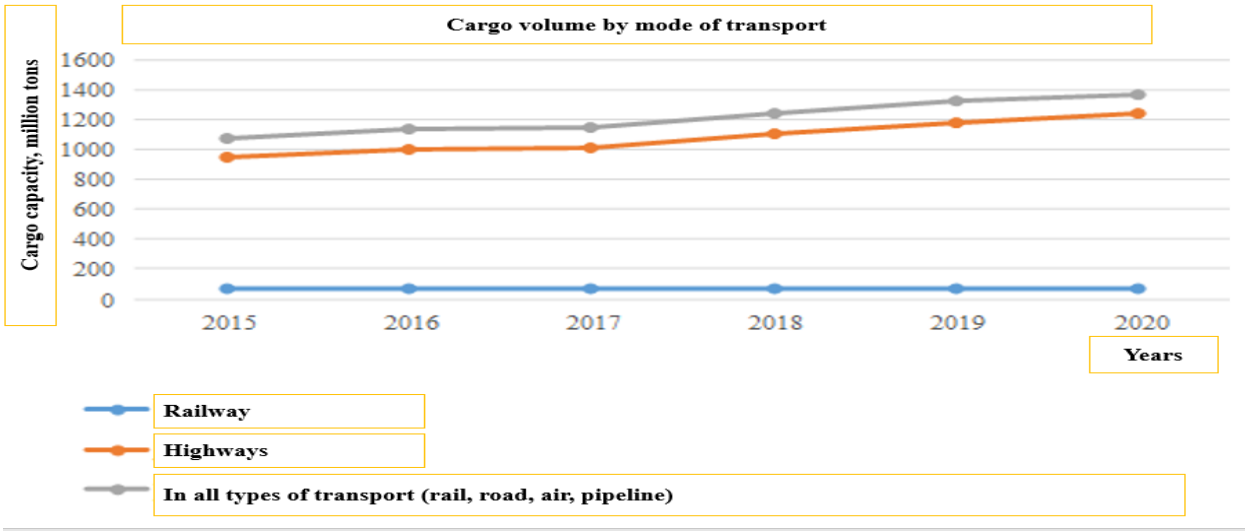

Figure 1. Changes in the volume of freight traffic by modes of transport over the years.

Figure 1. Changes in the volume of freight by type of transport over the years.

In order to optimize the delivery of future cargo flows to domestic and foreign markets and reduce their cost, it is necessary to develop the transport and logistics sector. One of the key factors in the development of transport and logistics is the level of demand for transport in the region, i.e. a well-developed economic infrastructure.

A highly developed and efficient transport system is seen as a key factor in creating logistics centers and attracting investment.

Improving the transport supply of the region, in turn, will create opportunities for the effective management of flows and minimization of transportation costs in the chain of multimodal transport in the region. To do this, it is necessary to develop a scientifically based methodology.

LITERATURE REVIEW

An analysis of the literature on multimodal cargo planning shows that researchers use three main levels in planning, namely strategic, tactical and operational levels, from which tactical level issues are studied extensively, followed by strategic and operational level issues (SteadieSeifi M., et al., 2014).

Forms of design of multimodal transport network and methodological bases of capacity are considered (Goncharuk S.M., et al., 2012).

Prospects for the construction of high-capacity roads in Europe, ways to increase transport capacity in Slovakia, reloading stations ("Construction of transport capacity in Slovakia, reloading stations") and reduce the time of freight traffic from Eastern Europe and Asia (Tchumlyakov KS, Tchumlyakova DV, 2015).

At present, multimodal transportation (Petraška, A., Palšaitis, R., 2012) is indicated as one of the main methods of delivery of oversized and heavy loads from the sender to the consumer.

The problems of planning multimodal transport routes have been studied in many studies, and most studies have focused on optimization in terms of cost, time, risk, and environmental

protection (Chang, T.-S., 2008; Sawadogo, M., Anciaux, D., Roy, D., 2012; Xiong, G., Wang, Y., 2014; Sun, Y., Lang, M., Wang, D., 2016; Dib, O., Moalic, L., Manier, M.-A., Caminada, A., 2017; Fazayeli, S., Eydi, A., Kamalabadi, IN, 2018).

Genetic algorithm in the planning of multimodal transport routes (Sun, Y., Lang, M., Wang, D., 2016; Dib, O., Moalic, L., Manier, M.-A., Caminada, A., 2017; Fazayeli, S., Eydi, A., Kamalabadi, IN, 2018), ant column algorithm (Sawadogo, M., Anciaux, D., Roy, D., 2012), hybrid algorithm (Kai, K., Haijiao, N), Yuejie, Z., Weicun, Z., 2009) and the short path algorithm (Idri, A., Oukarfi, M., Boulmakoul, A., Zeitouni, K., Masri, A., 2017), (MuratovA.Kh. 2021) are widely used.

The use of a short-distance algorithm (KSP) in the planning of multimodal transport routes is considered expedient and is effective in obtaining optimal solutions. The short path algorithm (KSP) has the advantage that it gets optimal and stable (stable) solutions.

For KSP algorithm, many scientists have conducted research in recent years to solve short path problems according to KSP algorithm (Eppstein, D., 1998; Yen, JY, 1971; Martins, EDQV, Pascoal, MMB, Santos, JLED, 1999; Aljazzar, H., Leue, S., 2011; Chen, BY, Li, Q., Lam, WHK, 2016; Liu, H., Jin, C., Yang, B., Zhou, A., 2018).

In solving the multi-route problem of multimodal transportation of long-distance and oversized loads, the transformation of the transport network to a vertical network, i.e. a multi-prism network, has led to a solution in the form of a Yen and J.Y. algorithm (Yen, J.Y., 1971) was improved (Yan Luo, at all, 2021).

It is known that research on short-distance multimodal transport is insufficient. This paper uses a multi-sectoral approach to solve the multimodal problem of multimodal transport, and the developed model aims to simultaneously determine the direction of transport by modes of transport, as well as the nodes and lines that are being reconstructed to reduce overall costs.

A general scheme for the formation of a multi-network of road, road and rail transport in Surkhandarya region has been developed, focusing on the optimal distribution of freight traffic in this network (Shermukhamedov A.A., Kuziev A.A., 2020).

Despite the great attention paid to the above-mentioned issues, there are many problems and issues that need to be addressed in this regard.

In particular, the main difficulties in the organization of multimodal transport are: first, the interaction of different modes of transport and the process of coordination of work, secondly, the legal relationship, and thirdly, the lack of permanent routes.

RESEARCH METHODOLOGY

In the course of the research work, a multi-sectoral method of delivering freight flows to consumers in the region was analyzed. Load flow optimization is implemented in an extended single terrestrial transport network. A single transport multinational network differs from a normal network in that it has several transport sections and additional (fictitious) nodes. Mathematical methods, multidisciplinary, graph theory and statistical analysis and other methods were used to cover the topic.

ANALYSIS AND DISCUSSION OF RESULTS

In the article, the optimization of freight flow is carried out in an extended transport multitask. The transport multidisciplinary differs from the ordinary network by the presence of several transport sections and additional (fictitious) nodes. It is created in the following order. The available points of each mode of transport (in terms of sending, receiving, economic and technical, capacity and other indicators) are shown as nodes of the graph.

Addresses where different modes of transport are connected, i.e. points where it is possible to reload from one mode of transport to another, are represented in the form of several addresses, respectively, which more fully takes into account the transport costs of door-to-door transmission (Figures 2 and 3).

The real point where the different modes of transport are connected is divided into B-sender, S-receiver conditional and neutral links 1,2,3. The oriented arc between the conditional links reflects the costs of the initial-final operation of the corresponding modes of transport, as well as the costs of reloading from one mode of transport to another.

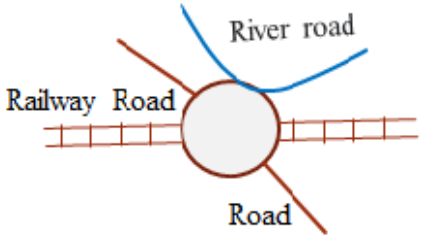

Figure 2. View of the transport network

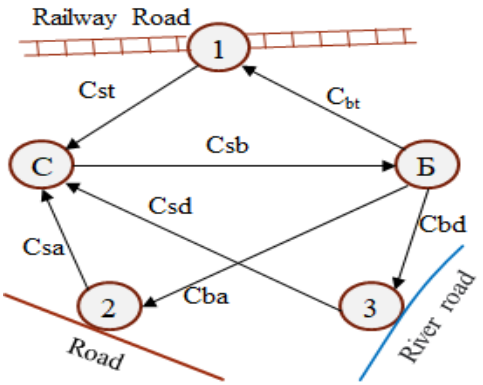

Figure 3. Multi-network view

Therefore, S_{BA} and S_{SA} - determine the cost of initial and final operations on road transport, S_{BT} and S_{ST} - railway, S_{BD} and S_{SD} - on river transport, and S_{SB} - indicate the additional costs of cargo storage (Figure 3). It will be possible to add other modes of transport (air) to the network.

We will introduce the basic concepts and indicators related to the transport network to address the issue and develop a model.

The basic concept of the road and rail transport network is the addresses (junctions) where the various road links (arc) meet. Such points we call connection addresses (TM). TMs are addresses where the consignor or consignee, the transmitter of goods from one mode of transport to another, intersects the links of railways or highways in different directions. The TMs of the network can also be the addresses of the sender, receiver or transmitter of goods from one mode of transport to another, which can be launched in the future.

To illuminate the issue, we enter the following definitions.

Sector	
N	set of nodes

S	shipper
t	receiver
S , $t \in N$	this set and a set of addresses S

Parametrs

$X_{ij,l}^{p}$	The parameter variable that characterizes the transport flow
ij	link (arc) connecting the transport network $\boldsymbol{i}$ address with j addresses
$\boldsymbol{i}$	$\boldsymbol{i}$ =1,2,…, n -shipper
j	j =1, 2, ..., m -freight receiver
l	the type of load associated with that current
p	the degree of development of the transport flow arc
a_i^l	the volume of cargo shipped from one address to each $\boldsymbol{i}$
b_j^l	the volume of cargo accepted for each j address
l	l=1,2,…, k -a set of indices indicating the type of load
$X_{ij,l}^{p}$	flow of transported goods
$D_{ij}^{p\max}$	ij the maximum possible number of vehicles crossing the road on average per day
$X_{ij,l}^{p} \cdot \frac{1}{Д_к \cdot q_{ij}^{p}} \cdot K_{ij}^{p}$	conversion of the traffic flow parameter to the maximum number of vehicles passing through section ij per day
q_{ij}^{p}	Average load capacity of vehicles passing through the section at the level of development of ij arc p , t
K_{ij}^{p} –	coefficient indicating the share of vehicles of other types, except trucks, in the traffic flow through the section
$Д_к$ –	number of calendar days
C_{ij}^{p}	indicator, i.e. the cost of transportation per unit volume

Now we move on to the analysis of the characteristics of the arc of the transport network in relation to the transmission of freight flows. In general, the problem of optimality can be taken as the sum of the product of the parameters C_{ij}^{p} and X_{ij}^{p} of the elements of transportation costs for all l type of cargo in all ij arc of the network. However, in this case, it is necessary to determine the composition of C_{ij}^{p} parameters differently, depending on what level of development of the transport network is considered for P. For example, if the problem is solved for an existing

network, P=0, then $C_{ij,l}^{p} = C_{ij,l}^{p(ж)}$. Where $C_{ij,l}^{p(ж)}$ is the cost of transportation at current costs per unit volume of traffic. Conversely, if $P > 0$ is then $C_{ij,l}^{p} = C_{ij,l}^{p(жк)}$, and $C_{ij,l}^{p(жк)}$ is the sum of current expenses and capital expenditures per unit volume of freight. Analytical expressions of the current and total cost formation of freight for different transport networks and operations are analyzed in detail in the following articles.

Another important issue in the formation of the mathematical model of the problem is to ensure that the optimization parameter $X_{ij,l}^{p}$, ij arc do not exceed the limiting value range determined for each arc of the transport network in accordance with its level of development. Such a constraint is represented by the appearance of different parameters for each type of transport. For example, the level of development for the road network is determined by road categories, and the ij road sections in each category are characterized by an average of $D_{ij}^{p\max}$ of the maximum possible number of vehicles crossing the road per day on average. To express this limitation in the model of the problem, it is necessary to change the parameter of the flow of freight from $X_{ij,l}^{p}$ to $D_{ij}^{p\max}$, the maximum possible number of vehicles passing through the ij -arc section per day. Such a transition can be made using the expression $X_{ij,l}^{p} \cdot \frac{1}{Д_{к} \cdot q_{ij}^{p}} \cdot K_{ij}^{p}$.

The volume limiting freight flows for railway transport arc is characterized by a maximum value of $Q_{ij}^{p\max}$ of the volume of traffic that this section can carry per day. Due to the differences in the limiting parameters for the load currents in the arc of different transport networks, it is necessary to divide the set of arc in the area IJ into local sets of arc for each mode of transport, ie local arc of $IJ_{AЙ}$ highway and $IJ_{TЙ}$ arc of railways.

Thus, the problem statement and the mathematical model are formed as follows: in the area of the economic zone, the given connection addresses are determined by the arc ij and the non-negative $X_{ij,l}$ load currents

$$X_{ij,l}^{p} \geq 0,\ ij \in IJ \text{ and} \qquad (1)$$

and in this case the intensity of traffic passing through the arches of all highways shall not exceed $D_{ij}^{p\max}$, the maximum capacity of this section of traffic flow.

$$\sum_{l=1}^{k} X_{ij,l}^{p} \cdot \frac{1}{Д_{к} \cdot q_{ij}^{p}} \cdot K_{ij}^{p} \leq D_{ij}^{p\max}, ij \in IJ_{AЙ}\ ; \qquad (2)$$

the flow of transport for all types of cargo transported on all sections of the railway network does not exceed the maximum capacity of the $Q_{ij}^{p\max}$ capacity of cargo passing through this section;

$$\sum_{l=1}^{k} X_{ij,l}^{p} \leq Q_{ij}^{p}\ ,\ ij \in IJ_{TЙ}\ ; \qquad (3)$$

the volume of currents sent from TM across all arcs is equal to the volume of currents received at the next address

$$\sum_i a_i = \sum_j b_j \begin{cases} i = 1,2,...,n; \\ j = 1,2,...m; \end{cases} \quad (4)$$

for each node i=1,2,…, n and l=1,2,…, k for each load;

$$\sum_j \sum_l X_{ij,l} - \sum_j \sum_l X_{ji,l} = \begin{cases} a_i, agap, i \in S; \\ 0, agap, i \notin S, t; \\ b_j, agap, i \in t. \end{cases} \quad (5)$$

The current $(F_Ж)$ or full (F_T) costs of transporting area freight flows are minimized

$$F_Ж = \sum_{ij} \sum_l C_{ij,l}^{p(Ж)} \cdot X_{ij,l} \to MIN; \quad (6)$$

$$F_T = \sum_{ij} \sum_l C_{ij,l}^{p(ЖК)} \cdot X_{ij,l} \to MIN. \quad (7)$$

This view (formulation) of the issues of optimal development of the transport network takes into account the various options for the expansion, reconstruction and reconstruction of existing links in the transport network. It is possible to add new sections to the network of different modes of transport. In general, any type of transport section can be accessed as a *ij* link model with a specific transportation cost. Only this cost should be determined based on.

CONCLUSION

The development of the transport network is mainly based on the transport condition of the roads, respectively. This will allow for the rational distribution of capital funds allocated for the development of the transport network of the region.

The use of the results of this study provides a great opportunity in planning and designing the future development of the freight network in transport. In our view, while addressing the issue of efficient distribution of flows in the transport network in the economic zone, it provides a clearer and more comprehensive justification for the development of the transport network in the region. This saves the transport costs of the productive forces considerably. This, in turn, will increase the competitiveness of our products and our economy as a whole.

ABSTRACT

The article describes the formation of new social relations in our society today, the integration of education into the world educational system, the development of democratization and development processes, the need to use innovative educational technologies in the educational process, as well as the need for a new approach, the need to acquire independent knowledge in the educational process, the problematic organization of education, in order for the majority of students to thoroughly master the knowledge given in education, it is necessary to introduce pedagogical technology, to organize all parts of education on the basis of technological approach, to teach young people deep and thorough thinking, to form the ability to obtain independent knowledge in the educational process, to base pedagogical technology on the technological approach, to, the situation that guarantees the expected results in achieving the set goals is interpreted as the organization of education on the basis of innovative technologies, the activation of students in education, the optimization of education based on the principles of technological approach.

KEYWORDS: *Student, Purpose, System, Technology, Approach, Education, Process, Content, Principle, Quality, Control, Result, Suggestion, Interest, Creativity, Formation.*

INTRODUCTION

Today, technological approaches to the educational process are being implemented on a global scale. At the same time with this process, significant changes are taking place in the theory and practice of the pedagogical educational process. The composition of approaches in education is changing and a different relationship, pedagogical mentalities are being established. The educational system is enriched by the ability to work with new information, focusing on the individualization of the educational program of the creative solution. An important component of

the educational – pedagogical process is the interaction between the student and the teacher, aimed at the individual. The role of Science in the organization of pedagogical technologies, equivalent to social knowledge, is increasing. The learning process is incredibly complex. The effectiveness of education depends on the activity of educators and students, the availability of educational means, organizational, scientific, methodological perfection of the educational process, the need for people with knowledge in society and other factors that have not yet been determined. Society demands that the effectiveness of education be high based on its socio-political, economic needs.

All the joints of education should be organized in such a way that it should teach young people a wide range of thinking, along with providing them with deep and thorough knowledge. The formation of the need for independent knowledge in the student in the educational process is a requirement of the present day. A number of methods of work were supported in pedagogical practice and research. Problematic organization of education, activation of students in education, cooperation pedagogy, justification of base words, optimization of education, etc.Passed from experience. But even if these pedagogical tools give an effective result in some teachers, it could not be included in the mass or educational system. The main essence of pedagogical technology is to provide students with interesting training and full mastering of knowledge. The thorough mastering of the knowledge given in education by the majority of students is the main goal of the introduction of pedagogical technology.

The peculiarity of the new relationship is that it differs from traditional education in that it does not prohibit the independence and educational activities of students, but rather the direction to the established goal, the organization of educational activities in cooperation, the conscious transfer of them to the activity, the acquisition of interest in the study of the basics of Science in students.

Main part

Education is a key factor in the reform of society and its transformation into a society more open to the outside world and oriented to new technologies and knowledge [9]. Increasing the effectiveness of modern didactics and educational components in education, scientific development and practical justification of new ideas and technologies are being switched to. In this situation, it is important to establish a link between different pedagogical systems and educational technologies, the aprobation of new forms of the state educational system in practice, the application of pedagogical systems of the past in the present tense.

Until the emergence of pedagogical technology, among other things, the rule of sufficiently effective design of the educational process within the framework of the educational system, in which complex devices and processes are studied, has not been developed. This gap is filled by pedagogical technology, leaving a wide space for the teacher's creative approach to the designed learning process. The peculiarity of pedagogical technology is that the unconditional achievement of educational goals is designed and carried out in the educational process. The technological approach is most pronounced not only on the surface, but also on the pair, which makes it possible to realize the planned result.

The purposefulness, the diagnostic examination of the results of the process, makes it possible to embody all aspects of the educational process in the period of its development. It basically includes the following [11]:

- Setting the objective of education;
- Transition from a specific goal to a specific goal;
- Consideration of attention to the indicators of demand mastering;
- Active participation in assignments and educational discussions to be performed in training sessions;
- Evaluation of the result.

The norm of the complete standardization of educational objectives can be as follows:

a) High but not absolute;

b) Definitely.

In the first case, due to the complexity of the goal, it does not allow it to be converted into a fully observable type of behavior, the period scan is not reproduced. In the second case, it is dealt with the reproductive type of Education, which is a convoluted process.

Ўқув жараёнининг барча босқичларида бутун тизимнинг асосий технологик жиҳати – ўқув жараёнининг сўнгги натижаларига йўналтирилганлигини кузатиш мумкин.

In general, the composition of pedagogical technology includes [15]:

- Development of identified learning objectives in education;
- Taxonomy of educational objectives;
- Converting the objectives of control assignments into teaching aids;
- Methods of achieving the goal;
- Evaluation of the educational objectives achieved.

The main directions of improvement of modern pedagogical technologies from the psychological and pedagogical point of view are expressed as follows [12]:

- The transition from memorization to the function of memorization, that is, the transition to the process of self-development, which requires the possibility of using what has been developed;
- Transition from student orientation to secondary education and individualized education programs;
- Transition from external motivation of motivation to internal spiritual regulation of motivation.

The main way to understand pedagogical technology is to focus on clearly defined goals, establish regular interaction with the educator. Interaction forms the basis of pedagogical technology and completely covers the educational process. The teacher sets himself the goal that the students should understand and master the content of the teaching material, acquire certain knowledge and learn to apply it in practice. In the event that there are clear means of knowing whether the pedagogical goal has been achieved or not, the teacher can make sure that his or her work is effective and that the techniques he or she chooses are purposeful or, conversely, ineffective.

The specific methods of setting goals by teachers according to M.V.Clarin's opinion [3] are as follows:

1. Set a goal based on the plan of the study material.

2. To determine the purpose through the activities of the teacher.

3. To set the educational goal of the student through internal processes and legislation of social, emotional, personal development.

The purpose of the study is to determine through the content of education, the activities of the teacher or student does not allow to have a clear impression of the expected results in education.

In general, in order to have the opportunity to measure, determine, repeat the tasks in the educational process, it is necessary to know the criteria for achieving each goal, that is, the purpose of education should be laid so that it is possible to draw a clear conclusion about the achievement.

The educational process forms the basis, core of modern pedagogical technology and is represented as a system consisting of elements such as the purpose of education, the content of education, student, form of education, methods, tools and educator. The constituent elements serve to illuminate the technological general essence of the educational process in mutual unity and interrelationship.

Technological approach to the educational process is organized in accordance with the following basic conditions [4]:

1) the emergence of social (or personal) needs for the acquisition of education, the acquisition of certain theoretical and practical knowledge;

2) the awakening of stimulus to the acquisition of education, the acquisition of certain theoretical and practical knowledge;

3) to determine the content of student's educational and cognitive activities;

4) availability of factors that drive the management of student's educational and cognitive activities.

Today, the incentive to education and its content can be a guarantee of the success of the educational process [10]. After all, in the recent past, the participation of students in the educational process is sufficient by their role in the quality of theoretical knowledge acquired and mastered, the subject demonstrating practical skills, according to the requirements of educational technology, the leading subject of the educational process of students, manifested as the main performer. Now the students do not receive the information transmitted by the teacher. Rather, the trainee's ticket, in accordance with the instruction, assimilates theoretical knowledge by independently acquaintance with the proposed educational resources, creates practical skills and qualifications under the supervision of the teacher. Students are required to be able to conduct independent activities, promote independent and Free Thought in themselves on the basis of mastering theoretical knowledge, bring up evidence, educate the ability to defend their own opinion, self-criticism, decide on the qualities of self-assessment. Now it is forbidden to turn students from being a slow listener of the educational process into an active participant.

The leadership role of the educator in the educational process gives the opportunity to solve the following pedagogical tasks:

- To find a solution to the internal need for mastering knowledge in students;
- Form a conscious approach to the assimilation of knowledge;
- Formation of skills of independent activity in students;
- Ensuring students ' activity;
- To develop and improve the skills of independent thinking, analysis of the essence of theoretical and practical knowledge, to draw conclusions on them,to generalize them and to apply them to their practical activities.
- Formation of self-control, evaluation qualities.

The purpose of the educational process should be clearly defined. Such determination of the educational goal creates the opportunity to draw conclusions on the level of organization and implementation of the didactic process at a certain and valid time.

The diagnostic designation of the target is characterized by the following:

– The moral and moral qualities that are formed in a person, as well as the intellectual potential, are guaranteed to this extent clearly and clearly, as a result of which it will be possible to easily distinguish them from the qualities that a person shallots in any desired, pre-situation time interval;

– There will be a clear method aimed at real control over the level of formation of diagnosed moral and intellectual qualities of a person;

– Tt will be possible to determine its effectiveness on the basis of the results of the control conducted to determine the diagnosed qualities of the individual;

– On the basis of measurement criteria, there will be indicators of assessing the quality of certain knowledge, skills and qualifications.

This means that the purpose of the educational process is based on the content of the social order and the interoperability of the models of the student personality.

Formation of the educational goal at the stage level the goal at the actual level is divided into specific stages of educational preparation. Due to the fact that the educational system is oriented towards the profession without integrity, the model of the student's personality remains its object. In the process of education, the age indicators of the individual are ranked, proceeding from the main goal, in accordance with the stages of its natural formation.

Thus, the content of the educational process serves to ensure a positive solution of such tasks as teaching, upbringing and development of the individual [13].

RESULTS AND DISCUSSIONS

Pedagogical technology is based on a technological approach. The technological approach is understood as a situation in which the process used in the production processes to obtain a finished product (similar to the production technology) is understood and guarantees the expected results in achieving the set goals.

L.V. Golish according to [2], if we understand that the way of knowing the method, the way of research or the acquisition of a certain field of practice and theoretical knowledge in an activity

is a complex of actions, operations, methods, then pedagogical technology in a certain sense implies the achievement of the necessary results in educational processes.

There are many signs that distinguish pedagogical technology from traditional teaching methods. Pedagogical technology differs from traditional methodology primarily in the setting and achievement of goals [6]. Pedagogical scientist M.Ochilov noted that-the component of the pedagogical technology method includes the development of the general objectives of education (the goals of the teacher and the student), the transfer of educational goals to control (test) assignments, the methods of achieving the goal [5].

Relying on the collaborative pedagogy that expresses the relationship between the teacher and the student, the joint education of the students is carried out. The main methods of modern pedagogical technologies, such as joint education of students, the design of educational processes, and the design of work with students, etc., are considered [1].

The new pedagogical relations established in the educational process require the use of modern pedagogical technologies in this process. Different approaches are used in the science and practice of pedagogy. They are oral-visual, research-driven, systematic, functional, komplex, technological, active approaches [14].

The introduction of modern pedagogical technologies into the educational process requires a positive performance of the teacher [7]. The educator must have complete information about the external opportunities that help him in himself, that is, the availability of theoretical and practical, educational weapons and tools [8]. The educator should have the ability to orientate on the basis of available information and opportunities on the direction of education, as well as on the intended purpose of advanced teaching methods.

It is known that modern pedagogical technologies are based on the principles of developing education and should be directed towards educating the student personality. At the center of the theory of pedagogical technology is the leader of the educational process, at the same time, teachers and students who are both subjects and objects of this process. Therefore, it is necessary that the interaction, interaction between these subjects, their interaction with each other, be able to meet the requirements of the most modern pedagogical technologies from the influence they have on each other. For this purpose, the teacher, first of all, the requirements for the organization of the educational process, the principles of organization and management of education, the ways in which the student develops intellectually and physically methods of service, cooperation with him, directing him to study and study, the correct organization of the activities of the student personality, the introduction of communication with them, the, the student must be armed with techniques that allow him to accurately and correctly evaluate his activities.

Although modern pedagogical technologies have common didactic principles, they also have the following principles that are inherent in the same:

1. The principle of one integrity, integrity. This principle reflects two aspectstiradi:

– Unity of education and training and personality;

– The fact that modern pedagogical technology has a certain, strict system, the concept of “systematism” in this place symbolizes the uniqueness of both the process of teaching a particular subject and the general educational process.

2. The principle of reasonableness (fundamental). This principle is in different directions according to the object, internal essence and characteristics of the study of sciences and expresses the advantages of the study. Educational sciences arecategorized in the style of natural, social and humanitarian Sciences. Each educational science has a basic quantitative data, these data serve asa base concepts by which an individual can learn the basics of the sciences, obtain independent knowledge in a specific specialty, pass on the acquired knowledge.

Such a competent approach also makes it possible to use the feature of scientific communication in the process of training specialists in a certain direction. The combination of Educational Sciences in a certain direction in a certain way reduces tension in relation to the memory of a person, and also increases the power of thinking, promotes the occurrence of thinking.

3. The principle of cultural awareness (compliance with the development of cultural life). This principle has not lost its relevance to this day either. The principle of cultural awareness implies that students are educated based on the level of cultural development of their social society. In the last century, when the level and skill of the educator was recognized as a leading factor in ensuring the effectiveness of education, it became clear that today the teacher can not only achieve success with a high level of knowledge, potential and skills. In this place, it is important to pay attention to modern science and technology opportunities, in particular, computer, multimedia tools, as well as social and economic development of society. Now it is necessary for specialists to have a good knowledge of the peculiarities of their field or directions, to be able to carry out theoretical and practical knowledge, certain activities, to be able to solve specific tasks within the specified period and to achieve certain achievements.

4. The principle of humanization of educational content. Humanization refers to the introduction of social sciences (history, culturology, sociology, psychology, philology, etc.) into the list of subjects studied in educational institutions, while the concept of humanization refers to a positive approach to the person and his activities. In other words, if humanization is the process of organizing activities based on the human factor, respect for its dignity, honor, dignity, rights and duties in the process of relations between man and society, then humanization is the process of activities organized on the idea that “all conditions are for man and his perfection”.

In the design of the educational process, each teacher must strictly adhere to this principle, or it is desirable to pay attention to the fact that when solving problems related to his specialty it is in harmony with the interests of society.

5. The principle of teaching, research, research, teaching. This principle serves to illuminate two aspects:

1) Every teacher of educational institutions should conduct research involving students in their field:

2) The teacher develops educational technology, tests it in practice, observes and makes corrections, i.e. he studies the educational process.

These two aspects of the teaching process are important, as they provide a basis for improving the professional and pedagogical skills of teachers and thoroughly preparing students for future professional activities.

6. The principle of continuity of education. This principle implies that students have professional qualities, the existing qualities are improved during life activities. It is impossible to give a

person the knowledge that will help him for the rest of his life, because the existing knowledge changes and enriches the content every five to ten years. Thus, this principle means that the teacher pays attention to the organization of independent learning in his work, to create conditions for students to learn independently from the education provided by the teacher's leadership.

7. The principle of the folly approach is based on the didactic connection of theory and practice. In didactic theory, the concept of knowledge is interpreted in two different ways:

a) Knowledge that students need to acquire;

b) Knowledge acquired by them and applied in the process of practical activity, which has become a personal experience.

Knowledge is strengthened only in the process of activity, so it is necessary to cultivate in students the ability to apply theoretical knowledge in practice. Knowledge that has no application in practice will soon be forgotten.

Thus, these are the basic principles of pedagogical technology, that is, the initial rules. The organization of pedagogical activity in accordance with them increases the pedagogical skills of the teacher, the acquisition of intellectual and moral qualities of students, as well as the formation of personal experiences in them.

CONCLUSION

It is expedient to take the following measures to generalize and apply in practice the work on the introduction of pedagogical technologies in the educational process, especially the creation of a modern system of pedagogical technology of the systematized educational process using the experience of pedagogical technologies in foreign countries:

1. Between the participants of the educational process - the teacher and the students: the development of the curriculum, that is, when the teacher develops a plan for the study of the department and the chapter, this plan should reflect the activities of students and teachers. The consistent planned distribution of educational work between teacher and student, which is one of the principles of modern pedagogical technology, requires the teacher to consistently manage the educational process.

2. Targeted use of internal communication and inter-citizen communication opportunities of science. Each learning unit, small and large, relies on what has been learned before. Interdisciplinary connections and knowledge of students' preparation levels are also important. This means that when introducing a student to a new chapter, chapter, it is possible to rely on the existing knowledge, if the existing knowledge is not enough to study a new chapter, intermediate preparation, and only then move on to the next stage of learning.

3. Defining learning criteria. Learning criteria consist of concepts, definitions, rules, laws, events, events that a student should learn, and the provision of a logical connection between them leads to the mastery of this chapter or section. The teacher chapter is the criteria that students should study in the hours allotted for the department, and the marginal value of the assessment of student knowledge is determined. When creating a curriculum, the teacher and students identify the units of study they need to know by sections, chapters, and assign them a task before studying the section as an independent assignment.

4. Diagnostic analysis. Diagnosis is carried out in order to identify gaps in students' knowledge, to fill them and take them to the next stage of mastering. Diagnosis is one of the key elements of educational technology, ensuring that the outcome of the educational process is guaranteed by identifying the hours of deficiencies in basic mastery, determining the level of knowledge of each student, making adjustments to the course.

5. Make a correction. If the result of the diagnostic analysis of the level of mastery of the department or chapter gives less than 50%, the teacher must make adjustments to the course of the educational process.

6. Replenishment (elimination of defects). The purpose of the revision is to address the shortcomings in the knowledge gained. Defective situation must be reported to seller.

7. Get the expected result. This element is the central idea of modern pedagogical technologies. While pedagogical technology requires that the outcome of the educational process be guaranteed, it makes it a task for teachers to ensure that the intended purpose of the process is achieved and planned to be effective.

ABSTRACT

This article deals with the civil society as a set of non-political, as well as social relations outside the framework of power-state structures.The problem of civil society is one of the key issues in modern political thought. Strengthening its relevance in the XXI century. Due to the ever-deepening processes of democratization of public life, requiring a clearer division of the functions of the state and civil society, an increase in the role of citizens and their voluntary associations in the functioning of all spheres of life.

KEYWORDS: *Civil Society, System, State, Structure, Values, Self-Government, Economics, Politics.*

INTRODUCTION

The problem of civil society is one of the key issues in modern political thought. Strengthening its relevance in the XXI century. Due to the ever-deepening processes of democratization of public life, requiring a clearer division of the functions of the state and civil society, an increase in the role of citizens and their voluntary associations in the functioning of all spheres of life.

By virtue of this, the identification of the essence and problems of the formation of civil society, the determination of its qualitative parameters in relation to the existing realities allow ensuring close interaction between the state and civil society as the basis of political stability in society.

In the modern view of political scientists, civil society:

-This is a set of non-state relations of people - moral, religious, socio-economic, family and social communities (institutions) that are outside state structures, with the help of which the interests of individuals and their groups are fixed and satisfied;

-Social interaction of the population of a given territory in the economic and social areas on the principles of self-regulation, self-government, based on personal equality and the norms of traditional hostel (state regulation acts only in order to control anti-social actions);

-The highest modern stage and form of human community, which includes as structural elements voluntarily formed primary communities of people: families, public organizations, cooperatives, associations, professional, creative, sports associations, unions, guilds, clubs, foundations, and so on, excluding state and political structures.

Civil society is a mature stage of the historical development of society. Citizenship is a measure of a person's political development, his ability to live not only in a family and his own home, but together with others and for the sake of others. And only in this capacity can people form a society called civil. A developed civil society is built as an interaction of organized entities. It consists not only of the activities of individual individuals, but also of the interaction of organized groups, associations, institutions, local self-government bodies and other public formations.

Civil society is a system of individuals, groups and institutions that are independent (at least directly) in their activities from the State, its bodies and institutions. Civil society can also be defined as a set of non-political, i.e. public relations outside the framework of governmental structures.

According to the leadership of the Republic of Uzbekistan, it is the mahalla that should become the foundation of civil society. It should combine both traditional national values of self-government and new, modern methods of self-government of societies, overcoming economic and political backwardness, in the name of decent human conditions. Mahalla, as a type of self-government and as a type of social self-government, leads primarily to the decentralization of power, a change in the way the subject and object interact.

Although the mahalla is not a religious organization, it promotes the spread of traditional Islamic ideas. It helps to organize the main events of the people's life, such as weddings, funerals, and various holidays. "Hashar" is a traditional way of mutual assistance. Collectivist moral life positions have been well preserved in neighboring territorial communities (mahallas) common in Uzbekistan, representing a layer of socionormative culture that characterizes the spiritual appearance of Uzbeks. Hospitality is one of the characteristic features of Uzbek life, a guest in every family is considered a respected person. In Uzbek society, there has always been a high moral orientation towards the opinion and respect of others. The correlation of one's behavior with traditional standards is the most important component of the Uzbek mentality. In the socionormative culture of the Uzbeks, one can find traditionally fixed attitudes for human behavior for almost all standard cases of life, which are formed from childhood. Respect for elders and the elderly is one of the important components of the system of value orientations of Uzbeks. Often grandparents are the nominal heads of families (even if the primacy does not exist due to old age). All other family members listen to their decisions and advice. The tradition of visiting, gifting and treating elderly relatives, neighbors, acquaintances on holidays is observed.

In the Uzbek language there is a concept of "savob ish" (a good deed or a boon). Such good deeds include helping widows and orphans. The aphorisms that exist among the population, traditions about the deeds and activities of outstanding people, their sayings and instructions, together with religious legends from the lives of saints are of great importance in moral education. In Uzbek society, the traditional ethics of human behavior represented an entire life system. The moral behavior of the individual has always been given special importance in it.

Moral beliefs, principles and norms constitute the spiritual core, the innermost foundation of the individual, therefore they cannot be imposed from the outside. Moral education is inseparable

from the very existence of a person, his life as a rational being with freedom of choice. It is the process of moral self-determination of a person, the creation of himself through his own actions and behavior. In general, moral education as a spiritually meaningful, personally conscious process has two mutually dependent sides: the formation of the person himself, his improvement, and the improvement of society, the human world. Moral education is the education of a person in his integrity, the formation of fundamental human qualities, and not the cultivation of some of his individual specific traits and features. In the complex process of human formation, the following specific moral gains can be distinguished, which constitute a minimum of humanity: understanding of the irreducibility of morality, its absolute unity with human existence, its vital importance.

Based on the foregoing, the following definition can be given: civil society is a set of those interpersonal, family, socio-economic, cultural, religious relations and structures that develop in society outside the framework and without direct state intervention and provide conditions for the self-realization of individuals and collectives.Adherence to universal human values is the social setting of the emerging civil society, the content and goal of the state's spiritual policy. For, in order to build a civil society with a highly developed economy and culture, it is necessary to assimilate the most advanced achievements of the world community in all spheres of social and economic life, to enrich the national with universal humanity. Knowledge of the spiritual heritage also serves as the spiritual basis for building a civil society. Since it serves to strengthen and develop national identity, national pride, national identity, a clear definition of its place in the process of global progress. Love for one's Motherland, pride in it, willingness to sacrifice for its sake, concern for its prosperity are the most important manifestations of patriotism, which are considered one of the foundations of the formation of civil society. Correctly understood, patriotism, free from nationalism and national narrow-mindedness, is also a social guideline in the construction of civil society. The ability to harmonize national interests with the requirements of our time is also related to the spiritual foundations of building a civil society.

ABSTRACT

Software-defined networking (SDN) technology is an approach to network management that enables dynamic, programmatically efficient network configuration in order to improve network performance and monitoring, making it more like cloud computing than traditional network management. SDN which decouples the control and data planes of the network, is one of the most promising paradigms in the recent networking architectures. The SDN concept relies on a centralized controller. However, a centralized architecture faces the challenges of scalability, availability and fault-tolerance. OpenFlow (OF), the most commonly used southbound interface for SDN, makes the provision of using multiple controllers. In this paper, we propose FOIL, a new Fault-tolerant OpenFlow multi-controller model with ICMP-based lightweight inter-controller communication for achieving fault-tolerance and reliability in the SDN control plane.

KEYWORDS: *FOIL, ICMP, Multi-Controller, Openflow, Reliable Control Plane, SDN.*

1. INTRODUCTION

The software-defined network (SDN) has many advantages over the traditional network architecture in terms of flexibility, openness, programmability and cost-effectiveness. SDN has a centralized control architecture which makes the network programmable from a controller device. Single controller is vulnerable to single point failure and puts questions on the reliability of the network. In order to ensure reliability, researchers have been working towards developing a suitable architecture for multi-controller SDN. OpenFlow (OF) is an interface for SDN to program and control the switches of the network[1].

Using OpenFlow, the controller can read switch statistics and write, delete or modify rules installed in the switches either proactively or reactively. OpenFlow controller exchanges OpenFlow messages with OpenFlow switches over asecure channel. OpenFlow provides a basic

framework for multiple controllers but keeps the options for detailed architecture open[2]. In this paper, we propose a Fault-tolerant OpenFlow multi-controller model with ICMP-based lightweight intercontroller communication named FOIL for ensuring the reliability of the SDN control plane for DCNs (Figure 1). FOIL provides a mechanism for high reliability and fault-tolerance. The proposed controller is implemented on a Mininet-based emulated test bed for performance study[3].

In order to check that the MASTER is active, the EQUAL controllers periodically send echo request messages to it. If an EQUAL controller does not receive echo reply within suitably chosen but randomized timeout period, it again checks for the controller IP in the native-controller-list to confirm that MASTER has not changed during its echo request[4]. If there is no change in the MASTER, then it assumes that the MASTER has become inactive. The following steps are taken thereafter:

- Once the EQUAL realizes that the MASTER is either not active or not reachable, it sends echo request to all the other controllers to notify indicating its intention of replacing the current MASTER, the notification will be sent with a time-stamp. If there was notification received from any other EQUAL, it withdraws from contention.
- If the current MASTER inactivity was due to some temporary reason, it will respond with the broadcast of an echo request with an ACTIVE message to notify all the controllers in the cluster of its being active.
- If no ACTIVE message is received within a set period, the other EQUAL/SLAVE controllers verify the validity of the IP address of the requesting EQUAL controller in the native-controller-list. If it is found to be a valid EQUAL controller, the other controllers send echo reply in acknowledgement.
- If a contender EQUAL receives a notification for replacing the current MASTER from any other EQUAL, it compares the time-stamp in the notification with its own time-stamp. If its own time-stamp is older than the other contender, then it becomes the first contender. Else, it withdraws from the contention.
- The first contender EQUAL controller on receiving acknowledgements from all other controllers in the cluster, other than the inactive MASTER.

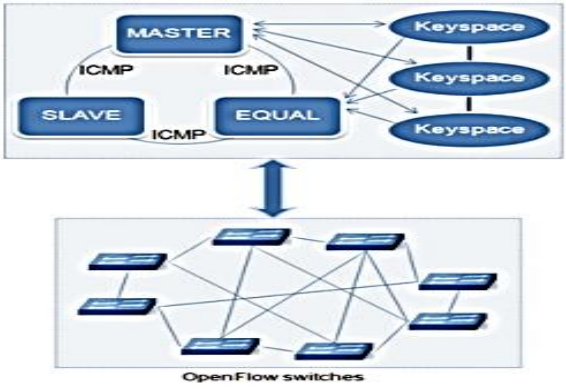

Figure 1: FOIL Controller Cluster is Connected to All the Switches; Controllers Communicate to Each Other Via ICMP

The contender EQUAL node sends role request to MASTER message to all the OF switches under the control of the inactiveMASTER. On receiving a role reply message from a switch, it elects itself as the new MASTER for the switch and issues barrier request message to the switch to finish any pending task at the switch. On completion of the migration of all the switches, the new MASTER notifies the active SLAVE nodes for selection of a new EQUAL by sending an echo request to it. The SLAVE sending the earliest echo reply is selected to be the next EQUAL. The new MASTER notifies the selected SLAVE to change its role EQUAL[5]. The SLAVE immediately on receiving the second echo request sends role request to EQUAL message to all the switches. On receiving echo reply from a switch, it becomes an EQUAL node for that switch. The new MASTER now updates the IP addresses of the new MASTER, EQUAL and SLAVE controllers in the native-controller-list of the cluster in the database.

Normally, an EQUAL controller will not respond to any asynchronous message received from the switches in order to satisfy the safety property requirement. But after a MASTER controller failure is detected by any EQUAL controller, it starts processing the asynchronous messages. Multiple EQUAL nodes may process the asynchronous messages till a new MASTER is selected. EQUAL controllers stop processing the asynchronous messages once the MASTER controller IP is changed or updated in the native-controllers-list of the cluster[6]. This is to avoid loss of asynchronous messages without being processed during a MASTER controller failure. Similarly, a SLAVE controller checks whether at least one EQUAL is active (Figure 2).

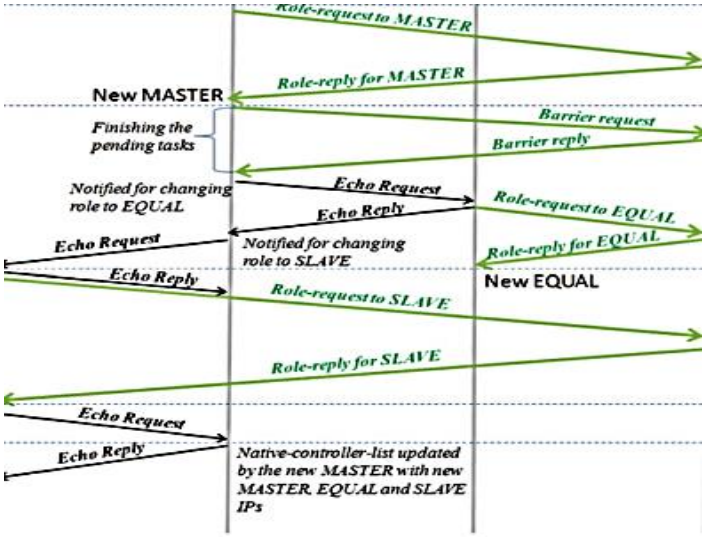

Figure 2: Switch Migration for Recovery from the MASTER Failure

2. LITERATURE REVIEW

Static configuration between controller and switch creates difficulty in terms of handling unpredictable traffic in the network. In such a case, it is required to migrate the switches from a heavily loaded controller to a less loaded one using distributed controllers. OpenFlow provides a multi-controller model which allows multiple OpenFlow controllers to exist in the same network[7]. In the multi-controller scenario, the roles of the OpenFlow controllers are formulated in three categories, namely—MASTER, EQUAL and SLAVE. A MASTER or EQUAL controller role has complete access, including reading asynchronous messages from the switches and writing or modifying actions on the switches except that there can be only one MASTER for a switch, the controller in charge.

The EQUAL role is the default role of any controller. A SLAVE controller has read-only access to the switches. It does not receive asynchronous messages from the switches and cannot write new rules or modify any rule on the switches[8]. When a new MASTER controller is selected for any switch, it changes the role of the earlier MASTER to SLAVE. As a switch can connect to multiple controllers at a time, the OpenFlow multi-controller model provides the scope to incorporate failure avoidance and controller load balancing. Here, the controller handover can occur in a distributed manner but no definite basis and scheme for the controller distribution, load balancing, failure recovery, etc., have been specified. It is therefore important to develop suitable mechanisms for the OpenFlow multi-controller framework to achieve desired reliability and fault-tolerance. The distributed multi-controller implementation must satisfy two important properties at any given time—safety and liveness[9].

Safety requires each OpenFlow switch to listen to only one MASTER or EQUAL controller for the processing of asynchronous messages and liveness requires that at least one controller is active, either MASTER or EQUAL, for each one of the OpenFlow switches. Physically distributed multiple SDN controller designs found in the literature can be categorized into two types—logically centralized and logically distributed [5]. In a logically centralized design, there are multiple controllers but each controller has thesame global view of the network and works with similar responsibilities. In logically distributed design, controllers are physically as well as logically distributed, and the individual controllers may not have a global view of the network. Instead, each may be responsible for a domain of the network and perform a given set of functionalities.

ONIX [6] is one of the logically centralized distributed OpenFlow controller architecture which provides a distributed control plane with cluster of servers running several ONIX instances. It maintains a network information base (NIB) which contains the entire network state that is shared among all the ONIX instances. The ONIX instances require updating the NIBs through database transactions each time any state information is to be communicated between any two controllers and this makes the overall system slower due to frequent database transactions[10]. Elasticon is another logically centralized architecture with a cluster of controllers sharing the workload by using a flexible switch assignment and migration scheme with role switching. It maintains the global network view using distributed data store modules.

Elasticon shows that load balancing improves the controller performance. However, the issue of controller assignment to the switches of a large network has not been addressed in Elasticon. Kandoo is a logically distributed architecture with two layers of controllers, namely, the local controllers and a root controller running different applications[4]. The local controller queries switch to detect elephant flows and once detected it notifies the root controller to install or update flow entries on network switches. For intercontroller communication, local controllers must signal the root controller which makes the local controllers dependent on the root controller. A failure in the root controller may lead to failure of the network. Reported results show performance improvements in Kandoo as compared to the traditional OpenFlow.

Logically centralized architectures like ONIX and Elasticon work by storing the global network state in distributed data stores. The latency in accessing the distributed data will, however, grow when the global network state information base becomes large. It is therefore required to minimize the volume of data to be accessed from distributed data stores and inter-controller communication should be made light with minimum use of transactional databases. In a multi-controller environment, dynamic assignment of the switches to the controllers is conceptually

simple but hard to achieve without disrupting normal network operations [6]. Further, frequent migration of a switch among controllers may affect the liveness of controller operations. The existing distributed architectures generally tend to use the popular distributed routing protocols like BGP, OSPF, IS-IS, etc., for inter-controller communications. But, these protocols generate routing overhead due to the broadcast of link state databases. Hence, there is need for a distributed architecture with suitable dynamic controller allocation mechanism for load balancing and failure recovery while making inter-controller communications light.

3. DISCUSSION

The performance study of FOIL was carried out on an emulated set-up on an IBM Server x3500 M4 model having Intel(R) Xeon(R) CPU E5-2620 2.00 GHz processor. A three-level tree-based topology was created for experiments in Mininet comprising one core switch, two aggregation switches, n number of access switches connected to each aggregation switch and a single host connected to each access switch. An experimental test bed is created using Mininet with OpenVSwitch (OVS) software switch and floodlight controller which support OpenFlow version 1.3. We modify the source code of the software switches used in Mininet, i.e. OpenVSwitch (OVS), to generate a large volume control traffic required for our experiments. Mininet runs on a Xubuntu VM allocated with four CPU cores and four GB RAM. Each controller instance runs on a Lubuntu VM allocated with one CPU core and one GB RAM. Necessary modifications are made in the OVS source code in order to generate a large volume of OpenFlowpacketin message traffic (Figure 3).

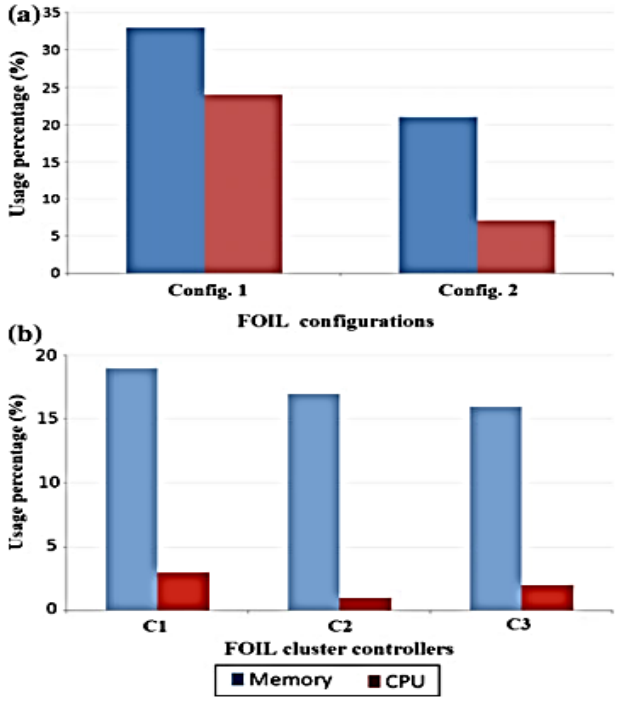

Figure 3: (A) Average Memory and CPU Usage Percentage Per Controller in each Configuration, (B) Average Resource Utilization in the Controllers.

With the changes in the OVS code, a tree topology with 131 switches can generate up to 30 Mbps of OpenFlow traffic towards the controller. While generating traffic, each controller uses the default forwarding module, topology manager and link discovery module. Major portion of

the controller traffic is generated by the sequential ICMP messages communicated by all the 128 hosts in the topology. In FOIL, inter-controller messaging is done by ICMP messages shared among the controllers. These inter-controller ICMP messages are detected by TCPDUMP [15] installed in the controller system which notifies the controller about incoming ICMP messages. CPU and memory usage data of the controller devices is collected by the controller by executing shell commands at regular intervals of one second. Whenever the CPU or memory usage of any controller goes beyond the set threshold values, FOIL load balancing procedure is invoked by ICMP message exchange. All the experiments are performed 20 times and results are averaged to obtain final figures for the experiments where average values are taken.

4. CONCLUSION

In this paper, we have presented FOIL, a Fault-tolerant OpenFlow multi-controller for the reliable SDN control plane. It provides efficient mechanisms for load balancing among controllers and for failure recovery in the controller cluster. The intercontroller communication is made lightweight with use of ICMP. Performance study of FOIL is carried out in a Mininet-based set-up. From the experimental results, it is seen that FOIL is efficient in terms of failure recovery and load balancing. It achieves a balanced utilization of controller CPU and memory and minimizes per controller traffic load. Further, it introduces a very small delay in switch migration and the controllers display fast response towards the queued OpenFlow packets. The TCP packet loss experienced for switch migration during load balancing is nil and that during controller failure recovery is negligible. Thus, FOIL provides fault-tolerance and thereby reliable control plane for OpenFlow using a distributed approach.

SOCIAL ENGINEERING ON DIFFERENT TYPES OF ONLINE FRAUDS

Dr. Shambhu Bhardwaj*

*Faculty of Engineering,
TeerthankerMahaveer University,
Moradabad, Uttar Pradesh, INDIA

ABSTRACT

Scammers employ social engineering to effectively use human vulnerabilities and carry out emotional assaults on unwitting victims. The contents of 100 phishing e-mails and 100 advance-fee-scam e-mails were reviewed, and the persuasive methods used by social engineers for their illicit profits were assessed. The studies revealed that alerts and account verification were the two most common triggers utilized to get phishing e-mail recipients' attention. These phishing e-mails were often accompanied by a menacing tone shown via haste. Timing is less important in advance-fee e-mails; the primary motivator is the possibility for financial benefit. The two most frequent incentives utilized to entice victims were business offers and big unclaimed money. According to the findings, social engineers employ positive and negative comments, as well as authoritative and urgent persuasions, to influence innocent people's response choices. Because it's doubtful that internet fraud will ever be fully eradicated, the most effective approach for combating social engineering assaults is to educate the public about the dangers that criminals pose.

KEYWORDS: *Advance-Fee Scam, Internet Fraud, Online Fraud, Phishing, Social Engineering.*

1. INTRODUCTION

In the investigation of online fraudulent behaviors, the concept of social engineering has lately emerged. The exploitative character of misleading communications used by social engineers in the execution of fraudulent actions has been the focus of this line of study. People fall prey to scams because they are uneducated, naive, or greedy, according to accounts of such actions. Instead, this research suggests that neither gullibility nor ignorance can account for the effectiveness of such deceptions. The research, which will concentrate on online fraud, will demonstrate how social engineers may use psychologically built interactions to acquire desired

behaviors and privilege information. With a disguised, appealing e-mail, these con artists may expertly lead victims into an emotionally vulnerable condition[1]. The seriousness and repercussions of internet scams necessitate a look into this kind of crime.

Attacks against social engineering are carried out on both a physical and psychological level. The workplace, telephone, trash cans, and the Internet are the most frequent places for the social engineer to seek illegal information and access in preparation for a psychological assault. Persuasion, imitation, ingratiation, compliance, and friendliness are all targets of psychological assaults. To start and execute their assaults and elicit automatic emotional reactions in their victims, social engineers depend on cognitive biases or mistakes in the mental process. Choice supporting bias, exposure effect, and/or anchoring are examples of cognitive biases. When someone has a propensity to recall previous events as being more good than bad, this is known as choice supporting bias. For example, an eBay buyer may inadvertently provide his or her credit card information to a fake site masquerading as eBay, stating that payment for a bought item has not been received[2].

People will gather and interpret information in a manner that supports their beliefs, according to confirmation bias. Employees who are used to seeing caretakers in particular uniforms, for example, may not be concerned when they encounter an impostor wearing the same outfit. As a result, the social engineer may obtain access without revealing his or her identity. People prefer things and people they are acquainted with, according to the exposure effect[3]. Someone who uses online social networks, for example, may be more likely to visit a malicious website purporting to provide a "online dating service." Anchoring implies that a person concentrates on recognizing a distinguishing characteristic. Visitors may be misled by fake websites that show similar logos to legitimate banks. Fundamental attribution bias, salience effect, and pushing conformity, compliance, and obedience may all lead to social mistakes.

Individuals assume the actions of others and immediately reflect permanent traits that characterize the person, according to the fundamental attribution mistake. As a result, social engineers attempt to create a good first impression in order to win their victim's confidence.

On the other hand, discovered that social engineers have attacked internet users by using persuasive arguments in either positive or negative tones—or both[4]. According to the salience effect, the individual who sticks out the most in a group has the least influence. As a result, social engineers are masters at blending in with their environment. People alter their actions in response to pressures of conformity, compliance, and obedience. Social engineers have figured out how to anticipate how people will react to these demands. A social engineer may impersonate an executive utilizing power and persuasion, and even without presenting identification, persuade an employee to divulge sensitive information. To assist them design the optimal offensive strategy, social engineers utilize cognitive biases and social mistakes. The degree to which a person is aware or recognizes something influences their decision-making.

A person who is considered to be evil is usually avoided, while a nice or familiar person is generally welcomed. By presenting oneself in a favorable light and creating excellent first impressions, social engineers take advantage of this. Social engineers have developed new methods to alter behavior based on their understanding of cognitive biases and mistakes.

1.1.Social Engineering Attacks*:*

Only the hacker's imagination limits the variety and scope of social engineering assaults. These assaults are successful because they target an organization's most susceptible link: its people. Social engineering attacks have the ability to get around even the greatest technological protection and reveal a company's most sensitive data. Trojan e-mail and phishing messages, advance-fee fraud, impersonation, persuasion, bribery, shoulder surfing, and dumpster diving are just a few examples of social engineering assaults. Two of the most popular types of social engineering assaults are Trojan e-mail and phishing communications.

1.2.Different Types of Online Fraud

Credit card fraud, identity theft fraud, web and e-mail spoofing (also known as phishing), IM spimming (similar to spoofing but involves the use of instant messaging), high-tech catastrophe fraud, and online hoaxes are some of the more prevalent types of online fraud (referred to as advance-fee fraud). While each kind of fraud may take up a lot of time, the present research focuses on web and e-mail spoofing (phishing) and online hoaxes (advance-fee fraud), since these are two of the most well-known and recognized frauds using a range of misleading methods used in online interactions.

1.3.Phishing

Phishing is a rapidly expanding field of Internet fraud, with an increasing number of victims. In 2007, 124 million people in the United States reported getting phishing e-mails, up from 109 million in 2005. Phishing, according to Jakobsson and Meyers, is a kind of social engineering in which an attacker (or phisher) impersonates a reputable or public institution to get private or sensitive information[5]. Phishing, sometimes known as brand spoofing, involves sending e-mails that seem to come from companies with whom the victims have previously worked or are presently affiliated. There has been a worrying trend in the growth and sophistication of phishing assaults in recent years. Banks, online companies (e.g., eBay and PayPal), and online service providers are some of the most frequent firms and sectors linked with phishing (e.g., Yahoo and AOL). Unsuspecting victims get e-mails that seem to be from these organizations, typically implying that the account has been compromised and demanding personal information (e.g., personal identification numbers, credit card numbers, and social security numbers). In the end, the phisher wants to exploit the victim's personal information for personal benefit. Up to 20% of those who receive the e-mails reply, which may result in money losses, identity theft, and other kinds of fraud. Scammers may steal information directly or use social engineering to convince people to reveal financial information by associating with particular kinds of "brands."

1.4.Operation Phishing

Phishers typically use two main techniques to steal sensitive personal information. The first approach includes infecting personal computers with malicious software via technological deception. This program is capable of capturing the user's keystrokes and transmitting those data to the phisher.Typically, social engineering techniques send a fake e-mail to the recipient, encouraging them to visit a connected website that seems to be from a legitimate company. When the user clicks the link, they are sent to a fake website that requests personal financial information such as credit card or bank account details. Phishers then use the information they've gathered to steal money from the victim's credit card or bank account, or even apply for a new credit card under a fake name. Social engineering apps use a variety of phishing techniques and targets. While some e-mails include basic fill-in forms, others use a variety of fake websites to

target their victims. Because phishing is primarily used for financial gain, financial services was the most frequently targeted industry, accounting for 74% of all reported phishing activity[6].

The Internet service provider was the second most active phishing target, accounting for 9% of all cases. Although fraudsters are less likely to make money in this sector, they are likely to be able to utilize the stolen information and accounts to continue their phishing operations, such as sending bulk e-mails from the stolen accounts[7]. Retail is the third most profitable market for phishers, accounting for 6% of all phishing attempts. Phishers make online purchases and ask for the products to be delivered to a place where the phisher has access. The difference between financial scams (74%) and all other sectors (26%) according to a Symantec research is the greater simplicity and quick cash payoff for successful deceit.

One thing that phishing e-mail campaigns often try to do is mimic a reputable organization. Some con artists employ deception to make their e-mails seem more genuine. The use of business logos, hyperlinks to the firm's web page, and fake return addresses are examples of these tactics. The next stage in the phishing process is to produce a message that demands the receiver to perform a particular action, such as responding to the phishing e-mail, filling out a form given by the phishing e-mail, or following a guided link[8]. The messages' content varies, with the most frequent version stating that information is needed for account verification or a security update. Because fake web sites and e-mail messages are rapidly discovered and banned, the messages are usually designed to create a feeling of urgency in the recipient.

When visitors click the false link and access the spoofed site, it is critical that the web pages seem genuine to the user. Company logos and slogans, website layouts, typefaces, and color palettes are among the misleading online characteristics exploited by phishers[9]. Many online phishers are adept at not just imitating the visual appearance of genuine websites, but also at include some of the indications that consumers look for when evaluating a website's security and validity. The usage of a safety padlock in the menu bar, a https device in the URL, and the “TRUST-e” sign are all examples. Since early phishers utilized domain names that were merely similar to the genuine business they were impersonating, one could study a website's URL and be more sure of identifying a counterfeit site. Today's fraudsters, on the other hand, may display the company's genuine domain name, such as www.ebay.com, but when the user clicks on the hyperlink, it takes them to the phisher's site.

1.5.Fraudulent Payment in Advance

As has been shown, thieves utilize the Internet to perpetrate various kinds of fraud; nevertheless, advance-fee scam e-mail communications are responsible for the greatest monetary losses. Individuals claiming to require help transferring a significant amount of money out of their nation send these communications. Those who reply to these communications are often victims of fraud and identity theft[10]. The frequency and incidence of fraud, in which thieves acquire property or money from victims via deceit or cheating, has been the subject of much criminological study. The majority of frauds include some kind of contact between the victim and the perpetrator, whether it's via face-to-face meetings or phone calls. Criminals have started to exploit the Internet as a method of committing fraud since people across the globe have grown more reliant on it.

2. DISCUSSION

These phishing emails were often accompanied by a menacing tone expressed via the use of urgency. Timing is less of an issue in advance-fee scam emails; the primary motivator is the possibility for financial benefit. The two most frequent incentives utilized to entice victims were business offers and big unclaimed money. Authority and civility were used extensively in both phishing and advance-fee communications. It seems that social engineers plan to combine these two persuasive tactics in order to enhance the validity of the e-mail while also evoking the feeling of politeness that is prevalent in commercial procedures. This research also showed that social engineers use both positive and negative comments to convince readers to fall for their frauds. Online scammers have utilized e-mails to manipulate users' emotions such as enthusiasm, pity, and terror. The employment of authoritative and, in some cases, emotive persuasions has led readers to let their guard down when it comes to possible dangers. According to the findings, courtesy and formality were often employed to make the reader feel at ease and safe while replying to the e-mail. Social engineers have strategized and carried out emotional assaults on innocent individuals by exploiting human vulnerabilities. As social engineers improve their ability to attack via false persuasions, prospective victims must be prepared to defend themselves at any moment.

According to the findings, courtesy and formality were often employed to make the reader feel at ease and safe while replying to the e-mail. Social engineers have strategized and carried out emotional assaults on innocent individuals by exploiting human vulnerabilities. As social engineers improve their ability to attack via false persuasions, prospective victims must be prepared to defend themselves at any moment. Because they concentrate on human variables, social engineering assaults are simple to carry out and complex to fight against. Because most individuals have a helping attitude and think that this kind of assault would never happen to them, they are often duped without even realizing they have been a victim of an internet scam.

Users are still susceptible to social engineering assaults due to the inherent human inclination to believe what others say. Finally, the greatest approach to protect yourself against social engineering assaults is to educate yourself. This may be done through instilling in users a sense of the importance of the information resources available to them, as well as raising knowledge of human hacking methods, making it simpler for users to spot a social engineer. Governments and companies have embraced education as a method to combat internet fraud. Organizations have made efforts to increase awareness of social engineering via lectures, booklets, web pages, and security warnings sent in e-mails addressed to users.

Users are still susceptible to social engineering assaults due to the inherent human inclination to believe what others say. Finally, the greatest approach to protect yourself against social engineering assaults is to educate yourself. This may be done

through instilling in users a sense of the importance of the information resources available to them, as well as raising knowledge of human hacking methods, making it simpler for users to spot a social engineer. Governments and companies have embraced education as a method to combat internet fraud. Organizations have used lectures, booklets, web pages, and the transmission of security messages in e-mails sent to users to increase awareness of social engineering.

3. CONCLUSION

There have also been concerns expressed about the psychological impact of instructional efforts on consumers. From the perspective of the client, banks have long been seen as security providers that are expected to provide users with security advice and warnings.

Because regular people are unfamiliar with IT, they are aware that they must follow the specialists' advice. Users will often make choices based on their emotions and what they are acquainted with, often disregarding security risks, flawed traps, or potential financial losses. It is unrealistic to expect people to be able to differentiate between a fake and a genuine e-mail and not to follow the directions in the former. Due to the use of spoofing and software that hides an individual's location, identifying the fraudsters responsible for these communications is extremely difficult. As a result, dealing with fake e-mails is tough for law enforcement authorities.

To resist social engineering assaults, these difficulties have led to a growing dependence on technological protections created by the private sector. Phishing filters, security firewalls, and e-mail authentication devices have all been included into Microsoft's and other computer firms' online application software as frontline barriers. These companies are flexible in the face of competition and have the technological know-how to better manage and monitor the flow of e-mail messages. Their assistance in combating internet fraud has complimented many elements of police crime prevention operations. Preventative measures remain the most practical and beneficial for regular people. Never provide account information in response to a solicitation e-mail, constantly changing passwords, typing or copying URL addresses from legitimate sources instead of following a hyperlink embedded in an e-mail, and calling the financial institution directly when suspicions arise from an e-mail are just a few examples.

Overall, a fundamental knowledge of how social engineering assaults work, along with a healthy dose of skepticism, will decrease the likelihood of becoming a victim. It's reasonable that there aren't any simple methods for preventing internet fraud. More legislative initiatives in the areas of online fraud and computer crimes in general, however, are required. This means that there must be sufficient laws addressing different computer crimes and their penalties, as well as consistent court decisions on how the law may be applied to crimes committed online. Many legal experts wonder whether the legal system will be able to manage high-tech crimes in the future, despite the fact that government agencies are devoting more personnel and resources to the investigation and prosecution of computer crimes. In many cases, it seems that technology advances quicker than legislation. As soon as a law is passed to restrict a certain activity, technology advances, and the statute becomes outdated or no longer covers all potential actions. As a result, education continues to be the most effective method of preventing online fraud. Social scientists should continue to play a role in educating the public about the dangers of social engineering perpetrators.

INTRODUCTION

Literary studies are the study of artistic creation, the art of speech as a whole, because they are mobilized to develop the consciousness of our people, to ensure their spiritual maturity. At the same time, each artist must be distinguished from each other, although he has his own image, style, and unique laws. They have a place in life, in real life, independent tasks, different tools, weapons. Consequently, a literary study examines the artist's skill from different angles, relying on scientific discussion and observation.

The infiltration of the national ideology, the idea of independence into science, in particular, Uzbek literature and criticism, is reflected in the works of art - the perfect, scientific analysis and interpretation of the literary text. Analysis and interpretation can shed light not only on modern Uzbek literature, but also on our classical literature, a thorough analysis of unique examples of world literature, a deep interpretation of the national ideology, the idea of independence. When a critic comments on a work, he shows a social view of the product of the poet's or writer's work, the essence of history. He enriches the creative work with social content, historical attitude.

THE MAIN FINDINGS AND RESULTS

The courage and bravery of people who have made a worthy contribution to the development of science in the development of society is noteworthy. AbduraufFitrat and AbdulhamidCholpon, who have a special place in the literature of the twentieth century, set an example with their advice and intellectual potential. At the beginning of the century, the intellectuals who called mankind to science and enlightenment were diligent in bringing innovation to life. They led the formation and development of the national press, the methodical school, the theater, and criticism. Importantly, they stressed the need to raise the consciousness of the people, to raise their social status. Indifference to the issue of national language and literature is a serious concern for selfless scholars.

AbduraufFitrat is an encyclopedic scholar who has thoroughly studied classical literature, the history of religion, and literary theory. In his Handbook of the Rules of Literature, views on science are scientifically based. In the deep understanding of the essence of the matter, the rich thinking and scientific potential of the scientist becomes clear. This source is notable for its clear and concise information on theoretical issues. A complete explanation of the concepts of art forms, literary science, style, skill increases the value of the manual. His articles “Our Language 1” and “Our Language 2” raise a topical issue. What is the richest, most unfortunate language in the world? Do you know? The pain in the tone of the appeal “Turkish” is felt.

It seems that the author is not indifferent to the fate of the Turkish language, he thinks boldly without being afraid to assess the real picture, the situation. He emphasizes, first of all, that the prestige of any language is associated with national pride. The richness of language emphasizes that the ability to express is determined by the dialectal feature, lexical, phonetic perfection. He reminds that “Muhokamat-ul-Lughatayn” gives complete conclusions about the structure and use of words in the Turkish language. In proving the unhappiness of the language, the critic acknowledges the Arabic language, which was introduced into circulation under the influence of the Arab conquest, and says that it has been a leader for centuries. The article acknowledges Firdavsi's courage, which honored the Persian language, and regrets that indifference caused the Turkish language to be on the way. AbduraufFitrat remembers with regret that the great scholars Ibn Sina, Farobi, Jawhari, Rumi, and Nizami originally created works in Persian by Turkish boys. Although it has been oppressed for a thousand years, it lives in Turkish, and because it is rich, it does not run out. The value of the word, the scholar who thinks about its future, urges the people, the nation to respect the national language.

When the value of our language is lost, when the opportunity to use it is lost, the author rings the bell and urges awareness. "Turkish language is rough, music is tasteless, history is dark" is the basis of the comments. There is a desire to remove Arabic and Persian words from Turkish. AbduraufFitrat makes a proposal to raise the status of the language. Concerned about the captivity of the Turkish language, it wants an independent language for the Turkish people, the development of science in that language. It is obligatory for a Turkish writer to use words in pure Uzbek. He speaks well-founded, truthful words that use words in accordance with Turkish law instead of words that are not found in Turkish. The scientific considerations in these articles are still relevant.

AbduraufFitrat is a versatile artist, an encyclopedic knowledge, who has conducted effective research in various fields of artistic and scientific creativity. He was a scholar who thoroughly mastered religious and secular knowledge, and was a sincere man who cared only for the

interests of his nation, his people. The literary scholar founded the ChigatayGurungi Society in Tashkent, which aims to study in depth the issues of Turkic peoples, in particular, Uzbek culture and art. Members of the society pay attention to the promotion of science and enlightenment, the promotion of language and literature, even in difficult situations.

Literary critical views of the scholar AbdulhamidCholpon, who considered it his duty to be responsible for the future of the nation, have always been in the spotlight of experts. This can be seen in the courage of a true man who remains faithful to his faith. At the most critical moment, the great scholar resolutely promoted the eternal theme of literature. AbdulhamidCholpon is constantly searching for a stable place for Uzbek literature on the world stage.

Critical literature is privileged to demonstrate the great power of the word through its works. His aspiration and inquisitiveness are evident in his careful observation of the works of representatives of world literature. His articles on the late "TawfiqFikrat", "RizoTawfiqbek", "Tagore and Tagore Studies", "Who is Tagore", and "The Great Indian" highlight their role in raising spirituality and their contribution to Eastern and Western literary ties. He makes a detailed observation of the biography of thoughtful writers, the laboratory of creation. In particular, Robindranath Tagore, an expert in the field of art, provides new information about his enlightenment activities. AbdulhamidCholpon also pays attention to the place of representatives of world literature in national literature. Importantly, the critical critic advocates the synthesis of Eastern traditions with Western traditions and puts forward sound proposals.

AbdulhamidCholpon finds comfort in the works of Oybek, Botu, Qodiri, who are incorporating the principles of renewal in the art of speech into the literary process, and shows their impact on the development of the field. In the articles of young critics, current problems are studied step by step and solutions are presented. AbdulhamidCholpon loves the translation of works by Pushkin, Gorky and Tolstoy. Says he learned a lot from them about the skill. Cholpon thinks about the theater, the script, the skill of the actors, and notes the shortcomings that hinder the development of the industry. It seeks to strengthen the propaganda work among the people to attract the audience to the theater, to attract them. The critic, who dreams of the nation's knowledge and enlightenment, thinks of ease and convenience in this way. He emphasizes the role of the press in the development of criticism.

AbdulhamidCholpon puts forward theoretical views on literary and artistic criticism. His meticulousness is evident in his deep understanding of the problem in every field. The main credo of AbdulhamidCholpon's critical activity was to raise literature to the level of the art of speech, to influence our hearts and minds through it in raising the spirituality of the people. The critic warns that a nation that values art will never perish. In Cholpon's critical activity, truthfulness, quick-wittedness, objectivity, zeal, is conspicuous. In the article "500 years" he praises the work of AlisherNavoi and recognizes the contribution of the thinker to world civilization. AbdulhamidCholponNavoi proposed to immortalize his personality and dreamed of naming the university and the city streets. It is courageous to think this way about great figures with courage in a critical moment. The wish of the critic came true and AlisherNavoi was glorified by his personal followers.

It is no exaggeration to say that Munaqqid's article "Adabiyot Nadir" shed light on its essence. "Literature literally cleanses the black mud that has soaked not only into our bodies, but into our blood, to soothe the souls of the dead, the dead, the dead, the wounded, and the pure water of enlightenment that washes away the filth of the sharp heart. We need it more than the water of a

cleansing spring,"he said. Clever followed the philosophy that critical literature is the life of the nation.

The power of the aesthetic influence of the artistic word is that it does not retreat with the beauty of expression. On the contrary, it essentially remains the beauty of life itself. The artistic word is to become a symbol of beauty in achieving a specific goal that the artist is pursuing. The art of the word is a criterion of beauty that evaluates the spiritual values reflected in these works of art, defining its philosophical aesthetic significance. A work of art is not a means of propaganda; it is a work of art, a phenomenon of beauty.

The concept of beauty in the aesthetics of literary criticism is determined by how much the work of art perfects and raises the spirit of the period, the spirituality of the nation, the consciousness and level of society. Artistic taste and aesthetic level are the main criteria that determine the value of a literary work. In the samples of art created during the independence, the principle of having different colors, praising national values, boldly expressing the truth, delicately depicting the human heart, looking at its deepest layers, describing the goodness in the heroic nature has increased.

The artist's talent is manifested in a thorough knowledge of the language, the ability to use artistically saturated words in place, to create vivid, figurative expressions through various visual means, to draw logical, coherent conclusions, to express a clear idea. The creators use the word sparingly and wisely. Squeeze sentences absorb a wide range of meanings. In the analysis of critical works, the critic uses a dense but deep expression, logically-coherent image, philosophical-aesthetic views.

The creative word is aimed not only at demonstrating the uniqueness of the style of use, mainly the melody and enthusiasm, but also to reflect the holistic view of the person, period, time. Fiction fully demonstrates the power of words. Human thought is directly influenced by the word, the word, to the heart. The essence of the artistically saturated word is understood during the reading and mastering of the work.

Begali Kasimov, HamidullaBoltaboev, UzokJurakulov made a worthy contribution to the science of nature. OzodSharafiddinov, NaimKarimov, SirojiddinAhmedov, SheraliTurdiev, DilmurodKuronov paid great attention to the study of astronomy. In research, the development of the artist's literary, critical views is examined in close connection with the process of formation of creative aesthetic principles, with the comparative analysis of his works. It also highlights the importance of the aesthetics of each artist in our cultural life today, the role of artistic thinking in the formation of new principles and criteria, the role of cultivating literary taste.

The creative experience and theoretical teachings of Abdullah Qadiri, AbdulhamidCholpon, and AbduraufFitrat are covered in harmony with world culture and art. It is argued that modern aesthetics is a new stage in Uzbek literature as a manifestation of enlightenment realism in the interpretation of human personality and social life. Critics have attached great importance to their views on artistic perfection, historical authenticity, and vitality in promoting the legacy of devotees who have highlighted the issue of social activism of art as the basis of national literature.

CONCLUSION

These artists pay special attention to the formation of the nation, the awakening of national consciousness, self-respect even in complex social conditions, the belief in the current process of globalization, the preservation of loyalty to the people. Systematic comments are made on the personality of the word artist, the history of creation of his works, art, and the psychology of artistic creation as a new direction of development. It is also shown that the literary, aesthetic, enlightenment, moral views of writers are analyzed as a whole process with the period, society and social reality. Critics' research on the mysteries of creativity, the weight of words, the art of artistic perception and expression, the method and possibilities of imagery play an important role in raising the field of literary criticism.

ON THE ANALYSIS OF THE ASSOCIATIVE FIELD IN THE POETIC TEXT

Hamida Makhmudovna Ortikova*

*Teacher,
Department of "Linguodidactics",
Alisher Navoi Tashkent State University ofUzbek Language and Literature,
UZBEKISTAN

ABSTRACT

This article analyzes the associative units used in poems of the same name, explores the influence of linguistic and extra-linguistic factors in the emergence of these units, and explores the ability of creators to use individual associations. In linguistics, the interest in the study of the image of the external world in the psychological imagination of man and its reflection gave rise to associative linguistics. A.Nurmonov, Sh.Safarov, D.Khudoyberganova, I.Azimova, N.Hoshimova commented on this issue in Uzbek linguistics. Professor D. Lutfullayeva conducted in-depth research on the linguistic nature of associative units, their classification and their role in the formation of the text.

KEYWORDS: *Associative Analysis, Associative Unity, Stimulus, Response, Poetic Text, Basic Unity, Linguistic Factor, Extra-Linguistic Factor, General Association, Individual Association, Creative Thinking.*

INTRODUCTION

Today, with the development of science, new fields, new centers of research are emerging. Evidence of this can be seen in the field of modern linguistics. In particular, cognitive linguistics, pragmatic linguistics, linguo-culturology, anthropocentric linguistics. It can be said that all of these directions have taken a new approach to language, aiming to study the language together with the person who makes it real, and thus the features of the language have become even clearer.

In linguistics, the interest in the study of the image of the external world in the psychological imagination of man and its reflection gave rise to associative linguistics. A.Nurmonov, Sh.Safarov, D.Khudoyberganova, I.Azimova, N.Hoshimova commented on this issue in Uzbek linguistics. Professor D. Lutfullayeva conducted in-depth research on the linguistic nature of

associative units, their classification and their role in the formation of the text [1, p. 140; 2, p. 376; 3, p. 240].

THE MAIN FINDINGS AND RESULTS

N.B.Krushevsky explains the associative attitude as follows:"Any similarity is associated with other words according to the sign; this similarity is reflected in our minds not only externally, phonologically, morphologically, but also internally, semantically, it will be able to provoke other similar words and move with them"[1, p. 31]. When we hear or see a word (stimulus), certain units involuntarily begin to remind each other. This "reminder" process is the basis for the emergence of associative units.

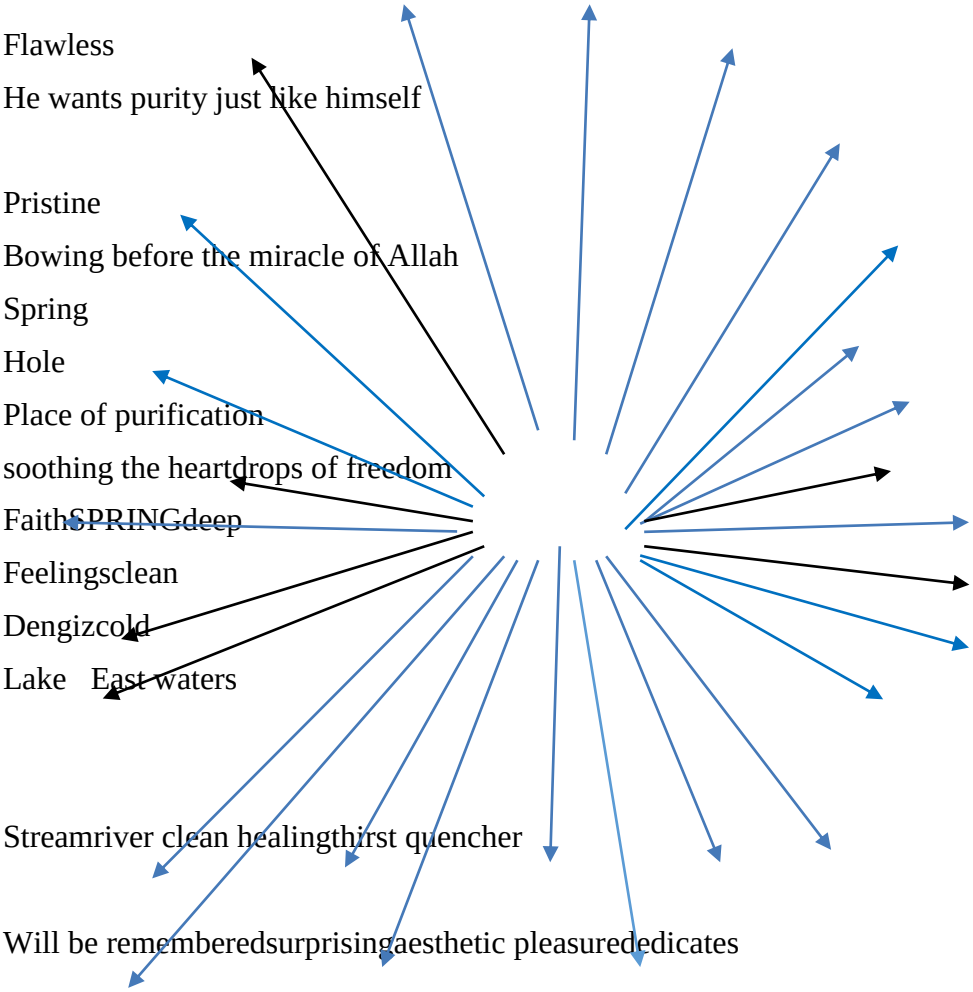
We experimented in a small experiment with what associative units the word *spring* can interact with in people's minds (the experiment was conducted with students of philological education) and found that it has a paradigm of the following units:pure water (7 times), clear water (6), thirst-quenching (4), pure, spotless (3), purity (2), spring, carved, large, clear, cold, deep, eastern waters, a place of purity, healing, transparent, river, stream, lake, sea, ocean, drops of longing for freedom, the miracle of Allah, soothing the soul, wants purity just like itself, feelings, faith, head before the creations of Allah bends, amazes, comes out naturally, stays in the memory, gives aesthetic pleasure.

In this experiment, the word spring stimulus was not repeated anywhere;word associations 18 (pure, spotless, purity, spring, carving, big, clear, cold, deep, healing, transparent, river, stream, lake, sea, ocean, feelings, faith); 9 associations in the form of phrases (pure water, clear water, thirst-quenching, eastern waters, a place of purity, drops of longing for freedom, the miracle of Allah, soothing the soul, bowing before the miracle of Allah); the associations in the form of speech are 5 (surprising, natural, memorable, gives aesthetic pleasure, wants purity just like itself).

The relationship of these units to the word spring stimulus is different. In particular, the associations of pure, spotless, clean, transparent, *clear, cold, healing, revealed* the relationship of the object and its sign. The lexemes of *river, sea, lake,* and *stream* formed a paradigmatic relationship with the word spring. Words and phrases that q*uench thirst, satisfy thirst, give aesthetic pleasure, amaze, remain in the memory, and soothe the soul, while the drops of longing for freedom, purity, faith, and emotions reflect an analogous attitude,* formed a cause-and-effect relationship with the word. The combination of fr*esh water, clear water, and eastern water* created a whole-part relationship with the word stimulus. *Bowing before the miracle of Allah* has always expressed man's individual attitude to reality.

The relationship of the units of the associative field in the experiment can be described in the diagram as follows:

Comes out naturallyclean water clean water



Literature is the artistic realization of language. All the magic, charm, and even the nuances of a language are reflected in a work of art created in that language. Therefore, we have observed the relationship of associative units in the two creatures below.

First, we analyzed the poem “Spring” by E.Vakhidov:

BuloqonaYersiynasidan
She’rsingariqaynaboqadi.
Suvningkumushoyinasidan
Mehrimbo`libquyoshboqadi,
To`yibichdim, suvbilango`yo
Dilgasingdi yurt muhabbati,
Tashnaligimqondi-yu, ammo
Yana ortdiqalbharorati[5,18].

The spring is from Mother Earth

It flows like a poem.

From the silver mirror of water

The sun feeds kindly.

I drank to my heart's content, as if with water

The love of the country is in my heart.

I'm thirsty, though

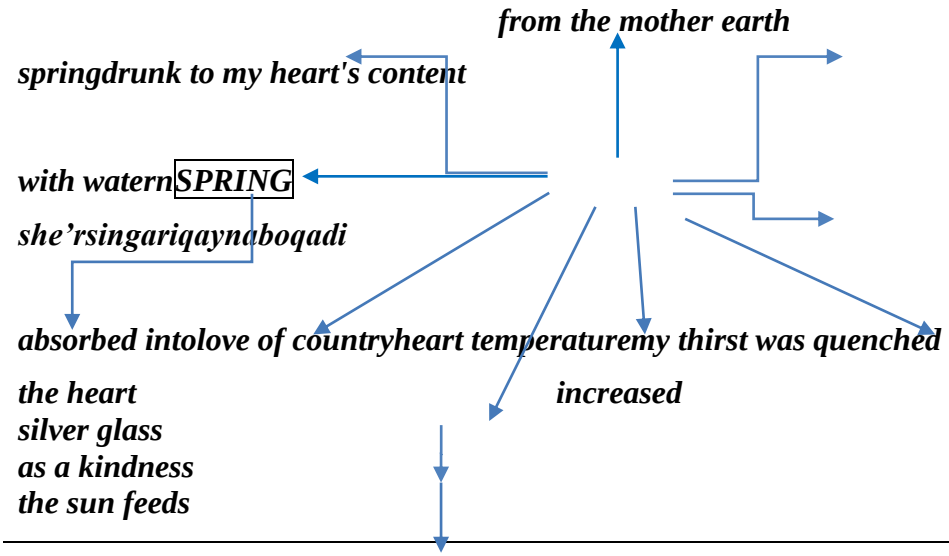
Increased heart temperature.

Associations in the text of the poem: units such as earthly, boiling like a poem, water, silver glass, lovingly nourishing the sun, satiating, satiating, sinking into the heart, love of country, thirst, bleeding, warmth of heart with the lexeme of spring associatively linked. These stimuli are combined into the associative field of the word.

The associative units in the poem are formed in connection with both linguistic and extra-linguistic factors. In particular, the stimulus forms a whole-part relationship with the word *water* lexeme. The *spring-water* confluence is also associated with the sign of mutual vital necessity, because without water, there is no spring: water is necessary for the emergence of a spring. The combination of *silver glass* revealed the relationship between the object and its sign. An example of an association based on spatial connection is *the union of the mother earth*.*Drinking* is a person's attitude to reality, an association based on desires; *boiling flow* depending on the activity and the object; and the accumulation of *blood in my thirst* gave rise to an association based on a cause-and-effect relationship. In addition, the units *that flow like a poem* (the spring boils like a poem), *the love of the land that flows into the heart* (the entry of spring water into the body is like the absorption of love of the country into the heart) are associative in their relationship to the nucleus.

While the above associative units formed a direct association with the word stimulus, *the sun-loving unit*, which is affectionate, entered into an indirect associative relationship.

The relationship of the units of associative space in the poem can be illustrated as follows:



In the work of the poet and in the minds of human society, we have seen what associations the word spring creates. Based on the above analysis, the following units can be cited as common members of both associative areas: *water, thirst quencher (quenches my thirst*). So, these concepts are general concepts that enter into an associative relationship with the word spring stimulus.

In A. Aripov's poem of the same name, we witnessed the following scene:

Qutlug` birsahardako`zochdibuloq,

Yo`l soldi daryolar sari adashib.

Ungarahmetmoqchiodamlarshuchoq,

Tog`-u toshlararoyaqinyo`lochib.

Odamlar, tegmangiz, mayli, toshsin u,

Mayliga, tog`ni ham ko`rsinyo`lida.

Qo`ying, o`zyo`linio`zitopsin u,

Zavqlanolsin u ham kurashso`ngida[6, 39].

Kutlug opened his eyes one morning,

He lost his way to the rivers.

People who want to feel sorry for him then

It opens a close path between mountains and rocks.

People, don't touch it, andlet's throw it,

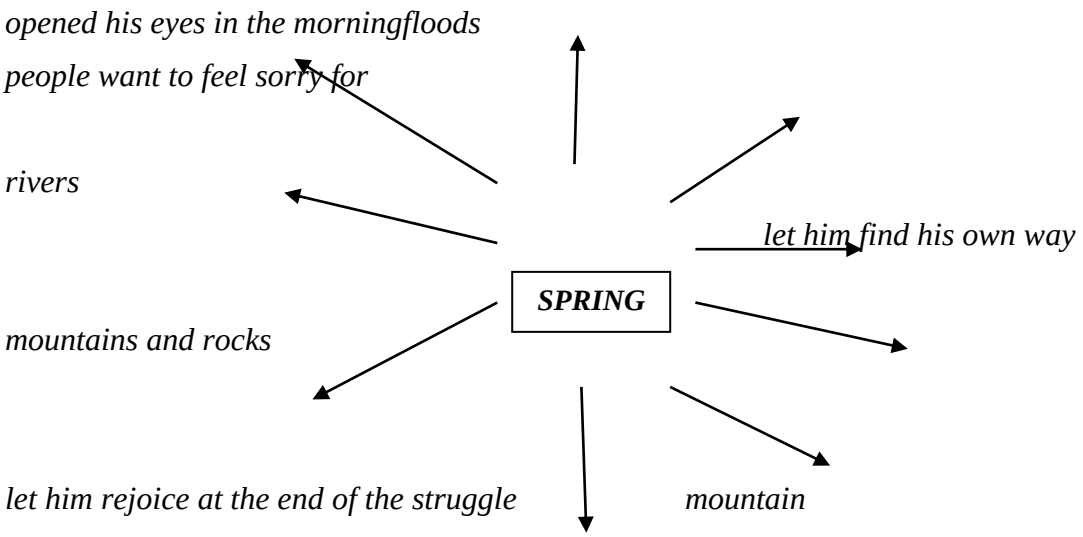
May he see the mountain on his way?

Let him find his own way,

Enjoy it at the end of the fight

As we can see, the poem is symbolic and rich in movement. Through the symbol of the spring, the poet describes the life of a person from birth to the end of his life. There are many obstacles and difficulties in a person's life, and in these obstacles, someone helps him, and when he achieves his aspirations, he enjoys it.

Associations in the text of the poem: *opened his eyes in the morning, rivers, led the way, people want to have mercy, mountains and stones, opened the way, let the stone, the mountain, find its own way;* the units formed an association with the word stimulus, as if to be enjoyed at the end of the struggle. The units of associative space in a poem can be expressed in the diagram as follows:



The unity of the eye in this poem is an example of an association based on the interconnectedness of objects in time. The *spatial-mountain* association was formed by a spatial-mountain association. If the unity of *human compassion reveals* man's attitude to reality, then the spring is the way, the spring is the association based on the connection between activity and object; *the unity of enjoyment at the end of the struggle reflected an association* based on a cause-and-effect relationship between subjects.

Drawing on the poems of ErkinVahidov and Abdulla Aripov of the same name ("spring"), we note that in the work of E. Vahidov the responses of the *spring* stimulus are used in their own sense, and in the work of Abdulla Aripov the associative units are completely symbolic (the main reason for this is that the text of the poem itself is symbolic). Although the factors in the formation of associations in both poems are similar, the content is approached differently. Both poems reflect the unique style and direction of the poets. According to Freud, associations of words can be not only related to the situation, but also to the effect, the process of inner emotion [4, p. 67]. Therefore, we also encounter various individual associations in the structure of the associative field. In the experiment, such combinations as "*God's miracle*", "*bowing before the creatures*" highlighted the beliefs of the speaker, while in the work of E.Vakhidov flo*wed like a poem, the love of the country in the heart,* in the work of A.Oripov he *opened his eyes in the morning, let him find his way, let him enjoy the end of the struggle*. The associations he formed with his units directly revealed professional individuality. That is, each person has a personal, individual attitude to the stimulus, in addition to the general associations.

CONCLUSION

As K.G. Jung points out, associative experience not only reveals the different meanings of the word stimulus, but also determines a person's personality [4, 82]. Based on such analysis, we can get information about the attitude of artists to reality, the scale of its thinking. Thus, in the formation of the poetic text, verbal associations, which are the products of the artist's associative thinking, participate as basic units. The analysis of associative units used in the poetic text also

allows us to draw conclusions about the perception of reality by the creators, how they perceive it, the ability to use language units in the text.

ABSTRACT

One of the most important and highly effective factors in the technology of cultivation of agricultural crops is the protection of these plants from pests, diseases and weeds. The present paper is about the application of carbophos in the control of plant spiders in Bukhara region.

KEYWORDS: *Tetruychusurmal Koch, Spider, Cotton Plant, Fruit Trees and Shrubs, Omayt, Carbophos, Agriculture, Avtomax, Yield, Hectare.*

INTRODUCTION

In the economic development of agriculture, it is important to increase the productivity of cotton plants by selecting and planting high-yielding varieties that are resistant to pests, diseases and weeds [1, 2, 5].

THE MAIN FINDINGS AND RESULTS

Among the pests that damage the cotton plant, the most dangerous is the spider, the biology of which has been extensively and comprehensively studied [6,7]. In Bukhara region, spiders also damage cotton, reducing cotton yields by 20-25%. The main purpose of our experiments is to determine the timing of spider damage to cotton, to develop measures to combat it and to introduce them to regional farms. The spider infects more than 248 plant species, including 173 weeds and ornamental plants, and 38 fruit trees and shrubs.

Tetruychusurmal Koch is the most common spider in cotton-growing areas, killing an average of 35-40% of the cotton crop.

According to F.M.Uspensky [3.4], spiders reduce cotton yields by 50-60% if no protective measures are taken when they fall on cotton in June and by 2-6% if they fall in August.

On average, if there are 150 spiders per 100 leaves, it is recommended to protect them with chemicals during this period.

For the active movement of the spider, the temperature should be 25-30 ^{0}C and the relative humidity should be 45-65%. The female of the spider lives up to 30 days and lays 200 or more eggs. The spider lives in weeds in early spring. They are 20-30 times more common in roadside weeds than in other areas [6,7].

During 2020-2021, an experiment was conducted at the Khumin mahalla of Jondor district of Bukhara region, at the farm "Urin-Bahron-Bekzod". As a result of our experiments on ancient irrigated meadow-alluvial lands on the farm, it became clear that the spider was found in the cotton plant in late April and early May, with 14-15 pieces per 100 cotton leaves. In order to study the effectiveness of the drug "Carbophos" in the control of spiders in cotton plants, the following variants were experimented with 50%.

1. Control (with water);

2. Omayt 1.5l / ha (57% concentrate emulsion) comparator;

3. Carbophos 1.2 l / ha (50% concentrate emulsion);

4. Carbophos 1.7l / ha (50% concentrate emulsion);

The Bukhara-6 cotton variety was used in the experiment. There are 3 replants in the area of 100 m^2; cotton seedlings are located at a thickness of 91-95 thousand pieces per 1 hectare.

2020-2021 On the morning of July 14-15, using a rentomoy machine "Avtomax" sprayed the cotton plant with a working fluid at a rate of 600l / ha. Scientific observations and specific studies have been conducted to study the effectiveness of the drug used against spiders.

TABLE 1 THE EFFECTIVENESS OF THE DRUG "CARBOPHOS" IN THE FIGHT AGAINST COTTON SPIDERS (AVERAGE FOR 2020-2021)

Experimentoptions	Consumption drug rate l / ga	The average number of spiders per leaf.				Efficiencybetweendays, in%		
		untilprocessed15.07.	Daysafterprocessing					
			3	7	14	3	7	14
1. Control (withwater)	0	61.8	65.0	100.0	1.7	-	-	-
2. Omayt 57% k.em. comparator	1.5	42.0	1.5	0.8	1.0	96.5	98.1	50.0
3. Carbophos 1.2 l / ha 50% k.em.	1.2	75.0	3.0	1.8	0.5	96.0	97.6	99.6
3. Carbophos	1.7	38.0	15.0	2.5	0.8	60.6	94.5	97.9

1.7 l / ha 50% k.em.								

From the data in Table 1, it was found that after 7 days of chemical control of spiders, these drugs showed their effect in reducing the number of spiders, and after 14 days, their amount decreased to 99.6%. The variant used by Omayt also reduced the number of spiders, but due to the sulfur content of this drug, the farm of Khumin mahalla of Jondor district did not last long due to low soil and climatic conditions, high air temperature and lost its effect on crop storage. .
The results of the experiments showed that the carbophos used was 50% k.em., the drug had a long-term effect on the cotton plant, protecting it from spiders and increasing the yield of cotton (Table 2).

TABLE 2 THE EFFECT OF THE DRUG "CARBOPHOS" ON THE YIELD IN THE FIGHT AGAINST COTTON SPIDERS

Options	The rate of drugs consumed, l / ha	2020йил		2021йил	
		Productivity, ts/ ha	Additionalyieldts / ha	productivityts / ha	additionalyieldts / ha
1. Control (withwater)	-	30.5	-	28.8	-
2. Omayt 57% k.em. comparator	1.5	34.8	4.3	32.5	3.7
3.Carbophos 1.2 l / ha 50% k.em.	1.2	36.6	5.5	34.5	5.7
3.Carbophos 1.7 l / ha 50% k.em.	1.7	35.3	4.8	34.0	5.2

The results in Table 2 show that the number of pests per leaf in the control variant was 63.3-70.1 at the end of the year in the control variant of Khumin MFY farm of Jondor district, and the spider completely disappeared in the variants using chemicals, especially "Carbofos".

According to the options, when maintaining the yield of "Carbofos" at a dose of 1.2-1.7l / ha, an additional yield of 4.8 to 5.7 ts / ha of cotton was achieved, which ultimately led to high economic efficiency.

CONCLUSION

Also, the application of "Carbofos" against spiders in the amount of 1.2-1.7 l / ha in cotton plants grown in the Bukhara oasis, has a positive effect on plant growth and development in alluvial soils, which have long been irrigated; it was possible to get 34-36 quintals per hectare, and the additional yield was 4.8-5.7 quintals / ha.

ABSTRACT

Because many vital systems depend on software, software failures may have huge implications in terms of endangering people's health as well as causing financial loss. Furthermore, as software gets more sophisticated, preventing errors becomes progressively more challenging. Using automated static analysis, bug detection programs may detect flaws in software source code. Other testing as well as review processes may take less time as a result of this automation. To do so, we must first understand how the flaws discovered by bug detecting tools connect to the problems discovered by other methods. This article presents a case study in which various initiatives, mostly from the industrial sector, were utilized to analyze interrelationships. The primary result is that bug detecting techniques mostly identify flaws that are not identified by testing; however a subgroup of defects that are found by reviews. The kinds that can be identified, on the other hand, are examined in more depth. As a result, if the large rate of false positives from the instruments can be accepted, a combination is the best option.

KEYWORDS: *Bug, Defect-Detection, False Positives,Software.*

1. INTRODUCTION

Software quality assurance already takes up almost half of such development cycles[1]. As a result, it's critical to enhance defect-detection methods while also lowering their prices. Automation may be a viable solution in this regard. Automated test-case creation based on executable models, for example, is being investigated as a way to improve testing efficiency[2]. Bug detection tools have been used to do extensive study on identifying flaws in code using automated static analysis.

Despite the fact that research into the issue is continuing, there are few studies on how these tools interact with one another and with other well-established defect-detection methods such as

testing and reviews. We'll now go through the issue scenario in more depth. In the following, we define the words we use briefly: Failures are perceived deviations in output values from anticipated values, while errors in code or any other documents are the source of failures. Both of these things are referred regarded as flaws. When there are no failures involved, such as with faults linked to maintenance, we primarily utilize defect in our analysis. Problem[3]. We look at how automated dynamic analysis using bug detecting tools compares to other kinds of defect-detection methods and if it's feasible to decrease defect-detection work by utilizing such tools.

Other kinds of defects, such as logical errors or incorrect function results, are not detectable by bug detecting techniques. These flaws, on the other hand, may be discovered during a software testing through following test cases. In conclusion, the review outperforms bug detecting techniques since it can identify much more fault kinds. However, it does seem to be advantageous to use a bug detecting tool first before examining the code, since this ensures that any flaws discovered by both have already been fixed. Because it is automated, it is less expensive and more comprehensive than a human evaluation. However, we have seen that all tools have a large proportion of false positives. This leads in considerable non-productive labor for the engineers, which may outweigh the benefits of automation in certain instances[4].

This is broken down into three questions.

- Which methods are used to detect which kinds and classifications of defects?
- Is there really any overlap amongst the faults discovered?
- What is the percentage of false positives generated by the tools?

The following is a summary of the major results.

- Bug-finding software only detects a portion of the fault kinds that may be discovered via a review.
- The kinds of flaws that the tools can detect can be examined more extensively, implying that the technologies are better at detecting the bug patterns for which they were designed.
- Unlike issue detecting tools, dynamic tests discover flaws in a totally different way.
- Bug detection software has a high rate of false positives.
- In various projects, the bug-finding tools provide significantly varied outcomes.

There are four main implications from the findings.

- Bug detection tools cannot replace dynamic tests or inspections since they discover much more and varied kinds of defects.
- Because certain problems do not need to be manually identified, bug detecting programs may be a suitable pre-stage to a review. One option is to highlight faulty code so that it is not missed during the review.
- If the false positives rates of bug detecting techniques can be decreased, they may offer a substantial reduction in the work required for defect identification. According to our case studies, the existing ratios are not yet fully acceptable.
- To deliver more consistent outcomes across projects, the tools must be more forgiving of programming style and design.

1.1.Testing vs. Bug Detection Tools

For system testing the program, we utilized both black box and white box tests, as well as some unit tests. The black box tests were based on the testers' experience and the written requirements. Equivalence and boundary testing were employed as standard methods. Source code and path testing were used to create the white box tests. Several hundred test cases were created and performed in total. The quality of the test suites was also checked using a coverage tool. There were no stress tests, however, which might have skewed the findings considerably. Defects were identified only in the projects EStA and C[5]. The other projects are probably too advanced for regular system testing to discover any further flaws.

The flaws discovered during testing are divided into three categories: application failure, logical failure, and insufficient error handling. According to the defect analysis above, bug detecting tools are more likely to discover flaws in the area of code maintainability. As a result, dynamic testing methods uncover a wide range of problems. There were no similar flaws identified using testing or bug finding techniques for the software systems for which faults were discovered. Furthermore, the tools identified a number of flaws in the systems that the tests were unable to detect. These are flaws that can only be discovered via lengthy stress testing, such as open database connections. If the system is under heavy load and there are a large number of open database connections, this may only lead to performance issues or possibly application failure. The majority of faults, on the other hand, are related to maintainability and therefore are not detected by dynamic testing. In conclusion, various flaws are detected using dynamic tests and bug detecting tools. Bug finding tools are excellent at identifying flaws linked to maintainability, whereas dynamic testing is effective at finding logical problems that are best apparent while running the program. As a result, we advise utilizing both methods in a project.

1.2.Bug- Detecting Software

Bug detecting tools are a kind of software that, like a compiler, uses static analysis to identify bugs in code. However, the findings of such a tool are not necessarily true faults, but they may be interpreted as a warning that a section of code is important in some manner. Identifying such important code parts may be done using a variety of methods. One of the most popular is to identify common bug patterns based on experience and to disclose common hazards in a programming language. Additionally, coding rules and standards may be reviewed to improve readability. In addition, more advanced analytic methods based on dataflow and control flow are used. Finally, some technologies provide extra annotations in the code to enable for expanded static inspection and a conjunction with model checking[6].

1.3.Analyzed Methods:

The following are descriptions of the three bug detecting technologies that we utilized for the comparison. Because the projects we examined, as detailed below, are all written in Java, we only consider tools that analyze Java programs. All three tools are free to use and distribute under an open source license. These three tools were chosen to illustrate tools that primarily utilize bug patterns, code standards, and dataflow analysis. We purposefully excluded technologies that need code annotations since they have quite distinct features. FindBugs is a program created at the University of Maryland that uses a collection of bug patterns to identify possibly problematic code snippets. It may detect errors like as null-pointer dereferencing and unused variables. It also utilizes dataflow analysis to some degree for this.

We analyze the interrelationships between the flaws discovered by bug detecting tools, reviews, and tests using the software from the five projects. To do so, we used each of these methods as much as feasible to each piece of software. While only project C was reviewed, all other projects were subjected to black-box and white-box testing. We ran the bug-finding programs with great care so that we could compare them. We also examined each warning from the bug detecting tools to see whether there was a genuine fault in the code to get a better comparison with the other methods. This was accomplished by having experienced developers examine the appropriate code sections. The methods were used independently, meaning that the testing and review were not influenced by the findings of the issue detection tools. In this case study, the external validity is low.

We only looked at five systems, despite the fact that we mainly looked at commercially produced software that is in use. More trials are required for improved results. Furthermore, the testing on more mature systems, that is, those that are currently in use, revealed few flaws. This may restrict the applicability. Furthermore, data from a single review is not typical and may only provide a preliminary impression.Finally, we only looked at three bug detection programs, all of which are currently under development. If other tools had been used, the findings could have been different. All of the warnings produced by the bug detecting tools are referred to as positives in the following. True positives are warnings that are proven to be code flaws, whereas false positives are incorrectly identified issues.

1.4.Categorization of Defects

We utilize a five-step classification of the faults based on their severity for the comparison. As a result, the faults are classified based on their consequences rather than their source or kind of occurrence in the code. We utilize a standard severity classification that has been significantly modified to fit the faults identified in the projects. Category 1 defects are the most severe, while category 5 defects are the least severe. The following are the categories:

- Defects that cause the application to crash. These are the most serious flaws, which prevent the whole program from responding to any user input.
- Errors that result in a logical failure. This category includes any flaws that cause the program to fail logically but not crash, such as an incorrect result value.
- Defects caused by a lack of error handling. Minor flaws in this category do not crash the program or cause logical problems, but they are not addressed correctly.
- Defects that go against organized programming concepts. These are flaws that usually have no effect on the program but may cause performance bottlenecks and other issues.
- Defects that make the code less maintainable. All faults that solely impact the software's readability or changeability fall under this category. This categorization allows us to evaluate and contrast different defect-detection methods based on the degree of faults found and the kinds of defects found.

1.5.Efficacy of Defect Removal

According to Jones, defect elimination effectiveness is the percentage of all faults identified by a particular defect-detection method[7]. The major issue with this measure is that it is impossible to determine the entire number of faults. As an estimate for this amount, we take the total of all distinct faults identified by all methods under consideration in our case study. Tab. 5 displays the

findings. According to the metric, tools are the most efficient methods, whereas tests are the least efficient. However, we must also consider defect classification, since this has a major impact on the image. It is clear that tests and reviews are much more effective at detecting category flaws than bug finding methods, which are the most serious errors.

2. REVIEW OF THE LITERATURE

Only a few research has been done on how bug detecting methods interact with one another and with other well-established defect-detection approaches like testing and reviews[8]. PMD and Find Bugs, for example, are contrasted in based on their warnings, which were not entirely verified for false positives. The results show that, although there is some overlap, the tools' cautions are largely different. With our statistics, we can back up this conclusion.

Engler and Musuvathi compare and contrast their bug detection tool with model checking methods. They argue that static analysis can examine greater quantities of code and discover more errors, while model checking can verify the code's implications, not simply its surface characteristics. A static analysis tool for C code is described in[9]. According to the authors, thorough examination of pointers, for example, results in much fewer false positives than basic syntactical tests. It describes an intriguing mix of static analysis tools and testing. It is suggested that static analysis be used to identify possible issues and that test cases be generated automatically to check whether there is a genuine fault. The strategy, on the other hand, is clearly ineffective when it comes to maintenance-related issues.

Bush et al. provide a static analyzer for C and C++ code that may detect a number of additional dynamic programming problems[10]. A comparison with testing, however, was not carried out. Nonetheless, this study backs up our view that defect-finding skills are significantly influenced by programmers' coding approaches. A comparison of static analysis tools for C code in terms of buffer overflows is given in. The faults were inserted, and the percentage of buffer overflows discovered with each method was calculated. It's also worth noting that the number of false positives or false alarms is alarmingly high. Palsberg presents several bug-finding techniques based on type-based analysis in [11]. He demonstrates that they can identify race situations and memory leaks in software.

3. DISCUSSION

The fact that bug detecting techniques mostly identify problems related to code maintainability is consistent with what an experienced developer would anticipate. Only specific patterns in the code, as well as basic dataflow and control flow characteristics, may be found using static analysis. As a result, only reviews or tests can validate the software's logic (as long as the static analysis is not linked with model checking techniques). In that sense, the tools do not "understand" the code. The most obvious example is the changing efficiency of initiatives. In many instances, the tools failed to recognize that some database connections are not terminated in the same Java method as others, but in a separate one.

They just look for a certain pattern. As a result, static analysis techniques are limited by what may be expressed by bug patterns, or by how excellent and general the patterns can be. However, there isn't a single overlapping fault identified by bug detecting tools or dynamic tests, which is unexpected. On the plus side, this means the two methods are completely complimentary and may be used in tandem to great effect. On the downside, utilizing the automated static analysis methods we discussed may not allow us to minimize expensive testing efforts. The fact that the

tools are mostly used to identify maintenance-related problems explains why there is so little overlap. However, one would anticipate at least some of the flaws discovered by the tests to be identified by the tools, particularly in the areas of dataflow and control flow. The fact that most of the projects examined are very mature, and several of them are already in operation, explains the study's unfavorable findings. As a consequence, only a limited number of flaws were discovered during testing, which may explain the absence of overlapping.

The large percentage of false positives generated by the tools is a very disappointing finding. The anticipated advantage of utilizing such technologies to automate fault detection is that it will need less human involvement. However, since two-thirds of all warnings are false positives, the human work required when utilizing bug detecting techniques may be much more because each warning must be reviewed to determine its significance. Despite the considerable variations across the instruments, selecting the optimal mix of tools may still be beneficial. Given the overlap of flaws with other methods and the false positives ratio, bug finding tools that utilize extra annotations in the code for defect identification may be helpful. The annotations enable the tool to comprehend the code to a certain degree, allowing for certain logic tests. This increased understanding of the code may help to decrease the number of false positives. The annotations, on the other hand, need extra work on the part of the developers. It must be determined whether or not this endeavor is profitable. In this research, the effort and expense of determining faults using the tools (including screening for false positives) were not assessed.

4. CONCLUSION

The work provided is not a complete empirical research, but rather a case study based on a number of projects, mostly from the industrial sector, that provides preliminary evidence of how bug detecting tools connect to other defect detection methods. The primary results were that bug detecting techniques showed entirely different problems than dynamic tests, but only a subset of the review kinds. The defect categories identified by the tools are examined in more depth than those detected through reviews. The efficacy of the tools seems to be highly dependent on the individual programming style and software architecture, since the outcomes varied greatly from project to project. Finally, if the number of false positives is minimal, combining the use of issue detecting tools with reviews and tests would be the best option. The time spent resolving a false positive is likely more than the time saved by utilizing the tools. As a result, the primary conclusion is that bug detecting tools, when used in conjunction with other defect-detection methods, may save money if tool developers can improve the tools' false positive rate and tolerance for various programming styles.

This research is just a first hint, and further empirical confirmation is required before strong conclusions can be drawn. We want to replicate the research on other topics and with alternative tools, such as commercial tools or tools that utilize extra annotations in the source code. Because we just looked at web apps in this research, it's also essential to look at other kinds of software. More study is needed to figure out how to combine the many methods in the best way possible. To compare bug detecting methods with other approaches, more reliability-oriented metrics, such as failure intensity efficiency [19, 20], may be employed as a first step. This may provide additional information about the impact of bug detecting tool use on the dependability of the system.

ABSTRACT

Digi XBee is the brand name of a popular family of form factor compatible wireless connectivity modules from Digi International. The first XBee modules were introduced under the MaxStream brand in 2005We perform a performance evaluation of ZigBee mesh networks based on XBeemodules, in terms of packet delay and received signal strength (RSSI). The XBee radios can all be used with the minimum number of connections — power (3.3 V), ground, data in and data out (UART), with other recommended lines being Reset and Sleep. We evaluate the performance for both line-of-sight (LOS) and non-line-of-sight (NLOS) environments in buildings and a parking lot. The results of our study are useful for building wireless sensor networks and communication networks of mobile robots where the communication distances between nodes are greater than the single-hop range and hence communication between nodes requires multi-hop transmissions.

KEYWORDS: *Mesh Network, Wireless, Xbee, Zigbee.*

1. INTRODUCTION

Nowadays, many wireless communication networks are being developed and deployed rapidly, including some of the Wireless Personal Area Networks (WPANs) which are the wireless networks for short ranges. The IEEE categorizes WPANs into two standards: IEEE 802.15.3a for high-speed WPAN and IEEE 802.15.4 or Zigbee for low-speed WPAN. In this paper, we consider a performance evaluation of Zigbee networks. Zigbee is a standard that defines a set of communication protocols for low-data-rate short-range wireless networking. Zigbee-based wireless devices operate in 868 MHz, 915 MHz or 2.4GHz frequency bands. The maximum data rate is 250 kbps. ZigBee uses DSSS (Direct Sequence Spread Spectrum) which divides the 2.402 to 2.480 GHz spectrum into 16 channels or 10 channels in the 915 MHz spectrum and 1 channel in the European 868 MHz spectrum[1].

XBee modules are available in three form-factors. All XBees, with the exception of the XBee 868LP, are available in the popular 20-pin through-hole form-factor. The latest XBee modules are also available in surface-mount and micro-mount form-factors, which are popular for high-volume applications due to the reduced manufacturing costs of SMT

- Through-Hole (TH)
- Surface Mount (SMT)
- Micro-Mount (MMT)

XBee modules typically come with several antenna options including U.FL, on-board chip, RF pad and integrated PCB. XBee modules can operate either in a transparent data mode or in a packet-based application programming interface (API) mode.

- Transparent mode: data coming into the Data IN (DIN) pin is directly transmitted over-the-air to the intended receiving radios without any modification. Incoming packets can either be directly addressed to one target (point-to-point) or broadcast to multiple targets (star). This mode is primarily used in instances where an existing protocol cannot tolerate changes to the data format. AT commands are used to control the radio's setting
- API mode: data is wrapped in a packet structure that allows for addressing, parameter setting and packet delivery feedback[2], including remote sensing and control of digital I/O and analog input pins.

The multiple access schemes is Carrier Sense Multiple Access/Collision Avoidance (CSMA/CA) similar to that used in IEEE 802.11. Zigbee is targeted for low-data-rate, low-cost, and battery-powered applications[3]. In many Zigbee applications, the total time that the wireless device is engaged in any type of activity is very limited; the device spends most of its time in a power-saving mode, called “sleep mode”. As a result, Zigbee-enabled devices are capable of being operational for several years before their batteries need to be replaced. In term of its networking capability, ZigBee provides several types of network topologies ranging from pointto-point, star, to mesh topologies[4].

Mesh networks are suitable for dynamic and large-area networks where nodes are far away from each other and communication between them require multi-hop transmissions and the nodes are dynamic (e.g., mobile) or there are high interference levels in the communication links so that nodes may be considered “active” or “inactive” from the network periodically[5]. There are many interesting applications requiring mesh networks, for example, in building and construction automation system, in logistics and grain storage, in swarm of robots, and in vision-based wireless sensor networks.

Given such various applications with wireless mesh networking, we are interested in building mesh networks using XBee modules which are ZigBee-compliant chips manufactured by Digi International, Inc. Our initial interest in Xbee is because XBee modules are inexpensive and widely available in Thailand. We are interested in building Xbee-based wireless mesh networks and studying the performance of the networks in term of delay and received signal strengths in the indoor and outdoor environment. The rest of the paper is organized as follows. In Section II, we give information related to wireless mesh networking with ZigBee/Xbee. Specifically, Section II discusses the types of devices and mesh topology. The experimental results are shown in Section III. Section IV summarizes the paper and discusses some future extension[3].

1.1.Zigbee Network Formations

Zigbee defines three different device types, which are coordinator, router and end device [10].

- Coordinator: Start a new PAN by selecting the channel and PAN ID, allow routers and end devices to join the PAN, transmit and receive RF data transmission, and route the data through the mesh network.
- Router - Transmit and receive RF data transmission, and route data packets through the network.
- End Device - Cannot assist in routing the data transmission but transmit or receive RF data transmission, and intended to be battery-powered devices.

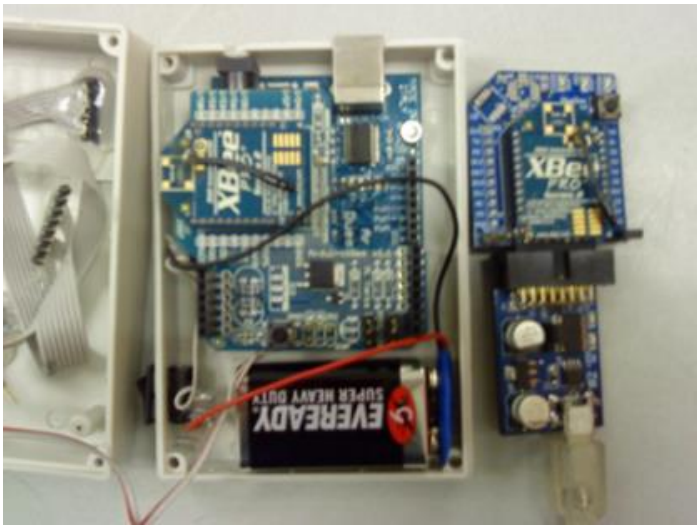

Figure 1: Xbee with Arduino (left) and BlueBee dongle (right)

- **Mesh Topology**

In general, Zigbee mesh topology consists of a coordinator and a set of routers and end devices [10]. A router can be linked to one or more routers and end devices. The communication rules of mesh topology are flexible because the routers that are located within range of each other can communicate directly. An advantage of mesh network is that there is likely another alternative route in case an existing link fails. Hence, this type of network topology is very reliable. Also this concept is applicable to wireless networks, wired networks, and software interaction. The example of mesh topology network is shown in Figure 1.

- **Building XBee Networks**

Building an XBee network is done automatically by Xbee devices. The Coordinator starts a ZigBee network by scanning for existing PANs in that area and for available channels. It then selects an unused PAN ID and a channel. From now on, a router or an end device can join a nearby Coordinator or another router that has already joined the PAN. If the router or end device is not being a part of the network, it performs a PAN scan of the SC channels and looks for the coordinator or router operating with the valid PAN ID. The router or end device scans the SC channel until the valid device is discovered. Then, it sends an association request frame to associate device and receives an association response to verify the allowance into the network. The joining router and end device then send a broadcast discovery frame to discover 64-bit

address of the Coordinator. Each router and Coordinator parents can allow up to 8 end device children to join their own device.

1.2.RSSI Measurement

RSSI (Received Signal Strength Indicator) is the signal level (in -dBm) of last good packet received. There are two ways to read RSSI value: 1) RSSI value is encoded into pulse-width modulated signal available at Pin 6 of the XBee module, and 2) RSSI value is read via an API command. The RSSI value reported by XBee Pro module is between -36 to -100 dBm while that of a standard Xbee module is between -23 to -92 dBm. However, the XBee manual says that the reported value is accurate between -40 dBm and the sensitivity of Xbee module's receiver [14]. However, we did not verify these numbers in our test.

- RSSI Measurement in a Parking Lot: In our experiment for RSSI measurement, we connect two XBee Pro modules (i.e., one node is a Coordinator and the other is a Router/End device) and then vary the distance between them to measure the relationship between RSSI values and distances. We make RSSI measurements in line-ofsight (LOS) and non-line-of-sight (NLOS) settings in a parking lot and in a building. The first results are measured from an SIIT parking lot. First, for the LOS setting we put two Xbee nodes into the vacant area that they can directly "see" each other. Second, for the NLOS setting we put the two nodes in a parking lot which has some obstructions from cars.
- RSSI Measurement in a Library: Another location that we measure the RSSI is a library at SIIT. We perform on RSSI measurements in NLOS setting, where we fix the position of the Xbee Coordinator node in one room and move the Router/End device node away from the Coordinator in to the room next to the Coordinator's room and measured the RSSI.

1.3.Packet Delay Measurement

To measure packet delay in XBee networks, we program the Arduino to send the "Hello World" sentence, which has the size of 10 Bytes. We send the sentence in every 5 seconds to the Coordinator and wait until the Coordinator responses back with an acknowledgment packet (ACK) back to the source. The packet delay in our experiments is defined to be the duration between sending a packet until its acknowledgment packet has been received by the source. This may be different from the standard definition of packet delay where a one-way delay from the source to destination is considered. Our delay is defined as the round-trip time (RTT) until an CK is received

Note that when a packet is transmitted from a source node to a destination node (possibly via multiple hops), a network-level acknowledgment is transmitted back from the destination node across the established route to the source node. This acknowledgment packet indicates to the source node that the data packet was received by the destination node. If a network acknowledgment is not received, the source node will re-transmit the data.

- Delay Measurement in Point-to-Point Link: We first perform a measurement of the packet delay in a point-to-point link. We connect an Xbee module that act as the Router/End device to the Arduino board which sends "Hello World" packets to the Coordinator, receives ACK packets from the Coordinator, and calculate the delay times. We observe the results of the delay time around 64 to 67 ms while the two Xbee modules is still able to communicate to each other until the nodes are out of range.

- Delay Measurement in Multi-Hop Networks: In the second experiment, the delay measurement is done in a dormitory building with three Xbee modules. We position the three modules

XBee® and Zigbee® have some commonalities and share a relationship. XBee is a family of radio modules and is a registered trademark of Digi International[6]. Zigbee is a wireless communications protocol and a registered trademark of the Zigbee Alliance. Many people confuse these two names because both are involved in radio networking and have "Bee" in their branding. But they are quite different. Let's compare XBee and Zigbee to get a better understanding of what they are, how they are different, and their relationship.

Zigbee is a wireless communications protocol for low-power, local area wireless mesh networking with modern security, that is standards-based, and operates on global frequencies. It's commonly used in home automation, smart energy, wireless sensing and industrial automation.

XBee is a brand name that refers to a family of devices from Digi International. Digi XBee radio modules share common form factors, a standard host interface, supporting tools and software, and a group of protocols to select from including Wi-Fi, LTE cellular, DigiMesh® as well as Zigbee. Therefore, there are XBee modules running the Zigbee protocol, but not every XBee is Zigbee, or vice versa.TheZigbee protocol is a standard, the same way that Bluetooth is a standard. Any manufacturer's device that fully supports Zigbee can communicate with any other company's Zigbee devices[7]. So just like a Beats Bluetooth headset made by Apple can connect with a Galaxy smartphone made by Samsung, any Zigbee light switch from G.E. can communicate with Zigbee lamps from Phillips, or with any other Zigbee-certified device.

How does this work? Well, just like a great cake, robust network protocols are all about layers. Each layer adds features and functionality with enough independence that implementation changes in one layer do not require changes in any of the others. Zigbee is a protocol layer that defines wireless networking stuff, like how to start a network, perform address resolutions and route packets. It also specifies how to implement certain applications, with predefined ways of communicating about things such as lighting control, managing smart energy systems, or environmental monitoring.

The layer below Zigbee supporting its advanced features is known as IEEE 802.15.4. This is a set of standards that define how the radio spectrum is utilized and many other operations that promote reliable transmissions. Digi's XBee brand radio modules can be configured with or without Zigbee. There's even a configuration that supports 802.15.4 directly in its native form[8].

Zigbee itself adds three important features:

- Mesh routing - uses routing tables that define how one radio can pass messages through a series of other radios along the way to their final destination.
- Ad hoc network creation - an automated process that creates an entire network of radios on the fly, without any human intervention.
- Self-healing mesh - a process that automatically figures out if one or more radios is missing from the network and reconfigures the network to repair any broken routes.

Every Zigbee network assigns different roles to the radio modules, or nodes. These include:

- **Coordinator**

This radio is responsible for forming the network, handing out addresses, and managing the other functions that define the network, secure it, and keep it healthy. Each network must be formed by a coordinator and there's never more than one coordinator in your network.

- **Router**

A router is a full-featured Zigbee node. It can join existing networks, send information, receive information, and route information. Routing means acting as a messenger for communications between other devices that are too far apart to convey information on their own. Routers are typically plugged into an electrical outlet because they must be turned on all the time. A Zigbee network generally has multiple router radios.

- **End Device**

End devices are essentially stripped-down versions of a router. They can join networks and send and receive information, but that's about it. They don't act as messengers between any other devices, so they can use less expensive hardware and can power themselves down intermittently, saving energy by going temporarily into a nonresponsive sleep mode. End devices always need a router or the coordinator to be their parent device to help them join the network, and to store messages when they are asleep. Zigbee networks may have any number of end devices.

Zigbee is a shared protocol, so chips and modules are available from many manufacturers. That standardization is a key part of its value. What makes Zigbee on Digi XBee special? First of all, Digi has created an excellent implementation, one with the highest quality of engineering and that is fully certified by the Zigbee Alliance for interoperability[9]. These essential basics are just the foundation.

A standardized host interface promotes fast and easy-to-understand configuration, control and communications[10]. The user can choose between simple human-readable AT commands, or a structured API that implements rock-solid machine-to-machine interactions. An assortment of module form factors mean that Digi XBee can fit into temporary sockets, or be permanently soldered to PCBs. These standard form factors include an extremely small Micro size that packs the power of XBee into a module no bigger than a fingernail[11].

Digi layers its TrustFence security framework onto the modules, including secure boot, secure identity and privacy. Each module is user-programmable, so application logic, sensor input, power management and more are supported without the need for any additional microcontrollers. Finally, there's the power of the Digi XBee ecosystem. If any part of the project needs to be moved to a different communications protocol in the future, there's no need to change module footprints, form factors, host interfaces or embedded programs. This makes changing between standards a breeze.

XBee radio frequency (RF) modules are produced by Digi International Inc. These modules make it easy and cost-effective to deploy wireless technology in electronic devices, especially those used on device networks for smart cities, precision agriculture, industrial automation, sensor networks, medical devices and asset tracking applications[1].

2. DISCUSSION

Digi XBee 3.0 modules are configurable, with one module supporting multiple protocols, including Zigbee, Wi-Fi, Bluetooth, 802.15.4, DigiMesh, 868 MHz, 900 MHz, Cellular LTE Cat 1, LTE-M and NB-IoT. All Digi XBee modules support a common command language and communications interface, so switching between protocols is easy, and can often be accomplished with no physical or logical changes at all. This flexibility lowers manufacturing and engineering costs, and offers OEMs the ability to quickly expand their roadmap. All XBee modules share a common pin layout and are available in compatible footprints. Digi XBee modules are available in three form-factors: through-hole, surface mount and Micro surface mount, each with a choice of antenna options.

Digi XBee modules are pre-certified in multiple regions, enabling developers to get to market quickly at lower cost. Digi XBee devices can be monitored, managed and updated with Digi Remote Manager®, which enables mass firmware updates, automation, alerts and reporting from a dashboard. Digi XBee is part of a complete system of pre-certified, programmable wireless modules, as well as gateways, adapters and software — all engineered to accelerate wireless development for global deployments.The Digi XBee ecosystem offers device developers a full range of rapidly deployable drop-in networking solutions for wireless communication between devices, adaptors and gateways. One socket allows you to connect to device networks around the globe. You can future-proof your design and know you'll be covered for new wireless technologies as they emerge.

3. CONCLUSION

This paper reports our initial study of Xbee-based wireless mesh networks. We evaluate two main performance parameters: the received signal strength (RSSI) and the round-trip packet delay. We measure a relationship between RSSI and distance for a point-to-point link in both line-of-sight (LOS) and non-line-of-sight (NLOS) environment. Next, we measure the packet delay in both star (single-hop) and mesh (multi-hop). The delay that we measure is the loopback or RTT delay for the ACK from the application sublayer. These delays vary little with the more number of hops. Hence, we could conclude that the main part of the delay is due to getting the ACK from the application layer. Future extensions of this work include an automatic monitoring of RSSI in real time systems, testing for battery consumption time, network life time, and measuring the parameters (RSSI and packet delay) in larger network settings. We also plan to include the mesh networking capability into the temperature monitoring system being developed in parallel by our colleague.

ABSTRACT

The article is a scientific and critical study of the Muhyidiwans of the poet MuhyiddinMuhammadrizoAkhundoglu, who lived and worked in the literary environment of Kokand in the second half of the XIX century and the beginning of the XX century. In this research, we have tried to study the diwans of the poet Muhyi according to the same rules.

INTRODUCTION

From the creation of mankind to the present day, there is a composition of life based on the mutual reflection of the parts that define the way of life of each period. The fact that one compositional device gives way to another evolutionary device, the renewal and change of the unity of time and space, provides an increase in human life, living conditions, content. As Aristotle points out in his Poetics, “A whole is something that has a beginning, a middle, and an end. Genesis is not necessarily followed by something else, but something that follows or happens according to the law of nature: on the contrary, the end is due to necessity or, as a rule, something else that follows: then nothing happens. The middle itself is based on the fact that something else follows and something else comes after it” [Aristotle, p. 19]. This idea of the great Greek philosopher determines not only the composition of the beginning, development, and end of time and space, but also the structure of examples of fiction.

Hence, any work, according to Aristotle's definition, has a beginning, a middle, and an end. Of course, this definition is to some extent more relevant to works that prioritize the spirit of drama. Because small-scale works: poems, gazelles, kita (fragment)s, hens - especially in the literary genres typical of Oriental poetry, it manifests itself in the form of a more communicative composition. In the ghazal genre, which is the flower of Eastern poetry, the system of language,

the system of characters, moves in harmony with each other, and the core of meaning stops the movement of decoration through emotions, symbols. With this action, a semantic composition is created.

Literary scholar Yo.Isakov, in his work "Navoi Poetics", speaks about the structure of the ghazal genre and makes the following comments: However, each real poem has its own composition depending on its semantic structure.

It can be concluded from these considerations that composition in lyrical genres has characteristic features, but there is no single monolithic compositional device. Therefore, mainly in post-Islamic Arabic classical literature, the attempt to create a logical chain that complements each other by collecting, systematizing and complementing poems of a certain genre - the creation of a diwan - creates an active appearance in literary processes. In the first attempts, it was customary to add poems and jokes to the diwan. In our view, this reflects more social motives, the predominance of the point of view of synchronization with the period. Indeed, the poet and the period are inseparable concepts. It is natural that the processes directly in the space of life and activity, the need to evaluate it in the context of the literary requirements and criteria of the time, led to the introduction of poems and comedies in the first-order diwans. In the following periods, the rules for creating a diwan gradually expanded. In particular, special attention is paid to the compilation of poems whose rhymes and rhymes end with certain letters. Interestingly, these updated diwan also featured poems in the qasida genre after praise and notes. Of course, there is a reason for this. First of all, the representatives of Eastern poetry developed under the protection and pressure of the authorities until the middle of the XIX century. In the life and work of the creators of this or that period can be seen the influence of the support of the authorities or, conversely, an unfair attitude. That is why Navoi's reform of the diwan tradition in the 15th century is recognized as a literary revolution.

Literary scholar D.Salohi writes about this: “If we think about the poet's comments in the preface of Badoe'ul-bidoya, the structure of the diwan, we see that Navoi was a pioneer not only in the poetry of his time, but also in the field of diwan [Salohi. 26].

These rules of Navoi'sdiwan composition are described in detail in the preface of his diwan "Badoe' ul-bidoya" in the following order:

1. First of all, each of us has arranged the diwan, which consists of 32 letters in the composition of the people, and in the book of the nation they do not refer to the shoe, the four letters. [Navoi. 20]. Thus, according to Navoi, the poets who arranged the diwan do not pay due attention to the four letters (پ (pe) چ (che) ژ (dje) گ (ge))that exist in the Turkish script.

2. They do not follow the stylistic difference between the ghazal of each letter and the previous ghazal. It is inevitable that in every commandment, the HaqqSubhanahu WA ta'ala praises the Messenger of Allaah (peace and blessings of Allaah be upon him) for a moment, or he is a generation that is not unaware of a command that indicates these two things [Navoi. 21].

So, according to this rule, at the beginning of the poems in each letter category in the diwan is the introduction of poems with the content of praise or nat. This event gives each group of gazelles a unique spirit of independence.

3. On the other hand, it is as if some people do not understand anything other than the description of the metaphorical beauty and the purpose of the appearance of the handwriting. I can't find Diwan and I can't be a ghazal, I can't be a byte preacher at the moment. When the world is

finished, all the toil and toil will be wasted. In this regard, I have written all the praises and sermons in this divan, and I have been inspired by a few verses of advice and sermons. If the verses of these ghazals are not a joke, but a veil, then the exhortations and sermons of these verses will be an obstacle" [Navoi. 21].

4. Some of the poets who wrote the ghazal said, "If the matla is a special kind of verse, they do not wear itmamkhilaat and anjamkiswatin in the style of hamulmatla. "This picture of the spot seemed distant and polite." [Navoi. 22].

5. That the poet tried to include in the diwan all his poems of all kinds (genres) that were shoe in his time. Badoe' ul-bidoya includes almost all types of poems that existed in the Persian and Turkish literature of the time - "diltortarghazals", "ruhafzomuhammas", "ravonosomusaddas", "mufitruboiyot", "barjastaqita", " dilpazirmusta'zods, "unique individuals," problems, dictionaries, tales, and hens. Diwan does not include only works written in the genre of masnavi and qasida. This is because the poet called them "any other place" [Navoi. 22] in the hope that it would be collected as separate books.

MAIN PART

Muhyi's Turkish diwan is now kept in the Manuscripts Department of Institute of Oriental Studies named after Abu RayhonBeruni of the Academy of Sciences of Uzbekistan under inventory number 1303. It consists of 161 pages. Copied in Nasta'liq letter in 1320/1902. Size: 13x20.5 cm. In addition to this information, the title of Diwan states that it was written in Uzbek. However, in the process of careful study of this manuscript, we came across almost no Uzbek ghazals (there are very few Turkish poems in it). After that, in order to find a manuscript of the poet's Turkic office, the department of manuscripts of the main library of SamSU named after Abdurahmon Jami, Samarkand State Museum named after A. Ikramov, Department of Manuscripts of Institute of Oriental Studies named after Abu RayhonBeruni of the Academy of Sciences of Uzbekistan, Tashkent State Museum of Literature, Fergana State Museum of Literature named after G. Gulom, Andijan We carefully examined all the manuscripts available in the museums of literature and in the private house museums of Professor I.Abdullaev, but we could not find a manuscript copy of this diwan. However, it should be noted that the perfect manuscript of Muhyi's Uzbek and Tajik diwans is selected in the Department of Oriental Manuscripts of the Academy of Sciences of Tajikistan. [Mirzoev. 190-191]. This manuscript of Diwan in Tajikistan was published in 1319 h. / 1901 m. copied by the poet Muhyi. The title indicates a Persian-Tajik diwan stored with inventory number 885:

سرگشته در تحیر چشمت غزالها

Эй аз фуруғи ҳусни ту акси ҷамолҳо,

Саргашта дар таҳаййур чашмат ғизолҳо - b

yte, and the Uzbek-language diwan stored under inventory number 887

ایکی عالم گولشنی اندین تاپیب نشؤ نما

Эйбаҳорисанъатингдиндаҳрўлубгулшансаро,

Эйкиоламгулшаниандинтопибнашъунамо.

It starts with this byte. The catalog states that the diwans are composed of ghazals, qitas, qasida, masnavi and poetic letters dedicated to the poet's contemporaries.

This copy is the same as the copy of the poet published in lithography in Tashkent in 1911 (after the poet's death), which is now stored in the fund of lithographs of Institute of Oriental Studies named after Abu RayhonBeruni of the Academy of Sciences of Uzbekistan with inventory number 3220. That's why we used mostly these copies to cover the topic.

The diwans include poems in the genres of ghazal (muwashshah ghazal), qita, fard, masnavi, rubai, murabba, musaddas and qasida. It should be noted that there are 7 genres of poetry in the Turkish diwan and 6 genres in the Persian diwan. However, the exact same genres are not included in both diwans. For example, in the Turkic diwan there are genres of ghazal, qita, fard, murabba, musaddas, masnavi and qasida, and in the Persian diwan there are ghazals, qita, rubai, fard, qasida, masnavi. By comparison, the Turkic diwan does not include poems of the rubai, the Persian diwan includes poems of the murabba and musaddas genres. The genres of ghazal, qita, fard, qasida, and masnavi are available in both divans. So, there are a total of 8 genres of poems in the poet's divans. Note the following table:

Genres	ghazal	Kit'a	fard	kasida	ruboiy	murabba'	musadddas	masnaviy
Turkish diwan	153, 1438 bytes	81, 165 bytes	6, 6 bytes	1, 21 bytes	-	1, 7 verses (28 bytes)	1, 7 verses (42 bytes)	2, 29 bytes
Persian diwan	277, 2668 bytes	103, 221 bytes	24, 24 bytes	2, 78 bytes	2, 4 bytes	-	-	4, 273 bytes
Total	430	184, 386 bytes	30, 30 bytes	3, 99 bytes	2, 4 bytes	1, 7 verses (28 bytes)	1, 7 verses (42 bytes)	6, 302 bytes
The total volume of the Diwans	4997 bytes (9994 lines)							

The leading genre in both diwans is ghazal, which makes up a large proportion of diwans in number and size. The Diwans are mainly ghazals ending in 28 letters of the Arabic alphabet and 2 letters of the Turkish alphabet, which are arranged in the following order:

Alphabet	**The number of ghazals in the Turkish diwan**	**Bytes**	**The number of gazelles in the Persian diwan**	**Bytes**
أ	15	144	34	321
ب	5	43	13	120

ن	15	149	25	253
و	3	25	4	39
ه	12	103	13	119
ى	6	57	18	182
Total:	**153 gazelles**	**1438 bytes (2876 lines)**	**277 gazelles**	**2668 bytes (5336 bytes)**

The total number of gazelles in the Turkish diwan is 153, and their volume is 1438 bytes (2876 lines); the number of gazelles in the Persian diwan is 277, and the volume is 2668 bytes (5336 lines). So, the poet's Persian diwan is quite weighty. As for the Turkish diwan, the number of ghazals in the Persian diwan is 124 ghazals, 1230 bytes (2460 lines) more. The total number of ghazals in Persian and Turkish diwans was 430, and their volume was 4106 bytes (8212 lines).

Diwans mainly have ghazals from 5 bytes to 19 bytes, of which the most widely used in terms of number and weight are ghazals of 8 and 9 bytes. The remaining 5, 7, 10, 11, 12, 13, 14 byte gazelles did not make up a large proportion of the diwans in number. As for the 18- and 19-byte ghazals, first of all, they are included in the Turkish diwan only once. One of them was written in response to a letter sent by Mullo Abdullahjon Nasimi, as noted by the poet himself, and the other was written in response to a letter sent by Nasimi Khokandi, as it is written in the preface of the ghazal. This, in turn, led to an expansion of the volume of the ghazals.

Muhyi wrote his ghazals mainly on orifona, romantic and social topics. It should be noted that there are no rindona gazelles in the diwans. Romantic ghazals are much more numerous. Many of them are reflected in the poet's muvashshahs.

In the Persian diwan, after the ghazals, there are 103 (221 bytes) kita (fragment)s, including 2 (4 bytes) rubai, after the kita (fragment)s, 24 fards and 4 (273 bytes) masnavi.

There is only one murabba and musaddas in the Turkish diwan, but there are no poems of this genre in the Persian diwan. The Diwans have a great deal of poetry from the kita (fragment)al

genre, covering a wide range of philosophical and social themes. They are placed in the Turkish diwan after the ghazals under the heading "Elephant kita (fragment) ayzon" on page 342 of the diwan, and in the Persian diwan under the heading "Elephant kita (fragment) var-ruboiyoot" from page 184. In the Persian diwan, as indicated in the title, rubai were also included among the kita (fragment)s, and to distinguish them from the kita (fragment)s, they were preceded by the title "rubai."

The first kita (fragment) of the Turkish diwan is as follows:

Муҳйики қаноат этти пеша,

Манзури туъиззу ман ташодур.

Ҳорискиталабишиҳамиша,

Мақҳуритузиллуманташодур. [Девон. 342].

Muhyi creatively mastered the experiences of the unique poet, creating kita (fragment)s full of high ideological content and sophistication. They reflected the images of a wise, prudent and perfect man. The kita (fragment), in general, is not strictly limited in its size, weight, theme, ideological content, as the poetic fragment is considered as a diary of the poet's ideas about life, life, man, compact poems. We have chosen to divide the kita (fragment)s of the Muhyi diwans into groups according to their subject and content:

1. Kita (fragment)s devoted to the expression of moral, enlightenment, philosophical ideas of a social nature.

2. Kita (fragment)s dedicated to the depiction of specific events and real personalities.

3. Kita (fragment)s on a romantic theme.

Many of the poet's social, moral, and philosophical themes promote such virtues as not being greedy for wealth, enduring hardships, giving up arrogance, and being a companion to the good.

In one of the didactic kita (fragment)s of the poet, it is said that collecting dice increases arrogance, and the abundance of wealth makes the owner more proud and, as a result, can hurt others.

On the following kita (fragment), the poet urges the reader to put his trust in the Creator in everything, to persevere in the face of adversity, to abandon worldly desires, career ornaments, and to embrace poverty and despair.

Ҳақ зотиға ҳамиша таваккул айла,

Ҳар меҳнату ғам келса таҳаммул айла.

Мискинлиғу навмидлиғ айлаб пеша,

Тарки ҳавасу жоҳу тажаммул айла.

Муҳйи сўзини жумла ҳақиқат англаб,

Ҳарнуктасигаонитааммулайла. [Девон. 344].

The total number of kita (fragment)s written in the Turkish diwan with any relation or to individual persons is 10 in total. Some of them (for the sake of the shopkeepers, for the Eid, in

the year of the prohibition of pilgrims, the kita (fragment)s written to inform the back of the image of Islambul) are a series of kita (fragment)s.

It should be noted that the diwan consists mainly of two- and three-byte kita (fragment)s. Of these, two-byte kita (fragment)s are the most commonly used in terms of number and weight. In our previous poems, it was said that Muhyi creatively followed Fuzuli and created many poems under the influence of his poetry. His passion for Fuzuli's poetry prompted Muhyi to write poems dedicated to his description. As a result, the poet wrote two kita (fragment)s in the Turkic diwan in Fuzuli's description. Both kita (fragment)s, which Muhyi wrote to Fuzuli, consist of two bytes. According to the poet, Fuzuli's diwan consists of enlightenment, science and tradition from the beginning to the end, as if it were a huge garden. Fuzuli himself is arif. And his kind words amaze the sages of the world. Let him make the place of the Creator Fuzuli from heaven. Because he was a guardian and a mystic.

The kita (fragment)s written at the request of the shopkeepers in Diwan, as we have noted, are a series of kita (fragment)s. All 6 kita (fragment)s of these 12 bytes are focused on the shortcomings that exist in society, in particular, some shortcomings in matters of trade. The poet speaks mainly of cash and credit trade on these kita (fragment)s. Encourages people to trade in cash as much as possible. Even if the loan is traded, it is necessary to return the deposit to the owner whenever possible, not to harm the owner of the property under various pretexts and frauds.

The number of kita (fragment)s dedicated to the Hajj is 18. They are also all 2-byte kita (fragment)s. They mainly describe Hajj and its virtues. Since sacrifice is one of the pillars of Hajj, in some places there are thoughts about the Eid al-Adha.

Ийди қурбон ҳар кишиким хайр этиб қурбон қилур,

Ҳақ таъола ҳам ўшал мўъминға кўп эҳсон қилур.

Тавба айлаб йиғласанглар, эй мусулмонлар, мудом,

Очилиб каъба йўли ҳаж айламоқ осон бўлур. [Девон. 350].

According to the poet, the reason for the closure of the pilgrimage, the cessation of the pilgrimage, is the large number of sins on the shoulders of Muslims. If they repent of their sins and purify their hearts, Allah will make the path of the Ka'bah easier for them.

Another of the series is dedicated to the depiction of about twenty photos sent from Istanbul, Turkey. Muhyi writes about this at the beginning of the kita (fragment):

The kita (fragment)s depict various structures in Istanbul, such as mosques, madrasas and mausoleums, rivers and bridges, royal armies and their barracks. On one kita (fragment), the poet describes the city of Istanbul as the head of all countries:

ШаҳриИсломбулкибуоламаро,

Барчакишварнижаҳондабошидур.

Айлағилназзорабутасвираро,

Жумласиулкупурукнибошидур. [Девон. 353]

On the next kita (fragment), written as a commentary on the image of the artillery, the poet praises the military power of the country. He compares each player in the picture as if he were a dragon and writes:

ҲазратиСултонҲамиднишукри,

Чиққонэрконулказармадинбири.

Ушбулардуртўпчиларнисурати,

Ҳарбиридурбегумонбираждари. [Девон. 354]

The poet's Persian divan, like the Turkish divan, has a series of kita (fragment)s dedicated to the description of the paintings depicting the city of Istanbul. To prove our point, we comment on the kita (fragment) of the poet dedicated to the image of the castle of Holota:

Иниморатрокибинидарҷаҳон,

Азшукуҳашдарзамонағулғуласт.

ГарнадониМуҳйимегўядшунав,

ҚалъаиХолотадарИстамбуласт. [Девон. 154]

Meaning: See this building that exists in the world. The people of the time are amazed at his greatness. If you don’t know anything about this building, listen to Muhy. This is the Holy Father's Fortress in Istanbul.

After the kita (fragment)s dedicated to the image of the city of Istanbul in the Persian diwan, the kita (fragment)s dedicated to some of the poet's contemporaries are placed. These kita (fragment)s of Muhyi are dedicated to Andijan judge MulloSayyidJaloliddin, Tajalli, MiyonYunushantora, Shokirjon and MulloNumanjonSamarkandi.

The poet has 103 (221 bytes) in the Persian diwan and 87 (165 bytes) in the Turkish diwan, for a total of 190 (386 bytes) kita (fragment)s. The poet wrote his kita (fragment)s mainly devoted to the expression of moral and enlightenment ideas of a social nature, the depiction of specific events and real personalities, as well as romantic themes. The poet's philosophical tone and generality prevail in the first kita (fragment)s, in the second the direct attitude to society and people, sometimes to certain events, and in the third the expression of delicate lines depicting the image of a friend. Muhyi created these kita (fragment)s with high ideological content and full subtlety. On the kita (fragment)s he portrayed the images of the wise, the learned, and the perfect man.

There are 6 individuals in the Turkish diwan after the kita (fragment)s and 24 individuals in the Persian diwan. They were originally called Mufradot to distinguish them from the kita (fragment)s.

It is well known that individual specimens of poetry in the form of ‘individuals’ were relatively independent, emerged as a special fruit of the author’s observations, and in many cases had separate living specimens. It is one of the smallest, most concise lyrical genres in terms of volume in poetry, and is considered an independent poetic work with an aphoristic complete content.

Individuals of Uzbek literature, such as Khorezmi, Sayfi Sarai, Yusuf Amir, Navoi, Babur, Khoja, Uvaysi, Raqim, Almai and Muqimiylar, rhymed in the form aa.

The study found that Muhyi rhymed 25 of the 30 individual bytes as aa. It is evident from this that Muhyi also, according to tradition, sought to create mainly musarra - a pair of rhyming fardbytes.

AlisherNavoi's last, fifth rule on the design of the diwan stated that the diwan should not include only works written in the genre of masnavi and qasida, as each of them had a separate mujallad. At first glance, this rule does not seem to be followed in Muhyi's office. The reason for this is that the poet's Turkish diwan included one verse and one masnavi, and the Persian diwan included 2 verses and 4 masnavi. However, this does not mean that Muhyi is not finished in another verse or masnavi. Because in the process of reviewing the many sources related to Muhyi's work, we came across so many poems and masnavis that were not included in the poet's Turkish diwan that it is even possible to compile them into a separate book.

CONCLUSION

So, in the Turkish diwan there are 153 (1438 bytes) ghazals, 81 (165 bytes) kita (fragment)s, 6 individuals (6 bytes), 1 (21 bytes) poems, 1 (7 points) murabba, 1 (7 points) musaddas, 2 (29 bytes) masnavi; 277 (2668 bytes) ghazals, 103 (221 bytes) kita (fragment)s, 2 (4 bytes) rubais, 24 (24 bytes) fards, 2 (78 bytes) poems, 4 (273 bytes) masnavi are placed in the Persian diwan . The Persian diwan is 16 (56 bytes) more than the Turkish diwan, 18 (18 bytes) more than the fard, 1 (57 bytes) more than the qasida, and 2 (244 bytes) more than the masnavi. Based on the results of the research, it can be said that a total of 8 genres were used in Muhyidiwans - ghazal, qita, rubai, murabba, musaddas, fard, qasida, masnavi. Their total size is 4997 bytes (9994 lines).

Based on the topic, the article mainly researched the Turkish and Persian diwans of Muhyi and found that the total volume of these diwans was about 10,000 verses. However, it should be noted that many poems related to the poet's work are not included in these divans. Although the only example is that the poet has many muhammas in his work, there is no muhammas in either of his diwans.

MODERN TRENDS IN TEACHING FOREIGN LANGUAGES AND INTERCULTURAL COMMUNICATION (ON THE EXAMPLE OF GERMAN)

Kurbonova Nargiza Samadovna*

*Senior Lecturer,
Pedagogical Institute of Karshi State University,
UZBEKISTAN

ABSTRACT

The methods of teaching German today may not be exactly the same as 10-15 years ago. First of all, because in the era of the Internet and desktop systems, a lot of opportunities for teaching German appear before the teacher. Among them are interactive courses, online communication, watching films in German and many others, the use of which in the classroom depends on the teacher's personal creative approach? This article provides a theoretical approach to the methods and effective ways of teaching a foreign language.

KEYWORDS: *The Cognitive Sphere of the Subject, the Motivational Sphere of The Individual, Linguistic Consciousness, The Modern Approach To Teaching, The Pedagogical Experience Shows.*

INTRODUCTION

Although in recent decades the range of psychological and pedagogical problems associated with teaching a foreign language has expanded significantly (new works are noted in the thesis), however, the problem of the relationship between the personality characteristics of an individual learning a language and his subjective characteristics has not been sufficiently studied. The effectiveness of mastering foreign languages depends on the characteristics of the cognitive sphere of the subject of mastering, the motivational sphere of the individual, the development of skills for self-regulation of educational activity.

In the development of scientific and methodological foundations for the study of German literature at the language faculty of a pedagogical university, the category "linguistic consciousness" is decisive, which acts as a kind of semantic integrator of individual, personal and subjective resources of a person learning a foreign language. In the aspect of the category "linguistic consciousness", it seems possible to determine the parameters of teaching technologies, focused not only on the formation of linguistic knowledge, skills and abilities, but

also on the development of a person who uses a foreign language as a resource for self-actualization. s

Further, based on the works of P.Ya. Halperin reveals the difference between linguistic consciousness and cognitive consciousness. Cognitive consciousness is formed in the process of practical interaction of the subject with external objects, and in the same process its truth is verified. The content of cognitive consciousness is the images of objects, connections and relationships between them. The senses and logical thinking serve as the channel of cognition. The criterion for selecting the content of cognitive consciousness is practice as a purposeful activity of the subject to coordinate the results of activity with the aim of acting in a specific situation. Unlike cognitive, linguistic consciousness has developed not as a means of reflecting reality, but as a means of modeling the external and internal world of an individual.

Let's move on to consider some modern, innovative technologies for teaching a foreign language, aimed at more effective personal development and adaptation within the framework of a modern rapidly changing society.

Active learning is based on the fact that the student is increasingly faced in real life with the need to solve problem situations. This method is aimed at self-organization and self-development of the individual. The basic principle is that the learner himself is the creator of his knowledge. Active learning is, of course, a priority at the present stage of teaching a foreign language. It is necessary to give preference to active teaching methods, which are aimed at the formation of the student's independence, flexibility, critical thinking. The object of studying foreign language is foreign language speech activity as the most important means of intercultural interaction in general. Intercultural interaction is possible only if students have formed all the components of a foreign language communicative competence (ICC): educational, language, speech, socio-cultural and compensatory.

The modern approach to teaching is to build it on a technological basis. General principles and rules of teaching technology are seen in the following: goal setting; transformation of the student's activity into his independent activity; concretization of educational and developmental goals and methods; thematic planning, including a brief description of the final results and the construction of the entire chain of individual lessons, connected by one logic; control at each stage of the student's educational and cognitive activity; stimulating his creative activity, focusing on the student not only knowing, but also able; a variety of forms and methods of teaching, non-admission of universalization of a separate means or form.

However, the rate of its spread is incredibly rapid. The use of Internet technologies in foreign language classes is an effective factor for the development of student motivation. In most cases, the guys enjoy working with the computer. Since the classes are held in an informal setting, the learners are given leeway, and some of them can “shine” with their knowledge of ICT.

The prospects for the use of Internet technologies today are quite wide. This could be:

- Correspondence with residents of the countries of the studied languages via e-mail;
- Participation in international Internet conferences, seminars and other network projects of this kind;

- Creation and placement in the network of sites and presentations (They can be created jointly with the teacher and the student. In addition, it is possible to exchange presentations between teachers from different countries).

As the pedagogical experience shows, the work on the creation of Internet resources is interesting for students for its novelty, relevance, and creativity. The organization of students' cognitive activity in small groups makes it possible for each student to show their activity. The World Wide Web provides a unique opportunity for foreign language learners to use authentic texts, communicate with native speakers, creating a natural language environment and forming the ability for intercultural interaction.

Purposeful use of Internet materials in foreign language classes allows you to effectively solve a number of didactic tasks, namely:

- Improve reading skills;
- Replenish the vocabulary with the vocabulary of a modern foreign language;
- Improve the skills of monologue and dialogical expression, discussing materials on the network;
- To form a stable motivation for foreign language activities in the process of discussing problems of interest to everyone.

The Internet presents exceptional opportunities in the process of teaching a foreign language for mastering the means of communication in writing, providing the opportunity to implement a communicative approach to teaching written types of speech activity. For the purpose of teaching a foreign language, both free communication on the network and communication in the e-mail mode are used.

To achieve the maximum effect, it is necessary to use a wide range of innovative, including, of course, various media educational technologies in the educational process.

In the modern methodology, "multimedia" is considered as one of the many technical teaching aids (TCO), which is able to solve a range of problems, determined by the didactic properties and functions of this CO. From this point of view, multimedia is a TCO that integrates different types of information - sound, visual, and provides interactive interaction with the learner. The properties of interactivity, that is, the ability to control the process of presenting information, involves the student in an active educational process, stimulates his cognitive activity, and helps to maintain a stable motivation for learning.

This learning tool (multimedia) allows you to:

- ✓ integrate different types of information in one container object (text, sound, video) and present it by influencing different organs of human senses;
- ✓ develop skills for working with large amounts of information of various types;
- ✓ develop critical thinking;
- ✓ stimulate the cognitive process;
- ✓ interactively interact with trainees;
- ✓ adapt to the requests of the latter;

- ✓ organize group work in multimedia environments;
- ✓ to form a stable motivation for learning;
- ✓ Create conditions as close to reality as possible for the development of educational and professional skills.

Multimedia, as a learning tool, differs from other learning tools, first of all, by two main didactic properties: an integrative approach to presenting information in various forms (text, sound, video, etc.) and interactive interaction with a learner, which allows solving many modern didactic tasks, namely, to form key competencies, designated by regulatory documents as the basis for the content of modern education:

- Competence in the field of independent cognitive activity;
- Competence in the field of civil and public activities;
- Competence in the field of social and labor activities;
- Competence in the domestic sphere;
- Competence in the field of cultural and leisure activities.

Modern computer tools make it possible to create new computer programs, both teaching, training, and controlling. Such programs are created for special educational purposes and are widely used in the process of independent and homework when learning a foreign language. In case of independent study of the material, the use of a computer provides: 1) free work mode, 2) unlimited work time, 3) exclusion of subjective factors, 4) maximum support in mastering a foreign language. Computer means of control increase the efficiency of independent work, efficiency in obtaining the result, increase the objectivity of the assessment by 20-25%.

The introduction of modern methods and techniques into the educational process makes it possible to realize the goals of learning based on new approaches to education:

- ➢ Strengthen the practical orientation of education, focus on the development of personality traits, capable of effective life in a rapidly changing world;
- ➢ Ensure the continuity of general and vocational education;
- ➢ Having ensured functional knowledge of a foreign language, stimulate the student to continue language education;
- ➢ Develop the skill of students' independent work and their awareness of the need for continuous education and self-improvement;
- ➢ Strengthen the individualization and differentiation of the process of teaching foreign languages based on the student's personal experience;
- ➢ Contribute to the professional growth of teachers, the creation of a community of creative teachers.

The methodological foundations of teaching English have also changed significantly. New extremely effective methods, techniques and techniques of teaching English have appeared. In the course, we touch on the concepts of "cognitive linguistics", "corpus linguistics", "multiple intelligences", "teaching with dogma", "grammar", "and teaching with chunks" and many others.

Modern education is focused on the development of the cognitive potential of the individual, increasing the ability to learn, mastering new systems of knowledge, developing the creative abilities of the individual and expanding his creative capabilities. One of the innovative and little-studied ways of organizing training is a case-technology (Case Study). The essence of this method lies in the comprehension, critical analysis and solution of specific problems or cases (cases). The purpose of the case study method is to analyze the specific situation proposed by the teacher and additional information materials (using the potential of a group of students), develop an optimal solution and present it to the audience. The use of this method is most effective when teaching students of non-linguistic universities the language of business communication and the language of the specialty. Work on the posed problem situation takes place in groups of students, and it can be conditionally divided into the following stages:

- Analysis of the material presented, formulation of the problem;
- Discussion of various options for solving the problem;
- Choosing the best solution based on a comparison of all the proposed options;
- Presentation and defense of the solution.

Stage one - the analysis of the presented material can be carried out taking into account a specific issue or cover all aspects of the situation, which depends on the wording of the assignment. Stage two - discussion of various options for solving the problem takes place in groups (3 - 5 people). If the level of language training of students is high enough, then the discussion takes place in a foreign language. This is the best option for students to use vocabulary, grammatical and stylistic skills of constructing sentences in a foreign language as actively as possible. The teacher controls this process. Students in the course of work on a certain case are in the form of an interactive decision-making process. The presentation and defense of the decision can be presented both orally and in writing. At this stage, the analysis and discussion of joint activities takes place, the main task of which is the manifestation of the educational and learning results of working with the case.

The key point is that the problem situation should be relevant, taken from real life. Using the method of specific situations allows you to:

- Take into account the educational, personal interests and needs of students, their individual psychological characteristics;
- Monitor knowledge of a foreign language;
- Apply all forms of classroom work with students: individual, pair, group, frontal;
- Develop all types of speech activity: reading (overview, selective, detailed), speaking (monologue, dialogical speech), writing (planning, writing essays, etc.), listening and translation;
- Carry out interdisciplinary communications;
- Stimulate the creative activity of students.

Application of the case-study method makes high demands on the level of training of students. A difficult task for a teacher, requiring erudition, pedagogical skills and time, is the development of

a case, i.e. selection of the appropriate real material, which simulates a problem situation and reflects a set of knowledge, skills and abilities that students need to master. The peculiarity of the work of a teacher practicing the case method is that he not only realizes his abilities to the maximum, but also develops them. The main content of the teacher's activities includes the performance of several functions - teaching, upbringing, organizing and research. Thus, case technology contributes to the development of the ability to analyze situations, evaluate alternatives, choose the best option and draw up a plan for its implementation. The case-study method contributes to the development of self-analysis skills, as well as analytical, practical, creative, communicative, social skills of students.

The choice of technology by each specific teacher is based on the analysis of the pedagogical situation. The definition of the technology of teaching a foreign language will necessarily be affected, for example, by the amount of time allotted for a subject, a separate topic; the level of preparedness of students, their age characteristics; material equipment of the educational institution; the level of preparedness of the teacher himself.

ABSTRACT

This article will tell about the contribution of the great statesman Amir Temur to the development of military art, directly about the army and its structure, the structure of the army, its structural arrangement, innovations introduced into tactical methods, the location of the military tactically and other methods of warfare, in general, about changes in military tactics and strategy during the war.

KEYWORDS: *Tactics, Strategy, Kunbul, Khabargir, Javongir, Barongar, Chagdavul, Center (Qo'l)-(G'ul), Hirovul, Commander (Smir Ul-Umaro), Manglay, Tuprad, Sipohiy Favji, Ogruq, Yazak, Taloya, Oron, Rad, Radandozs, Takhshandozs.*

INTRODUCTION

The history of military Amir Timur, rightfully recognized him as one of the greatest military leaders in the world. Our great-grandfather's military talent was manifested mainly in two directions: skillful as a military organizer and an outstanding commander.Throughout his adult life, he pursued a policy based on such slogans as *"Haq bo'lsang, najot topasan"* (if you are right, you will be saved), *"kuch adolatdadir"* (strength is in justice), and his grandfather contributed to the development of world military art along with politics, economics, social justice, cultural development, public administration.

Amir Temur was the first to legitimize the social status of the military army and introduced the concept of social attention that the state paid to the soldier, and not only for bravery or combat actions, as a factor of victory in the main battle.

Amir Temur, in addition to emphasizing the blessing and attention shown to them, led ordinary soldiers into the fifth category: he noted that "Sipohiylarimni hamisha jangga tayyor holda tutdim, oylik haqlarini so'rattirmay vaqtida berdim. (I always pay soldiers` salary on time) Chunonchi, Rum yurishida sipohiylarimga o'tgan va kelajakda qiladigan xizmatlari etti yillik ozuqalarini birvarakayiga berdim (For example, before fight in Rum I have paid for seven years

salaries all of them)"[1] And he noted also: "Amirlar, sarhanglar-sipohsolorlarga majlisimdan o'rin berib, martabalarini yuqori ko'tardim (I careered advancement of army chiefs). Ular bilan suhbatlashib, maslahatlar oldim (I conversed with them, got advice)" and put the army chiefs in the fourth category.[2]

Historical sources indicate that Amir Timur was the commander of 313 beks (governor) in various parts and divisions of the restored powerful army. The first hundred of them were unbegilik (chief of hundred soldiers), the second hundred were a yuzbegilik (chief of second hundred soldiers), and the third hundred were holders of the rank of a mingbegilik (chief of third hundred soldiers). Amir Temur's supporters and commanders have expressed their trust in him since his first visit to the political arena of Temur, which consisted of skilled people, namely his friends, as well as the owners of infallible, who demonstrated their resilience, intelligence in various battles, and the grandchildren. Amir Temur wrote in his work, namely "Tuzuk": "Uch yuz o'n uch amirimning barisi aql-hush egalari, mahoratli sarkarda, g'anim lashkari to'pini buzib, uni mag'lub etuvchi kishilar edi (313 my emirs are smart, they are skillful commanders, they know how to defeat the enemy). Jangning sir-asrorini, g'anim askarlarini sindirish yo'lini bilgan, urush qiziganda o'zini yo'qotmasdan, qo'l-oyog'i bo'shashmasdan, lashkar favjlarini jangga boshlay oladigan, agar qo'shin safiga rahna tushsa, uni tezda tuzata oladigan kishigina amirlik va hukmronlikka loyiq hisoblanadi".

If we give information directly about the army and its structure, then the following units functioned in the army of the great army: kunbul/kumbul–hirovul, manglay, radandozlar, sonsiz, talol, takhshandozs, khabargirs, yazak, chagdovul, quvguner, shocking from behind, cavalry, advanced part, the advanced part that conducts the intelligence work with combat, artillery, personal guard, night guard group, a group of crossbow shooters (the humming and pitchers were filled with gunpowder, the mouth was rinsed, and the fuse burned and shot towards the enemy with the help of a clown), spy, scouts, day guard cavalry group, auxiliary unit in reserve, cavalry unit used to capture.

Sahibkiran decided to reorganizing the order structure of Genghis Khan's army. The structure of the army, its structural location, tried to introduce innovations in its tactical methods. From the point of view of tactics, Amir Temur's army was allocated to 7 divisions or 7 captives. The division of the army into *unlik, yuzlik, minglik*and*tuman*was used in the performance of tasks set during the battle. Amir Timur developed a method of conducting combat in 7 divisions (captives) of the army after the famous "Jangi loy" (Battle in clay) (1365). Sahibkiran for centuries, which improved the way of fighting the Turkish-Mongol troops into five parts, was revised after the same battle and supplemented with side guards, cavalry attacking at the right time. He used new method with battle the Mongol khan, Tukhtamishkhan in Kunduzcha, near the river of Volga, 1391. According to Sharafiddin Ali Yazdiy`s note, the army of Tukhtamishkhan was more than Amir Temur`s army.

Amir Temur promises to create an army in an unusual order from the state of the traditional order - the center, left and the right wing, and uses a new method of combat order, the army is divided into 7 captives. Emir Sulaymanshoh was commander in the center of army. After him, the army of Muhammad Sultan was located, after Muhammad Sultan, it was located the army of Sahibkiran reserve army, which numbered 20 army (buluk). The part of *Barongor*, it was located the army of Mironshah mirzo, the part of *kunbul* (wing), it was located the army of emir Khoji Sayfuddin barlos, the part of *javongar*, it was located the army of Umarshayk mirzo, for him, it was located the army of emir Berdibek as *konbul*, also was located the army of *Saribugo* hands.

Amir Temur took command of reserve army and the part of ugruk section. His status was behind the center, and anyone who needs help is ready to send support to him. Later it became known that the fate of the battle was decided by this military unit.[3]

Tokhtamishkhan divided his army into 5 divisions and appointed princes and high-ranking emirs of the Joji dynasty as their commanders. When it comes to the distance at which both sides can see each other, Amir Timur commands a division commanded by his grandson Mirzo Abubakir to set fire, tents, carpets in front of the enemy. Such demonstratively cold-blooded frosts negatively affected the psyche of the enemy.[4] The battle lasted three days and ended with a complete victory of Amir Timur.

Despite the fact that the total strength of the Sahibkiran army consisted of 800,000 cavalry and infantry, the number of troops participating in major marches ranged from 100,000 to 250,000 people. At the end of 1404 , the trip to China consisted of 272612 people.[5] According to historian Sharafiddin Ali Yazdiy`s note, according to the order of the trip, each *tumanbegi*, *mingbegi*, *yuzbegi*, *unbegi* acted in combat order with units and subunits of the combat manner instead of occupying their own level, position and ranks.[6] The person who violated the order was severely punished by the Sahibkiran. When the army stops to rest or goes to the battlefield, the perimeter of the army is tightly surrounded by chariots that are chained to each other, blocked by ditches, a chapar fence is laid on the belt, surrounded by mounds. The fortress was guarded by day-spring and night-field guards. With the appearance of the enemy, the army came out of the ditch and turned against him, forming a battle line. Each unit, group, section has its own password (Oron) to prevent hiding and vandalism during walks or sealing.

In most cases, Amir Temur pretended to be weak in order to engage the enemy army in battle. "Amr qildimki, dushman urush ochmaguncha o'zlaricha jangga kirmasinlar" (I ordered them not to engage on their own until the enemy opens war) noted Sahibkiran in his work, namely "Tuzuk".[7]This strategic trick (savkul-jaysh) would have a good effect in many cases.

The first clash with the opposition army was started by the light cavalry, that is, the guard, which was engaged in reconnaissance tasks. After that , the advanced units of the right and left wings - the main forward unit in support of barongor hirovuli (part) and javongor hirovuli (part)- entered the battle of manglay. Manglay was followed by the barangar and the other two parts of the javongor, the chapovul and the shikavul. If this force is not enough to defeat the enemy, then the leading forces, led by the commander-in-chief, amirul-ul-umaro, were thrown into a decisive battle. "Shundan so'ng Allohning madadu inoyatiga tayanib, lashkarboshining o'zi ham janggi kirsin (After that, relying on the help of Allah, let the commander himself join the battle). Meni ham urush maydonida hozir deb bilsinlar (Let me also be recognized by those present on the battlefield). Allohning yordami bilan g'animga sakkiz zarba etgandan so'ng, to'qqizinchi zarbada dushman engilib, fathu nusrat nasib bo'ladi (After eight blows to the enemy with the help of Allah, the enemy will be defeated in the ninth blow and victory will be granted)".[8]

When the signs of the enemy's flight and defeat became apparent, a pursuer consisting of left-handed cavalry was assigned to pursue him. Stone lilies (catapults) were found near the walls of the enemy fortress, saws mounted on drums were restored, stones were thrown from each garaf facing the siege, raids were put into effect. Tunnels are dug under the pipes. Through the rafters that opened in the walls, the soldiers began to pour in like a flood. The soldiers climbed up using ropes, ladders, various rings. In the army of Amir Temur there are glasses with a combustible substance - naphthene (oil), a propellant herbicide - there are special gunners - radandozs, which

ensure the continuous production of rada. The number of such guns has reached 10 thousand, according to the writings of Nizamiddin Shamiy.[9]

The army was also organized precisely and carefully, its order of battle improved from battle to battle, the army was armed with the most modern weapons, the units differed from each other in clothing - head, flag and trim. Such a distinction was at hand when managing an army during a battle.Such news as the division of the army into parts, divisions, the introduction of certain types of military clothing for each of them, were later assimilated by European peoples.Amir Temur also provided pedestrians with horses as a basis for long walks, unlike the Mongols. It should be noted that at those times when it was necessary to shoot at a clear target, the cavalry also fell from their horses and moved without a bow, the cavalry with the main role in the army mobilized high-speed light cavalry and divided into heavily armed cavalry. The task of the heavily armed cavalry was to deliver a decisive blow to the enemy. If the Mongols used heavy weapons for security purposes, then Sahibkiran further strengthened their role in the battle.

In the army, along with cavalrymen, who formed the basis of the armed forces, pedestrians also served. Sahibkiran was one of the first in the East and brought firearms (*taprad*) to the army. Special military units and units were formed in the mountainous areas, which conducted military operations.

Such operations as the destruction of enemy mudofa by various methods, the battering ram strike on large enemy cities, the long siege of the fortress, the siege of the forces of the enemy on the largest possible scale, the conquest of the village, city, district, provinces one by one, the pursuit of the enemy to complete destruction. Tactically, Amir Temur's army had its own peculiarities. Intelligence is well established, the necessary measures and measures have been developed so that units can move at the required level on the battlefield or in combat ranks, with special emphasis on their rapid management during combat.

Another great merit of Sahibkiran in the development of the art of war was the introduction of a cavalry unit - a convoy, which was formed in order to protect the wings of the army from enemy attacks during the battle and, in turn, to bypass enemy's forces from the side and strike him from behind.[10]There was no such new military unit in the army of such noble generals as Alexander, Hannibal, Genghis Khan, Lyudvik XIV, Great Fridrikh. There was such a kism in Shayboniykhon's army, and it was named after *tulgama* (the name of tactic). According to military experts, Napoleon Bonaparte, before a military trip to the eastern countries, studied the structure of Amir Temur's army, his combat path, mastered tactical techniques that he considered necessary.[11]

The army operated in the following order of battle during the journey: far ahead of the main forces were the guard (avanpost), then manglay (hirovul) (avangard), barongor, javongor (center hand), chagdavul (avangard). The army was followed by ugrok (oboz).[12]

According to historical sources, the army of Amir Timur numbering 12 thousand people entered the battle in this order: The first confrontation with the enemy was started by a guard who was engaged in espionage. After that, the advanced units of the right and left wings — the main advanced unit in support of *baroness hirovuli* (part) and the *javongor hirovuli* (part)- engaged in battle with the *manglay*. After *manglay,* the part of two parts of *chopovul* and *shikovul* followed from *barongor* as well as *javongor*. If these forces are not enough to defeat the enemy, the leading forces led by the commander-in-chief (A*mir ul-umaro*) - the center (arm) - (hand) - were thrown into a decisive attack.

The tactical overview of the huge battles in which the so-called Sahibkiran army took part was as follows: the center of the army was divided into 40 divisions-regiments and was subordinate to the supreme commander. Of these divisions-regiments, 12 pieces consisting of rows are in the 1st row of the line, the remaining 28 pieces are in the 2nd and 3rd rows. In front of the right side of the forty sections, parts of princes were lined up, in front of the left side - parts of relatives and allies. In the *barongor* of the 2nd row, 6 pieces were ranked with their advance-*hirovul*. The same amount of piece, and there was also a part for *hirovul*.

In front of the 2nd *barongor* and *javongor* is a number of details in the above order. In front of him the head was moving forward - *manglay* (or *hirovuli buzurg*). Consisting of light cavalry, the army of the 2nd division was engaged in protecting the ram from attack, observing the movement of enemy forces.

And from a military-tactical point of view, the location of the army is also defined in the*"Temur tuzuks"*. The course of the battle, its duration, and the number of soldiers who should participate were personally calculated by Amir Temur himself.

According to the tactics of Amir Temur, when choosing a place where the battle will take place, the following should be taken into account: a place where it is convenient to place and store water, an army, you can dominate the enemy in the place chosen for the battle, and especially not to get into the face and eyes, as well as on the battlefield.[13]

Before the battle, the place of each of the ranks was assigned so that Amir's troops could move freely. The army had to go straight without turning both their horses to the right and left, when they encountered the enemy, they were vigorously thrown at him. This event was aimed at ensuring that the troops standing in line did not fire in vain, but conducted a fierce attack.

He had experience, and the skill had to carefully inspect the battlefield before the battle with the commander, find out from which side the enemy is superior, quickly eliminate his shortcomings, observe whether the enemy is attacking in separate detachments or engaged in battle with the secret troops, knowing whether they have secret plans.

The Russian military historian of the XIX century M.I.Ivan was given his own assessment and an unbiased assessment in this regard: "Hali bironta ham xalq qo'shinini to'g'ri saflashni bilmay, tartibsiz va taktik harakatlarsiz, faqat o'zidagi jasorat darajasi bilan uzun-yuluq jang kilayotgan bir paytda Temurning to'g'ri saflangan, bir necha yo'nalishdan iborat muntazam tartib bilan jangga kiruvchi, kuchli zahiraga ega bo'lgan kuchli armiyasi bor edi" (At a time when there was still a long battle with a level of courage in itself, without knowledge of the proper purification of the people's army, without unorganized and tactical actions, there was a strong army of Timur, entering into battle with a regular order consisting of several directions, properly built, having a strong reserve). "Harbiy san'atda egallagan beqiyos mahorati va botirligi unga janglarda deyarli hamisha g'alabalar keltirdi" (The unsurpassed skill and courage that he mastered in the art of war almost always brought him victories in battles).[14]Sharafiddin Ali Yazdiy also noted separately in his work, namely "Zafarnoma" that "hali hech kim o'ylab topmagan uslubni Sohibqiron o'ylab topib, qo'llaganligini" (the fact that he invented and applied a style that no one has yet come up with).

When the number of the enemy army exceeded 40 thousand people, Amir Timur himself opposed him. At this time , the army is preparing for battle as follows: 40 units were directly at the disposal of Amir Temur. The most sorted 12 units were occupied by the 1st row, the

remaining 28 were occupied by the 2nd and 3rd rows. 40 units indicating troops led by his son and grandchildren are located in front on the right side, while troops led by relatives and allies are located in front on his left side. Then there were wings, ranks and other units.

The Turkish fighters, who studied military tactics from Amir Timur, could not resist the enemy's attack, ran away on horseback and fired, unable to aim from a distance of 60-100 paces. To remove the tracks, they walked from four sides, after 5 calls each unit was divided into 3 parts, after 3 miles of walking they were again divided into 3 parts, and then on the agreed terrain they were collected in a jar at a distance of 40-50 miles from the starting point. Dispersal escape was accomplished by horseback riding in just over an hour and a half.

Sahibkiran Amir Timur believed that the more you know about the enemy, the easier it will be to win, and also paid special attention to the army unit engaged in espionage (informant, spies).It is noted that Amir Temur collected the necessary information about the border countries with the help of light units numbering 1,000 people. These divisions rode thuja through barren desert lands without water, while elsewhere the movement without cavalry and on foot. There was also a special sponsorship for travelers, traders and caravaneers, from which they could learn important information about the state of their country of origin.

This is how Sahibkiran Amir Temur managed to form the strongest and most efficient army of his time. The execution of strategic plans, such as the skillful destruction of enemy, striking large cities of enemy with a battering ram, a prolonged siege of fortified fortresses, as well as an extensive siege of the forces of the enemy, as far as possible, pursuing the enemy, lead the owner only to victory. As part of the army, special military units and units were created that conducted effective and rapid combat operations in mountainous areas.

Amir Temur also used various military tricks in battles. One of them is that he tied wood to horses in order to cause panic in the heart of the enemy, again and again driving his small army along the chetra from the battlefield. There was a panic noise, and from the dark dust-dust, the mind of the enemy soldiers hurried.

The ambassador of the Spanish King Rui Gonsalesde Klavikho wrote in his "Kundalik" (diary): "Harbiy ishlarda katta tajribaga ega Temurbek oz fursatda qo'shin to'plab, Erondan shoshilinch Turkiyaga yo'l oladi va Arzinjon erlaridan o'tib, Sabastriya shahriga etib keladi (Temurbek, who has big experience in military affairs, collected the army in a short time goes to Turkey from Iran and through the area of Arzinjon, arrives the Sabastriya city). Temurbekning bu erga etib kelganini eshitgan Boyazid o'z yo'lini o'zgartirib, yuk ortilgan barcha ot-aravalarini mustahkam Anguri qasrida qoldirib, qo'shinini Temurbekka qarshi qo'yadi (Hearing that Temurbek had arrived here, Bayazid changed his path, leaving all his horse-drawn wagons with cargo in the fortified Angur castle, and moved his army against Temurbek). Uning bu ishidan xabar topgan Temurbek ham o'z yo'lini o'zgartirib, baland tog'lar tomon yuradi (Temurbek, who was informed about this work, also goes his own way to the high mountains). Temurbek o'z yo'lini o'zgartirganini ko'rgan Boyazid esa, qochib ketyapti deb o'ylab, uni quvishga tushadi (And Bayazid, who sees that Temurbek has changed his path, thinks that he is going to run, rushes in pursuit). Temurbek tog'lar oralab sakkiz kun yo'l yurib, tekis yo'lga tushadi va Boyazidning ot-aravalari qolgan Anguri qasriga kelib, bu erdagi barcha narsalarni qo'lga kiritadi (Temurbek, after walking through the mountains for eight days, descends along a flat road, and Bayazid's horse-drawn carts arrive at the abandoned Anguri castle and seize everything that is there). Buni eshitgan Boyazid shoshilinch Anguriga qaytishga harakat qiladi (Hearing this, Bayazid hurriedly

tries to return to Anguri). Afsus, qasrga etib kelgan turk qo'shini holdan toygandi (Unfortunately, the Turkish army that arrived at the castle was exhausted). Boyazidni chalg'itish maqsadida atayin aylanma yo'llar bilan yurgan Temurbek shu erdagi jangda Boyazidni engib, uni asirga oldi (Temurbek, who deliberately made a detour in order to distract Bayazid, defeated Bayazid in a battle at this place and captured him)." [15]

Amir Temur paid great attention to the formation of a command staff of talented people with the necessary level of skill and qualifications in military affairs. Lyusen Keren, scientist from France, wrote in his book, namely "Amir Temur saltanati" (The reign of Amir Temur): "Uning qo'shinida har bir jangchi irqi, e'tiqodi va jamiyatda tutgan o'rnidan qat'iy nazar, ko'rsatgan mardligi va qahramonligi bilan qadrlanadi" (In his army, every soldier is valued for the bravery and heroism that he shows, regardless of race, religion and place in society).[16] A certain person with military abilities, regardless of his social status, has earned the title of a soldier. From the information and comments given in Sahibkiran's work "Temur tuzuks", it is not difficult to understand what a wise man he was, a man of skill. For example, in work such ideas are wise sayings that not only the warrior but every leader, man must follow: *"...ishbilarmon lashkarboshi o'zini va to'qqiz sipohiy favjini bir tandek ko'rib, ularni qo'l-oyog'i, boshi, ko'kragi va boshqa a'zolarini ishlatib kurashuvchi bir pahlavondek hisoblasin (Consider the business leader himself and the nine gypsies as a tandem and consider them as a wrestler who fights using his limbs, head, chest and other organs). Shundagina g'anim sipohi favjlari ustiga ketma-ket urilgan to'qqizta qilich zarbasidan keyin, to'qqizinchi zarbada, albatta, engilishiga umid qilsa bo'ladi (Only then could enemy hopes that after nine consecutive sword strikes on the fauns, the sepoys would definitely be defeated by nine blows)" or "... shunday qilib, Sardor aqlu tadbirkorlik bilan ish yuritib, shoshma-shosharlik qilmasin, chunki shoshqaloqlik shaytonning ishidir. Chorasi bo'lmagan ishga kirishmasin, chunki undan qutulib bo'lmaydi (Don't take a job that doesn't have the means, because it can't get rid of it)".*

In general, Amir Timur demonstrated his military tactics and strategy as a master commander during 40 years of his wars in Asia. His Holiness Amir Temur, the first regular army in world history that salted. Now the term "avangard" is used in the military. It is known that a special part of the Sahibkiran army, which was in the former ranks, was called so - "ovongort". The first military parade in world history was also held by our grandfather Jahangir. He established a strong iron discipline in his army.

Undoubtedly, our army today is a symbol of the evil of the army troops, the bravery of the defenders created by our great-grandfather, even for the defenders of our homeland. In a word, even if we study the lifestyle of our grandparents, the politics of statehood and or martial arts, we will certainly have our own affairs, thoughts, events and information that will be useful in our lives. After all, this is an example of what a person has done, everyone who said is equal to a fool a pearl.

ABSTRACT

The first-generation food printer concept designs and working prototypes are presented in this research, with the goal of revolutionizing personalized food production via 3D printing (3DP). Unlike robotics-based food manufacturing technologies that aim to automate manual procedures for mass production, 3D food printing combines 3D printing with digital gastronomy to create food items that can be customized in form, color, taste, texture, and even nutrition. This expands customization possibilities to the industrial cooking industry while also introducing creative skills to fine dining. On the basis of fabrication platforms and screen printing, the chosen prototypes are evaluated. For single or multi applications, a comprehensive description of various 3DP technologies and their associated dispensing/printing method for 3D personalized food manufacturing is presented. Food printing's effects on customized nutrition, on-demand food manufacturing, food processing technology, and process design are eventually discussed. Their use in home cooking and catering may offer not only an engineering solution for personalized meal design and nutrition management, but also a potential machine to reconfigure a customized food supply chain.

KEYWORDS: *Customized Food Fabrication, 3d Food Printing, Platform Design, Multi-Material.*

1. INTRODUCTION

Customized food items are in high demand, and the majority of them are presently developed and manufactured by highly educated craftsmen. The price is quite expensive for such a little number of components. Food Layered Manufacture, often known as three-dimensional (3D) food printing, may be one of the possible solutions to close this gap. Its goal is to layer-by-layer create 3D custom-designed food items without the need for object-specific equipment, molding, or

human involvement. As a result, this technology may improve production efficiency and lower manufacturing costs for the creation of personalized food items.

1.1.Food Printing and Robotics-based Food Manufacturing

Cooking is one of our most essential activities, and a robotic chef capable of following recipes would have a wide range of uses in both domestic and industrial settings. Baking cookies robots, for example, can find ingredients, combine them in the proper sequence, and put the resultant dough in an oven baking pan. These libraries-equipped robots can do daily manipulation tasks and fundamental motions like picking up, putting down, and pouring. These robotics-based methods are often employed in conventional food manufacturing for large production to automate manual operations[1]. They can significantly decrease workload, labor costs, and food production efficiency. Food producers are ecstatic about such advancements, but they are unclear about the reasons for and motivations for creating food printing methods and their distinct characteristics. As a result, a comparison between the two is necessary. two techniques is necessary[2].

Food printing differs from other robotics-based technologies in that it combines 3D printing (3DP) with digital gastronomy methods to create food items that can be mass customized in form, color, taste, texture, and even nutritional value. 3DP is a digitally controlled, robotic building technique that creates complicated solid structures layer by layer and fuses them together via phase transitions or chemical processes. The goal of digital gastronomy is to incorporate cooking process information into food production so that our dining experiences extend beyond taste to include all elements of gastronomy. Combining 3DP with digital gastronomy methods allows for digital visualization of food modification, opening up new possibilities for innovative food production at a low cost[3]. As a consequence, a personalized culinary design in the form of a digital 3D model will be converted immediately into a layered final product. Overview

Over the last several years, a lot of publications and papers on food printing have been published. The majority of them concentrated on manufactured new foods. Some academics have recently begun looking at basic problems in food printing, such as turning components into delicious goods for both health and environmental reasons. However, such material is dispersed among a variety of publications with varying technical foci[4]. The purpose of this article is to collect, evaluate, classify, and summarize relevant information on technology and its effect on food processing. The remainder of the paper is laid out as follows: Food printer ideas and platform designs, as well as a variety of printing materials, are discussed in section 2. Section 3 delves into the engineering of 3DP technologies for food printing, covering dispensing and printing technologies, as well as multi-material and multi-print head printing mechanisms. Food printing's effect on customized food design, personalized nutrition, on-demand food manufacturing, food processing technology, and process design is discussed in Section 4. Finally, in Section 4, a conclusion is given.

1.2.Food Printer Concepts and Platform Designs

The first generations of food printer concept ideas and prototypes are becoming available to the general public. A few research projects, ranging from concept designs to in-depth study on material extrusion and deposition, have been completed in a short time[5]. Conceptual Ideas: Nanotech Instruments Inc. patented a rapid prototyping and fabrication method for 3D food

objects in 2001, such as a custom-designed birthday cake. However, no physical prototype was built. Nico Kläber came out a Molecular concept design in Electrolux Design[6].

Ingredients in digital gastronomy may be decided based on online nutritional content, personal and societal preferences[7]. Table 1 shows three hypothetical ideas from the Massachusetts Institute of Technology (MIT) that incorporate a digital gastronomy concept into food printer design. Each one focused on a distinct element of cuisine, such as blending, modeling, and transformation[8]. These ideas seem to be more realistic than earlier concept designs, although they are still far from being technically viable.

Table 1: Summary of Conceptual Designs on Food Printer

	Concept Focus	Design Platform	Difficulties
Virtuoso Mixer	combine and mix diverse ingredients to control their quantities, types and source.	• top layer: storage containers to monitor temperature, humidity and weight • 2nd layer: processing chambers dedicated to mixing, whisking and crushing • bottom layer: extrusion unit with thermo control	• distribution and metering design between the layers, • machine cleaning • waste minimization.
Digital Fabricator	model and cook ingredients combination into specific shapes with defined dimensions	• refrigerated canisters of food • a three-axis mixing/printing head onto the printing surface • a fabricator chamber	• refilling canisters • machine cleaning • material supply to mixing head and storage system
Robotic Chef	transform existing ingredients into new flavour and design pattern	• two five-degree of freedom robotic arms • a tool head to localise transformations such as drilling, cutting and dispensing via syringes • a heating bed for cutting/cooking/ sintering	• design and program to fabricate diverse food shapes • complicated manipulation

1.3.Platform for Food Printing

The fundamental components of a food printer platform are a three-axis XYZ stage (Cartesian coordinate system), dispensing/sintering devices, and a user interface. Such platforms can manipulate food in real-time thanks to a computer-controlled three-axis motorized stage and material feeding system[9]. According to computerized design modeling and route planning, food composition may be deposited/sintered basically point by point and layer by layer. At least four functions are suggested to create and customize new meals rather than merely automate the conventional food manufacturing process: measuring, mixing, dispensing, and cooking (heating or cooling). In the present commercial or self-developed food printing systems, only the dispensing and cooking features are provided.

1.3.1. Food printers based on commercial platforms

Researchers adapted commercially available open-source 3D printing platforms for food printing to simplify the development process and save development time. One typical modification is to replace the original print head with a specifically built dispensing unit with an extra valve to regulate the material flow rate, or to replace the conventional inkjet binder with food-grade substance such as starch mixes[10]. Although not particularly intended for culinary applications, the Fab@Home system was one of the first desktop fabricators compatible with food ingredients. Frost ruder MK2 was also incorporated into the MakerBot Researchers utilized two solenoid valves to regulate the flow velocity of creamy peanut butter, jelly, and Nutella on the extrusion frost platform. A food printing platform with a printhead developed at the National University of

Singapore is shown in Figure 1. The platform is based on a Prusa i3 platform that has been modified to include a self-developed extrusion printhead[11].

(a) Food Printing Platform (b) Printhead

Figure 1: The Food Printing Platform Developed at National University of Singapore

Researchers can rapidly construct complicated food forms and analyze the properties and manufacturing methods of different food materials using a customized commercial platform. Those platforms, on the other hand, lack flexibility in terms of future development and are only relevant to a restricted range of materials, making them unsuitable for in-depth study.

- Food printers based on self-developed platform

Personality platforms are created to meet particular needs, such as producing 3D sugar structures using a browser laser machine, making 3D cheese and chocolate things from edible materials, or using open-source technology to reduce the cost of freeform sugar product manufacturing. They offer additional material dispensing options, allowing a suitable printhead to be developed and executed from a pool of candidates, as well as greater flexibility and optimization in dispensing parameters and manufacturing processes.Self-developed platforms are built based on specific requirements, such as creating 3D sugar structures with a computer-controlled laser machine, building cheese and chocolate 3D objects from edible ingredients, or reducing cost associated with freeform fabrication of sugar products with open-source hardware. They provide more choices for material dispensing so that a suitable printhead can be designed and implemented among a few candidates, dispensing parameters and fabrication process can be more flexible and optimized.

- User control interface design

User control refers to complete control over form, ingredients, and materials, all of which may have a big effect on culinary creation. The design of the user control interface has three functions: 1) offering tools for shape design and material selection for personalized food item design, 2) converting this design into a computerized 3D model, and 3) designing the dispensing route and related processing parameters. As a result, it's critical to provide an interactive user interface that connects to an open-access web-based template library.

Customers may use this interface to create their own customized food items, get design files from a technological service provider, and share their designs with other people. The goods may therefore be produced in front of consumers using a personal 3D food printer in a new context of home product manufacturing, which would be difficult to accomplish with current techniques.

CONCLUSION

3D food printing has already shown its worth by creating customized chocolates and basic homogeneous nibbles. These apps, on the other hand, remain basic, with restricted internal structures and repetitive textures. A systematic approach to investigating printing materials, platform design, printing methods, and their effects on food production is required. Meanwhile, the food design process should be organized to encourage user creativity, the fabrication process should be quantified to ensure consistent fabrication outcomes, and a simulation model to connect design and fabrication with nutritional management should be created. Meal's printers may become part of an ecological system, where networked machines may order new ingredients, make beloved food on demand, and even cooperate with physicians to design better diets, if an interactive open web-based user interface is developed.

DISCUSSION

This research presents the first-generation food printer concept sketches and functional prototypes, with the aim of revolutionizing bespoke food production via 3D printing (3DP). 3D food publishing, unlike robotics-based food manufacturing technologies that seek to automate manual procedures for mass production, combines 3D printing with digital gastronomy to produce food items that can be personalized in form, color, flavor, texture, and even nutrition. This gives the industrial cooking sector more customization options while also bringing gourmet dining to creative talents. The first prototypes and concept concepts for food printing are now accessible to the general public. In a short period of time, a few research projects spanning from concept designs to in-depth studies on injection molding and deposition were accomplished.They provide more material dispensing choices, allowing for the development and execution of a suitable printhead from a pool of candidates, as well as more flexibility and optimization in dispensing parameters and manufacturing processes. Self-developed platforms are created to meet particular needs, such as producing 3D sugar structures using a computer-controlled laser machine, making 3D cheese and chocolate things from edible materials, or using open-source technology to reduce the cost of freeform sugar product manufacturing.Only dispensing and heating functions are offered in current commercial or self-developed food printing systems.

ABSTRACT

There has been increased interest in supplier integration in recent years, much of it supporting such initiatives in organizations. We operationalize supplier integration as a bundle of practices that include a set of ''internal'' and ''external'' practices. We hypothesize that such practices in specific configurations can be as important a source of performance differentials as the adoption of individual practices themselves. We theorize the existence of a level of integration that results in optimal performance. The paper uses data from a cross-section of more than 300 US manufacturing companies to test the notion of an optimal level of supplier integration, and examine the conditions surrounding its development. The results provide empirical support for the concept of an optimal set of supplier integration practices. We show that deviations from the optimal profile are associated with performance deterioration, and that indiscriminate and continued investments in integration may not yield commensurate improvements in performance.

KEYWORDS: *Empirical Research, Management, Supply, Supplier Integration, Sourcing Strategy.*

1. INTRODUCTION

When it comes to supplier integration, there's a frequent question that comes up. How do some businesses get greater performance returns from supplier integration efforts than others? We believe that part of this effectiveness stems from the way integration practices are integrated and structured, rather than the character of the activities themselves. Supplier integration is defined as a condition of synergy achieved via a range of integration techniques among an organization's supplier, buying, and production components. From the standpoint of the purchasing company, we define success in traditional manufacturing c and firm level measures [1].

Favorable correlations between firm-level indicators of integration and organizational success. However, there is considerable uncertainty about how integration as a generic strategy affects

performance, whether some integration practices are more central to performance than others, the returns from integration, and whether complementarities among integration practices benefit performance While studies have shown the importance of integration in rent generation and appropriation, process [2].

Despite its potential for rent destruction, little attention has been paid to its development and better company performance. Nonetheless, research such as so, which looked at integration returns, showed that increasing integration indiscriminately may actually lower performance. Integration investments, like other kinds of investments, are susceptible to decreasing returns that may ultimately degenerate into negative returns if taken to extremes. If pursuing integration relentlessly isn't advantageous, neglecting it altogether is clearly not in a company's best interests. The question is intriguing and crucial: how much integration is ideal? We contend that the connection between integration and manufacturing performance is multivariate and nonlinear in nature, with unique combinations of integration techniques yielding better rent. As a result, the structure of integration efforts may be as significant as the programs themselves in determining manufacturing performance heterogeneity. We also believe that, contrary to the prevalent notion that "more is better," circumstances may need a decrease in efforts [3].

To investigate these problems, we use a variety of theoretical frameworks. First, the resource-based viewpoint is utilized to promote a configurationally view of integration, implying that it is the performance synergies that arise from particular arrangements of practices that count, not the effect of isolated practices. Second, the principles of transaction cost analysis (TCA) are used to describe the mechanism by which integration increases performance heterogeneity from a theoretical standpoint. TCA indicates that integration may help save costs and improve performance. Finally, we use institutional isomorphism theory to illustrate why integration may be detrimental to a company. The article offers an intermediate stance in integration projects based on these theoretical frameworks, explaining why curvilinear returns may be predicted in the connection between integration and performance.

The research is groundbreaking in that it looks into whether excessive investment in integration practices can be harmful. This raises the question of what constitutes a "optimal profile" of integration practice investments. We investigate this in depth using industry data and well-established research methods. This research makes a major contribution to the body of knowledge on supplier integration. We propose and test the hypothesis that performance variability stems as much from the choice of specific supplier integration practice configurations as it does from the character of a certain supplier integration practice. Our main goal is to see whether there are any trends in supplier integration methods that cause performance heterogeneity. As a result, we create an initial set of supplier integration techniques and highlight problems of sequence and synergy among them, both for immediate consideration and future study.

We go on to look at the circumstances that led to the formation of such ideal practice setups. Finally, we present a novel approach to integration research based on a technique that has some significant benefits over traditional methods. The discrete manufacturing sector is the empirical context for our research.

1.1.Integration of suppliers

The awareness of interdependency drives integration. The issue in previous, more vertically integrated periods was getting different functional divisions of a business to work together to

achieve corporate objectives. Companies must integrate operations across partners and supply chains to successfully deliver goods to the market, since growing parts of product value are partitioned to entities outside the company. Supplier integration is defined as a condition of syncreticism among an organization's supplier, buying, and manufacturing components. A number of supply chain management studies have focused on integration as a theme. Customer/market integration information integration, logistics and distribution integration, and purchasing integration are all examples of supply chain integration. The emphasis of this article is on supplier integration. The main emphasis on intra-company and supplier base integration distinguishes it from the wider notion of supply chain integration [4].

Technology initiatives like electronic data interchange (EDI) and web-based integration systems, applications software like enterprise resource planning (ERP) systems and supply-chain-optimization (SCO) software, and relational capital development initiatives like cross functional involvement, supplier relationship development, and joint problem solving are all examples of integration mechanisms. Not all resources provide lasting value in the resource-based view (RBV) paradigm. It's critical to distinguish between resources that can generate long-term rent and those that can't. Such resources, in addition to being valuable, will provide the firm with long-term benefits because they are rare and, above all, anima. In terms of replication or substitution. Integration can be achieved using technological resources such as EDI systems or knowledge-generating resources such as cross-functional teams or group problem solving.

The former usually entails a specific and well-defined product that can be contractually protected, or else necessitates significant complementarities or historical endowments for competitors to replicate. The latter is a form of knowledge that is largely tacit, socially complex, temporally demanding, limited in mobility, and difficult to decipher and codify [5]. Intangible knowledge-based resources are more likely to contribute to competitive advantage and are less susceptible to imitation. Rents accumulate when resources and capabilities are resistant to replication by competitors, according to RBV.

As a result, we concentrate our efforts on the knowledge-creating and knowledge-based components of supplier integration. What is the various knowledge-based components of supplier integration, and how do they interact? Should they be considered a synergistic unit. Supplier integration is accomplished through a combination of internal purchasing–manufacturing and external supplier-related activities. Internal purchasing–manufacturing integration was co-opted into the scope of supplier integration for a variety of reasons. With today's outsourcing trends, a concept known as "co-makership" considers the supplier as an extension of the customer's factory, aiming for "seamless end-to-end" continuity between production, purchasing, and the supplier. Purchasing serves as a vital link between manufacturing and the supply chain, interpreting and communicating product plans and production requirements to suppliers while also allowing manufacturing to stay informed about supplier technologies, capabilities, and limitations. Internal cohesion and coordination are required as a pre-requisite for mutual interdependence between intraorganizational and interorganizational integration. Purchasing–manufacturing integration facilitates the access, transfer, and utilization of explicit and tacit firm-specific knowledge to purchasing from a knowledge-based perspective [6].

2. DISCUSSION

The findings back with our hypothesis and provide empirical evidence to the predicted curvilinear connection between supplier integration and performance. By distinguishing different negative utilities perceived in deviations from an ideal configuration, our results contribute to the notion of decreasing utility in operations. According to our findings, integration may be a double-edged sword, with indiscriminate use resulting in performance deterioration. The rule of decreasing synergies seems to be applicable to integration usage. The timeliness of the interaction between internal and external integration may be of interest, in addition to the importance of creating the appropriate configuration of integration techniques. When external integration is still in its infancy, it is possible that internal integration initiatives will have the biggest effect on performance [7].

When sunk costs are minimal and process owners may change direction without substantial transition penalties, internal integration is the greatest option for matching supplier and buyer capabilities. External integration may include asset-specific investments in supplier partners, such as EDI interface systems and other capital expenditures. Changes in buying habits and tactics may be simpler to accept and achieve at an early stage when no major investments have been made. As a result, an exclusive or dominating strategy to external integration may potentially be detrimental to performance.

We provide information regarding supplier integration dynamics and recommended sequence of actions to the literature on supply chain integration. The benefits of interactions and complementarities across resources have been shown in the literature, with the multiplicative impacts of practices and capacities frequently outweighing the gains from individually deployed practices. Although ambiguity and limited reason prevent complete insight into such interactions, the structure of the basic set of activities provides some broad options. The engagement of buying in corporate strategy formula576 is one of the six integration techniques. The other four activities are part of an external integration strategy: collaborative issue solving, creation of collaboration institutions such as buyer–supplier councils, extensive bi-lateral interactions, and supplier development. What's interesting is how these various integration methods interact with one another.

Ell ram and Carr identified three streams of strategic buying research in their assessment of the literature. Surprisingly, all three streams agree on one thing: the significance of integrating buying into company strategy. When purchasing participates in the strategic planning process, sourcing and supply chain management issues are taken into account when evaluating strategic options; when purchasing coordinates goal setting with manufacturing, key purchasing decisions for example, value partitioning, new supplier technologies are coordinated with the firm's other strategic decisions. Internal integration efforts are aimed at integrating strategic buying processes with the company's competitive objectives. recall many paradigms in the strategic sourcing literature. The development of buying from regular, clerical purchasing operations to a proactive, crossfunctional, integrative role in the business is a recurrent topic.

As a company's buying department matures, it shifts its emphasis from functional to strategic excellence. To achieve this objective, internal integration procedures offer a formal interface mechanism between buying and other company activities. A lack of buying integration will lead to a misalignment between purchasing methods and production objectives. A high degree of buying integration, on the other hand, will result in a greater alignment of purchasing methods

with manufacturing objectives, which will lead to increased performance. This is in stark contrast to the buying literature's conceptual frameworks that place purchasing integration as the last step in a firm's purchasing development Freeman phase IV stage" and Rack and Long's integrative" phase. Internal integration activities seem to need to be undertaken a priori or concurrently with the adoption of external integration techniques. In the supply chain literature, similar reasons for the desirability of concurrency in buying activities have been made. Internal integration may therefore serve as a catalyst in the development and deployment of external integration practices, creating and sustaining a strategic connection between these practices and competitive objectives at critical phases of buying development. Buying executives must thus expressly resort to internal integration methods prior to an external integration effort to guarantee the strategic relevance of purchasing activities with the supplier base [10].

What is a supplier integration profile that has been properly calibrated and, if Misfit is found, what can managers do to minimize it Is it true that Misfit in one practice has distinct consequences than Misfit" in another these are important topics to investigate.

Responding to the first question may be influenced by a variety of variables that were not explicitly included in this study owing to a lack of data or a small sample size. One might argue that the "optimal" degree of integration varies by industry, product life cycle, and manufacturing strategy [8]. The extent and depth of integration efforts would undoubtedly be influenced by a valuenetwork's competitive environment. Supplier integration has become a significant and competitive advantage as competition has evolved from intra-industry fights to struggles between whole supply chains. We created an "ideal" profile of supplier integration procedures and calculated the aggregate performance effect of departures. This specific combination of integration techniques cannot be used as a universal standard or template for blind replication. However, there are several signs that our profile is fairly robust: our sample included a diverse range of manufacturing industries, and our measure of deviation from the "ideal" profile ('MisFit') was consistent across different production process types, a proxy for industry type, as well as different production strategies. 6 In reality, managers would choose an "arrow core" of integration techniques in their strategic competitive area and create an "ideal" supplier integration profile for benchmarking and replication. A gap analysis would identify deviations from the profile of integration practices (both good and negative), and steps would be made to address them [9].

3. CONCLUSION

We've tried to respond to two key issues about supplier integration: How do some businesses outperform others when it comes to supplier integration? Is it possible that any of their success may be ascribed to them Regarding the way integration efforts are put together Rather than the substance of the activities, it is the way they are structured that is important. We came up with some general responses. We discovered that performance variability stems from both. Content and organization Supplier integration that works may be achieved by recognizing individual differences Practices of integration linked to performance and locating and installing such a configuration. Activities that are (are) specifically linked to optimal performance. The second point is more interesting.

About the consequences of over-investing in supplier integration According to our findings, a balanced approach toThe ideal path to performance is via supplier integration. Investing in supplier integration is a wise decision. ItHowever, it may be imprudent to continue in this

manner. Investing in a non-selective manner conceptually (and empirically), a stance in the middle exists. The ‘ideal' profile of synergistic integration investments to get the best results without a doubt, such ‘ideal' situations exist. Although the logic of equifinality suggests such configurations are not unique, our results indicate that they do exist. Probably in a variety of forms, depending on the situation. Industry and market conditions the notion of an "ideal" profile clarifies synergy. To be had in integrating decision-making it gives you a lot of options. Decision-makers may use a composite, multivariate benchmarking tool. The non-linear connection between ‘Misfit' and ‘Failure to Fit ‘and performance, underlines the need of recognizing Investment trends in integration for competitiveness analysis and benchmarking In theory, the concept of The notion of ‘domain' is brought to life through ideal profiles.

Companies use ‘navigation' to develop operational strategies that fit environmental circumstances the research has several caveats and limitations. The emphasis of our study was on a major supplier As a consequence, the outcomes are out of the ordinary. Interactions with less important aspects of the organization supply-base. We don't claim that the collection is complete. The practices shown as the study's "ideal profile" isgeneralizable outside the study's sample scope Awe may have made a hold out with a bigger sample. For cross-validation, take a sample. Replication in other countries surroundings would help to solidify the ideate concept of 'optimal' profiles is valid. Furthermore, our Purchasing integration techniques are not treated in the same way. Over the course of many investigations, a set of findings emerged. It’s possible that new integration techniques may develop that can be considered to formatively depict the supplier's 'arrow core ‘Practices of integration that are resistant to product differences as well as business. We basically demonstrate that the concept of a ‘ideal' is a fallacy. The degree of supplier integration is conceptually sound. This is backed up by actual evidence. This discovery has the potential to Future study on supplier-supplier relationships will be sparked. Supply chain integration and the broader concept integration, as well as the ability to locate and create Supply chain profiles that are ‘ideal' for long-term competitiveness advantage.

FEATURES OF TEACHING THE DISCIPLINE "INFORMATION TECHNOLOGY IN EDUCATION" IN HIGHER EDUCATION INSTITUTIONS

Asanova Uldaulet Sagindikovna*

*Nukus State Pedagogical Institute,
Karakalpakstan, UZBEKISTAN

ABSTRACT

The article discusses the features of teaching the subject of information technology in higher education, the conditions necessary to increase the effectiveness of teaching the subject, the problems associated with teaching.In the process of teaching the subject "Information Technology in Education" it is necessary to develop students' thinking, to gain their understanding of the role of computer science in the development of society, its importance in the social environment and professional activity. The subject of computer science is a new science in comparison with others, and its application in practice changes the direction of material and spiritual activity of man.

KEYWORDS: *Information, Computer Science, Information Technology In Education, Computer Technology, Problems.*

INTRODUCTION

Paragraph 4.4 of Annex IV to the Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No UP-4947 "On the Strategy of Actions for the further development of the Republic of Uzbekistan" related to development priorities . ensures the development of the social sphere, education and science. It is noted that the system of continuing education has been further improved, and the policy of training highly qualified personnel in accordance with the modern requirements of the labor market continues. This, in turn, places a great responsibility on higher education teachers.

In this regard, the formation of knowledge, skills and abilities of students in the disciplines and their professional training is an urgent task. Having sufficient knowledge of students about their future professions and becoming qualified specialists will help to determine the future of our country.

In the process of teaching the subject "Information Technology in Education" it is necessary to develop students' thinking, to gain their understanding of the role of computer science in the development of society, its importance in the social environment and professional activity. The subject of computer science is a new science in comparison with others, and its application in practice changes the direction of material and spiritual activity of man. The individual is an active subject in society, so it is necessary to study the consequences of the impact of computer science on man, taking into account and analyzing various aspects of informing society.

The subject of "Information Technology in Education" is an integral part of the subject of informatics, which is aimed at solving problems such as processing data found in all areas of human activity using hardware and software tools and methods. Therefore, problems related to informatics in general can be divided into 3 groups: 1) current problems of informatics, 2) philosophical problems of informatics, 3) problems of informatics.

1. Current problems of computer science may include special data processed by us, the creation of a programming language, information structure, units of measurement of information and their interpretation, as well as information modeling.

2. Philosophical problems of the science of "computer science" include questions of a philosophical nature: "What is computer science?", "What is information?", "What is the relationship and interaction of computer science with other objects and sciences?"

3. Information and philosophical problems of computer science means questions explaining the terms of informatics, theses and terms that are part of the philosophical categories related to the structure of information. In the process of teaching computer science, students gain the necessary understanding of the subject and expand their knowledge.

Because in teaching, understanding science, knowing, as well as the formation of new knowledge are philosophical processes. Education in the field of science, the assimilation of new information by students, shapes their rational knowledge. Our compatriot Abu Nasr Muhammad ibn UzlagTarhan, who was engaged in creative work under the pseudonym Farobi in the 9th-10th centuries, said that the learning process consists of two stages - mental and emotional perception, in particular, the process of cognition. The two stages are rational cognition and emotional cognition. These stages cannot be added without information and therefore information is an element that forms the basis of knowledge.

In his book The Dignity of Science and Art, Farobi emphasizes that the process of knowing nature is infinite, that knowledge of ignorance is the primary path to perception, and that you can achieve results by identifying the cause, and on this basis to further expand knowledge and deepening is available. Another compatriot in the Khorezmi an educational process paid great attention to the individual observations of students and the practical application of the acquired knowledge.

The object of study of information technology in the educational process includes: information, information processes, algorithms, computers, as well as hardware, software, etc. It is known that informatics is the collection, storage, processing of data using computer technology, analysis, evaluation, transmission and individual decision making.

By information we mean the level of reflection or its impact and connection through all our senses in our future consciousness. Knowledge is formed directly in the learning process and it means the study of scientific knowledge or scientific knowledge. Scientists A.I.Mikhaylov,

A.I.Cherniy, R.S. Gilyarevsky gave the following definition of the term "scientific information": scientific data are logical data obtained in this mental process, which can be used in socio-historical practice to accurately reflect the laws of the objective world.

Based on this, we can say that, first of all, man receives "scientific information" in the mental process, which is applied in practical work and can serve as a basis for science. Second, “scientific information” is logical information that is transmitted through human thinking through logical thinking and is formed as a result of processing information. Third, it illuminates the world sufficiently objectively, and fourth, it must be put into practice. For information to be scientific, there must be a continuous connection between the data. Gathering information about natural and weather events in different regions of our country cannot be “scientific data”. Because it does not satisfy the third condition.

Based on the above concepts, it can be said that the knowledge that students need to study in computer science is based on scientific knowledge and appears in the sequence “mixed → information → knowledge → scientific knowledge”.

The main object in higher education is the student. The main task of the training is to provide teachers with the necessary information related to computer science and to transform it into knowledge by students through in-depth study, comprehension, memorization and, if necessary, the formation of scientific knowledge through their application. in practice.

This process is led by computer science teachers on each subject. We see this in the example of the following topic: "Technology in MS Excel" in the process of teaching university students in the field of "School Management" These are: mathematical calculations, performing complex calculations, working with mathematical formulas, converting table data into a graphical view (diagram), the importance of using Excel, ya ' The ability to provide relevant information using the program.

The information given to students during the teaching of the topic is displayed on the screen and explained using a computer, projector and electronic boards. Students will be provided with all the necessary information on the topic using information and communication technologies. In these processes, data based on clear evidence provided by the teacher is converted into data. During the course, the topic is explored in the above order, and as a result of students' independent practical and laboratory work, using the Excel program tasks related to the work of the principal, the deputy directors for the management of the educational process school, e.g. the development of curricula, lesson schedules, the organization of science Olympiads, as well as the mastery of the sequence of their implementation, the data become knowledge.

Students will be able to perform tasks related to school management based on the knowledge they have acquired during the lesson, find solutions to problems encountered with the help of textbooks and the Internet, and ensure that the knowledge gained becomes scientific knowledge.

Consecutive study of topics by students in this order and their application in practice leads to an increase in their interest in science, to deepen their knowledge.

Therefore, teachers of higher education in the field of "Information Technology in Education" have a big task:

- Clearly define the purpose of the topic;
- Highlight the main concepts being studied, based on the purpose of the topic;

● Provide students with content relevant to the basic concepts using information and communication technologies;

● Assignment of relevant tasks in practical and laboratory classes;

● Supervise the study of the topic by students;

● Work with students who have not mastered the topic.

Students' responsibilities include:

● Study of data and information provided by the teacher;

● Implementation of theoretically studied concepts in practical and laboratory classes with the use of information and communication technologies;

● Analyze problems in the course of tasks and try to solve them;

● Use of textbooks, Internet sites to solve problems, as well as to make individual decisions;

● Write reports on the tasks performed and draw personal conclusions.

Teaching the subject "Information Technology in Education" in all areas of higher education, today the use of computer technology in science and education contributes to the development of the education system. As a result of in-depth study of this subject, students can gain in-depth knowledge in the field of computer technology and apply it in their future professional activities.

THE EFFECTIVENESS OF ENERGY TECHNOLOGIES IN THE DIGITALIZATION OF INDUSTRIAL ENTERPRISES

Bakhodirova Khilola Bakhodirovna*

*Doctoral Student of TSTU,
UZBEKISTAN

ABSTRACT

This article describes the energy efficiency of enterprises through the digitalization of technologies. Technological efficiency ensures the sustainability of economic regulation of fixed costs. Energy efficiency makes it easier for a company to manage energy with energy diagnostics and monitoring and control software backed up with financial tools to meet customer needs. This kind of transition requires current production standards to save costs and ensure a cyclical life of the productivity of goods and services. After a detailed analysis of their energy consumption, we evaluate, design and install advanced solutions to optimize energy consumption in their buildings and industrial facilities using monitoring tools and controllers, ultra-high LED lighting, heating, air conditioning systems that reduce energy consumption, and high-efficiency industrial boilers.

KEYWORDS: *Digital Economy, Energy Efficiency, Technological Advantages.*

INTRODUCTION

The 21st century is the age of information technology, but information technology also has its reproducibility, and this can be seen in the production of every potentially developing company. Today, energy enterprises are transitioning to energy efficiency through the digitalization of enterprises. Energy efficiency has gone into efficiency not only as an indicator but also as an economic category.

Energy efficiency makes it easier for a company to manage energy with energy diagnostics and monitoring and control software backed up with financial tools to meet customer needs. This kind of transition requires current production standards to save costs and ensure a cyclical life of the productivity of goods and services. After a detailed analysis of their energy consumption, we evaluate, design and install advanced solutions to optimize energy consumption in their buildings and industrial facilities using monitoring tools and controllers, ultra-high LED lighting, heating, air conditioning systems that reduce energy consumption, and high-efficiency industrial boilers.

Energy efficiency offers a kind of advantage for companies: it provides direct control from both the user and intelligent grid optimization systems through our plant charging site. Give your customers and / or users access to the best charging solution with JuiceNet Enterprise available for Android, iOS and web platform.

According to Schneider Electric, electricity consumption will increase by 80% by 2040, putting the world in a paradigm driven by this electricity demand.

Faced with this scenario, the company is turning digitalization into an Alternative for development in modern energy management and solutions. In infrastructure and real estate, the firm recognizes the integration of technology tools into buildings of all sizes and curves as a critical element for improved energy management.

“A properly managed building saves up to 50% on operating costs and energy,” said Tanya Kalinka, Director of Digital Energy at Schneider Electric in Mexico and Central America. “We estimate that 82% of buildings around the world can improve their energy efficiency, which opens up an area of opportunity for their owners.”

In addition, the brand has identified three pillars and characteristics associated with the energy digitization of buildings:

- Simplicity in technology: defined by standardization and mobile technology

- Energy efficiency

- Productive digitization: one where an Internet of Things (IoT) enabled service generates savings of about 20% per year

Speaking of the company, a proposal that offers customers the ability to transform their buildings into comfortable, sustainable and efficient spaces is EcoStruxure Building Operation. This platform enables real estate to be monitored, scaled and secured in a digital and intelligent scheme through three levels of operation: connected products, border control and analytics and services.

With EcoStruxure Building Operation, we want to maximize the performance of our clients' assets by transforming them into engaging, functional and connected spaces. The result is a building that functions properly, lowers operating costs, and has predictive maintenance analytics. All these features enable our clients to make strategic decisions based on reliable information, which ultimately increases the value of their assets.

Schneider Electric has released the Global Digital Transformation Benefits Report 2019, which provides concrete evidence of the power of digitization across the spectrum of global industry, commerce and the public sector. This proof takes the form of deep, quantifiable business benefits from a repository of 230 client projects the brand has completed over the past five years in 41 countries, all of which use the EcoStruxure architecture and platform.

The purpose of this report is to provide readers with a useful and realistic guidance on the potential of digital transformation in energy management and automation. At the heart of this report are 12 key business benefits of digital transformation, which fall into three categories, each of which is essential for effective market competition: capital cost (CapEx), operating cost (OpEx), and resilience, speed, and productivity. The report focuses on four key sectors of the economy: buildings, data centers, industry and infrastructure, which will revolutionize the way people live, work and play.

The evidence presented in the report confirms in the market that digital transformation is a costly capital investment proposal that involves new systems and complex integration into existing processes. The client projects examined in the report prove the opposite.

Research shows that digitizing engineering processes, for example, can save businesses and organizations an average of 35 percent in capital expenditures and time optimization. In addition, commissioning costs for new systems and assets can be reduced by an average of 29 percent.

The study also shows that digitization using Internet of Things (IoT) technology can lead to significant savings in operating costs, resulting in improved efficiency, reliability, security and resilience. Companies and organizations report an average energy savings of 24 percent as a result of digitization.

In industrial applications, digital transformation enables companies to do more with less - more productivity with less energy, fewer materials, and fewer work hours. The productivity gains - up to 50 percent - are the result of efficiency in energy management and automation throughout the value chain, from IoT-enabled tracking to automated production lines.

The global report includes a PROJECT IN Mexico with the Mexican Oil Company (PEMEX), a state-owned oil company, which has decided to leverage the digitization opportunities with a project to upgrade its natural gas metering sites. SCADA International, Schneider Electric's partner in the System Integrator Alliance, has installed SCADAPacks, intelligent remote terminals, providing the ability to check the volume of gas flowing through its pipes in real time, allowing them to better see the performance of their system. The benefits of this equipment include simplified configuration and historical reporting, guaranteed replacement equipment, and improved operational efficiency through intelligent maintenance.

Schneider Electric began its digital transformation journey several years ago. In 2009, Schneider Electric launched EcoStruxure, its open and interoperable architecture and IoT, plug and play platform. Now, with cloud and digital services, EcoStruxure delivers increased value in security, reliability, efficiency, resilience and connectivity. EcoStruxure leverages advances in IoT, mobility, discovery, cloud, analytics and cybersecurity to deliver innovation at all levels, from connected products, edge management, and applications, analytics and services. EcoStruxure has been deployed to over 480,000 sites, supported by over 20,000 system integrators and developers, connecting over 1.6 million assets under management across over 40 digital services. Based on EcoStruxure, 45 percent of Schneider Electric's global sales in 2017 were IoT.

The broader story of the power of digital transformation in energy management and automation follows from this report: as companies digitize both energy management and automation, they work together to deliver even greater and unprecedented value.

Digital transformation is the only way to ensure consistency and efficiency across the entire company. Technologies such as the Internet of Things, artificial intelligence and big data analytics are making companies more efficient and innovative, increasing their competitive advantage. The report says many businesses and organizations need robust authority to manage the complexity of unlocking the full potential of digital transformation. Powered by EcoStruxure, these technologies leverage the power of digitization, enabling our customers to be more efficient, secure, reliable, connected and resilient leaders in the new digital economy.

FOREIGN EXPERIENCE IN THE DEVELOPMENT OF INNOVATIVE ACTIVITIES OF ENTERPRISES IN THE ENERGY INDUSTRY

Bakhodirova Khilola Bakhodirovna*

*Doctoral Student of TSTU,
UZBEKISTAN

ABSTRACT

The article examines the features of foreign experience in managing innovative activities in energy enterprises. The need to remove special attention to the innovative development of energy enterprises in the context of the transition from a monopoly structure to a competitive model of the industry. Traditional strategies have focused on the regulator, capital investment, and customer service. Typically, these strategies are focused on regulatory compliance rather than market demand. Accordingly, energy companies preferred to proceed with caution and avoid taking on unfamiliar risks. However, the development of the structure of electricity and gas markets, as well as the acceleration of transformation, mean that conservative approaches to strategy development are not able to effectively position the energy sector in the economy of the future, the contours of which are still being formed.

KEYWORDS: *Energy Companies, Innovation Management, Energy Industry.*

INTRODUCTION

Over the past 30 years, electricity and gas markets around the world have changed dramatically as the role of market forces in the supply and distribution of energy has increased. Markets have opened, competitors have emerged, businesses have become more rational in their operations, companies that have long been present in the sector have merged, technologies have been improved, and consumers have begun to experiment with new functions.

Today, in a changed industry that retains its inherent reliability, the processes of shaping a completely different future for the industry itself and for its stakeholders are underway. Some international energy companies have already moved far from their previous business formats.

Traditional strategies have focused on the regulator, capital investment, and customer service. Typically, these strategies are focused on regulatory compliance rather than market demand. Accordingly, energy companies preferred to proceed with caution and avoid taking on unfamiliar risks. However, the development of the structure of electricity and gas markets, as well as the

acceleration of transformation, mean that conservative approaches to strategy development are not able to effectively position the energy sector in the economy of the future, the contours of which are still being formed.

Tomorrow's strategies need to be focused, aggressive and consistent despite the uncertainties. When developing them, it is necessary to take into account that insufficient awareness of the vector of transformations and their results should not limit the ability to accept all the challenges that will arise in the course of the sector's development in the future.

Successful market strategies are not limited to the largest energy companies many smaller businesses are strategically well positioned. However, the actions taken by the energy market leaders provide some insight into how the electricity sector can develop and what leverage is in place to deliver valuable and long-term market and financial results.

In addition, changes are hindered by the process of energy supply itself, which by definition is conservative, due primarily to the focus of energy companies on meeting the standard needs of the economy and the social sphere in energy resources. The rigid technological structure of the electric power industry, which does not allow deviations, also contributes to a decrease in flexibility in terms of mastering modern technologies and an orientation towards a universalized approach in solving industry development problems.

Another feature of innovation in the energy complex of different countries is the dependence of the directions of its implementation on the availability and cost of certain fuel resources, climatic conditions, requirements of national legislation on environmental preservation and other factors. This explains a certain differentiation of the priorities of innovation activities of foreign energy companies, the general range of interests of which covers a fairly wide area of scientific and technological development.

It should be noted that in recent years in the economies of many countries, conditions are emerging, under the influence of which the innovative development of their national energy systems is reaching a qualitatively new level. On the one hand, there is a general trend in the world of an increase in the cost of the main types of fuel for power plants and a decrease in its reserves, accompanied by a constant increase in demand for energy. According to the International Energy Agency, by 2030 the needs of the world economy for energy resources may increase by 55%, reaching 17.721 million toe. At the same time, global electricity consumption will increase even more rapidly, reaching the level of 29.737 TWh by 2030. All this leads to a significant increase in interest in improving traditional technologies for energy production and predetermines an active search for cost-effective areas for the use of renewable energy sources.

On the other hand, with the development of high-tech industries in the world economy, a change in the nature of demand in the domestic sector due to the growth in the use of digital technology, the requirements for the quality of the organization of the energy supply process itself are increasing, which, in turn, stimulates the emergence of a new generation of energy systems with improved characteristics. Reliability and efficiency of functioning.

These circumstances predetermined the emergence of innovative systems in the electric power industry, the structure of which is of a network nature, as evidenced by the wide geography of location and the institutional heterogeneity of their elements, as well as the wide range of ongoing innovative developments. The initiators of the creation of such network formations are transnational energy companies, whose scale of activity allows not only to concentrate

significant financial resources, but also to determine the optimal directions of their investment, creating the basis for flexible and operational management of the innovative development process.

The central element of such innovative networks is the internal research units of the largest energy companies, which, on the one hand, are aimed at realizing their own potential for scientific and technological development, and, on the other hand, they search for innovative developments created by third-party organizations and scientific teams.

The focus on using the results of external research is explained by the technological complexity of the electric power industry, which limits the ability of energy companies to independently carry out innovative developments across the entire spectrum of priorities for their scientific and technological development. At the same time, each major energy producer is interested in possessing unique competencies that provide him with a competitive advantage in any technological area, which necessitates his own research centers.

Unsurprisingly, at this point, utilities are taking on a fairly similar strategic action, as has usually been the case in the power sector. But the degree of strategic change and the corresponding levels of investment can vary significantly.

Over the next few years, we will see a dividing line between the most aggressive and innovative energy companies in the Top 40 and other peers. The degree of delimitation will allow investors to assess the value of the business of energy companies in different ways based on their strategies and achievements in the market.

Today, the Top 40 energy companies in Europe are outperforming their competitors in North America and the Asia-Pacific region, largely due to early policy changes and restructuring measures.

However, the Top 40 companies from North America and Asia-Pacific are following the same path as their European counterparts.

New business areas such as solutions and services, renewable energy, gas (and sometimes water) infrastructure, and distributed energy naturally create growth prospects.

In the coming years, the Top 40 leaders will include more acquisitions with the required competencies in their strategic initiatives, will increasingly forge partnerships with equipment manufacturers and solution providers, and innovate more in their business models.

The strategies of Top 40 companies provide a deep understanding of the sector's development vector. Although the vector of development seems to be well-defined, there is still the possibility of unplanned changes caused by possible changes in the current policy, accelerated technological progress and the impact on the market of new patterns of consumer behavior. All factors will contribute to the adjustment - both planned and sometimes unforeseen - of the outlined strategic course.

In recent years, the experience of countries around the world has shown that every strategic measure helps to overcome the problems in the development of the national economy. In particular, Eastern countries such as China and Japan will increase the economic efficiency of enterprises operating in the energy system by developing and expanding the green economy. For example, they are developing a green economy through the use of biotechnological devices, increasing the productivity of natural products (running greenhouses with modern technologies),

organizing production without violating the laws of ecology and the environment, and seeking ways to avoid polluting technologies. Its efficiency for energy companies is reflected in the production of energy from waste, the efficient use of wind and hydropower due to the improvement of the environment, and the expansion of solar energy production.

The experience of enterprises in the energy system in European countries shows that great attention is paid to improving efficiency through the development of digital technologies. In Germany, for example, special digital panel rugs are installed in the most crowded places, producing energy that is concentrated through the steps that walk through that rug. Many European countries are organizing construction projects to implement the same technology in parks.

In the U.S., however, companies operating in the energy system are to be commended, largely as a result of their practice with so many technologies. For example, recycling, redirecting waste to energy sources, wind energy storage devices in motorcycle fields, as well as redirecting to an energy source through the effective elimination of tornadoes in the event of a tornado.

The above technologies have been widely used in recent years in the construction of buildings and structures. Various new residences in the United Arab Emirates, using only solar energy, are widely used by electric cars for mountain trips in Japan.

Uzbekistan is opening the door to the flow of these technologies through the organization of various innovative projects, government programs and scientific competitions. Mechanisms to encourage investment and innovation projects to implement preferential, simplified and localization programs of the credit system are widely used in our country. In conclusion, it should be noted that the study of technology that corresponds to the infrastructure of our national economy, the selection of the most effective and the emphasis on its improvement in our country will help our country to join the ranks of developed countries.

ABSTRACT

Health care workers are increasingly using smart phones. Ophthalmological apps are readily accessible, and they may transform smartphones into sophisticated medical equipment. Smart phones may be helpful for evidence-based medicine, professional education, mobile clinical engagement, patient education, illness self-management, remote patient monitoring, and administrative tasks. Several apps are available to evaluate sharpness, colour vision, astigmatism, pupil size, the Amsler grid test, and other ophthalmological tests. For capturing pictures of the anterior and posterior eye segments, smart phones may be helpful ophthalmic equipment. With the usage of smart phones, professional literature and instructional information for patients is readily accessible. Smart phones are capable of storing large amounts of data and are helpful for long-term monitoring while maintaining patient anonymity. The use of smart phones as diagnostic instruments, in particular, is not standardized, and the findings should be carefully weighed. Smart phones are the future of ophthalmology and medicine because of their innovative role in research, teaching, and information exchange.

KEYWORDS: *Communication, Education, Eyes, Ophthalmology, Smart Phone.*

1. INTRODUCTION

A smartphone, often known as a smart phone, is a multipurpose electronic device that combines a mobile phone with sophisticated computing and networking capabilities. Smartphones offer sophisticated capability and the capacity to run numerous complex apps, browse the web, send and receive e-mails, produce and display pictures, videos, and office documents in addition to phone calls and text messaging. Smart phones have become more popular because of technological advancements, which have resulted in a greater number of accessible apps and lower prices. In 2012, there were an estimated 1-billion smartphone users worldwide, which is expected to rise to 1.75 billion in 2014[1].

Smartphone usage have increased significantly among health professionals, from an estimated 30% in 2001 to 64% in 2009. Currently, 86 percent of health professionals use their smartphones on a regular basis for a variety of reasons. Many commonly used tools for clinical assessment and education may be combined into one simple, portable interface for smart phones. Smart phones may be used for evidence-based medicine, mobile clinical communication, patient education, illness self-management, and remote patient monitoring thanks to medical apps[2].The goal of this essay is to show how smart phones may be used in ophthalmology in a variety of ways.

1.1 Applications of Smartphones in Ophthalmology:

Ophthalmological apps are transforming smart phones into medical instruments, with over 342 distinct ophthalmological applications accessible now. Between 2009 and 2012, there was a 9-fold rise in the number of surgical apps accessible for smart phones. There are now 621 surgical smartphone apps accessible, with 121 of them devoted to ophthalmology. The most popular platforms among healthcare workers are Apple's iOS and Google's Android. According to certain polls, the Apple iPhone is the most popular smartphone among ophthalmologists across the globe. There are a variety of smartphone apps that offer surgical exposure and familiarization with typical operational procedures, ranging from simple flashcards to virtual surgery apps[3]–[5].

The intended user may split smartphone apps into three categories: healthcare professionals, medical or nursing students, and patients. In the area of ophthalmology, smart phones may serve a variety of purposes, which can be divided into the following categories:

- Tools for evaluating patients.
- Visual aids for patient education.
- Information and education for health-care professionals.
- Patient records–tools for administration.

1.1.1 Instruments For Assessing Patients:

Different diagnostic instruments are used in ophthalmological examinations. These exams are simple to conduct in professional settings, but in situations such as outpatient or inpatient consultations, as well as emergency department visits, smartphone apps for various visual tests may be extremely helpful.Many apps may be used to evaluate patients.For pre-school children and ignorant adults, these apps may evaluate visual acuity using the Snellen visual acuity test or contemporary interactive visual acuity tests. Color vision, astigmatism, pupil size, Amsler grid test, oculomotor reflexes, a Worth 4 dot test and accommodation targets, red desaturation test, and OKN drum simulator are among the uses. It is worth noting that fluorescein light and pen light may be helpful in less-than-ideal situations. The examiner will have to raise the screen brightness to maximum and decrease the ambient light to minimum in these circumstances. Smart phones may be used as paediatric fixation targets since they are bright, have motion and sound, and can be utilized to amuse children[6].One of the most popular apps is “Eye Handbook,” which includes nearly all of the testing instruments listed above, as well as “iSight test,” “Vision test,” “Macula tester,” and “Color blind test.”

Figure 1: The above figure shows theMagnify photo adapter[osa-opn].

Smart phones have becoming more popular for ophthalmic photography. Cameras on the new generation of smart phones have a resolution of 5 mega pixels or greater, allowing users to take high-quality pictures. There are various photo adapters for smart phones that allow them to be used as ophthalmic devices to take pictures of both the anterior and posterior eye segments. When using photo adapters, make sure the camera on your smartphone is aligned with the optical axis and near to the slit lamp eyepiece. Adapters for taking fundus pictures via an undiluted pupil may be attached to the "Panoptic Ophthalmoscope." It is also feasible to take a good photo of the retina using only a smartphone and an indirect lens. The examiner may see the smartphone display and collaborate with other practitioners to assess real-time pictures of the anterior and posterior eye segments, as well as record and share the results. Without a statistically significant difference from subjective refraction, a smartphone with a pinhole adapter (Near Eye Tool for Refractive Assessment–NETRA) may be used to assess refractive error (Subjective Spherical Equivalent). When interpreting the examination findings, the examiner–ophthalmologist should keep in mind that the testing instruments are not perfectly standardized, thus eye care professionals should rely on their professional judgment and expertise. Figure 1 shows the *Magnify photo adapter[7], [8]*.

1.1.2 Visualaids For Patient Education:

Patient management includes not only examination and therapy, but also patient education to enhance the patient's knowledge of ophthalmic illnesses and their processes. The use of smart phones for clinician-led patient education in illness prevention and management is easy and effective. Instruction papers, pamphlets, and films are examples of educational resources that may be used to help patients better comprehend their illness.Smart phones can reproduce high-resolution pictures, movies, and office documents that include a variety of medical-related information. High-resolution pictures of different eye conditions may help patients understand anatomy and pathology, as well as treatment methods and choices. Patients may download the app and the educational materials on their smartphone, study the information, and show it to friends and family, freeing them of the effort of translating often-complex ophthalmological explanations[9], [10].

Several apps provide a list of common eye diseases seen in daily ophthalmology practice, along with a brief explanation of clinical characteristics and treatment choices. These details may be given to the patient and his family or even emailed to them. In this manner, self–diagnosis may be possible in certain instances without the presence of a professional. The “Eye Handbook” and

"IKONION" patient education apps are now the most popular. Physicians may e-mail necessary education information to patients straight from their smartphones using the "Eye Handbook," which is a fantastic feature. Patients with severe visual impairment may utilize voice–activated assistant apps to help them with everyday tasks.With the use of the Global Positioning System (GPS), smart phones may also be used to track and monitor handicapped patients

1.1.3 Education And References For Health-Care Professionals:

Healthcare workers must continue to improve their skills. It is tough to keep up with the newest study findings when you just have a few hours available for professional growth. With the use of information technology, such as smart phones, the most recent data and conclusions are just a "click" away from practitioners. Angle anatomy, diabetic retinopathy, retinal holes, optic nerve oedema, and melanoma are all readily accessible classifications and grading systems. Several applications provide users access to clinical trial databases and literature searches in biological databases like PubMed/MEDLINE. "Pub Search" and "PubMed on Tap" are two of the most popular database search apps. These apps also enable you to share information with patients and co-workers.

Other smartphone apps include movies and color atlas pictures, which are very helpful in the training process and the development of surgical abilities. These apps may assist with patient follow-up, intraocular lens (IOL) calculations, and surgically induced astigmatism (SIA) calculations. A list of diagnoses not to miss, with definitions and differential diagnoses, a color–coded map of retinal drawings, questionnaires for frequently seen ocular diseases, and a review of benchmark randomized control studies in ophthalmology are just a few of the applications available.

1.1.4 Administrative Tools For Patient Records:

The number of smart phone apps that may be utilized in medical is steadily increasing. With the usage of smart phones, communication between doctors and hospitals is increasing all the time. In the area of ophthalmology, the dynamic interface offers a lot of promise for future development. Hospital Information Systems (HIS) applications provide safe access to patient data. These apps, such as "OsiriX" and "MEDITECH," allow for the safe transmission of information from a hospital's picture archiving and communication system (PACS) to another physician and from one location to another. Other relevant information may be transmitted as well, such as visual acuity and intraocular pressure readings, eye pictures obtained with a mobile or stationary ophthalmic camera, optical coherence tomography results, corneal topography images, or even the patient's entire electronic health record (EHR).

Tele-ophthalmology is the use of electronic communication and information technology to offer or assist a wide range of eye-care-related tasks. Smartphone apps allow real tele-ophthalmology to be used, and it covers a wide range of medical tasks, including diagnosis, treatment, prevention, teaching, and research.The transferred data may be examined in depth later or compared to prior results. Tele-ophthalmology allows eye treatment to be provided regardless of location or time. It is worth noting that certain apps that deal with coding diseases according to the International Classification of Diseases–9 (ICD–9) may be very useful and timesaving.

1.1.5 Smartphones And Distributed Eye Care:

The restoration of near-sightedness, which affects an estimated two billion individuals globally, is a basic illustration of this effect. Because current treatments require a skilled optometrist,

costly equipment, or both, only a small percentage of those patients have access to excellent eye care. Consequently, an estimated 517 million people suffer with uncorrected near-vision impairment that interferes with their everyday lives. Uncorrected far-vision impairment affects another 153 million people. Uncorrected refractive problems (vision poorer than 3/60 in the worse eye) are the second largest cause of blindness. Moreover, about 87 percent of those afflicted reside in poor countries. The cost of lost productivity due to uncorrected refractive error is estimated to be between US$88.7 and US$133 billion globally.

Smartphones have the potential to reduce these unnecessary economic and social costs by bringing basic diagnoses to places where there are no skilled optometrists or costly equipment. The Near Eye Tool for Refractive Assessment, or NETRA (Sanskrit for "eye"), is one noteworthy example, which utilizes a pinhole adaptor and software to measure refractive error (subjective spherical equivalent). Furthermore, the findings of NETRA do not reveal a statistical significance from the results of traditional subjective refraction examinations.NETRA is a project of the Massachusetts Institute of Technology's Media Lab that works with an ersatz version of the Shack-Hartmann acoustic sensor, an adaptive optics instrument used to characterize corneal aberrations and other optometric applications. In the clinic, traditional Shack-Hartmann systems utilize laser light reflected from the back of the eye; the laser and the Shack-Hartmann sensor are both costly and need precise optical alignment by a skilled operator. NETRA, on the other hand, utilizes a clip-on eyepiece and a smartphone display instead of an aiming laser light source, which saves money and even allows for self-evaluation while still giving data similar to clinical systems.

In this method, the individual stares at the phone display from a close distance and aligns (overlaps) patterns on the screen. The alignment task provides a measure of the optical imperfections of such areas since the light beams from these patterns travel via various parts of the visual system. The system calculates the relevant refractive error for myopia, hyperopia, and astigmatism after the patient performs this process for a few meridians with adequate pattern variation. The clip-on eyepiece is expected to cost $2.00 USD. Clearly, this approach may be extremely helpful in distant fieldwork or in rural or low-resource situations when there is no access to an ophthalmologist.The technique of divergent photo refraction, in which refractive correction is calculated from the shape and brightness of the crescent of light reflecting off the eye's inner surface, or fundus, is another way for determining refractive error. The camera flash on the phone is utilized to flood the retina with light. This may be used to rapidly evaluate the refractive condition of the eye in large groups of individuals, such as in poor countries, and among patient populations, such as the elderly and babies, where communication may be a problem.

2. DISCUSSION

The author has discussed about the use of smart phones in ophthalmology, Apps for ophthalmology are widely available, and they have the potential to turn smartphones into powerful medical devices. Evidence-based medicine, experts and business, mobile clinical contact, patient education, disease self-management, remote patient, and administrative chores may all benefit from smart phones. Sharpness, color vision, distortion, pupil size, the Amsler grid test, and other optometrists' exams may all be evaluated using applications. Smart phones may be useful ophthalmic equipment for taking photos of the anterior and posterior eye parts. Contemporary research and instructional material for patients are easily available because to the widespread use of smart phones. Smart phones can store many data and are useful for long-term

supervision while keeping the patient's identity hidden. The use of smart phones as diagnostic tools, in particular, is not standard, and the results should be evaluated carefully.

3. CONCLUSION

The author has discussed about the use of smart phones in ophthalmology, Smart phones have already had a significant effect on ophthalmology and general medical practice. Smartphone applications are becoming more widely accessible, and ophthalmologists are growing more comfortable with using them in their practice. Smart phones are the future of ophthalmology and medicine because of their innovative role in research, teaching, and information exchange.

THE BRIEF REVIEW ON THE STRUCTURE OF THE DRIVER SUPPORT IN AUTOMOBILE

Arun Kumar*

*Faculty of Engineering,
TeerthankerMahaveer University, Moradabad, Uttar Pradesh
Email Id -arun.engineering@tmu.ac.in

ABSTRACT

In today's society, injuries are more common than ever. It's past time for us to come up with a plan to stop it. Our article considers how to reduce the dreadful events that have such a huge impact on precious lives. We don't have a sophisticated system in India that would make it simpler to track occurrences. With this post, we've taken the effort to track the horrifying occurrences that are on the increase. Our article focuses on avoiding collisions on twisting roads, which are notorious for causing the majority of accidents since the driver on one side is oblivious of the car coming from the other. The first is scalability, or if the findings obtained from simulated driving data can be scaled to actual circumstances using real sensors. The output from real sensors, unlike the 'high-level situational awareness' that we receive from the simulator, will be unexpected and low-fidelity.

KEYWORDS: *Autonomous, Road Accident, Safety System.*

1. INTRODUCTION

Road accidents are the consequence of a complex interaction of variables such as the length of the road network, the number of vehicles on the road, the human population, and the enforcement of road safety regulations, among other [1]. Road accidents result in injuries, fatalities, disabilities, and hospitalization, all of which have major social and economic consequences throughout the globe. As a result, road safety has become a national and worldwide priority. From 4, 89,400 in 2014 to 5, 01,423 in 2015, the total number of road injuries increased by 2,5 percent. From 1,39,671 in 2014 to 1,46,133 in 2015, the projected number of people murdered increased by 4.6%[2].

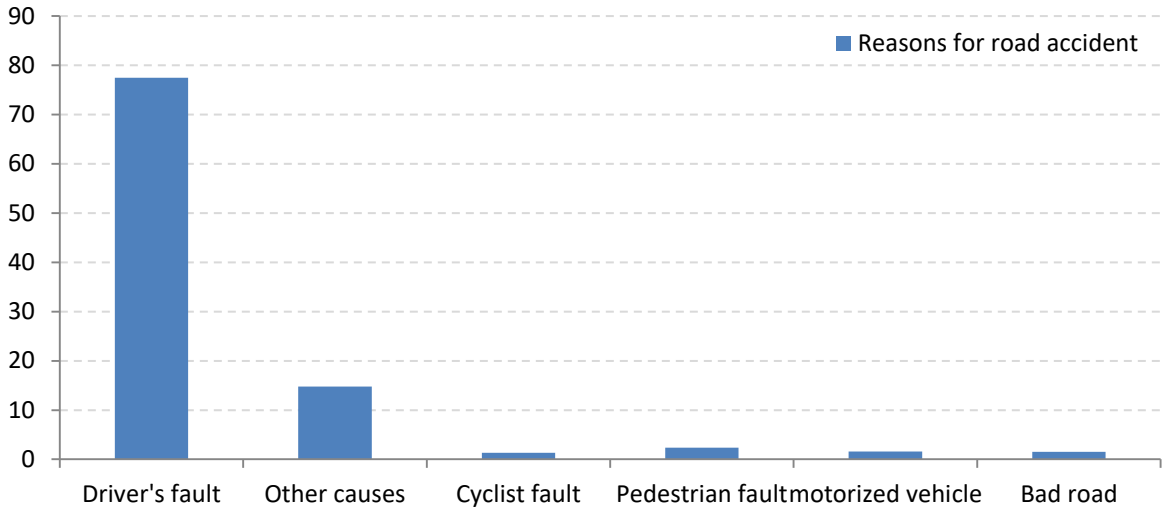

Figure 1:Reasons for accidents on road[3]

Accidents on the road have increased by 1.4 percent, up from 4%. The severity of the accident (number of persons killed per 100 occurrences) increased from 28.5 in 2014 to 29.1 in 2015. It also shows that there are 57 accidents and 17 fatalities every hour on average in our nation due to traffic accidents. In India, a traffic accident claims the lives of one person every four minutes. In India, severe traffic accidents occur every minute, with 16 people dying every hour on Indian roadways. Every day, 1214 road accidents occur in India. The state of Tamil Nadu has the greatest number of traffic accidents (figure 1).

1.1 Architecture ofthe System:

There are three main purposes of the driver assistance and safety warning system:

1.1.1 For safer and quicker driving, have suitable just-in-time information on the vehicle, the road, and the surrounding environment.

1.1.2 Passively notify the driver if his or her vehicle is in a hazardous state.

1.1.3 Warn the driver of potentially hazardous situations based on the vehicle's current position, orientation, and speed, as well as the route or surrounding conditions [4].

The driving agent serves two purposes. One is the driving assistance feature, which uses a high-acceptability method of drawing attention and revising driving operation suggestions while driving. Another feature is the reflection assistance function, which analyzes his or her driving habits and offers feedback in the form of good/bad driving scenarios, guidance remarks, and a short movie based on the assessment[5]. The driver agent uses these support systems to make the elderly aware of their own driving conduct and helps them to improve it. Figure 2 depicts the prototype driver agent's system setup. The system obtains driving operational data from the Controller Area Network (CAN) and facial direction via the use of a facial recognition software (face API, Seeing Machines). Furthermore, the agent uses onboard sensors and GPS/map information to determine the distance between the vehicle and obstacles such as a stop line and a pedestrian. The assistance material is determined by the control module based on the instructors' teaching model derived from the aforementioned data[6].

One of the most significant applications of artificial intelligence is autonomous driving. Autonomous cars are equipped with cameras, algorithms, and control systems and are intended to drive themselves with little help from human drivers [7]Continuous progress has been achieved, with some self-driving cars achieving outstanding outcomes. However, we agree that autonomous cars will take some time to become a reality. Meanwhile, smart cars, which are sophisticated driver management systems that are controlled by people, seem to be more promising [8].In this spirit, we're working on the Driving Advocate, an intelligent driver assistance system" (DA). Smart cars need a lot of the same technology as autonomous vehicles, such as camera, vision, and image processing systems, meaning and situation comprehension, mission modeling, and inference and decision-making capabilities. Designing an autonomous car, on the other hand, necessitates the use of external technologies such as user simulation, purpose detection, and human factors since the system must interact with the human driver. One of the challenges here is that each drivers' driving behavior varies widely, thus the driver assistance system must be able to react to each driver's unique characteristics [9].

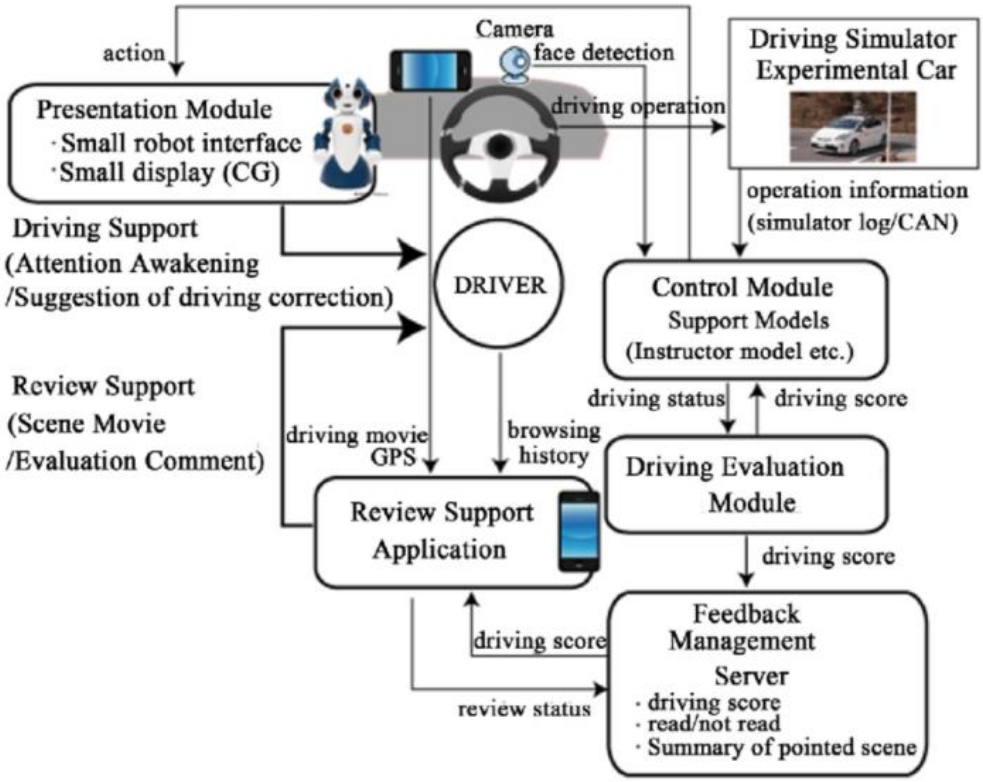

Figure 1: Structure of Driver-Agent System.

2. LITERATURE REVIEW

The driver assistance device was developed with two concepts in mind: car-to-vehicle mutual service and engagement to lessen the driver's workload and minimize the risk of injury. This addressed the question of whether such systems will lower driver morale or cause other issues of this type [10].

3. DISCUSSION

The driving agent has two functions. One is the driving aid function, which draws attention and revises driving operation recommendations while driving using a high-acceptability approach. The reflection aid function is another feature, which analyzes his or her driving behaviors and provides feedback in the form of good/bad driving situations, guiding comments, and a short movie based on the evaluation. These support systems are used by the driver agent to make the elderly aware of their own driving behavior and to assist them in improving it.The system uses a facial recognition program to collect driving operational data from the Controller Area Network (CAN) and facial direction (face API, Seeing Machines). In addition, the agent utilizes onboard sensors and GPS/map data to calculate the distance between the car and obstacles like a stop line and a pedestrian. The control module determines the support material based on the instructors' teaching model, which is generated from the aforementioned data.

Autonomous driving is one of the most important uses of artificial intelligence. Autonomous automobiles are vehicles that are outfitted with cameras, algorithms, and control systems, and are designed to drive itself with little assistance from human drivers. Continuous progress has been made, with some self-driving vehicles producing exceptional results. We do agree, however, that self-driving vehicles will take some time to become a reality. Smart vehicles, on the other hand, which are sophisticated driver management systems controlled by humans, seem to be more promising.

4. CONCLUSION

Safety systems are designed to prevent accidents and injuries by providing equipment that notify the driver of potential issues or halt collisions by enforcing measures and seizing control of the vehicle. Autonomous driving will be the future feature. The structure will be improved in the future, and the design will be used in advanced truck driver training. It would bring together a variety of approaches to adopting e-learning solutions, serious sports, realistic simulations with real cars, and simulator-based testing (both high-end and low-end). Individual acquisition of gained abilities is pursued throughout the training phase. This allows for more personalized learning methods and lengths. A key element of the definition is the pre-testing of drivers and the planning of training. Electronic stability control (also known as cornering break control), intelligent cruise control, and forward collision avoidance technologies are all available to less experienced pilots’. Frequent-Sleep Warning and Adaptive Headlights for Night DriversI'll wrap up this presentation by discussing a number of intriguing issues that we've encountered or may experience throughout the transition process. The first is scalability, or if the findings obtained from simulated driving data can be scaled to actual circumstances using real sensors. The output from real sensors, unlike the 'high-level situational awareness' that we receive from the simulator, will be unexpected and low-fidelity.

ABSTRACT

This article is a food in the country used in the countries of the world in the developmentof effective and efficient ways reflected the characteristics of the country, the use of internationalexperience of the selection proposal. The role of human resources in the efficient development of energy supply was also analyzed.

KEYWORDS: *Energy Supply, Engineers, Strategic, Resourcesaving, World Experience, Human Resources, Technological Modernization.*

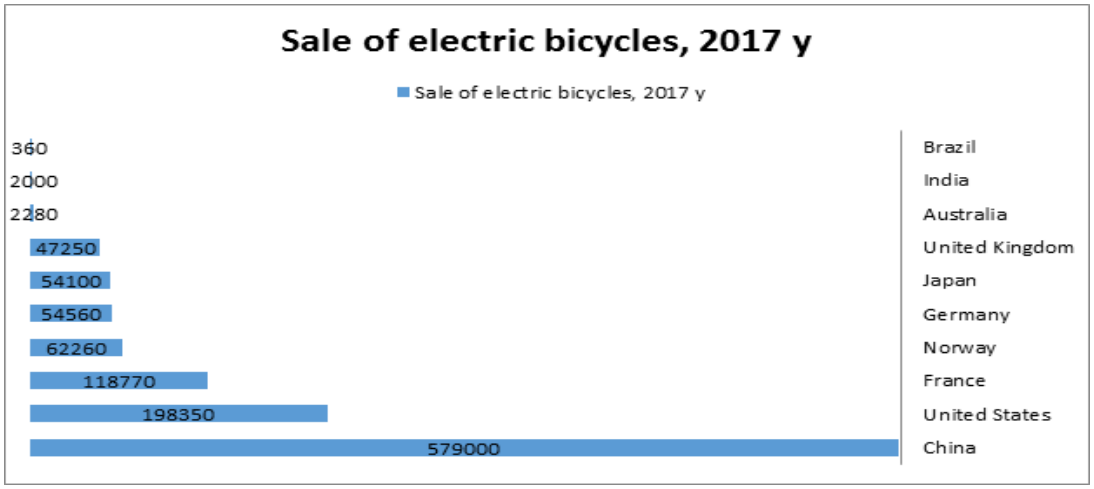
1. INTRODUCTION

See the power to put the modern economy in focus in the world. It is enough to give anexample of the proposal of the social layer in highlighting the importance of power supply. But justas any proposal has its own costs and labor, as in the case of energy supply, this issue is one of themost important aspects in regulating the economy. Eletr energy supply e provides growing shareof vertical services. Demand for electricity will grow in direct proportion to household income growth, and will also play an important role in the electrification of transport services, the electrification of services in related fields, the expansion of living conditions and the wide spread use of opportunities.

In addition to global environmental measures, including electricity, it has the largest share of industry in the world. Despite the fact that the growth of electricity is one of the main reasons for the extremely high level of global atmospheric missions in the energy sector in 2018, the commercial availability of various mission technologies did not negatively affect electricity consumption. But while attitudes toward electricity are growing, environmental transparency isachievedthroughacenturies-old pandemic, which means that people in most countries have stopped production as a result of a quarantine lifestyle. as well as the results achieved by chemicaltechnologies that cannot ensure the quality of environmentally friendly products. Although thistemporary situation does not affect the growth of the ecological taste of electricity,

it inhibits somenegative effects on environmental pollution. In addition, renewable energy plays an important roleinprovidingelectricityforall.[1]

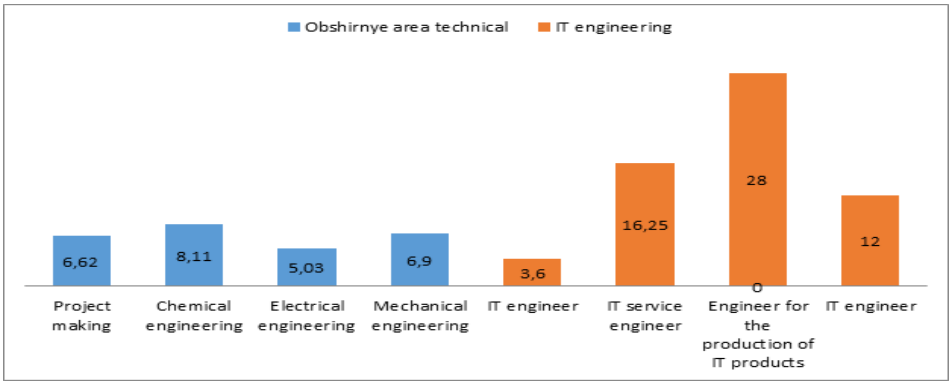
There is a joke among the Jewish people: the profession that causes the most disasters in theworld always pays a lot of money to its employees. This joke can also be used as a proverb in theeconomic language. The negative aspects of the environmental impact of electricity supply werementioned above. Energy is one of the highest paid professions. Seventh place in the ten most highly paid professions in the world is occupied by specialists in this field.The cartakes the first time, energy 7 places b will die in the near future, their first opportunity to stay after the forecast.This is due to the fact that in the near future a wave of refusal to use oil and gas products will beginin engineering. The reason for forecasting the future of electric power and engineering can be described by the following statistics (Figure1).



Saleofelectricbicycles,2017y

Source:ForbesStatisticalElectronicJournal,2017

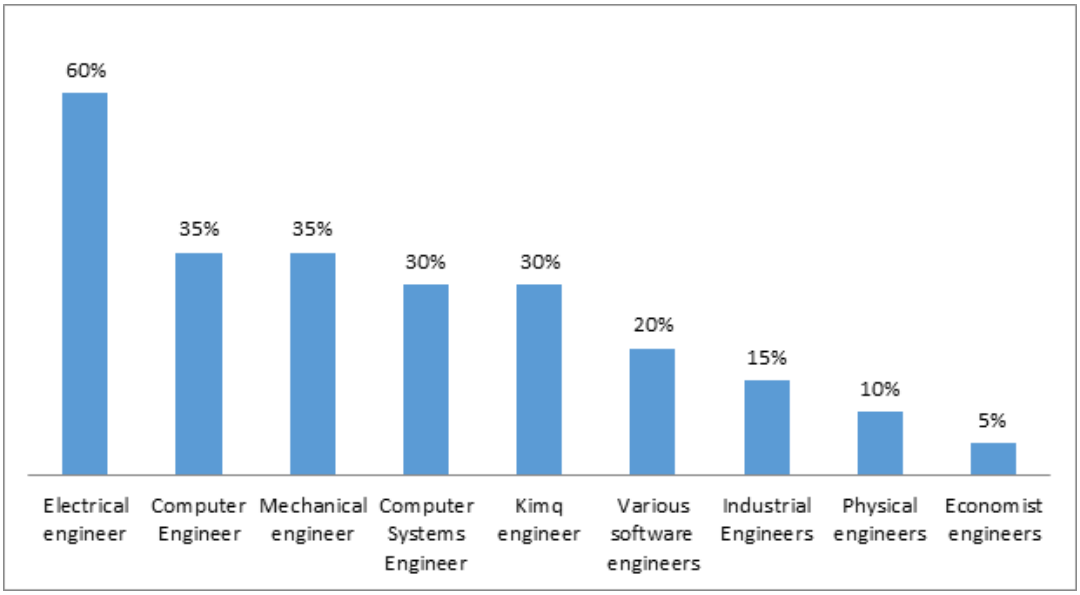
Electrical engineers have a unique reputation in manufacturing new and improved electronics,components and equipment. They also test and solve problems with existing electronics. Lectureengineers work to solve problems and provide internal structure and electronic acoustic wires tocars, robots, generators and a navigation system with so many products and systems working in.They also develop and assemble new products, test safety products, and oversee the installation ofcomponents.[2]



Manycreatetechnicaldrawingsandspecificationswithinstructionsandproperoperation.Thiswillleadt othecreationofacceleratedcentersoftechnopolisesandtechnologyparksfortheinnovation market. In the top ten most innovative products in the world, information technologyoccupies the first place, the textile industry takes the second place, and the third place is energy andalternative energy supply. [3] occupy the corresponding products (Fig. 2). To become an electricalengineer requires a bachelor's degree in electrical engineering. The salaries of electrical engineersrangedfrom$84,500to$128,610peryearin2018,accordingtoForb100magazine.[4]

We can cite the work of power engineers and their hard work on the example of worldstatistics.(3-figure).

Figure 3 Level of demand for professions when filling vacancies in enterprises around theworld(inpercent)



Source:https://yearbook.enerdata.ru/

Due to the demand for this profession among the countries of the world, high monthly salariesarealsocharacteristicoftheirtariffs.Accordingtointernationalexperience,intheimplementatio nof energy supply in our country, the concept of integrated socio-economic development of theRepublic of Uzbekistan until 2030 is included. The concept of sustainable economic development inthe future may depend on risks and threats, analysis of the main results of energiyata'minotdapotential in terms of the following conclusions: in the field of human resources, the rapidly growingconditions for the problem of employment in the creation of new production capacities in order tocreate favorable conditions for doing. The long-term nature of the decision is determined by thecurrent structural deformation of the country's economy, characterized by the backwardness of thetechnological base of key industries, the direction of export of raw materials and high levels of grossvalueaddedinagriculture,highenergyandresourcedensity.

First of all, when implementing power supplies, attention should be paid to the introduction ofdevices that produce electrical equipment. In this regard, countries such as China, Japan, the UnitedStates, Russia, Japan, India, even managed to use electrical devices in the sea and in the air. Theincrease in energy supply is associated with urban sprawl, population growth and

populationgrowth, as well as an increase in the number of production and service enterprises. However, in thecontextofthecountry'sstrategicdevelopment,thedevelopmentconceptprovidesfortheintroduction of energy equipment in the implementation of energy supply and heat energy, aconservation complex, small towns, gas processing plants together with closed heat supply systems.Andtheexpectedresultisexplainedbythefactthatitleadstolowerenergyprices.

The most useful aspect of observing international experience is that each country can applytechnologically,strategicallyapplicablepracticesdependingonitsclimateandgeographicconditi ons. In recent years, the United Arab Emirates has been striking the world with its largefacilitiesandnewsettlements.Duringtheconstructionofcitiesandbuildings,attentiontoenvironm ental issues and energy supply is taken into account at a high economic level. This solvedtheurgentproblemsofenergysupplyofcitieswiththehelpofsolarenergyandthecorrectorganizati onoftheworkforceinmaintainingtheergonomicsofshadedplacesandacleanenvironment in ensuring their environmental cleanliness. Of course, innovative technologies wereused at a high level. Our country has many advantages in using solar energy. It can be usedeffectivelyandefficiently.

ChangesinGermany'senergysupplyareexplainedbytheconceptofenergyshifts.Inaccordancewithth econceptofenergyrotation,theGermangovernmentunderstandsthepostpennyyotkazmovefromtheus eofiskopaemogouglevodorodnogotoplivaiyadernoyEnergyIpochti polnyy perexod on eyo vozobnovlyaemy istochniki. As part of this concept, for 2020 it isplanned to increase the share of electricity received from alternative sources to 35%, and in 2030,2040 and 2050 - to 50, 65 and 80%, respectively. [5] According to data at the beginning of 2019, theshare of “clean” energy will be more than 40% [6] of the generated electricity, the bulk of which isproduced in the solar and second energy sectors, which indicates a more active development of thisindustrythanwasplanned.

China has modernized all systems associated with this problem when it analyzes the economicinfrastructureofitslaboriouseffortstomaximizeenergysupply,determiningthatthemaincon sumersofelectricityareenterprisesinneedofmodernization,outdatedvehiclesandorganizations with outdated energy-saving equipment, and low-income populations. density. andenergy efficiency. However, since the environmental problem remains, it has been working for thepast ten years, moving on to the path of building eco-cities, paying particular attention to theimplementation of the acquisition process in relation to environmental funds.Singapore is also a country that has achieved unique successes in energy supply, and its experiencecan promise very effective and efficient results in the economic structure. The power supply of thiscountry includes systems specific to its segment: power supply to remote and isolated territories,commercial and industrial micro-grids, power storage systems, demand management, consumerservicesintheenergysectorasawhole.[7]

TheIndianexperiencehasbeenadaptedtothespecificsoftheprovincesandstates,thegeographicallocat ionandclimateofthevillages.Hydropowerisaccessibletoflood-pronepopulations, while wind energy works where the wind is efficient (hydro and wind are usuallylocatedclosetoeachother)andalsoprovidesolarenergy at almost all points.Development in the energy sector, companies need to restructure their experts - they should befocused on. Characteristics of equipment to ensure compliance with technical experts in the field ofskill management, analytical and commercial specialists who are entitled to demand his abdomen.This problem exists in all countries. This can be seen in the Colombian project on

energy efficiencyand the rational use of alternative energy sources. According to him, the emphasis on increasingintellectualinvestmentwillbestrengthened.

Older cadres in the field of labor and energy will become more and more to threaten progressin current work. This is only due to energy companies getting worse. This issue has also led toactions that run counter to HR models. For example, the Japanese model of lifelong employment isthe opposite. The new generation Singaporean model of personnel management is very youngbecause it could be. The experience of Russia in this world is enormous. However, the level ofimplementation of his projects is high, mainly due to the recruitment of personnel from foreigncountries.

The requirements for using a renewable power plant are different from those for a traditionalpower plant, and this requires new approaches. This requires the development and involvement ofstaff. This will increase the potential of Japan's skilled personnel globally. In it, the implementationof the teacher-student tradition plays an important role in the desire of employees for the future,withoutlosingtheexperienceoftheirteachers.

Thedevelopmentofenergycompanieswillleadtotheemergenceofnewmanagerswhowillbe able to manage the radical changes that should happen in the near future. When training themost experienced managers, constant competition goes to universities. This applies to countriessuch as the United States, Germany, Japan, India, Singapore, Norway, China, France and the UnitedKingdom. These personnel projects, which are formed in the learning process, are determined notby the internal order and strategic secrets of educational institutions, but by the potential of teachersandstudents.Mostteachersindevelopededucationalinstitutionsareinterns.Theyattractemplo yees with high results in practice. In practice, the essence of this change in energy companiesand new prospects or services may require the creation of a new innovative culture, as well as theneedsoflocalconsumersandthedevelopmentofastrategyfordevelopingcooperationwithregionalb odies.

Using these literature selection criteria, twelve articles were identified for review in furtherdetail,includingsixstudiesfocusingonbuildingfoundations,fiveontheconstructionphase(and/ orconstruction-
orientedproduct),andoneonthebuilding'stotallifecycle(Table1).Theassessmentofthesetwelvearticl es,withvaryingsystemboundaries,isintendedtoprovideanoverarchingpictureof the most recent application of LCA to the construction of building substructures. The aim was topresent results useful for communication about sustainable building construction and geotechnicalworks between stakeholders (e.g. LCA practitioners, geotechnical engineers, foundation designersand contractors),andto facilitatethe broader applicationofLCAresults atdifferentlevels ofplanninganddecision-making.

This process will not be easy for an industry that has long focused on safety and reliability.However, if energy is associated with change, taking a place in your areas of priority need if youwanttosolveit.

In conclusion, it should be noted that the effectiveness of many projects to introduce energysupply today is determined by human resources, the level of their innovation and the correctness oftheir application. At the same time, the most long-term and successful strategy is the fact that thecountry plans to implement and aims to meet the needs of its population without any financialconstraintstomeettheirneedsinthefuture.

THE IMPACT OF CONTINUITY AND CONTINUITY BETWEEN DISCIPLINES IN EDUCATION ON THE QUALITY AND EFFECTIVENESS OF EDUCATION

G. H. Nigmatova*

*Deputy Director,
Ph.D,
Bukhara Regional Center for Retraining and Advanced Training of Public Education,
UZBEKISTAN

ABSTRACT

The issue of continuity and continuity in education plays an important role in the formation of the child's personality, prepares students for social life and work, as well as provides a thorough acquisition of knowledge, skills and competencies necessary for further education.

KEYWORDS: *Continuity, Continuity, Relevance, Educational Standards, Competitive Personnel.*

INTRODUCTION

The experience of the development of world education shows that the development of society is closely linked with the improvement and development of education.

Continuing education is the basis for the training of qualified, competitive personnel, which includes all types of education, state educational standards, the structure of the training system and its operating environment.

It is known that the State Education Standards stipulate that the principle of continuity and continuity of the system of continuing education is mainly related to each independent type of education and other types and stages of education. At this point, each type and stage of education has its own characteristics, and it is clear that the transition from the previous to the next requires special training from the teacher and the student to be effective. Such problems exist mainly in addressing the issue of continuity, continuity and interdependence between disciplines in the organization of the content and process of education between secondary general education and secondary special, vocational and higher education institutions.

The issue of continuity and continuity in education plays an important role in the formation of the child's personality, prepares students for social life and work, as well as provides a thorough

mastery of knowledge, skills and abilities necessary to continue learning in the next stage of education. At the same time, the study of disciplines in a coherent, coherent manner opens up a wide range of opportunities for students to master their knowledge at all stages of education, from primary education to the continuous development of thinking, memory and creative imagination and the realization of individual abilities.

The establishment of interdependence, interdependence, and consistency between types of education is based on ensuring continuity between disciplines (subjects), chapters, topics, teaching materials. Therefore, to ensure continuity between topics that cover the basics of all disciplines in education, to select teaching materials in accordance with the characteristics of individual age groups of students, to place them on the basis of a certain logical sequence, interdisciplinary interdisciplinary coherence and coherence; creates a problem of substantiation.

Integration in education manifests itself in two forms. First, consistency and continuity between types of education (joints). At the same time, the content of the next type of education partially duplicates the previous one, and in terms of content, it is improved in its subsequent types of education, and the connection continues. Second, consistency and coherence between academic disciplines and topics. This is usually done through interdisciplinary or interdisciplinary links.

Teachers have the following views on ensuring continuity in education:

• In order to ensure full integration in the general secondary education system, it is necessary to work on the basis of the following principles:

• Subject curricula in general education meet the requirements of the STS; compliance with the social order;

• Reflection of theoretical knowledge of the national idea, national ideology; ensure the integrity of students' learning activities;

• Vertical and horizontal continuity in the program; the topics included in the content of the program are selected to form the worldview of students, their interest in learning;

• Correspondence of the existing loads in the program to the psycho-physiological characteristics of students;

•Guidelines for the integration of teaching in the implementation of interdisciplinary communication are reflected in the program;

• The program takes into account the instructions for the use of information technology;

• Placement of program materials on the principle of simple to complex; as well as the grouping of program materials based on thematic, problem-themed, historical principles, and so on.

Integration means the placement of educational material in a certain sequence, systematization, reliance on existing knowledge in the acquisition of knowledge, the application of educational material in certain stages, the duration of the stages of the educational process. This event promotes the effective selection of activities for the placement of materials of the subject and the basics of the subject (science). It should be noted that the following factors play a role in this process:

• The logic of the content of a particular subject (aspects that determine the existence of membership in the subject);

• Concepts, laws and arguments that make up the content of the subject;

• Actions that ensure the gradual disclosure of the essence of the knowledge of a particular field, first and then mastered in an organic way, on the basis of a certain sequence;

• The laws of the process of acquiring knowledge (actions, actions that do not allow the didactic processing of knowledge of a particular field directly into the subject).

Integrity is about ensuring that the types of education, interdisciplinary and interdisciplinary interrelationships and relationships are properly taught. The concept of continuity characterizes the requirements for students' knowledge, skills and competencies in each type of continuing education system.

Using interdisciplinary links in the classroom helps to systematize and deepen students' knowledge, to develop their independent learning skills and competencies, as well as to transfer the knowledge acquired at a lower level of teaching to higher levels.

Seminars and practical classes, in particular, are a method of teaching that ensures the exemplary interaction of the native language and literature and other disciplines in the context of secondary schools. It allows you to optimize the learning process, to realize the interdependence of disciplines in the native language and other areas of literature.

In general, if we gradually deepen the knowledge of the native language and literature, following the didactic principles as much as possible in the formation of skills and competencies in the native language and literature, then we will further strengthen the interest of students in learning it. In this way, students fully enjoy the results of their independent work, and they gain strength and pleasure in solving problems and examples. As a result, their desire to solve complex-looking tasks is growing. At the same time, by applying the function of interdisciplinary interaction to the solution of problems and examples on the basis of the internal laws of the native language and literature, we achieve the full implementation of the formation of skills and abilities of students on a conditional basis.

In our opinion, the basic knowledge in the process of teaching the native language and literature is the knowledge that is formed by the mutual integration of simple concepts, laws, rules, facts; providing for the knowledge of the native language and the science of literature, the exchange of forms that give rise to certain rules, actions and relations on its concepts; and so on. At the same time, as a result of analysis, synthesis, abstraction and comparison, more complex concepts can be interconnected on the basis of a new broad conceptual conclusion and divided into developmental and evaluative knowledge to obtain results in deeper areas of mother tongue and literature.

Therefore, the content of interdisciplinary relations is not limited to the issues of harmonious study of concepts, laws and theories that are common to related disciplines. Interdisciplinary relations are encouraged to reflect new scientific ideas and methods in educational cognition, as well as the broad social connections that have emerged as a result of its integration. However, due to the educational and acquisition nature of interdisciplinary relations, it cannot be exactly the same as the broad relations between disciplines.

The main pedagogical purpose of interdisciplinary relations is the formation of scientific and practical worldview in students through the integrated reflection of the social experience of scientific knowledge of the universe in the educational process.

The pedagogical significance of interdisciplinary communication in the teaching process is that it integrates all the elements of the educational process: content, form, methods and tools, and contributes to its effectiveness. Integral connection is a one-way connection from one component of the learning process to another. For example, the integral connection of theoretical material on a particular subject with the content of laboratory and practical work, or the relationship between the individual stages of training.The universal form of relations is called organic interdependence when the interaction between the components under study is two-way. An example of this is the interaction between educators and students. In some cases, in the interaction, the focus is shifted to the interconnected objects. The word interdisciplinary includes the concept of interdisciplinary interactions. The word interdisciplinary relations means that as a result of interactions between subjects or between their components, a developmental process takes place, that is, something emerges. Hence, the process of connection between objects takes place in order to master the new.

There is a correlation between the content of the subjects or the events, but the membership is not realized unless special pedagogical activity is carried out. Membership is the connection made between the components of the learning process.

Another important aspect of interdisciplinary communication is that in the process of teaching a subject, the teacher has to refer to a lot of literature before conveying it to the student. Especially today, when there is an abundance of information, it is necessary to use the Internet effectively and keep abreast of new information and news coming into our lives. This, of course, places a great deal of responsibility and tireless work on the teacher.

In short, the importance of interdisciplinary links in the teaching of all disciplines is an important factor in improving the general outlook and professional skills of the trained personnel.

ABSTRACT

This article outlines the basic values of the right to social security, social, economic, and cultural human rights recognized in a number of universal international documents of the United Nations and the International Labor Organization.The issues of implementation of international documents in the field of social protection into the national legislation of the Republic of Uzbekistan as a State recognizing the supremacy of universally recognized rules of international law were also touched upon.

KEYWORDS: *Recognizing, International, Implementation, Ensuring, Community.*

INTRODUCTION

The right to social security is also recognized in the institutions of international law as one of the most important human rights. To date, international standards have been developed and put into practice, reflecting the criteria of law and ensuring their implementation. Such standards cover all spheres of society, including the social security system.

As long as human rights recognized by the international community are implemented in this system, international pension standards are a reflection of international criteria (size, standards) in the field of human rights.

Practical experience has been accumulated in regulating public relations related to the realization of the right to social security, both on the basis of national legal systems and on an international

(interstate) scale, international legal norms and standards have been formed, organizational systems for regulating these relations have been created.

Among the acts that are the most important among the international norms relating to social security are the universal acts of the United Nations, first of all “The Universal Declaration of Human Rights" of December 10, 1948, "The International Covenant on Economic, Social and Cultural Rights" of December 19, 1966, "The International Covenant on Political and Civil Rights" and its Optional Protocols, Conventions on the Rights of Women, Children, and Persons with Disabilities.

Two universally recognized international legal acts on human rights - the Universal Declaration of Human Rights and the International Covenant on Economic, Social and Cultural Rights, adopted and published by the UN, define the most important criteria, procedures and rights related to pension provision.

The United Nations International Covenant on Economic, Social and Cultural Rights is one of the most authoritative international documents ratified by most countries of the world.

In recent years, after its ratification, the Republic of Uzbekistan has also been implementing legal reforms in the field of pension legislation within its framework.

This document enshrines social, cultural, and economic human rights, which are very important to him. The preamble to the Covenant specifies the following criteria for human rights in relation to his life: "In accordance with the Universal Declaration of Human Rights, it is recognized that the ideal of a free human person, free from fear and want, is realized only when conditions are created under which everyone can enjoy their civil and political rights, as well as their economic, social and cultural rights.”

The present Covenant provides extensive coverage of economic, social and cultural human rights, it also defines in detail the rights to social security, which differ from the "Universal Declaration of Human Rights" (articles 6-15).

In the Covenant, as in other citizens' rights, the rights to social security were described directly, and the details were set out quite clearly and clearly. For example, article 9 of the Covenant states that "the States parties to this Covenant recognize the right of everyone to social security, including social insurance". It is also stipulated that States parties to the Covenant must have an adequate standard of living, including adequate food, clothing and housing for themselves and their families, as well as the steady improvement of living conditions, take the necessary measures to ensure the realization of these rights.

In the "Universal Declaration of Human Rights", human values are highly valued, from an international legal point of view, the inviolability of his body, personality and rights is recognized. This is a human rightand it is emphasized that ensuring freedoms is the main task facing every State.

The basic human rights related to obtaining social security, as well as the content and essence of these rights, issues of their implementation, guarantees and protection are set out in detail in the convention and recommendations of the International Labour Organization. Also, multilateral agreements of regional international organizations provide for international norms and requirements concerning the social protection of various categories of persons (disabled people, children, the elderly, people with certain diseases, single mothers, etc.).

All the Conventions of the International Labour Organization provide, to one degree or another, norms concerning pension provision, since the main task of this organization is to protect the material rights and interests of employees and their family members.

The Republic of Uzbekistan, as a State committed to human rights and ideas of State sovereignty and recognizing the supremacy of universally recognized rules of international law, can recognize that in its Constitution and laws, the Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights, the International Covenant on Civil and Political Rights, all norms and rules concerning equality of women and men, directed against racism and any forms and manifestations of social inequality.

In our country, special national organizations dedicated to the protection of human rights have been created, all organizational and legal measures have been taken for the full implementation of all international UN human rights instruments.

In addition, international universal documents on social security law are being implemented into national legislation in a timely manner. For example, article 39 of the Constitution of the Republic of Uzbekistan establishes that "everyone has the right to social security in old age, in case of disability, as well as in case of loss of a breadwinner and in other cases provided for by law."

This article in form and content fully complies with the "Universal Declaration of Human Rights", which establishes that everyone has the right to a standard of living necessary to ensure the health and well-being of him and his family, including clothing, food, medical care and necessary social services, as well as in other cases of unemployment, illness, disability, widowhood, old age or lack of livelihood due to circumstances beyond his control.

Also, the following international documents on social security rights prescribe procedures, criteria and recommendations.

Definition of the circle of subjects entitled to receive social security, types of social security, minimum wage and other important provisions "on minimum standards of social security", adopted in 1952. The 102nd UN Convention on Human Rights.

And international requirements related to the preservation of the right to receive pensions or benefits during certain periods (for example, time spent abroad, time spent in hospitals, etc.), on the basis of which pension provision is issued, are enshrined in the 48th ILO Convention of June 4, 1935 "On the Establishment of systems of International Cooperation arising from Disability, Old Age and loss of breadwinner".

The sixty-sixth session of the ILO on June 4, 1980 adopted Recommendation No. 162 "on older workers", which contained recommendations concerning social security for workers of pre-retirement age and those who have reached retirement age, protection of their material and other rights.

Guarantees for the protection of the rights of foreign citizens and stateless persons to receive social security on the territory of another country are provided for by the ILO Convention No. 118 of June 6, 1962 "on equal rights of citizens of the country and foreign citizens and stateless persons in the field of social security".

Although some documents of international organizations have not been ratified in Uzbekistan, the legislation has been adapted to international standards. Today, one of the urgent tasks facing

us is the ratification of a number of conventions of the International Labour Organization concerning social security of the population, and further reform of legislation based on them. For example, in order to improve national legislation on pension provision and bring it into line with international standards, we consider it appropriate to ratify the International Labour Organization Convention No. 102 “on Minimum Standards of Social Security”.

In the formation and development of the legislative system of social security, along with the conventions of the International Labor Organization, its recommendations in this area served as an important basis. As an example, we can cite the recommendations of the International Labor Organization of 1927 “On insurance against diseases”“ "On insurance against disability, old age, loss of breadwinner”“ "on the introduction of an international system ensuring respect for rights in the field of social security" and a number of others.

"The European Social Security Code is one of the main acts defining European standards in the field of social security, and was adopted by the Council of Europe in 1964.”

The document provides for social security, the types of which are provided to citizens, categories of persons entitled to receive them, criteria for providing social security and other essential circumstances.

As subjects entitled to social security, the document provides for the sick, single mothers, minor children, families with children, the elderly, the disabled, temporarily deprived of work and labor income (unemployed citizens), refugees, migrant workers and members of their families.

The ideas and solutions provided for by this Code, legal mechanisms, methods of pension provision, further improvement of national legislation on pension provision may contribute to a new approach to work in the field of pension provision. Therefore, although this international document has not yet been ratified by the Republic of Uzbekistan, its careful study is useful from a scientific and practical point of view.

The Charter of Paris for a New Europe (signed by the Republic of Uzbekistan on November 27, 1993) is notable for its focus on ensuring and effective protection of human rights in the world, social security of citizens and providing them with the necessary assistance.

In short, the above-mentioned international legal norms are reflected in the legislation on social protection of citizens in our republic.

In conclusion, it should be noted that a legislative system aimed at protecting human rights has been created in our country, legal mechanisms for protecting political, socio-economic rights of citizens have been created that meet international democratic standards, legal reforms are continuing aimed at further strengthening guarantees of freedom and rights in society, which is proof that human interests in our country are the highest value.

ABSTRACT

The early middle Ages will need to be studied in different parts according to their natural-geographical location. In our opinion, although this region is relatively, "the rustoks in the northern and northeastern part of Central Sogdia", "the rustoks in the northwestern part of Central Sogdia" and "the rustoks in the southern and central parts of Central Sogd" it is expedient to divide the rustaks in the south-western part into three parts, and the most densely populated parts of the Sogdian oasis in ancient and medieval times, suitable for sedentary farming - Central Sogdian political units (rustoq, urban, rural) were in their time the most developed settlements in Central Asia.

KEYWORDS: *Central Sogd Kabudon, Fay, Ishtikhan, Kushaniya Afrosiyob, Dobusqala, Kofirqala, Gabudan - Sivangin (Samarkand) Bulungur, Pay And Karasuv Maymurg Property Kang Talli-Barzu Rabinjon (Kattakurgon), Mingtepa, Bulungur, Pay And Karasuv.*

INTRODUCTION

In order to have a more complete understanding of the historical geography of Central Sughd, it is necessary to study its territory in different parts according to its natural-geographical location. In our opinion, it is expedient to divide this region into three types: “Rustaks in the northern and north-eastern part of Central Sughd”, “Rustaks in the north-western part of Central Sughd” and “Rustaks in the southern and south-western part of Central Sughd”. This is because Central Sughd consists of dozens of cities and rustaks, mainly along the north-eastern, north-western and south-western directions, some of which belong to the Samarkand government, some to the north and northeast and northwest to Kabudon, Fay, Ishtikhan, Kushaniya dominions, and in the south-east it belonged to the dominions of Panjikent and Maymurg [1]. In place of the central city-capitals of these political associations, the remains of cities such as Afrosiyab, Dobusqal'a,

Kofirqala, and Panjikent have been preserved [2] and they are rich in archeological findings which can provide a lot of information for studying the history of Central Sughd.

In Chinese chronicles, Kabudon is mentioned as a separate kingdom north of Kan (Samarkand), and it is noted that it was the southern neighbor of East Tsao-Ustrushona. It is noteworthy that the name of the Kabudon dynasty is mentioned in two different ways in Chinese chronicles at different times. The Bey-shi chronicle states that "Gabudan is located in the northwest of Sivangin (Samarkand) and its ruler lives in Gabudani." The Chinese monk Xuanzang (629-645), who passed through Central Sughd, mentions it in the form of Kienputana. So, in the first quarter of the VII century, this land was a separate kingdom.

This political-administrative unit, which appears in Arabic sources in the form of Kabudon, Kabudonjakas, is shown 2 farsakhs (16 miles) north of Samarkand. Kabudon was a small monarchy located near Samarkand, leading from Samarkand to Ustrushona in the northern direction, sometimes was a subordinate to Samarkand, and sometimes a relatively independent political association [4]. Researchers equate Kabudonjakas in Arabic sources with today's Gubdin[1] [5]. It should be noted at this point that the equating of Kabudon with Gubdin or Kabud was firstly put toward by V.V. Tomashek[2] [6]. But V.V.Bartold, who looked a little different from him, wrote that the village of Kabud was on the site of the present-day village of Besh-ariq [7].

Vidor

The next city after Kabudanjakat was called Vidor or Vidar. The term is also used in some sources as Vizar. In medieval sources, Vidor comes as a city, or rather rustak, located 4 fars (28-30 km) northeast of Samarkand. Its territory is said to have vast, irrigated fertile lands and mountainous areas. It is assumed that large crop areas of Vidor were irrigated through Bulungur, Pay and Karasuv canals. This city was probably located near the mountains called Gobdin and Qaraqchitog today.

It can be seen that the village of Vidor included the areas on the right tributary of the Zarafshan River, north of the present-day Akdarya. According to A. Raimkulov, Vidor included the present-day Payarik district and the western part of Gallaorol district, as well as the territory of Koshrabad district. According to the researcher, the central city of this rustak - Vidor or Vizar is now the largest city in the mentioned area and was in the place of the present Chelak. If the distance between the cities is taken as an average of 4 farsahs, it turns out that the city of Chelak is located 4 farsahs northwest of Kabudanjakat (Mingtepa) [9]. This is confirmed by archeological data. The hill, which covers an area of about 40 hectares in the Chelak area, may be the remains of the ancient city of Vidor. According to researchers, this archeological monument, which is believed to be the ruins of a certain city, is located north of the city of Samarkand, and its location corresponds to the data of written sources. In addition, no monument of this nature is found at this distance except at Chelak [10].

In short, the city of Vidor was one of the largest cities of the Marzban ibn Turkash's rustak, and its location was mainly in the present-day Bulungur district.

Maymurg

In the early Middle Ages, this dominion-estate had its own ruler and army, political boundaries, and included the oasis, which stretched from Panjikent in the east, the Zarafshan River in the

north, Kesh in the southeast, and Samarkand Raboti (Wall of Resurrection) in the west. Maymurg's rule later included the present-day Panjikent, Urgut, Taylak and Samarkand districts.

It is known that in ancient times the estate of Maymurg was formed in the southeastern part of Samarkand Sughd in the I century AD, based on the confederate administration of the Qang state. During this period, the area around the central city of Maymurg (Kuldortepa) was surrounded by strong defensive walls, urbanization processes developed in the oasis, and an urban culture was formed.

In the second half of the 6th century, when Sughd became a major political and economic center under the influence of the Turkish Khanate, along with the Central Sughd rulers, the political, economic and social life of Maymurg flourished and merchants of the oasis began to move along the Great Silk Road. In Maymurg, the urban culture was well-developed (at Kuldortepa, Kofirqala), its area was expanded, defense capabilities were strengthened, and palaces were erected. In the architecture of residential construction, the rooms were built by master builders taking into account the fact that they perform different functions. Prefabricated projects were used in their construction. Archaeological materials confirm the structure of cities, the uniqueness of bullae, pottery, and the widespread use of wood carving, crafts, art and culture was developed. This indicates that in the early middle Ages the influence of wealthy merchants, aristocratic peasants and artisans in socio-political life increased.

In addition to accommodation, administration, and utility rooms, separate rooms were provided for Zoroastrian religious activities (Kofirqala, Room 26). In addition, separate Zoroastrian (Jartepa) and Christian (Koshtepa) temples were built outside the cities. Prior to the Arab conquest, the population practiced Zoroastrianism as well as Christianity. That is, the principle of religious tolerance was followed during this period. The religious temple dedicated to the Zarafshan River in the oasis is considered to be the patron saint of Jartepa and the goddess of water, the goddess Nana Maymurg, who is the protector of the whole being that provides fertility. The estate of Maymurg was also a kind of shopping center in the early middle Ages. In the early middle Ages, oasis merchants actively moved along the Great Silk Road, reaching as far as China. It is mentioned in the written sources that they supplied various material goods to China.

The march of the Arab armies to Sughd also had an impact on the political and economic life of the Maymurg estate. In particular, in 712 the palace of the first period of construction of Kafirqala was completely burnt down, while the marches of 736 under the leadership of Asad ibn Abdullah caused a decline in the political, social and economic life of the estate and caused it to split into several rustaks. That is, in the first half of the VIII century, the estate of Maymurg became a field of political struggle of the Arabs. There were a number of reasons for this. The first is the availability of strong economic opportunities in ownership. This is because the Arabs obtained most of the wealth, military booty, slaves, and food supplies from Sughd through unilateral agreements. That is why the Arabs tried to keep the whole of Sughd under the influence of the caliphate. The second is the presence of a dam in the estate area that supplies water to Samarkand and its environs. In order to quell the uprisings, the Arab armies repeatedly made military raids on the Varagsar Dam. They tried to subdue the population by destroying the existing dam and leaving Samarkand without water. Third, a branch of the Great Silk Road connecting Samarkand with Kesh passed through Maymurg, which was the closest, most convenient, and safest road to Samarkand along the Takhtikoracha Pass. This also created favorable conditions for the movement of Arab troops. The first archeological excavations in

these areas were carried out in the 30s and 40s of the XX century. The first archeological excavations were carried out by A.Yu. Yakubovskiy [12], G.V. Grigorev and I.A. Sukharev at the Talli-Barzu monument and in the Kofirqala shahristan, in its khumdons and nauses [13]. As a result, G.V. Grigorev divided the Talli-Barzu monument into 6 construction periods, where life lasted from the VI-V centuries BC to the VIII century AD, and the monument was the center of the Rivdad rustak which was mentioned in written sources [14]. Although G.V. Grigorev made some mistakes in dividing the monument into construction periods, he isolated the first medieval complex of Central Sughd, developed its periodic date, and began preliminary research on this basis. Later, A.I. Terenojkin enriched this periodic date with new materials, divided it into 5 stages and periodized the first medieval period with TB IV (V – VI centuries) and TB V (VI – VIII centuries) [15]. As a result of planned and stratigraphic excavations carried out in the 50s of the last century, by B.Ya. Stavisky and M.K. Ormanova on the Kuldortepa arch and the defensive walls of the Shahristan, it was concluded that the memorial arch was formed in the III-IV centuries, and the defensive walls of the Shahristan from antique epoch. Researchers have also acknowledged that Kuldortepa was the capital of the Maymurg estate mentioned in written sources. Later, O.G. Obelchenko made an archeological study at Kofirqal'a [16] and G.V. Shishkina at the hill near Kofirqal'a.

In addition to this dominance of Central Sughd - estate or rustaks, there were also several dozen of other large urban and rural fortresses. Among them Choyanchitepa (Kattakurgan), Ishchantepa, Kuldortepa, Jartepa, Koshtepa (Urgut t.), Arabtepa (Samarkand t., Urta Arabkhana village) are located in the northern, eastern, south-eastern, southern, south-western and western parts of Samarkand. Some of them are large settlements belonging to the ancient and early middle Ages, some of which are localized, and some of which are still unknown in the written sources to which city or large village they belong. For example, a monument called Sogish-tepa by the locals can be equated with a city mentioned in early medieval Arabic and Persian sources as Sogarj. Because, on the one hand, the location of this monument and the information about it in the written sources are consistent, and on the other hand, the mutual harmony of the words Sogarj - Sogish allows them to be compared.

In the pre-Islamic periods mentioned above, the dominions in the northern and southeastern parts of Central Sughd were estate: Ishtikhan, Kabudon, Maymurg, and many of the rustaks within them had their rulers, and it is not entirely clear in what titles they ruled. However, it is known that the rulers of Samarkand, the leading force in Central Sughd, ruled under the title "Ikhshid". Yet on the basis of written sources in Arabic and Persian, some researchers, including O.I. Smirnova made specific comments on exactly what titles the rulers of several of the Central Sughd administrations used. According to the researcher, the rulers of the small administrations in the Sughd oasis were called "peasants", "maliks", the first of which was of Sogdian origin and the second of Turkish origin. However, it should be noted that this assumption has not yet been fully confirmed due to lack of evidence.

However, O.I. Smirnova argues that in the relatively small political and administrative units of the Sughd oasis, Iranian-specific terms meaning "great, big" were used – "buzurg", "mehtar" (Sughd: msyδr) [18]. In our opinion, these terms can include Sogdian titles such as xwβ "xuv", xwt'w "god" (probably "katkhudo"), which means a ruler or rustok ruler.

Information on the geographical location of these political and administrative units, located mainly in the northern part of Central Sughd, is reflected not only in the works of Arab and Persian geographers, but also in Chinese sources. At the same time, some information about

them can be found in medieval historical works. For example, in Abu Ja'far al-Tabari's "Tarikh ar-rusul wa-l-muluk" (History of the Prophets and Rulers) (IXcentury), there is information about the population of Buzmajon, Ishtikhan, Fay, Sibiskat (Isbiskat), Yorkat, who fled to Fergana together in the early 720s due to the Arab invasion. It is obvious that political relations were established between the inhabitants of these neighboring rustaks, in which their population spoke a single ethnocultural basis - the Sogdian language and Zoroastrianism.

Archaeological excavations in the northern districts of Samarkand region in recent years have uncovered many early medieval Sogdian coins, some of which bear the image of a ruler and a stamp, and some of which mimic Chinese coins. These coins contain a distinctive title, symbol - a seal and a toponym, on the basis of which it can be assumed that the Central Sogdian rulers, such as Ishtikhon, Fay, Kabudon, Maymurg, had their own coins. Some of the coins have the image of a ruler typical of the ancient Turks, Turkish titles such as "Haqqan", "Khotun" and tribal seals. At the same time, the inscriptions on some coins have not yet been read in full, and it is possible to think more clearly about this issue if they determine exactly which authority is the name of the estate, a certain title. Only so far it can be said that most of the coins are found in the northern and northwestern regions of Samarkand region, Rabinjon (Kattakurgan), Mingtepa, as well as in the remains of a number of cities in the east of the region, indicating that their minting is associated with these areas.

Thus, in the ancient and medieval times, the most densely populated, sedentary parts of the Sughd oasis - the political and administrative units of Central Sughd (rustok, city, village) were once the most developed settlements in Central Asia. This feature of these administrative units, which are mentioned in written sources as settlements inhabited by artisans and traders, is more vividly confirmed by archeological research conducted for almost a hundred years.

ABSTRACT

An animal that has successfully integrated modified DNA into its germ line is known as a transgenic animal. The transgene may be passed on to every progeny of such an organism. It is important to note that a transgenic individual's transgene is present in all of his or her cells. The capacity to insert foreign genes into the germ line and successfully express the inserted gene in the organism has enabled unparalleled genetic manipulation of animals. The knowledge acquired through transgenic technology may be used to virtually every area of contemporary biology, including developmental gene control, oncogene activity, the immune system, and mammalian development. Because particular mutations can be inserted into transgenic mice, precise mouse models for human genetic disorders may be created, as well as a systematic genetic dissection of the mammalian genome can begin.

KEYWORDS: *DNA, Germ Line, Genetic, Transgenic Animals.*

1. INTRODUCTION

One of the most significant recent technical breakthroughs in biology is the insertion of genes into the germ line of animals. Transgenic mice have helped researchers learn more about the processes of development and developmental gene control, oncogene activity, and the complex cell interactions that occur inside the immune system. Furthermore, transgenic technology opens up intriguing prospects for creating accurate animal models for human genetic disorders and huge amounts of commercially essential proteins using genetically modified farm animals. Microinjection of simian virus 40 (SV40) DNA into the blastocyst cavity produced the first animals with experimentally introduced foreign genes. DNA reassociation kinetics showed that the injected DNA was present in a variety of somatic tissues generated from animals that had been injected as embryos. In these early studies, however, incorporation of viral DNA into the germ line was not shown. According to a subsequent research, some SV40 DNA remained episomal in somatic tissues. When mouse embryos were exposed to infectious Moloneyleukemia

retrovirus (M-MuLV), which led in the creation of the first transgenic mouse strain, germ line transfer of foreign DNA was found in later investigations[1], [2].

One technique of genetically modifying mouse embryos involves infecting them with retroviruses. Direct microinjection of recombinant DNA into a pronucleus of a fertilized egg is a more frequently utilized method for producing transgenic animals. Finally, a newly discovered method includes injecting DNA into embryonic stem cells (ES cells) through viral transduction or transfection, which may contribute to the germ line when injected into host blastocysts.

1.1.Incorporation Of Genes In Animals:

1.1.1. DNA Is Injected Into The Pronucleus Microscopically.

The most commonly and effectively utilized technique for producing transgenic mice is microinjection of cloned DNA directly into the proudest of a fertilized mouse egg. Multiple DNA molecules organized in a head-to-tail array often integrate into the host genome in a stable manner. Before integration, the injected DNA molecules are believed to interact through homologous recombination and, in most instances, insert into a single chromosomal location. Random chromosomal breaks, perhaps produced by repair enzymes triggered by the free ends of the injected DNA molecules, may serve as tentatively conclude for the alien DNA, according to one theory. At the insertion sites, rearrangements, deletions, duplications, and translocations of the host sequences are common. The injected DNA, on the other hand, does not always integrate into the host genome. Depending on the structure of the injected DNA, the bovine papillomavirus (BPV) either integrates stably into the genome of transgenic mice or is retained as an episome[3].

The efficiency of producing transgenic lines that express most genes in a predictable way is the main benefit of direct microinjection of recombinant DNA into the pronucleus. However, this technique has the drawback of not being able to transfer genes into cells during later stages of development. Furthermore, due of the numerous copy inserts and host sequence rearrangements, cloning the chromosomal insertion site may be challenging. Infractions are returned. Retroviruses, unlike microinjected DNA, integrate into the genome of the infected cell via a well-defined process. Only one proviral copy is inserted at a particular chromosomal location, and no host genome rearrangements are produced other than a brief duplication of host sequences at the integration site.

The primary benefit of using bacteriophages or retroviral vectors for gene delivery into animals is the technological simplicity with which virus may be introduced into embryos at different stages of development. Furthermore, isolating the flanking host genes of a proviral insert has shown to be considerably simpler than isolating the flanking host sequences of a DNA insert generated from pronuclear injection. When trying to identify the host genes disrupted by proviral DNA insertion, this is a significant benefit. The size restriction for transduced DNA and unsolved difficulties of reproducibly expressing the transduced gene in the animal are the major drawbacks of using retroviruses for gene transfer[4].

1.2.Genes In Agrobacterium TumefaciensAnimals:

1.2.1. Cloned Genes Are Injected Pronuclearly.

The critical challenge has been the injection genes' predictable and tissue-specific expression. Only modest or highly variable expression, depending on the chromosomal location of the inserted gene, was observed in early studies. It was quickly discovered that the presence of prokaryotic vector sequences inhibits the proper expression of specific genes such as 3-globin, a-actin, and a-fetoprotein. As a result, most researchers now delete the prokaryotic vector sequences before injecting the gene into embryos to prevent any potential gene expression disruption caused by these sequences. Genes encoding immunoglobulin (Ig), elastase, and collagen, on the other hand, seem to be less susceptible to the presence of vector sequences and are often expressed regardless of chromosomal location[5].

Much work has gone into figuring out what causes genes to be activated throughout development. Transgenic mice have aided in the discovery of cis-acting sequence regions that regulate tissue-specific gene expression. The 5' flanking sequences, either proximal or distal to the promoter, inside the gene itself, and the flanking sequences have all been shown to include such components. By routinely introducing DNA constructs into embryos with various lengths of flanking sequences, tissue-specific enhancer elements for certain promoters have been discovered[6].

The use of transgenic mice in the study of developmental activity of the 3-globin gene family has proven especially beneficial. In erythroid cells, different "embryonic," "fetal," or "adult" globin genes are expressed sequentially throughout development. Cloned embryogenesis globin genes were expressed properly in the mouse germ line and stage-specific activation was reliant on enhancer regions at both the 3' as well as 5' ends of the gene. Despite this, significant issues with 3-globin expression persisted. The transgenes were never expressed at a level equivalent to the expression of the native gene, and their expression was always dependent on the location of chromosomal insertion or irrespective of the copy number. The injected gene was expressed at a level similar to the endogenous globin gene as well as directly linked to the copy number when sequences 20 to 50 kb from each side of the 1-globin gene were inserted.

The combination of a tissue-specific enhancer and a specific promoter often determines the tissue in which a gene is expressed. The Ig enhancer, for example, directs Ig or myc expression to B cells but boosts SV40 T antigen production in numerous organs. In a recent research, pairs of genes with or without introns (as complementary DNA) were microinjected into embryos, demonstrating that sequences located in introns may be important in regulating the amount of transcription in animals but not in cultured cells[7].

Microinjected genes have also been found in rabbit, sheep, as well as pig embryos. However, the success rate of producing transgenic domestic farm animals is considerably lower than that of mice, owing to technical challenges in seeing the pronucleus in these species' embryos. Despite these challenges, a human growth hormone gene effectively inserted into the pig was unable to enhance development, perhaps because the human hormone was not physiologically active in pigs. Although the value of genetic engineering in livestock improvement has been questioned, transgenic farm animals are expected to become a source of commercially useful proteins. Medically important proteins, for example, those have been targeted to mammary epithelial cells, may be extracted from the milk of transgenic cows, as has been shown with transgenic mice.

1.3.Viruses From The Past:

Preimplantation mouse embryos or embryonal carcinoma (EC) cells were shown to be incapable of supporting retrovirus production and replication in early studies. Virus, on the other hand, is

effectively expressed in later stage embryos or differentiated EC cells. Because the viral LTR, which includes the viral promoter and transcriptional regulatory elements, is not functional in early embryonic cells, virus replication is limited. In nonpermissive embryonal cells, transcriptional inactivity has been linked to de novo methylation of the provirus, nonfunctioning of the viral enhancer or downstream regions, repressor activity, and a lack of activating stimuli.

1.4.Transgenic Technology's Applications:

Oncogenesis and illness models; the possibility of employing particular promoters or enhancers to guide heterologous gene expression to a specific cell has sparked many efforts to manipulate an animal's physiology in the lab. The use of transgenic technology has been very beneficial in investigating the effects of oncogene expression in animals. Problems that cannot be addressed satisfactorily in cell culture can be addressed using transgenic mice, such as the spectrum of tissues susceptible to an oncogene's transforming activity, the relationship between multistep oncogenesis and oncogene cooperativity, and the effect of oncogenes on growth and differentiation[8].

1.5.Marker of ancestry:

The development of destiny maps to evaluate cell ancestry, cell location, and cell commitment in the developing embryo is a key problem in modern biology. Because the preimplantation embryo is readily manipulability, researchers have employed visual observation and implanted lineage tracers to investigate the early phases of mammalian development (76). The embryo's inaccessibility once implanted in the uterus, on the other hand, makes studying cell lineage at later stages difficult and prevents the use of direct lineage tracers. As a result, the creation of permanent markers of individual progenitor cells that do not disrupt the embryo was required for the investigation of cell lineage in the post-implantation embryo[9].

1.6.Markers That Identify Chromosomal Regions:

Foreign DNA sequences inserted into the adjacent host locus may serve as useful molecular markers for which no probes would otherwise be accessible. A proviral genome inserted into the pseudo autosomal region of the mouse sex chromosomes, for example, proven to be a unique molecular marker for the study of this extremely repetitive sequence-rich area (80). In the pairing area of the sex chromosomes, genetic research showed a significant incidence of uneven crossing-over as well as double cross-over events. Transgenes carried on the X chromosome have been discovered to either evade X-chromosome inactivation or to function like an X-linked gene. Cloning and analysis of the host sequences surrounding these inserts may help researchers better understand the molecular processes governing chromosomal pairing and mammalian X inactivation.

1.7.Transgenic mice have mutations:

By altering the function of an endogenous gene, the insertion of foreign DNA sequences into the cellular genome may induce mutational alterations. The majority of recessive insertional mutations in transgenic mice have been caused via retrovirus infection of embryos or ES cells or microinjection of recombinant DNA into the pronucleus.

Many integration sites have been cloned in mutants caused by DNA microinjection. To far, no transcripts of host sequences matching to the altered gene have been identified, in contrast to retrovirus-induced mutations. , duplications, rearrangements, Deletions, or translocations have all

been seen at the integration site, according to junction fragment analyses. Retrovirus integration, on the other hand, results in a brief direct duplication of host sequences at the location of the single proviral insert but no additional host genome rearrangements. The sequence rearrangements observed in insertional mutants generated by DNA microinjection are expected to make determining the underlying molecular defect that caused the mutant phenotype more difficult. This is especially dangerous if the rearrangements occur far from the exogenous DNA's integration location[10].

2. DISCUSSION

Researchers have been able to learn much more about processes of development and developmental gene regulation, oncogene activity, and the intricate cell interactions that occur inside the immune system thanks to transgenic mice. Furthermore, utilizing genetically modified farm animals to provide realistic animal models for human genetic diseases and large quantities of economically important proteins, transgenic technology offers up exciting possibilities. Transgenic technology has implications for almost every aspect of modern biology, including developmental gene regulation, oncogene activity, the immune system, and mammalian development. Specific animal models for human genetic diseases may be developed, and a systematic genetic dissection of the mammalian genome can begin, thanks to the ability to insert specific mutations into transgenic mice. In recent years, the use of transgenic animals has grown significantly. For a variety of reasons, embryo manipulation and gene transfer have advanced to the point that they are now considered standard procedures. Each of the three methods for generating transgenic animals has its own set of advantages and disadvantages for certain applications. Pronuclear injection of recombinant DNA is the method of choice for obtaining expression of a foreign gene in almost any tissue. Retroviruses or retroviral vectors are superior for genetic tagging of chromosomal loci, for example, for insertional mutagenesis, or of cells for lineage study. Finally, the most current method for generating transgenic animals from ES cells allows for the production of mice with any genetic or phenotypic characteristic for which in vitro screening or selection techniques are available.

3. CONCLUSION

In recent years, there has been a dramatic rise in the usage of transgenic animals. The techniques for altering embryos and transferring genes have been improved to the point that they are now considered routine operations for a range of applications. When genetic tagging of chromosomal loci, for examples, for insertional mutagenesis, and also of cells for lineage research, retroviruses or retroviral vectors are better. Finally, the most recently discovered technique for producing transgenic animals from ES cells allows for the creation of mice with any genetic or phenotypic traits for which in vitro screening or selection procedures exist. Rapid advancements are expected to occur in the following areas. Isolation and characterization of chromosomal regulatory regions regulating developmental gene activation across long distances will be critical. Incorporating such components into gene constructs should ensure that expression is predictable and efficient regardless of the chromosomal integration location. This is especially essential for big farm animal genetic engineering, because economic limitations limit the number of transgenic lines that can be produced and assessed. (ii) The numerous options for labeling early embryonic cells or ablating particular lineages allow researchers to get access to phases of mammalian development that have hitherto been difficult to manipulate. This will undoubtedly hasten our knowledge of mammalian development's intricate cell connections. (iii) The ability to generate recessive or dominant mutations in preselected genes will not only allow for the

development of precise animal models for human hereditary diseases, but it will signal the start of a systematic genetic dissection of developmental changes, which will have a profound impact on the future of experimental mammalian genetics.

USE OF EDUCATIONAL MEDIA AS A FACTOR IN THE INTEGRATION OF FOREIGN LANGUAGE TEACHING METHODS

Rakhimova Farangiz Abduvalievna*

*Teacher,
Samarkand State Institute of Foreign Langussages,
UZBEKISTAN

ABSTRACT

Foreign language teaching can be done by different teachers in full-time, part-time and mixed forms of education. Distance technologies are used in forms of distance and mixed education. This article is also about the effective use of information technology in foreign language teaching.

KEYWORDS: *Methodological System of Foreign Language, Verbal Communication Skills, Use of Information Technology, Linguistic Discourse, Psychological Skills, Computer Assisted Language Learning.*

INTRODUCTION

A variety of textbooks are used in foreign language teaching, including textbooks based on the use of computer technology. This is a description of the structure of the methodological system of teaching a foreign language, which is often implemented in pedagogical practice.

Involvement of educational media provides new opportunities in language teaching. With the help of these tools, the methodological system of foreign language teaching can be formed in such a way that the development of several types of skills and competencies can be carried out simultaneously using different teaching methods. For example, modeling and learning grammatical structures can be complemented by the development of verbal communication skills, which is ensured by the integration of different methods of teaching foreign languages within a course based on the use of educational media on the Internet.

The widespread use of information technology has allowed free access to educational media, such as e-learning resources for foreign language teaching. Of course, some of them may find practical application in a particular methodological system of education, but special approaches and methods need to be developed to select such e-learning resources that may be most useful in education.

It should be noted that the means of informatization of education allow the implementation of a mixed form of education.

All of the above requires the formation of a sound approach to the use of educational media in the methodological system of foreign language teaching. Such approaches can be built on the basis of the model of this methodical training system.

The theory and practice of teaching foreign languages in our country has a long history. However, the approach to the systematic study of linguistic material was only formed in the mid-20th century. From that time on, teaching foreign languages at local universities became mandatory. Students are focused on the practical mastery of foreign languages: the development of comprehension skills while listening and reading a foreign language, the expression of ideas in a foreign language orally and in writing. At present, the teaching of foreign languages is determined by the standard of higher education, which defines the main goals and content of education. The content of foreign language teaching is grouped around the following components:

- Linguistic discourse, which combines socio-cultural and linguistic and regional elements that students need to master;

- Psychological skills, including the ability of students to use a foreign language for communication purposes;

- Related to the acquisition of methodological, teaching methods, knowledge of innovation, related to the development of their independence.

It should be noted that the methods of teaching foreign languages change over time and are significantly objective (political, scientific, cultural, social, etc.) and subjective (student preferences and teaching). Depending on factors. Existing methods of teaching foreign languages G.V. Rogova has been considered in his scientific work.

1. Structural methods consider language as a system of structurally related elements of grammar: the grammatical-translational method is traditional, aimed at teaching translation and reading, the audio-linguistic method of listening and consists of repetition; the basis of the proprioceptive method by a student of records repeated many times by the teacher is the simultaneous use of cognitive, motor, neurological, auditory functions of the brain;

2 Functional methods, which consider language as a means of expressing or implementing a particular function: situational learning is based on the principles of language structure and behaviorism. The student learns by repeating the most common words and constructions of the language in practice, a focused practice is an approach in which the student repeats phrases before memorizing them mechanically;

3 Interactive methods, considering language as a means of creating and supporting social relations: the direct method involves teaching in the primary language, the sequential method - to A subtype of the ‘direct method’ involves the targeted use of communicative learning. language, both in assignments and for communication with the teacher / in the group, language absorption, silence method, the teacher who uses this method listens more than speaking, the natural approach - the student can not do their job emphasis is placed. Learn everything. Each subsequent part of the learning material should, of course, be based on the past and at the same time be easy to master, the method of physical response is that students first perceive passively

without using the material, and then they It implies that they have a physical relationship to things. Words, for example, to action verbs. And only after going through the first two stages do students begin to practice the language on their own, with reading and storytelling skills being part of the physical response method. It consists of the teacher telling short stories saturated with new words and a series of questions to the students, asking them to give simple but emotional answers, the method of teaching the language of "Dogma" - this method refuses to use textbooks. Instead, more emphasis is placed on teacher-student communication. The materials used by the student must be written by himself;

4 Methods that are the object of copyright: The Pimsler method is based on the mastery of a sequence of audio recordings that include a basic vocabulary and require students to actively repeat the material, the Michelle Thomas method is a series of lessons in the classroom audio recordings, where the teacher works with two students, tells them the basic rules of grammar, teaches vocabulary and gives assignments, Kitaygorodskaya method - a methodology due to the widespread use of group forms of interaction in the learning process and there is a close connection between social relations. Psychology describing this concept of intensive learning;

Thus, a variety of literature suggests different ways of teaching foreign students at universities.

Analysis of the literature shows that the use of information technology in the teaching of foreign languages began in 1926. It was at this time that the Sydney Machine was created. The methodology of this experiment was based on programmed teaching based on the work of American scientists. In 1954. CALL ("Computer Assisted Language Learning") stands for Computer-assisted language learning. The introduction of computers in foreign language teaching in the 1980s was both theoretically grounded and practiced in a number of foreign countries. The pedagogical process of using computers in teaching has developed in parallel in our country. In the 1960s and 1980s, computers were widely introduced in educational institutions, and training courses and computer programs were created. Since the late 1980s. In the USSR, and then in Russia, the problems of the introduction of information technology and computers in the educational process are being actively studied. In the works of V.P. Bespalko, M.A. Bovtenko, E.E. Gorshakova suggests several classifications and stages of the use of educational media in teaching and, in particular, in the teaching of foreign languages.

Nowadays, computer tools for teaching foreign languages can be located on a computer or can be accessed through the Internet telecommunications network.

In the 21st century, there is an opportunity to actively communicate using the Internet. This led to the creation of a new direction - electronic lingvodidactics, which includes language learning in contact and remote modes. It should be noted that all of the above approaches are mainly focused on the static use of data hosted on a computer network. This describes the paradigm of using information technology in education, known as web 1.0 technology. However, due to the widespread introduction and development of the Internet, the use of various Internet services for educational purposes and, in particular, for learning foreign languages is being updated. One of the promising directions is the use of these web 2.0 technologies and services for educational purposes. Web 2.0 technologies and services provide more active and efficient communication, the ability to place almost unlimited information resources on the Internet.

One of the features of the use of educational media in the teaching of foreign languages is the important role of e-learning resources. Such means of informatizing education are common. E-learning resources are teaching aids and should therefore meet a system of general, traditional

didactic requirements, which include: scientific character, availability, problem-solving, accuracy, structure and consistency of teaching, knowledge transfer Strength of integration, unity of education, developmental and educational functions of teaching. At the same time, they should be relevant to the didactic features of foreign language teaching and have an interactive nature, allow hypertext, sound and image to be combined, perform a detailed search for information, and include knowledge verification systems. The effectiveness of the use of educational media in general, and e-learning resources in particular, depends on the proper organization of the educational process, using methods and forms of education that are relevant to the purpose and content. There are enough e-learning resources in foreign languages on the Internet. In this regard, the problem of evaluating and selecting the required e-learning resources arises. Given the large number of factors that determine the quality of training, the lack of formalization of some processes associated with the teaching of foreign languages, the solution of the problem of selecting the necessary e-learning resources for the learning process can be done using expert assessments.

In conclusion, based on the analysis of the components of the methodological system of foreign language teaching, it was found that a certain set of teaching methods is used in a practical course of foreign language teaching. Full-time, part-time, mixed forms of teaching are used in the learning process. The use of educational media provides an organic combination of different methods of teaching a foreign language in one course, which determines the possibility of integration of educational media in teaching foreign languages. Among the many means of informatizing education in foreign language teaching, e-learning resources are of particular importance. Given the fact that the process of teaching foreign languages is not sufficiently formalized, the solution to the problem of choosing e-learning resources can be achieved through expert assessments of the quality of resources. The dissertation proposes a method of examination based on the request of experts, the purpose of which is to determine the appropriateness of the use of e-learning resources in foreign language courses.

SOCIO-CULTURAL FACTORS AND TRENDS IN THE DEVELOPMENT OF REPRODUCTIVE HEALTH CULTURE IN MODERN UZBEKISTAN

Abdunazarova Zulayxo Sharifkulovna*

Pedagogical Institute of Karshi State University,
UZBEKISTAN

ABSTRACT

This article is about the role of reproductive health in society, women's health, its development, making it a daily lifestyle. If we talk about the reproductive health system, then we mean not only diseases in the reproductive system, but also mental state and social well-being. Not only doctors but also psychologists and sociologists are concerned about reproductive health.

KEYWORDS: *Reproductive Health, Demographic Policy, Women's Health, Pregnancy, Childbirth and Postpartum Period, Abortion, Nutrition, Medical Care.*

INTRODUCTION

The population growth process in Uzbekistan is characterized by a sharp increase in mortality and a significant decrease in the birth rate, a decrease in the vitality of the newborn generation. In this regard, it is important to understand the importance of not only the quantitative aspects of birth, but also the qualitative aspects that are most fully expressed in the formation of the term “reproductive health”. Reproductive health is a state of complete physical, mental and social well-being in all matters related to the functions and processes of the reproductive system, as well as psycho-social relationships at all stages of life. It is an essential foundation for overall health and a central part of human development. Creating a conducive environment to achieve an acceptable level of reproductive health in the community will allow women to safely go through the stages of pregnancy and childbirth and give couples the best chance to have a healthy baby. Reproductive health applies to both women and men.

Reproductive health is a new direction in the development of demographic policy. Improving reproductive health is one of the most important national priorities of demographic policy in the concept of demographic development of the country adopted by the Government of the Republic. The success of its implementation is predetermined by the degree of scientific substantiation of ways to solve reproductive health problems.

It is now becoming increasingly clear that the state of women's health is the most important basis for shaping the interdependence of vitality and energy transfer from generation to generation.

However, the state of health of this woman, her level of ability to protect the immune system is becoming increasingly weak, which in certain adverse conditions contributes to a decrease in her reproductive potential, the level of health. And the vitality of the offspring of newborns, in all subsequent stages of the life cycle of their development. Nowadays, the presence of somagic, infectious and gynecological diseases in women, living in a state of constant psychological stress and prolonged chronic stress, a wide range of bad habits that lead to the manifestation of various mental disorders and misalignment to such uncomfortable situations. Prevalence, a sharp decline in the standard: living, inadequate or unbalanced nutrition, difficulties in receiving timely and adequate medical care, and so on.

As a result, the reproductive health of Uzbek women has deteriorated significantly.

One of the most important components of the deterioration of women's reproductive health is the increase in morbidity during pregnancy, childbirth and the postpartum period.

The most important manifestation of malnutrition and micronutrient deficiencies in the majority of Uzbeks is the increased risk of declining health potential due to the high prevalence of anemia in the population.

This may be due, on the one hand, to the worsening of anemia in recent years and the poor course of treatment, on the other hand, to a more negative reaction of the weakened female body to labor stress and even loss during childbirth. This is due to a decrease in the ability of functional compensation to restore the homeostatic parameters of a woman's life in the postpartum period. In addition, there is no denying that the prevalence of anemia among pregnant and postpartum women is related to the deterioration of nutritional quality, the lack of a system of mass targeted prevention of anemia, as well as established traditions.

Many medical-biological, socio-economic, ecological-geographical, sanitary-hygienic factors affecting the mother are manifested in the form of toxic effects on the fetus indirectly - hypoxia and restriction of fetal resource supply. Fetal hypoxia is a common complication of pregnancy and childbirth, leading to serious damage to the central nervous system and other vital organs not only in the postpartum period in newborns, but also in the later life of the child.

In modern conditions, maternal mortality is increasingly considered by experts as one of the leading criteria of socio-economic well-being of society. Indeed, modern advances in medical science are sufficient to prevent a single case of maternal mortality from the "complications of pregnancy, childbirth, and the postpartum period" causal class. However, maternal mortality is still high in developed countries.

The data obtained show real opportunities to further reduce maternal mortality while improving primary prevention of diseases during pregnancy, childbirth and the postpartum period, as well as improving the quality and availability of obstetric and gynecological care.

In modern socio-demographic conditions, the issue of reducing reproductive losses in the process of population growth by increasing the effectiveness of measures aimed at reducing the prevalence of induced abortions is particularly relevant. The prevalence of abortion remains one of the most striking features of the extent to which family planning ideas penetrate the mass reproductive consciousness of women.

Time will force us to focus on strengthening the evidence that it is advisable to implement the most cost-effective measures in reproductive health programs, in particular abortion reduction

measures. Ensuring the cost-effectiveness of the programs will be overshadowed by the success of major advances in reducing the overall number of abortions in the country. A clear example of this is the significant reduction in the use of mini-abortions in a number of regions, and in the country as a whole. This, in fact, leads to an increase in economic damage and an underestimation of economic efficiency due to a decrease in the number of abortions with the lowest risk of subsequent complications.

The rate of induced abortions in Uzbekistan remains one of the highest in the country as a whole, despite some positive trends in declining numbers in recent years.

Maternal ill health is primarily manifested as the health of newborns. The health of each subsequent generation of newborns continues to deteriorate. At the same time, diseases with a high risk of death and disability have increased significantly, which requires the development of highly specialized technologies of treatment and rehabilitation and the creation of a special network of medical and social institutions.

In recent years, the loss of premature infants has decreased, fetal losses have stabilized, which is related to the success of clinical and organizational tactics of treatment and rehabilitation of this contingent of children.

Numerous studies have proven a close correlation between economic factors and mortality rates. However, in recent years, transitional researchers have noted a change in the relationship between death and other factors. For example, the role of timely use of modern health technologies and education of the population is growing significantly.

So we can draw some conclusions. Against the background of a sharp decline in fertility in Uzbekistan, the process of reducing the reproductive capacity of women is developing rapidly, which should ensure the birth of healthy children from generation to generation. This requires attention not only to the quantitative indicators of birth, but also to its qualitative characteristics.

Pathological fertility is becoming a major factor complicating the birth process, reducing the need for children in modern families. Increased pathology of pregnancy, childbirth and the postpartum period, followed by initial and irregular visits to antenatal clinics, then the problems of timely, availability and quality of obstetric and gynecological care, the need to form a woman's personal responsibility for her.

Despite the declining prevalence of abortions, the birth-to-abortion ratio remains disproportionate, with the result that the consequences of abortion affect the state of women’s reproductive function over a long period of time. The parallel growth processes of the use of modern contraceptives reveal the incompatibility of educational activities with syphilis and serve as a basis for their correction and integration. Significant growth of malignant neoplasms of the reproductive sphere raises the problem of their targeted prevention. Indicators and causes of maternal mortality reflect unresolved maternal reproductive health problems. Successful resolution of the couple’s infertility problem is one of the resources for families to have the required number of children. There is a need to develop comprehensive reproductive health programs at the federal, district, regional and city levels.

In conclusion, it is worthwhile to make the following recommendations:

1. In formulating the basic principles of regional family policy, it is necessary to:

- Analysis of the demographic situation in the region, study of the sex, age and social composition of the population of the region, analysis of key indicators of reproductive health;

- Identify the strengths and weaknesses of existing systems and structures, identify priorities based on sociological research and analysis of key indicators of reproductive health.

2. The solution of temporary problems by program-targeted methods implies a proven validity and expediency of spending funds. The implementation of targeted programs is easily monitored and effectiveness is evaluated.

3. In order to increase the birth rate and provide access to medical care for women suffering from infertility, it is necessary to finance medical services for this type of pathology from the regional budget.

4. Creating an integrated model of family reproductive health protection requires consideration of several factors - medical, organizational and economic. In the absence of financial resources, the functional integration of different structures and departments aimed at solving pressing problems is the most desirable.

5. We believe that in order to rationally allocate functions and human resources, it is necessary, first of all, to develop a regional network of social assistance institutions for families and children, which will provide a professional and comprehensive solution to the social problems of the family.

6. In the implementation of interagency cooperation in the system of family protection, it is expedient to be based on the principle of medical and social support of the family, developed by us. Using the model we have created to evaluate the final results of activities on a monthly, quarterly and annual basis, it is possible to control the quality of work of subordinate institutions and the system as a whole. In addition, there is a need for rapid exchange of information between medical and social workers in order to resolve some issues in a timely manner.

In the reproductive health system, medical care should be provided from the planning stage of pregnancy and at each stage of development in the interdisciplinary section: fetus - newborn - girl - girl - woman. The guiding principles of the organization of medical care for women and children are timeliness, step-by-step, availability, proven expediency, family orientation.

7. We propose to expand the responsibilities of the family planning departments of antenatal clinics by giving them the responsibility to work with families with various problems in the reproductive sphere. It is advisable to conduct primary prevention activities with the wide involvement of educational institutions and the media.

LINGUOCULTURAL APPROACH TO THE STUDY OF SPANISH PHRASEOLOGICAL UNITS

Davurov Humoyun Shavkatovich*

Teacher of "Spanish and Italian Languages",
Department of Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

In this article we will focus on the phraseological units of the Spanish language, which have a pronounced national and cultural specificity. In the study of the national-cultural specifics of the phraseological composition of the language, the main attention is paid to the figurative basis of phraseology, usually represented by metaphors belonging to various cultural codes. The cultural component, reflecting the national-cultural originality of phraseological units, includes elements of material and spiritual culture inherent in a particular ethnic group, pre-scientific knowledge about the world, national symbols, references to precedent phenomena and processes.

KEYWORDS: *Cultural Linguistics; Phraseology; National And Cultural Specificity; Cultural Code, Precedent Phenomena; Evaluating Meaning.*

INTRODUCTION

Language should be considered as a verbal code of culture, as its creator, since material and spiritual culture find their expression in language [7, 15-26]. E. Sepir put 3 meanings into the term "culture":

1. Culture is understood as a kind of product of a person's material or spiritual activity, fixed by traditions and time.

2. Culture implies a certain set of rules of behavior in society, conditioned by its value orientations.

3. Culture is understood as a civilization reflecting both universal knowledge, attitudes, views on life, and purely national specifics [11, 466-470]. It is this definition of culture that is the main one for the linguocultural focus of our research.

The linguocultural approach to the study of phraseological units "is based on the postulate of the interaction of culture and language as two different semiotic systems, as a result of which the

formation of a culturally conditioned phraseological subsystem of natural language is carried out, in which any phraseological unit acquires the status of a sign of the "language of culture" [3, 8].

V.A. Maslova writes, "The nature of the meaning of phraseological units is closely related to cultural connotations, background knowledge of a native speaker, with the practical experience of the individual, with the cultural and historical traditions of the people speaking this language. Phraseological units directly (in the denotation) or indirectly (through the correlation of the associative-figurative basis with the standards, symbols, stereotypes of national culture) carry cultural information about the world, society.Therefore, phraseological units are a kind of "storehouse of wisdom" of the people, preserving and reproducing the mentality of the people and their culture" [2, 278].

Phraseology, according to V.N. Telia, is "the most culturally-bearing composition of the language, serving as a kind of translator of culture" [7, 11]. It was V.N. Telia who developed the basic concepts of linguoculturology, to which she refers the concepts of "culture", "text of culture", "thesaurus of culture", "code of culture", "symbolary of culture", "cultural connotation", "cultural and linguistic competence", etc. [6, 13–24].

As V.N. Telia noted, the main way of embodying the national-cultural specificity of phraseological units is the figurative basis, which may include culturally marked realities, and the main way of indicating this specificity is "interpretation of the figurative basis in the iconic cultural-national "space" of this linguistic community. This kind of interpretation is the content of the cultural and national connotation" [5, 215].

Let's focus on some types of nationally and culturally determined phraseological units of the Spanish language.

Phraseological Units Correlating With Spanish Precedent Texts

The phraseology "*Tantomonta*" ("everything is one, what is one, what is another") is part of the motto of the Catholic Kings Isabella and Ferdinand "*Tantomonta, montatanto*", which meant the unity of the crowns of Castile and Aragon: *Si no tienescoñac, échaleunchorrito de güísqui, que tantomonta*[8, 741-742].

"If you don't have cognac, pour him some whiskey, it doesn't matter". The famous phrase from the IX chapter of the 2nd part of the novel by M. Cervantes "Don Quixote" "*Con la iglesiahemos dado, Sancho*" (We stumbled upon the church, Sancho) in a slightly modified form "*Con la iglesiahemostopado*" is usually used in cases where there is a church ban on a particular type of activity, although in the novel itself this phrase is taken literally, because in search of the Dulcinea palace, Don Quixote and Sancho really stumbled upon a church building . The source of the origin of the speech formula "*Todos auna, comolos de Fuenteovejuna*" (lit. "all as one, like those of Fuenteovehuna") is the text of the drama of the same name by Lope de Vega (1614), which glorifies the feat of the inhabitants of the village of Fuenteovehuna, who unanimously rebelled against the cruel commander.

Phraseology "*Las bodas de Camacho*" (lit. Camacho wedding) is used to express a positive assessment that characterizes any event, celebration, distinguished by luxury, scope, abundance of delicious food. The origin of this phraseology is connected with the XX-XXI chapters of the second part of "Don Quixote", which tells about the failed wedding of Cytheria with the rich man Camacho and about the wedding meal that could saturate the whole army: *Para celebrar la*

buenamarcha de la empresa, el jefe nos ha invitado a unacomilonaespléndida. Parecían las bodas de Camacho [8, 429–430].

"To celebrate the success of the company, the boss invited us to a luxurious banquet. It's just like Malan's wedding".

Phraseological Units That Include National Precedent Names

Among the verbal precedent names, one can distinguish first of all Don Quixote, the main character of M. Cervantes' immortal novel "The Cunning Hidalgo Don Quixote of La Mancha", whose name is used in a phraseological comparative that characterizes a naive, noble idealist: "portarsecomo un quijote" (lit. "Behave like Don Quixote").

On the other hand, the large volume of the novel and the complexity of the perception of the text itself served to create a negative ethical assessment of "tedious, boring": "*sermáspesado que el Quijote*" (lit. "to be heavier than Don Quixote"). Even the name of Rocinante, Don Quixote's nag, is used in Spanish comparisons with the meaning of the negative aesthetic assessment of an "extremely thin man": "*sermásflaco que el caballo de Don Quijote*" (lit. "to be more skinny than Don Quixote's horse").

As Yu.A. Rylov notes, the name of Don Quixote's squire, Sancho Panza, is used mainly with the meaning "practical man, without ideals" ("como Sancho Panza"), as well as when describing a fat man [3, 82]. The standard of bravery for Spaniards, and therefore the source of a positive ethical assessment is the proper name of the national hero of Spain, one of the most prominent figures of the Reconquista, Rodrigo Diaz de Vivar, nicknamed Cid, sung in the poem "The Song of my Cid" (III in.): "*sermásvaliente que el Cid*" (lit. "Be braver than Sid").

The name of Lasarillo, a tramp and a ragamuffin, the main character of the famous anonymous roguish novel of the XX century."The life of Lasarillo from Tormes": his misfortunes and misadventuresbegan to be used as an image-standard of negative aesthetic evaluation of the "dirty man": "*tenermásmierda que los pies delLazarillo*" (lit. "Having more shit than Lasarillo's legs").

The name of the main character of the comedy of the same name by the Spanish playwright Agustin Moreto (1618-1669) Diego in the phraseology "*el lindo don Diego*" (lit. handsome don Diego) is used to negatively characterize a vain, self-in love man who devotes too much time to his appearance: "*¡Porahíva el lindo don Diego, todocompuesto y creyéndose que todo el mundo se da la vuelta para mirarlopor lo guapo que es*" [8, 264]. "Here comes our handsome man, just like Don Diego, dressed up and imagining that everyone is looking at him, admiring his beauty".

Phraseological units that include elements of folk mythology, beliefs, signs, pre-scientific ideas about a person and the world around him;

A hot-tempered, irritable person is likened to a legendary monster in the form of a dragon, presumably from Galicia or Leon, associated with the times of pagan cults "*Fiera Corrupia*" (lit. "The beast of Corruption"): "*Ten cuidado con Juan, porquecuando se enfada se pone hechounafieracorrupia y no se sabecómova a reaccionar*" [8, 342]. "Beware of Juan, because when he gets angry, he becomes ferocious like a beast, and no one knows how he will react further".

Among the characters of Spanish mythology, one can note the Martinique brownie. So, in Castile, this brownie lives in some houses, hooligans, makes noise, hides things of family

members, but always helps them in solving difficult life issues. In Aragon, when the children are put to bed, they call Martinico, who is responsible for dreams: "*YavieneMartinico*" ("here comes Martinico") [4, 180].

Liver and kidneys in many cultures were considered a symbol of vitality and courage. This symbolic meaning is reflected in the Spanish phraseological units "*ser de/tener (muchos) hígados/riñones*" (lit. "Have/a lot of liver/kidneys")*"¡Quétíos! —piensa,—¡hay que tenermuchosriñones!*" [9, 50]. "These are men! - he thinks, - you need to be very brave!" The ideas of medieval medicine that black bile, located in the liver and spleen, is a source of melancholy and anger is reflected in the phraseology that characterizes an evil person: "*tenermaloshígados*" (lit. "Have a bad liver").

Phraseological Units That Include Elements Of Material Culture

Phraseological units with a gastronomic component are one of the important fragments of the Spanish language picture of the world, characterizing a person and the world around him from the position of the national worldview.

Among the snacks of the national Spanish cuisine, the main delicacy is considered to be "*jamon*" (dried pork ham), presented depending on the method of preparation and the breed of pigs in two varieties: *jamón serrano* (lit. "Mountain jamon") and "*jamónibérico/patanegra"* (lit. "Iberian jamon/black leg");

The Spanish linguistic consciousness distinguishes both positive and negative characteristics in this gastronomic image. Thus, the excellent taste qualities of jamon, which create a positive hedonistic assessment, stimulate the appearance of a general positive assessment in the phraseology "*pasarlojamón*" (lit. "To spend time like hamon", "have a great time"): "*Hoy estuvimostoda la tardeen la cerveceríabailando y lo pasamosjamón*" [12, 140]. "Today we danced all evening in a beer bar and had a great time". Phraseological units "*estarjamón*" (lit. "to be a jamon") and "*jamón serrano*" (lit. "Mountainjamon") form a positive aesthetic assessment: *"¡Rebonita, jamón serrano!"*[10, 162]

As you can see, in the examples given in the article, various metaphors belonging to certain cultural codes are observed. According to V.V. Krasnykh, "the code of culture can be defined as a "grid" that culture "throws" on the surrounding world, divides, categorizes, structures and evaluates it" [1, 5-6]. Being essentially universal, the codes of culture find their embodiment in phraseological units marked with national-cultural specifics, forming a national linguistic picture of the world.

ABSTRACT

Biosensors of different kinds, such as enzyme-based, tissue-based, immunosensors, and DNA biosensors, as well as thermal and piezoelectric biosensors, have been discussed to emphasize their importance in a variety of areas. The food industry uses biosensors to monitor quality and safety, as well as to distinguish between natural and artificial ingredients; the fermentation industry uses biosensors in the saccharification process to detect precise glucose concentrations; and metabolic engineering uses biosensors to enable in vivo monitoring of cellular metabolism. Biosensors and their significance in medical research, such as early detection of human interleukin-10, which causes heart disease, and fast detection of the human papillomavirus, are essential issues to consider. Fluorescent biosensors are important in drug development and cancer research. In the field of plant biology, biosensor applications are often used to identify missing connections in metabolic pathways. Defence, the healthcare sector, and maritime applications are among the other uses.

KEYWORDS: *Biosensors, Enzyme Based Immunosensors, Tissue Based Immunosensors.*

1. INTRODUCTION

Analytical gadgets that transform a biological reaction into an electrical signal are known as biosensors. Biosensors should ideally be extremely specific, independent of physical factors like pH and temperature, and reusable. Cammann invented the term "biosensor," and the International Union of Pure and Applied Chemistry (IUPAC) defined it.Biosensor fabrication, materials, transducing devices, and immobilization techniques all need interdisciplinary study in chemistry, biology, and engineering. Biosensor materials are divided into three categories depending on their mechanisms: biocatalytic, which includes enzymes, bioaffinity, which includes antibodies and nucleic acids, and microbe-based, which includes microorganisms[1]–[3].

Types of Biosensors:

The pioneers Clark and Lyons invented biosensors in the 1960s. Enzyme-based, stem - cell, immunosensors, DNA biosensors, and thermal and piezoelectric biosensors are among the many kinds of biosensors utilized.Updike and Hicks published the first enzyme-based sensor in 1967. Immobilization techniques, such as van der Waals forces, ionic bonding, or covalent bonding, have been used to develop enzyme biosensors. Oxidoreductases, polyphenol oxidases, peroxidases, and aminooxidases are some of the most frequently utilized enzymes for this purpose.

Diviès created the first microbe-based or cell-based sensor. Plant and animal tissues are used to make tissue-based sensors. The analyte of interest may be either a substrate or an inhibitor of these activities. The first tissue-based sensor for the measurement of the amino acid arginine was created by Rechnitz. Membranes, chloroplasts, mitochondria, and microsomes were used to create organelle-based sensors. However, although the stability of this kind of biosensor was good, the detection time was longer and the specificity was lower[4], [5].Immunosensors are based on the fact that antibodies have a high affinity for their antigens, meaning they selectively attach to diseases or poisons, or interact with immune system components of the host. Single-strand nucleic acid molecules can identify and attach to their counterpart strand in a sample, which is how DNA biosensors work. The connection between the two nucleic acid strands is owing to the creation of stable hydrogen bonds.

Magnetic biosensors: Miniaturized biosensors that use the magnetoresistance effect to detect magnetic micro- and nanoparticles in microfluidic channels have a lot of promise in terms of sensitivity and size.

Thermal biosensors, also known as calorimetric biosensors, are created by incorporating biosensor materials with a physical transducer.The quartz crystal microbalance and the surface acoustic wave device are two kinds of piezoelectric biosensors. They are based on the detection of changes in a piezoelectric crystal's resonant frequency as a result of mass changes in the crystal structure.Optical biosensors are made up of a light source and a number of optical components that work together to produce a light beam with particular properties and direct it to a modulating agent, a modified sensing head, and a photodetector.

The creation of genetically encoded biosensors has been helped by the discovery of green fluorescent protein and subsequent autofluorescent protein (AFP) variations and genetic fusion reporters. This kind of biosensor is simple to construct, modify, and implant into cells. Another example is a single-chain FRET biosensor. They are made up of a pair of AFPs that, when placed close together, may transmit fluorescence resonance energy between them. Depending on the strength, ratio, or duration of AFPs, several techniques for regulating variations in Förster resonance energy transfer (FRET) signals may be employed. Synthetic chemistry is used to make peptide and protein biosensors, which are then enzymatically labeled with synthetic fluorophores[6], [7].

Applications Of Biosensors:

Biosensors have been used in a variety of sectors, including the food business, the medical profession, and the marine sector, and they offer greater stability and sensitivity than conventional techniques.

- **Monitoring, Food Authenticity, Quality, And Safety In Food Processing:**

The quality and safety of food items, as well as their maintenance and processing, is a difficult problem in the food processing business. Traditional chemical experimentation and spectroscopic methods have flaws owing to human tiredness, are costly, and time consuming. The food sector would benefit from cost-effective alternatives for food authentication and monitoring that include objective and consistent measurement of food items. As a result, the development of biosensors in response to the need for simple, real-time, selective, and low-cost methods seems to be advantageous.Pathogens in food may be detected using biosensors. A bioindicator of faecal contamination in food is the presence of Escherichia coli in vegetables. Using potentiometric alternating biosensing devices, E. coli was detected by detecting changes in pH induced by ammonia (made by urease–E. coli antibody conjugate). The liquid phase is obtained by washing vegetables such as sliced carrots and lettuce in peptone water. The mixture is then amalgamated in a sonicator to separate bacterial cells from food components[8]–[10].

- **During The Fermenting Process:**

Process safety and product quality are critical in the fermentation industry. To design, improve, and maintain biological reactors at optimum effectiveness, effective fermentation process monitoring is required. Biosensors may be used to evaluate process conditions indirectly by monitoring the presence of products, biomass, enzymes, antibodies, or by-products. Because of their simple instrumentation, impressive selectivity, cheap costs, and ease of automation, biosensors accurately regulate the fermentation sector and provide repeatable results. Several types of commercial biosensors are now available; they can detect biochemical parameters (glucose, lactate, lysine, ethanol, and so on) and are extensively utilized in China, accounting for almost 90% of the market.

The old Fehiing's technique was used to check saccharification throughout the fermentation process. Because this technique requires decreasing sugar titration, the results were incorrect. The fermentation industries, on the other hand, have profited since the commercial introduction of glucose biosensors in 1975. Glucose biosensors are now used to regulate production in the saccharification and fermentation workshop, and the bioenzymatic technique is used to generate glucose.

- **BiosensingTechnology For Long-Term Food Security:**

The terms "appearance," "taste," "odor," "nutritional value," "freshness," "flavor," "texture," and "chemicals" all relate to the appearance, "taste," "odor," "nutritional value," "fresh When it comes to food quality and safety, smart nutrient monitoring and quick screening for biological and chemical pollutants are critical. Material science, nanotechnology, electromechanical systems, and microfluidic systems are all marching forward to make sensing technology a reality. Efforts are being made to create control systems that ensure food quality and safety, as well as human health as a result.

Because the meal quantity and composition may change during storage, glucose monitoring becomes essential. German looked into how gold nanoparticles (AuNPs) changed the electrochemistry of glucose oxidase mounted on a graphite rod, improving its sensitivity.

- **In The Medical Profession:**

Biosensor applications are fast expanding in the field of medical research. Glucose biosensors are often employed in clinical applications for the diagnosis of diabetes mellitus, which necessitates accurate blood-glucose management.Home use of blood-glucose biosensors

accounts for 85 percent of the massive global market.In the medical sector, biosensors are widely employed to detect infectious illnesses. A potential biosensor technique for diagnosing urinary tract infections (UTIs), pathogen identification, and antimicrobial susceptibility is being investigated.

- **Biosensors That Glow In The Dark:**

Fluorescent biosensors are imaging agents that may help in cancer research and medication development. They've opened up new perspectives on the function and control of enzymes at the cellular level. FRET biosensors based on GFP and genetically encoded play an important role. Fluorescent biosensors are tiny scaffolds onto which one or more fluorescent probes are attached through a receptor (enzymatically, chemically, or genetically). The receptor recognizes a particular analyte or target and sends out a fluorescent signal that may be detected and quantified.

Fluorescent biosensors can detect ions, metabolites, and protein biomarkers with high sensitivity, as well as report on the presence, activity, or status of the target (serum, cell extracts) in a complicated solution. In areas including signal transduction, transcription, cell cycle, and apoptosis, they're used to look at gene expression, protein localization, and conformation. These sensors are used to detect arthritis, inflammatory disorders, cardiovascular and neurological diseases, viral infection, cancer, and metastases.

- *Applications in biodefense biosensing:*

In the event of a biological assault, biosensors may be utilized for military reasons. The primary goal of such biosensors is to sensitively and selectively detect biowarfare agents (BWAs), such as bacteria (vegetative and spores), poisons, and viruses, in practically real time. Several efforts have been made to develop such biosensors utilizing molecular methods that can detect the chemical markers of BWAs.Nucleic acid-based sensing systems are more sensitive than antibody-based detection techniques because they offer gene-based specificity without the need for amplification stages to achieve the necessary levels of detection sensitivity.

- **In The Field Of Metabolic Engineering:**

Concerns about the environment and the lack of long-term viability of petroleum-derived goods are progressively driving the need for the development of microbial cell factories for chemical synthesis. Metabolic engineering, according to researchers, is the enabling technology for a sustainable bioeconomy. They also believe that, rather of depending on petroleum refining or plant extraction, a significant portion of fuels, commodity chemicals, and medicines will be generated from renewable feedstocks by using microorganisms. The great potential for variety creation necessitates the use of effective screening techniques to identify individuals who have the desired trait. The previous techniques used spectroscopy to analyze enzymatic assays, but they had a low throughput. To overcome this barrier, genetically encoded biosensors for in vivo cellular metabolic monitoring were created, with the potential for high-throughput screening and selection utilizing fluorescence-activated cell sorting (FACS) and cell survival, respectively.

- **Plant Biology Biosensors:**

Advances in plant research have been made possible by revolutionary new technologies in the fields of DNA sequencing and molecular imaging. Traditional mass spectroscopy techniques for determining cellular and subcellular localization and measuring ion and metabolite levels were

very precise, but they lacked crucial information on the location and dynamics of enzyme substrates, receptors, and transporters. Biosensors, on the other hand, can readily tap into this information. We need to devise methods to visualize the real process, such as the conversion of one metabolite into another or the activation of signaling events, in order to assess a dynamic process under physiological circumstances. Sensors that react dynamically may help with this representation.

2. DISCUSSION

Biosensors are devices that detect analytes by combining a biological element with a physiochemical detector. These devices may be used in a variety of settings, from clinical to environmental and agricultural. Using nitrite and nitrate sensors, biosensors are utilized in marine applications to detect eutrophication. For organism identification, several sensors based on nucleic acid hybridization detection have been developed. In addition to the food sector, the instruments are utilized in industrial processing and monitoring. The kinds of biosensors discussed in this article include electrochemical biosensors, thermometric biosensors, optical biosensors, piezoelectric biosensors, whole cell biosensors, and immuno-biosensors. Biosensor applications are also discussed in this article.

3. CONCLUSION

Genetically modified proteins are injected into cells ex vivo or in vivo to create cell and tissue-based biosensors. Using biophotonics or other physical principles, they enable the researcher to constantly and noninvasively detect levels of hormones, medicines, or poisons. In this respect, the scope may be useful in ageing studies.Using nitrite and nitrate sensors, biosensors are utilized in marine applications to detect eutrophication. Various sensors based on nucleic acid hybridization detection have been developed for organism detection; the Monterey Bay Aquarium Research Institute's "Environmental Sample Processor," which aims to automate toxic algae detection in situ from moorings using ribosomal RNA probes, is a promising development in this field. One of the main objectives is to use biosensors to detect pollution, heavy metals, and pesticides. The use of nanoparticles in biosensors opens the door to the development of a new generation of biosensor technologies. Nanomaterials enhance the mechanical, electrochemical, optical, and magnetic characteristics of biosensors, paving the way for single-molecule biosensors and biosensor arrays with high throughput.Future research should concentrate on deciphering the mechanism of interaction between nanomaterials and biomolecules on the surface of electrodes or nanofilms, as well as using unique characteristics to create a new generation of biosensors. Nanomaterial-based biosensors, on the other hand, have a lot of promise and will soon be widely used in clinical diagnostics, food analysis, process control, and environmental monitoring.

METHODS AND PRINCIPLES OF FORMATION OF SPIRITUALITY IN PRIMARY SCHOOL STUDENTS

Makhmut Mamatov*

*Candidate of Philosophical Sciences,
Pedagogical Institute of Karshi State University,
UZBEKISTAN
Email id: mamatovmahmud51@gmail.com

ABSTRACT

Spirituality is the separation from unfounded, crude sexual interests, the pursuit of inner perfection, spiritual exaltation. Spirituality - in the most general sense - is the generality of the manifestation of the spirit in the world and in man. In sociology, cultural studies, and often journalism, "spirituality" is often expressed in the form of moral values and traditions, usually referred to as the unifying principles of a society, integrated into religious teachings and practices. Therefore, the object of the article is spirituality, and the inculcation of spirituality in primary school students is taken as a theoretical basis.

KEYWORDS: *Spirituality, Spiritual Nourishment, Folklore, Fairy Tales And Epics, Proverbs And Sayings, Children's Folklore.*

INTRODUCTION

Spirituality is a tradition that is passed down from generation to generation, respect for oneself, and the people around us, the environment and nature. Spirituality is nurtured in the family.The stronger the family, the stronger the bonds between generations, the better the chances of nurturing a spiritually mature person. Spirituality is a spiritual quality that consists of the supremacy of spiritual, moral, and intellectual interests over material interests.

Folklore is the basis of folk pedagogy, and examples of folklore are given in the primary grades of secondary schools. After all, culture, art, languages are the main factors in the development of a nation as a nation. Folk art is an integral part of culture, art and language. Therefore, it is no coincidence that in the "National Program of Personnel Training" of the Republic of Uzbekistan, adopted in 1997, "Spiritual and educational work" was approved as a separate section. It emphasizes the development and implementation of effective organizational, pedagogical forms and tools for the spiritual and moral education of the younger generation, based on the rich

national cultural and historical traditions, customs and universal values of the people. [http://library.ziyonet.uz/uz/book/66551].

At present, a vague but meaningful and in many respects exemplary historical experience has been formed in the upbringing of the spiritual and moral sphere of the individual as a whole, both theoretically and practically. The study and generalization of this experience from a historical perspective will actively help to solve the research problem.

The spiritual and moral education of schoolchildren is aimed at "raising the heart" of the child as the center of his spiritual life. It is the process of organizational, purposeful, external and internal (emotional and heart) influence of the teacher on the spiritual-moral sphere, which is the basis of the inner world of the person. This effect is complex, combined with a person's feelings, desires, and thoughts. It is based on a certain system of values that is embedded in the content of education and implemented by a particular position of the teacher.

The implementation of spiritual and moral education in the secondary school can be carried out on the basis of the human values of the content of education, the system of additional education outside the classroom.

The goal of modern verbal, incomplete and soulless pedagogy has its own meaning only when it is to understand the meaning of human life, to reveal the characteristics of the human spirit. To consciously develop (teach and nurture) the human soul, one needs real knowledge of its nature, laws, meaning, and evolutionary purpose. Therefore, it is necessary to study and teach spiritual science, theo-cosmos-anthropogenesis, history of religions, art, world civilizations, cultural studies, logic, ethics, aesthetics, applied psychology, acme ology, vale ology and other sciences. Theories and practices of the human spirit, without which the absolute meaning of life and pedagogy cannot be realized and put into practice;

Each student is approached on an individual basis, not on an individual basis. You don't have to work at school, you have to serve. Education is the food of the spiritual foundation. For this bullet the child was born. The child's spiritual axis is nourished by high images, experiences, and understanding them: love, compassion, respect, empathy, science, as a result of which he has integrity based on fundamental motivations, service consciousness, creativity, activism, and love for the world will be. Higher images and experiences form the original basis of the spiritual experience.

The process of reproduction of morality in society is incorporated into all sorts of social activities and is carried out in this way. In general, it is self-sustaining and promotes targeted influence and conscious control, mainly in the form of self-education, self-improvement. No one has the privileged authority to act on behalf of ethics, to represent the interests of society in this area. Each person has such a privilege and duty, and as a socially active intelligent being, he takes full responsibility for his moral formation and development.

Man can influence his moral development by developing certain behaviors, attitudes, moral qualities. What actions, Aristotle said, are the moral qualities of man.

Spiritual and moral education is aimed at "developing the heart" as the center of a child's spiritual life. It is the process of organizational, purposeful, external and internal (emotional and heart) influence of the teacher on the spiritual-moral sphere, which is the basis of the inner world of the person. This effect is complex, combined with a person's feelings, desires, thoughts.

We all go from childhood to a great life full of joys and sorrows, happiness and sorrow. The ability to enjoy life and to face challenges with courage is formed from early childhood. Children are sensitive and receptive to everything around them and they achieve a lot. To be kind to people, you need to learn to understand others, to show compassion, to admit your mistakes honestly, to be diligent, to marvel at the beauty of the nature around you, to treat it with care. Of course, it is difficult to list all the moral qualities of a person in the society of the future, but the main thing is that these qualities should be decided today.

It should be noted that the formation of ethical concepts is a very complex and lengthy process. This requires the constant effort of adults, systematic and systematic work to shape children's emotions and consciousness.

We believe that the use of folklore is the most effective and fun for primary school students.

The moral purity and charm of folk ideas embodied in the heroes of many fairy tales and epics, the folk wisdom of proverbs and sayings, the charm of riddles, the cheerful jokes of many of the oral works of the Russian people - all this reveals its history. a path to the heart and mind of the little reader.

"Collect study and process our folklore," said Gorky.

Folklore is poetry created by the people and dominating the public, reflecting their knowledge of labor, social and domestic life, life, nature, culture, and faith. Folklore embodies the views, ideals and aspirations of the people, their poetic imagination, the richest world of thought, emotions, experiences, dreams of justice and happiness. Folk poetry dates back to ancient times, people did not know how to write, so naturally, the form of oral expression was peculiar to him. It is an oral, verbal artistic creation that emerges in the process of the formation of human speech.

Folk oral art always meets the needs of people, is a reflection of the collective mind, the accumulated life experience. In it, long before the emergence of pedagogy as an academic science, folk pedagogy was formed - a system of education from birth to the transition to another world.

"People," wrote G.M. Vinogradov, "about life, the upbringing and education of the rising generation, the well-known goals and objectives of education and training, their specific means and methods of influence." had certain views. younger generations and others. Their commonality and interdependence give them what should be called folk pedagogy. ”

The high results of raising children in a popular environment are one of the most important topics in the science of pedagogy. Revealing the secrets of public education can shed light on the peculiarities of the pedagogical culture of the people and the country as a whole. The people respected the inner potential of man, his independence and personal responsibility for his behavior. Folk pedagogy is characterized by behavior, work ethic, so the best educators were usually the people most capable of a particular type of activity: artisans, singers, storytellers, and so on.

There is a special branch of folk art called children's folklore, which, according to the greatest researcher G.S.Vinogradov, was applied "almost exclusively to the pedagogical needs of the people." These are the same “needs” that are central to joint pedagogy - caring for a child's

physical, mental, and moral upbringing, that is. caring about nurturing a physically and mentally healthy person.

Children's creativity is based on imitating its moral characteristics, especially as an important factor in a child's development. The task of the teacher is to inculcate in children the tendency to imitate, to inculcate skills and abilities that are impossible to carry out creative activities without them, to teach them independence, to be active in applying these knowledge and skills, to form critical thinking. Thinking, purposefulness, positive character traits, models of correct behavior.

Children's folklore belongs to the minor folklore genres. These are the most interesting and richest works of folk art in terms of their educational nature:

Fairy tales as a work of art and literature are a field of theoretical generalization in many fields of knowledge at the same time. They are a treasure trove of folk pedagogy because many of them have pedagogical ideas.

Leading Uzbek teachers have always had a high opinion of the educational and pedagogical significance of folk tales, emphasizing the need for their widespread use in pedagogical work. Fairy tales about animals are taught more in the primary grades. Tales such as "The Tale of the Wolf as a Doctor" (A. Obidjon) [3, 70], "The Fox with the Eye" [3,51] are taught and analyzed in the form of clear life stories.

Tales are an important educational tool that has been developed and tested by the people over the centuries. Life, the practice of public education has convincingly proved the pedagogical significance of the fairy tale. Children and fairy tales are inseparable, they are created for each other, so getting acquainted with the fairy tales of their own people must be included in the education and upbringing course of every child.

Small forms of folklore instill in people a love for the Motherland, the understanding of work as the basis of life, social relations in society, the protection of the Motherland, the appreciation of culture.

All genres of folklore are tools of folk pedagogy, aimed at the spiritual and moral upbringing of the younger generation. Traditionally, upbringing has focused on developing a sense of femininity in girls and masculinity in boys.

Boys are taught from childhood to be stable and calm in the expression of emotions, in word, in action, in firm character, perseverance, agility, strength, courage, bravery, and so on.

Special attention was paid to the upbringing of girls in the family. From early childhood, the girl was taught household skills first in play and then in real life: cooking, sewing, washing, washing, and so on. By the age of 13-15, the girls were already ready. for independent living.

Games played an important role in the development of physical strength, agility, intelligence and military skills.

This means that the upbringing of girls and boys from an early age on the basis of folk pedagogy is different, corresponding to the roles of men and women with appropriate sexual characteristics.

Raising boys is aimed at developing qualities such as agility, courage, strength, reaction speed.

Girls were accustomed to such actions, which nurtured patience, the ability to set up and equip life. Girls are brought up with such qualities as loyalty, thrift, kindness.

Folk pedagogy also implies a special attitude to women - mothers. From childhood, girls are gradually preparing for this honorable role - motherhood. We can find the opposite in proverbs and sayings:

Bolaliuybozor, bolasizuymozor

Children's home is as a market, childless home isa cemetery.

Although folk traditions have changed significantly in recent times, modern life sometimes requires flexibility of thinking, the ability to reconstruct, the principle of raising children has been preserved, focused on the development of masculine qualities in men and women - girls.

In the current situation, the education of schoolchildren on the basis of folk pedagogy should be aimed at combining all the best from it with the demands of today's life.

The femininity of a girl, skillful hands, thrift, kindness - the future woman, mother, and caretaker will always be valued and appreciated.

The intelligence, strength, courage, perseverance, and ability to nurture a family and their offspring in men have always been valued and valued.

In this article, we have considered the possibility of using proverbs and sayings from this genre of folklore, created by folk pedagogy, as well as texts about the national beliefs of the Uzbek people in the spiritual and moral education of primary school children. Analyzed the role. In short, folk art is a complex of wisdom for all, young and old. Over the centuries, even though the issues of education have been artistically expressed in the works of our great scholars, folklore works, which are the product of folk thinking, continue to be of universal significance, and such spiritual views are ingrained in children's minds from an early age.

SOME ASPECTUAL CHARACTERISTICS OF THE SPANISH VERB

Vakhidova Anastasiya Abdusamiyevna*

*Teacher of "Spanish and Italian Languages",
Department of Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

The functional-semantic field of aspectuality as a set of means of expressing aspectual meanings and meanings is characteristic of all languages. The article discusses the main characteristics of the Spanish verb in the framework of the theory of functional grammar. Functional grammar is a branch of linguistics based on the study of universal categories of language. This is a grammar aimed at studying and describing the functions of the units of the language structure and the laws of the functioning of these units. Grammar of this type considers in a single system the means belonging to different tiers of the language, but united on the basis of the commonality of their semantic functions.

KEYWORDS: *Aspectuality, Spanish, Theory Of Functional Grammar, Grammatical Categories.*

INTRODUCTION

Functional grammar is a branch of linguistics based on the study of universal categories of language. This is a grammar aimed at studying and describing the functions of the units of the language structure and the laws of the functioning of these units. Grammar of this type considers in a single system the means belonging to different tiers of the language, but united on the basis of the commonality of their semantic functions.

When analyzing linguistic material, the approach "from semantics to its formal expression" ("from functions to means", the so-called onomasiological approach) is used as the main determinant of grammar construction, combined with the approach "from form to semantics" ("from means to functions").

The basic concepts of functional grammar are semantic category (functional-semantic category) and functional-semantic field. The fields lying in the field of the study of functional grammar include such as the field of intensity, locativity, temporality, comparativity, etc.

In Russian linguistics, within the framework of the theory of functional grammar, the concept of aspectualityis considered, which is interpreted as a functional-semantic category that unites multi-level linguistic means. Aspectualityis understood as a semantic categorical feature that conveys the nature of the flow and distribution of action over time.

Aspectuality is a functional and semantic field constructed by interacting linguistic means: morphological, syntactic, word-formation, lexical-grammatical, lexical and their various combinations, united by the commonality of semantic relations, i.e. relations, the content of which is to convey the nature of the flow and distribution of action in time.

According to A.V. Bondarko, aspectual meanings are concentrated primarily in the sphere of the verbal predicate, in the sphere of action, since aspectuality goes beyond the limits of the action-predicate. The aspectual characteristic is characteristic not only of the predicate, but also of the utterance as a whole. Therefore, we can talk both about the aspectual characteristic of the predicate, and about the utterance as a whole [1. p. 10].

Y.S. Maslov identifies two spheres of aspectual meanings: 1) qualitative and 2) quantitative aspectuality. The system of categories of qualitative aspectuality in Y.S. Maslov opens by dividing all phenomena into static (states, relationships) and dynamic (actions). Dynamic phenomena break up on the basis of the orientation of an action to its “internal” limit, into groups of marginal and non-marginal predicates. Limit predicates, in turn, are divided into actions that have reached the limit and actions that have not reached the limit [2. p. 12].

Unlike qualitative aspectuality, the categories of quantitative aspectuality, which include multiplicity, duration and intensity, are not united by a common semantic idea, but are recognized as “of different quality” and logically heterogeneous, as evidenced by the possibility of their combination within the same lexeme, i.e. they characterize the same action, but from different sides.

The main categories of aspectuality listed above, originally identified on the material of Slavic languages, and are also implemented in Spanish.

The category of aspectuality in Spanish is transmitted through a system of forms and meanings of tenses, which include the concepts of the limitation/unlimited duration of action, its duration and singleness, multiplicity and punctuality, limit and non-limit, that is, through the elements of aspectuality.

Many Spanish grammarians (I. Andres-Suarez, E. Alarcos-Yoranch, A. Bello) believe that with the exception of the simple past tense - *PretéritoIndefinido*, for example, *canté*, all other simple tenses mean an incomplete action, more precisely, there is no indication of the limited duration of the action, i.e. these forms express shades of meaning of an imperfect kind. In turn, all complex time forms and simple past tense (*he cantado, habíacantado, hayacantado*, etc.) convey a time-limited and in this sense complete action. Therefore, their values contain shades of perfect appearance. The opposition between simple and complex tenses presents opportunities for the Spanish language to express specific, aspectual shades.

Analytical verb constructions (turns, periphrases) are very common in Spanish. Many of them are also associated with the transmission of species shades. For example:*estar* + *gerundio, seguir* + *gerundio* (*estarescribiendo, seguircantando*). The verb *estar* + gerund is to do something at the moment, *seguir* + gerund is to continue doing something (to write at the moment, to continue singing).

Specific shades are also manifested in the semantics of some verbs, primarily those that express a certain mode of action. It is believed that such verbs have a lexical category of the mode of action.

So, V.S. Vinogradov [3. P. 98] leads one of the most common classifications Spanish verbs expressing manner:

– The effect is immediate (one-time, single-point) – *saltar, llamar, firmar, chocar, decidir*, etc.;

– The effect of repeated (recurring) – *golpear, picotear, pestañear, hojear, frecuentar*, etc.;

– The effect of long-term (imperfecto, unsaturated) – *saber vivir, querer, contemplar, knowing, respetar*, etc.;

– The action of the ultimate (perfect) – *nacer, morir, acabar, concluir*, etc.;

– Actionnacionalnoe (inchoative) – *amanecer, enrojecer, comenzar, empezar, alborear*, etc.;

– Action terminative (finetune) – *cesar, terminar, acabar, dejar(de)*, etc.;

– Action Stateline (expressed as) – *dormir, alegrarce, descansar, aburrirse*, etc.

Spanish linguists Pedro HenriquesUrena and Amado Alonso in "GramáticaCastellana" [4. p. 139] propose the following division of verbs according to the mode of action they express: first of all, verbs are divided by them into perfect and imperfect, i.e. into expressing an action that does not need completeness in order to become complete: *brillar, querer, saber, oir, ver, nadar* etc.; and those whose action is not complete, if it is not finished: *saltar, salir, entrar, terminar, comer, hacer, morir* etc.

But here, scientists note that such a division of verbs into perfective and imperfective is more in line with the generally accepted, international view of this problem, being terms of comparative linguistics.

Urena and Alonso offer their own classification, which is more acceptable and reflects, in their opinion, the realities of the Spanish language better. It is proposed to divide verbs into permanent (*permanentes*) and so-called desinate (*desinentes*).

Permanent verbs mean a complete and prolonged action, for example:*brillar, querer, saber* (to shine, to want, to know), *desinate* (derived from Latin desinere, terminar) - mean a complete action, for example:*nacer, morir* (to be born, to die). These definitions most closely coincide with the definitions of marginal and non-marginal verbs accepted in linguistics.

Another classification is proposed by the Spanish grammarian Jose Roca Pons [5. p. 385]. This linguist distinguishes three aspects of the consideration of action (Aktionsarten) – three ways of proceeding of action, respectively, three forms of the past tense:

1. Imperfective (*imperfectivo* - imperfect, imperfect);

2. Punctual (*puntual* - simple past);

3. Perfective (*perfectivo* - complex past).

Considering the question of the expression of the category of species in Spanish, Roca Pons suggests focusing on verbal periphrases - descriptive constructions that are very important from the point of view of the expression of species (*irhaciendoalgo* – gradual development of action, *volver a haceralgo* – repetitive action).

M. Alonso believes the following: “The verb form is usually included in the grammatical category of tense. The verb, by itself, denotes the process of action, as well as phenomena associated with the manifestations of the human soul and the objects of the reality surrounding us, has different types, judging by the beginnings or the limit, which it expresses perfectively or imperfectly”.

M. Alonso, who, along with the aspect of verbal action (*aspectodelhecho verbal*), explores the method of verbal action (*manera del hecho verbal*), which, as he writes, “comes from the semantic content of the verb itself... According to the mode of action, the verb has the meaning of incoativity, perfectivity, iterativity, etc., and according to the aspect of verbal action, certain signs give it the character of inhoativity, perfectivity, iterativity, etc”[4. p. 39].

It is noted that recently a comprehensive study of the aspectual capabilities of the Spanish language has led to a revision of the concept of the mode of action in Spanish studies. It began to be associated not so much with the nature of the verb lexeme itself, as with the modification of its meaning under the influence of various contextual means.

So, in Spanish, all the main differences of a specific nature take place only if there are discrepancies in temporal values, therefore, the allocation of the category of species as such is considered unjustified, and the various species shades manifested in the forms of tenses are interpreted as a secondary effect of temporal differences.

So, the Spanish system of verb tenses and lexico-semantic features of verbs have wide possibilities for transmitting a wide variety of temporal, aspectual and modal meanings, meanings and shades.

THE CONCEPT OF INTENSIFICATION OF EDUCATION WAYS TO ACTIVATE THE TEACHING OF RUSSIAN FOR NON-PHILOLOGICAL STUDENTS

Mukhiddinova Gulirano Negmatovna*

*Teacher,
Russian language at the Pedagogical Institute of Karshi State University,
Faculty of Languages, UZBEKISTAN

ABSTRACT

One of the most important ways to activate the learning process is to ensure that the components of the learning content are interconnected. Intensification of education is the transfer of large amounts of information with a constant duration of training, without reducing the requirements for the quality of knowledge. Intensification of education is to increase the productivity of teachers and students in each unit of time. This article also discusses the intensification of education, using the example of Russian language classes.

KEYWORDS: *Intensification of Education, Intensification, Efficiency, Individual-Typological Characteristics of Students, Teaching Technologies.*

INTRODUCTION

From the first years of independence, students of non-philological universities were taught Russian on the basis of dictionaries, grammars and texts in special subjects, as the preparation of first-year students in their specialties began. At the same time, attention was paid to the teaching of scientific speech syntax, methods of teaching types of speech activities were developed in the material of the field of professional communication [12, 3]. Textbooks in Russian were often based on the texts of the subjects studied at the university: both general scientific (mathematics, physics, chemistry) and highly specialized (materials science, geodesy, mechanical engineering, etc.) [9]. during this period, the term “language of specialization” was introduced and “began to be taught as a part of foreign language teaching, which provides educational, scientific and professional communication in the language of specialization in the educational institution” [8, 406].

In modern conditions, due to the transition of higher education institutions to the two-stage system of "bachelor-master" in the first stage of general education and special subjects, it is not possible to teach non-philological students the language of their specialty. This means that it is

necessary to reconsider the content of teaching Russian in non-philological universities. Profile language teaching refers to the teaching of the means of speech of the basic cycle sciences according to the university preparation profile, including general scientific dictionary, stylistic synonyms, and clichés used in educational literature, etc. Can provide communication within the first two years of study at the university, and then create a solid foundation that allows international students to independently master the material of special subjects in the future.

It is also necessary to intensify the process of teaching Russian as a foreign language, as it takes place in a target language environment, so foreign students can learn the language of the educational profile and the social sphere, in addition to learning the language of the educational profile they have to learn. To do this, the teaching of Russian as a foreign language should be carried out not only with textbooks on general and special sciences and articles of general scientific and narrow content, but also with works of art and journalism, films and videos. In this case, the intensification is done by working with more learning material in the group.

Addressing the language of the socio-cultural sphere of communication is important not only for educational and pedagogical purposes, but also because the teaching of the profile language is based on the language of this sphere.

In other words, a language that serves the social sphere of communication is the basis for mastering the language varieties necessary for other spheres of communication (the core of the field structure). The core space of the industry is formed as a result of mastering the general scientific language in school and language tools that serve the socio-cultural sphere of communication. In addition, the periphery of the field is formed in the subsequent vocational training, that is, the student learns the language of a particular field of study, and then the language of the specialty.

Intensification is the development of education, increasing the intensity of training. Intensity is one of the important indicators along with the efficiency, convenience, motivation and other parameters of the learning process. All of these parameters are appropriate for teachers and students seeking to ensure learning:

- Effective (successful), ie the results obtained in accordance with the objectives set by the cheapness of resources;

- Easy, ie not to overload teachers and students in the learning process;

- Motivation, ie for students to be interested in learning activities or to understand their importance;

- Intensive, ie to make the learning process as fast as possible.

Undoubtedly, the main among these parameters is the effectiveness of teaching, the indicator of which will be the quality of speech skills formed in the teaching of Russian as a foreign language. All other parameters, including the intensity of the training, are important, but additional parameters of the learning process will still be used during the training. Therefore, in pedagogical research, first of all, it is about increasing the effectiveness of training, and secondly, it is about increasing the intensity of training.

Yu.V.Vannikov and T.S. Kudryavtseva noted that the intensity of training is nothing more than the amount of work done in a given period of time. The intensity of training is directly proportional to the number of units of study for each individual unit of time and inversely

proportional to the number of units of time for a unit of study (the unit of study is specific to both units of linguistic material skills). In this case, intensification is understood as “an increase in the workload over a specified time interval or a decrease in the time interval with a set workload” [10, 49]. In this case, we are talking about changing the quantitative characteristics of the learning process, which is important only if the effectiveness of teaching is ensured.

This allows foreign non-philologists to teach Russian in the system of teaching Russian, when it is necessary to ensure the effectiveness of the educational process in the context of reduced teaching hours, that is, taking into account the conditions of the time. the program means teaching and teaching material that is no less successful than in previous years where academic hours are allocated. Accordingly, non-philological students are more likely to experience learning intensity (i.e., mastering more learning material, such as words), leading to learning effectiveness (high-quality speaking skills). Teaching methodology is needed. When measuring learning outcomes using this method, it is necessary to determine not only the qualitative characteristics of the learning process, such as the presence / absence of language errors, but also quantitative criteria, such as the number of words learned.

The organic link between training intensity and its effectiveness has also been noted by other scholars. For example, E.G. Azimov and A.N. Shchukin believes that this should be understood as “... one of the ways to increase the speed and quality of education”, “to strengthen labor productivity and quality of work” [8, 83]. B.A. Lapidus wrote: “Activating the learning process means increasing its efficiency, its‘productivity ’, without increasing the number of hours devoted to the subject” [13, 3]. A.A. Leontiev believed that learning can be activated in the educational process by creating the conditions for learning activities that have the most positive impact on its success [15, 88].

The scientific literature [11, 65] shows that the activation of teaching Russian as a foreign language can be achieved in different ways:

-Rationalization of the content of the subject "Russian language", in particular, the involvement of problem materials in the educational process;

-Rationalization and development of existing teaching technologies, in particular, the use of active teaching methods in order to ensure the intensity of communication in the classroom;

- Combining individual and group-group forms of classes;

- Systematic use of visual aids and teaching aids;

-Taking into account the individual-typological characteristics of students.

Let’s look at a few examples of intensification in relation to the training of non-philological students. First, it allowed distinguishing different profiles of education, in particular, engineering and technical education, taking into account the individual-typological characteristics of students [7, 52]. In addition, the individualization of the process of teaching students of technical specialties, taking into account their cognitive style, according to some researchers, has a positive effect on the acquisition of Russian as a foreign language [6, 132].

Second, experimentally determined and proven by many years of teaching experience: the intensive use of audiovisual and technical teaching aids: video films, computer programs, multimedia tools helps to intensify teaching Russian language to non-philological students . Textbooks on university profile [11, 47],

Third, intensive methods help to intensify the training of non-philological students, whose advantages include a large amount of material, taking into account the motivation to focus teaching on the practical needs of students. Already studied [17, 62]. The scientific literature, on the one hand, shows that intensive methods are most successfully applied in short-term teaching, and in the long-term education system of the university they are used in introductory and additional courses [14, 51]. On the other hand, a number of methods of intensive education have been noted to be easily transferred to ordinary (university, school) education [16, 145]. Shekhter and the method of activating the capabilities of the individual and the team G.A. Kitaygorodskaya. A.N. Shchukin emphasizes that intensive methods can be used in teaching communication in everyday, socio-cultural and general scientific fields, in particular, that teaching materials that implement the ideas of the emotional-semantic method include problem situations based on general scientific and specific foundations possible [18, 202-205].

Listing examples of accelerating teaching for non-philological students, we note that one of the most important ways to ensure the intensity of the educational process is to interconnect the components of the content of teaching Russian, which is not only rational selection of educational material and its placement in the educational process, as well as the development of rational teaching technologies. This does not preclude the simultaneous use of other methods of intensification, such as the involvement of technical training manuals, taking into account the specific features of the cognitive method of future engineers, increasing communication density, and so on.

In conclusion, although intensity is one of the important parameters of teaching, one of its quantitative features, in order to activate the educational process, it is necessary to take into account its qualitative aspect, the intensity of teaching Russian to non-foreign philologists. In order to provide, probably in different ways, often intensive methods, audiovisual and technical teaching aids, individualization of teaching are used.

ABSTRACT

IoT, being a subject of significant interest and significance for the future generations, includes various difficult and improving issues for the IoT application developers and researchers to work with. A wireless sensor mesh networking has emerged as an appealing alternative for broad variety of low-power IoT applications. This article demonstrates that how the data may be stored, received and processed parallelly by the parent node in the cluster from many sensor nodes, thereby decreasing the reaction time significantly. The usage of parallelized algorithm for the communication protocol optimized using OpenMP standards for multi-core architecture between the sensors and parent node allows various radio technologies to be utilized for an application which could not be more than one in case of serial processing. The suggested method has been tested for a wireless network application detecting temperature and moisture concentrations utilizing many sensors for which the reaction time is reported to be less than 10 ms. The article also covers in depth the hardware configurations for the application evaluated along with the findings shedding light on the parallel method for buffering and processing the messages. Finally, the study is completed by claiming the edge of parallel algorithm-based routing protocol over the serial in the light of graphical findings and analysis.

KEYWORDS: *Parallel Algorithm, Wireless, Sensor, Mesh Network Topology, Openmp, Iot.*

1. INTRODUCTION

Today, wireless sensor networks have become an essential component of the modern-day computer environment particularly in the area of communication and information sharing. These kinds of networks have found their existence and most importantly significance in variety of applications such as military surveillance and monitoring, home automation systems, mode of

transport like cars, airplanes, etc., industrial application like automating the machinery, environment analysis, weather predictions and many more[1]. The most significant use of wireless sensor networks is data gathering and processing. Owing to necessity of having high technical and computing in today's modern-day network situation, there is an increasing focus on data collecting in the wireless sensor networks[2].

Usually, huge or thousand numbers of sensor nodes are utilized for the gathering of data. Various techniques may be utilized for deployment of these nodes. The sensor nodes may be fixed or movable. The ultimate difficulty in this is how quickly the data can be processed and the results can be given back to the consumer. Keeping in mind the increased data availability and flow of information via the network, the requirement of applications is the immediate response to the actual world. This requires for some specific computing measures and method to be included in order to handle and compute such a big data in no time. In this paper, we come up with a concept of parallel read and data processing in an IoTbased application developed to read in the weather and moisture concentrations of an area.

The code for the program has been updated using the OpenMP standard for parallel processing using the parallel processing capability of multi-core architecture of contemporary computers. The paper has been modelled and organized into sections.

basic introduction to wireless networks, IoT-based applications and requirement of parallel processing in data buffering and reading. the wireless sensor mesh network design in short. Section 3 examines the different components of the network architecture. the applicability of parallel processing in reading and processing the data from sensor nodes parallelly in the network. Section 5 shows the experimental set-up and operating mechanism together with the hardware components and devices involved.

the integration of parallel processing to the method provides the experimental evidences in the light of performance comparison and graphical findings showing how the efficiency gain in terms of sudden responsiveness can be improved utilizing the parallel processing capability of many CPUs. Finally, the article wraps up with a Conclusion claiming parallel implementation to have an incremental speed increase over serial method with the growing number of sensor nodes in the network.

1.1.Wireless Sensor Network Architecture

Using Mesh Topology Wireless mesh networks operate like normal wireless networks, but with several convincing distinctions. Mesh networks does not offer a centralized infrastructure rather tries to maintain a decentral network by having each sensor node performs multiple functions, as a user and a router of data traffic[3]. This manner, the network lives as a self-organized and self-managed biological organism capable of delivering service to a huge number of users. Mesh networks usually depend on wireless nodes rather than centralized access points to build a virtual wireless backbone. Network "sensor nodes" create network connections with surrounding nodes, allowing traffic to hop between nodes on various routes across the network.

The wireless sensor network may be built using three structures—

- Layered according to hop count
- Clustered
- Utilizing mesh topology.

The fundamental architecture includes three main things: sensor nodes in which they gather all the information using different sensors like temperature, humidity, pressure, sound, etc., and they may also conduct computation on the received data and transmit it further in the network[3]. Base nodes: All the processed data is kept here. Cluster nodes: The network may be split into clusters. Each cluster consists of a cluster node which manages data of different sensor nodes present inside the cluster[4].

1.2.Wireless Sensor Mesh Network Preliminaries

A wireless sensor mesh network is a self-healing network. When one node can no longer work, remainder of the nodes may still function and interact with one another, directly or via individual nodes by automatically altering the routes between the nodes. These routes may be self-formed and self-healed depending upon the status of wireless nodes in the network. If a node is active and functioning, it may participate in constructing a route with the assistance of another node. Thus, a wireless network may have numerous links. Wireless mesh networks may operate with various wireless technologies like 802.11, 802.16, 02.16, cellular technologies, WiFi, Bluetooth, radio frequency, etc. In addition, need not be limited to any one technology or protocol. The wireless mesh network may potentially have several radios running at various frequencies to link the nodes in the network. Sensor node: The sensor node gathers all relevant information, if necessary, processing the data may also be done on the sensor nodes itself before sending the data further in the network (Figure 1) [5].

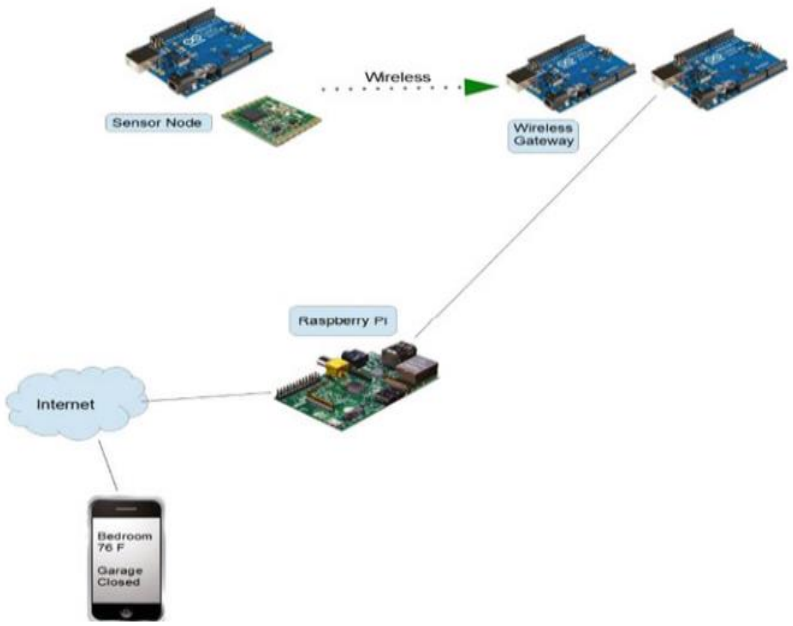

Figure 1: Flow of Data from Sensors with The Help of Raspberry in The Routes of Wireless Gateways

- **Multiple Sensor Node:**

  The network comprises of numerous sensor nodes which cooperate with one another, share valuable network information with one another to keep the network up and operating all the time.

- **Parent/Base Node:**

The gathered data is passed over to the base node for storing and processing further. The parent node may also execute actions depending on gathered data, such turning on the lights automatically when motion is detected in a room with home automation system. The parent node is aware of the sensor node from where the data originally came from, so it may transmit the feedback back to the same node. There may also be many parent nodes with in the network. Each parent node is responsible for managing set of sensors, thereby creating a semi-cluster-based mesh network.

A wireless mesh network (WMN) is a communications network made up of radio nodes organized in a mesh topology. It can also be a form of wireless ad hoc network. A mesh refers to rich interconnection among devices or nodes. Wireless mesh networks often consist of mesh clients, mesh routers and gateways[6].

In this context, connected things are generally defined as Smart Objects (SOs) and, thanks to the IoT, dynamically integrated in several scenarios, such as: smart industries applications, smart cities, smart agriculture, smart health, etc. Each application area has specific requirements to be taken into account, thus having implications for the communication technologies to be considered and, possibly, adopted[7]. Moreover, IoT network topologies are generally star- or tree-based, with data collected by groups of sensors and sent to a central collector or border router, in order to guarantee centralized processing. The emerging and constantly evolving IoT applications require more complex network topologies, without a predefined hierarchy but able to dynamically adapt themselves to changing conditions. For this reason, there is a strong academic and industrial interest on the development of hardware and protocols able to support Wireless Mesh Networks (WMNs).

1.3.Parallel Processing in Wireless Sensor Mesh Networks

Using an effective dynamic protocol helps improving the performance of the wireless sensor mesh network. This speed may further be improved by utilizing parallel processing methods. This may be done either by creating clusters of several parent nodes or by spreading the workload across the various cores of parent node for enhanced processing. Processing of multiple buffers was originally implemented by Intel in their I series CPUs[8]. Same approach may be used to wireless sensor mesh networks too. There are various techniques like as hashing or encryption, which are applied to stream of data buffers[9]. Since the data being processed is extremely big, there is an ever-growing demand for improving the performance.

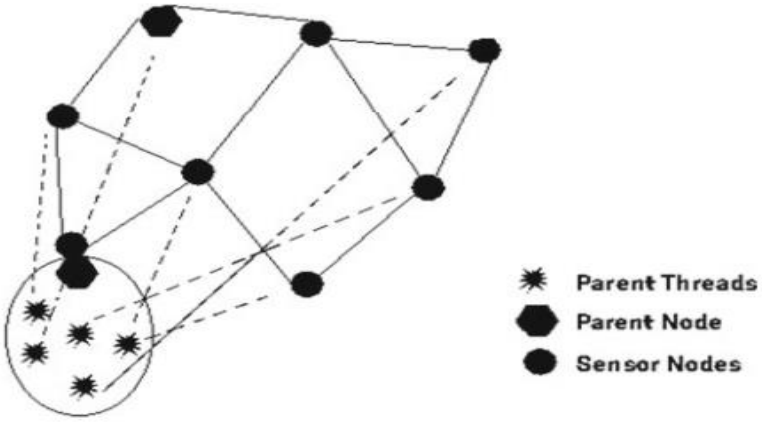

Figure 2: Sensor Nodes Sending the Data to Parent Nodes with Threads Along with Parent Nodes and Threads as well as Sensor Nodes

Two fundamental methods to accomplish this is to process several separate buffers in parallel or to process the buffers using SIMD instructions[10]. Processing in parallel manner helps lowering data dependence limitations. In Figure 2, the sensor nodes may transmit data to the parent node, which includes many threads, i.e. several instances of parent node are present indirectly to process the data. More are the number of threads available on the parent side, quicker the data can be processed; therefore the interval specified in the sensor nodes for transmitting information may be reduced significantly, for more accurate data recording and storage. Further advantages include improved reaction time in case of providing feedback to the appropriate sensor nodes for any action-related signals.

2. DISCUSSION

The functions for reading and data processing activities are divided across the many CPU cores utilizing the OpenMP programming standard. For our study, the inputs are the temperature and humidity concentration data from three distinct sensor nodes, one base station. Using parallel processing, several instances handle the nodes in a parallel manner for processing and response. It is comparable to having a personal thread for every sensor node. The execution timing is significantly reduced down for the parallel implementation of the method employed which is needed by real-time applications to offer immediate responses and output to the end users.

the temperature log for the data received from sensors read paralleled. Here a thread corresponds to each sensor node and is responsible for collecting the values from that corresponding node. Parallel processing creates a difference when collection of data, forwarding and response is done by several threads. An important point to notice about the technique is that when parallel processing is performed, the improvement in performance was significant as the payloads were being queued on the SOCs. The messages are not forwarded until preceding messages have successfully reached the destination and processed by it.

3. CONCLUSION

The article offers a simultaneous data buffering and reading method for situations requiring high number of sensor nodes. With the tremendously increasing data, in order to provide quick

spontaneity to the user inquiry via web, we need certain specific methods to display the results in real time. In this article, we have developed an IoT-based application for reading temperature and humidity concentration data of a particular location. By increasing the number of sensors in order to expand the coverage area slows down the pace at which the result is generated since each node interacts with every other node in the network as well as sends the results to the cluster head or parent node. This data retrieval and processing rate is improved by utilizing the OpenMP programming paradigm by translating the data reading and buffering operations to parallel architecture of the machine having multiple CPUs.

The article also covers in depth the experimental set-up along with the component description and connection. Graphical findings and the comparison table in the preceding section clearly show that the parallel version offers a high-speedup advantage over the serial one. As the number of nodes in the network grows, the performance benefit likewise increases. Further research may be done using the same idea of many parent nodes for a cluster-based computing environment as single machine meets to a specific restriction at some instance. The high use of the RF modules leads in heating up of the modules in case of extended operation, which impacts the performance and speedup a little. Instead of software implementation of data encryption, if the SOC is built in a manner such that the encryption is done on board, the speed may be improved further.

INTRODUCTION

In lingvoculturological and axiological studies of the Uzbek language, zoonyms have a specific semantic value. Language owners make extensive use of zoonyms when evaluating events or people in proverbs. Images and symbols are created through the skillful use of methods of comparison, comparison and contrast of knowledge.

LITERATURE ANALYSIS AND METHODOLOGY

In Uzbek linguistics, a number of studies have been conducted covering functional-semantic, morphological features of zoonyms, their use in speech, structural and semantic,

lingvoculturological features of zoonymic component parema and phraseological units [1,2,3,4,5].

Zoonyms are studied in the language under the terms zoonyms, zoomorphisms, animalisms, zoosemisms, zoometaphores, faunonyms, anthropozoomorphisms. “Anthropozoomorphisms are metaphors that describe man. The term zoomorphism is understood in philosophy and archeology as the depiction of gods in human form and has been used in linguistics in the study of zoometaphores” [6, p.29]. Also, “biomorphic codes are linguistic units that reflect human perceptions of the animal or plant world: cunning as a fox, a young lion; zoomorphic metaphor - words used in a metaphorical sense, denoting animals and birds: buffalo, lamb (in the sense of a child)” [7, p.22-23].

RESULTS

In the study, the anthropozoomorphism of zoonyms was analyzed through proverbs. They have been used to express both positive and negative meanings in proverbs, and in some places for both negative and positive evaluation relationships depending on the content of the text. In particular, the horse zoonym plays an important role in the assessment of human behavior, physical and mental capabilities in proverbs.

Positive assessment:

In proverbs such as *Отнинг ўлими – итнинг байрами*; *От қариса – охурда, ит қариса – чуқурда*the horse zoonym as an anthropozoomorphism has always valued people who have been brave and have done good to others. In the text, the zoonyms of horse and dog are used appropriately to show the people's attitude to the virtues and vices in man. Spoken antonyms such as ax-pit indicate that in the linguistic landscape of the language-possessors, the ax-lexeme is embodied in the sense of prestige, while the profound lexeme is embodied in the negative evaluation semantics (*бировга чуқур қазима, бир кун ўзинг йиқиласан*). The text O*т топади, эшак ейди*reflects the value of such qualities as courage, diligence, agility, generosity. *Эшак урган билан от бўлмас*: not being good is defined as a constant rule in proverbs. In the proverb, the horse is described to wise men through anthropozoomorphism.

Negative Assessment:

От ойлигин ўйлар, туя йиллигин; от миниб яқинни кўзлагунча, туя миниб узоқни кўзла thise proverbs describe people who think of today, not tomorrow. *Отни ит қайтарар*. It is well known that dog anthropozoomorphism is often described as bad – greedy, hypocritical people. The text states that a horse is sometimes a victim of such people because of the simplicity of good people. *Шернинг ўлиги ҳам от ҳуркитар*this proverb evaluates cowards.

Proverbs about horses are prone to error and sin: *От айланиб қозиғин топар, сув айланиб ёриғин; От босмайман деган ерини уч босар*. *От чачаси узунлиги – ўзига зарар* the proverb states that man's physical and mental superiority over others sometimes harms rather than benefits. “Chacha - is hair that grows from the top of a horse's hooves. Normally, strong, strong horses have long hair and can be overwhelmed and fall while walking” [8, p.213]. Language owners were able to create rules for themselves as a result of observing the natural movements of animals. *Булбул овозининг хушлигидан – қафасга гирифтор –* the proverb is also used in the same sense.

As anthropozoomorphism in horse zoonomic proverbs, the socio-economic opportunities of the individual, such as career, wealth, prestige, and their various effects on human life are also observed: *От ўлади, қуш учади; От минган отасини танимас, Той минган – оғасини; От минмаган от минса, чопа-чопа ўлдирар, Тўн киймаган тўн кийса, қоқа-қоқа тўздирар.*

Our people say, “От - мурод”. At the heart of the horse's will is a universal meaning [9, p.5]. The name of the horse in the proverbs also shows its value in the life of the people.

In addition to conveying certain information to the listener, the speaker also aims to have an emotional-expressive effect on him. Hence, the content of the character often reflects the modal attitude of the speaker.

The wolf - is the totem of the Turkic peoples, it is a symbol of courage and disobedience. Legend has it that the basis of Turkish tribes was tied to the wolf, which led to the preservation of their trust in the wolf. The main part of the trust in the wolf is associated with the birth of a child in different groups of Uzbeks, saving his life. In the Kashkadarya Uzbeks' bells, avahli, nayman, kuchchi, saroy, and mangit, pregnant women carry tumors from the wolf's skin, bones, and other organs. those who missed [10, p.68-69]. All this is a symbol of the attitude of the Turkic peoples to the wolf, and at the same time means to find prey like a wolf. It is no coincidence that the phrase "seen by a wolf" is not used for the lucky and successful people. Hence, the wolf zoonimi was a leader in totemistic views, describing a disobedient, courageous, resourceful man.

In the proverbs, the wolf zoonymy was observed to be actively involved in the process of evaluating ruthless, greedy people along with brave, disobedient people. Below we analyze its anthropozoomorphic properties:

Neutral assessment:

Бетда юрган бўриман, Насибамдан кўраман.The text describes the relationship between man and destiny, fate with the wolf zoononym.

Positive assessment:

In the proverb “*Бир бўри ўлжа топса, Ўн бўри ҳозир бўлар”* the custom of sharing the prey of the wolf with others is passed on to people, and the value of friendship and harmony is realized. *Бўри ҳамсоясига ола қарамас* as a continuation of a previous proverb about looking at a neighbor. People who are loyal to their brothers and sisters are valued by the people when “*Бўри бўрини ёрмасда*”. *Бўрининг озиғи – бурнида*.This proverb reflects the value of such qualities as proportion, availability of food, diligence, agility, appropriate to human action. In the text of *Ит еганидан бўри егани яхши*, *Бўри ориқлигини билдирмас* qualities are given to brave, courageous and frankly persons.Given that the Turkic peoples are a symbol of courage, disobedience, it can be said that the text expressed intellectual and moral qualities.

Negative assessment:

Лақмалик – Бир тулки етти бўрини етаклайди: пасткаш, ўз манфаати йўлида ҳар қандай ёмонликка тайёр: *Бўри бўронда қутурар; очкўз – Бўрининг ўзи тўйса ҳам кўзи тўймас*; ёвуз, кучли: *Бўри қариса ҳам битта қўйга кучи етар;* тавқи лаънат - халқ нафратига дучор бўлган киши: *Бўрининг еса ҳам, емаса ҳам оғзи қон;* бағри тош, золим: *Қўй билан бўри бир оғилда яшамас*; мавқеи баланд, амалдор: *Қўй қарғиши бўрига ўтмас* and so on. The proverb, *Бўридан қўрққан овга чиқмас, Илондан қўрққан сувга тушмас*, refers to the difficulties and hardships of life.

Greedy as a dog, stupid as a donkey, fat as a pig, and so on can be displayed. It can be observed that in different lingvocultures a certain thing is used, for example, an animal as a standard of constant imitation. For example, in most languages, the fox is actively used as a symbol of deceit, deception, deceit, as a standard: cunning as a fox, хитрий как лиса (Russian). Or as a peculiar analogy of the Uzbek language, soft as a sheep, thin as a ghost, eats like a mold, works like a dog,

These analogy standards also take an active part in the process of evaluation of the national worldview, the comparison of world events according to national perceptions, formed as a result of comparison.

Because man understands the world and himself through language based on universal and national experience. At this point, the national experience determines the specific features of the language at all levels. Because of the specificity of language, the linguistic landscape of a particular world is depicted in the mind of the language owner, and man sees the world through it.

The proverbs reflect the value of men and fathers in the anthropozoomorphism of camels: *Бақироқ туянинг бори яхши, Бақириб тургани ундан ҳам яхши.* Features such as the size of the camel, making it long and light, were the basis for describing the father – male; paternity:paternity responsibility:*Туя қанча - яраси шунча*; кучли: *Душманинг куя бўлса ҳам туя бил; Йиқилсанг ҳам туядан йиқил, Биров сенга кулмасин*; humble: *Кичкина юкка туя тиз чўкар*; senior, official (positive): Тайлоқни тайлоқ дема, Тайлоқ туя бўлар; enthusiastic, courageous people: Туя - катта, Яғрини – ундан ҳам катта such proverbs are positively expressed.

Туя чўкса, жой олар – инжиқ, Туя элакка қолганда бўкирибди –without will, *Туяга қанот битса, томингни бузар* –enslaved to lust, *Туяни ўйна десанг, Ҳамма ёқни пайҳон қилар* – stupid, foolish,*Туядан катта фил бор* – proud*Туяни чўмич билан суғориб бўлмас*–haughtya negative assessment was made in this proverbs.

Duck zoonymy has also been used in proverbs and sayings to describe human beings and to assess human defects. “*Ўрдакдай сувдан қуруқ чиқади*” – sly, “*Ўрдак мижоз*” – provocateur, “*Дунёни сув босса ўрдакка не ғам*” - selfish, “Шошган ўрдак ҳам боши билан, ҳам думи билан шўнғир” - hurried, the situation is described figuratively.

The goose has been involved in both aesthetic and ethical evaluation processes as a stereotypical image. “In Uzbek folklore, the images of geese and ducks are often used side by side. In such places, they become antonymous symbols with opposite poetic meanings ”[11, p.23]. For example, in the proverbs “*Ўрдак бўлмай ғоз бўл, билим олиб соз бўл”, “Қарға учиб ғоз бўлмас, бошлиқсиз уй соз*”, a goose appears as a positive image. So, while the duck is a symbol of ugliness in the process of perceiving beauty, in the proverb “Қўшнининг товуғи ғоз кўринар, келинчаги қиз” the goose reflects beauty in an aesthetic assessment.

The concept of“bad person”is also expressed in zoonyms:

Ит енгганини талар → act according to his ability, who can correctly assess the situation in the way of his negative goal;

Ит билан ўйнашиб бўлмас, кучук билан – ўйлашиб. "Кучук билан ўйлашиш" suggests that an adult should be consulted. At the same time, the "big" sema of the dog lexeme and the "small" sema of the dog lexeme are entering the opposition.

Ит итлигини қиларда - it is said that no good can be expected from a man of bad character. *Итнинг иши – узмоқ, ёмоннинг иши- бузмоқ, Куннинг ёмони кетар, одамнинг ёмони кетмас; Ёмон одам тўймас; Ёмонлигини қўймас*. The same content is expressed in proverbs that do not leave evil.

If we pay attention to the meaning of the proverbs, it is common to look at a dog when evaluating greedy and lowly people: *Дарё тўла сув бўлса ҳам, ит тили билан сув ичар, Ит туққанини танимас, Итдан суяк кутма*–the proverbs evaluated stingy and stingy people. *Ит иззатини билмас, эшак – тарбиятни*– in the proverb of upbringing the dog refers to inferiority, the donkey – to stupidity. Evil people who do not know good are likened to donkeys: *Эшак сийпаганни билмас, ёмон – сийлаганни.*

CONCLUSION

In conclusion, it can be said that zoonyms are one of the main linguistic units in the expression of axiological content. These proverbs contain such moral values as "Good - Evil", "Mercy - Cruelty", "Loyalty-Betrayal", "Humility-Arrogance", "Wisdom - Stupidity", "Beauty – Evil", which serve as the basis of human axiological characteristics found its expression.

IMPLICIT COGNITIVE STRATEGY EXPRESSION IN ENGLISH AND UZBEK LINGUOCULTURE

Laylo Qahramonovna Baymurodova*

*Teacher,
Karshi State Universirty, UZBEKISTAN

ABSTRACT

This article considers the expression of implicit cognitive strategy in English and Uzbek linguo-culture. Communicative strategies are analyzed in terms of "position" into different components, namely neutral strategy and cooperative strategy. The article also focuses on the essence of the manipulation strategy, with examples in English and Uzbek.

KEYWORDS: *Neutral Strategy, Cooperative Strategy, Manipulation Strategy, Speech Tactics, Extra-Linguistic Tools, Addressee, Addressee, Communication.*

INTRODUCTION

Communicative strategy is also inextricably linked with psychological processes. This strategy is considered a "dialogue debate" in psychology. In this case, the addressee includes actions aimed at weakening the position of the addresser by demonstrating his superiority over the opponent (interlocutor), holding his position, exerting pressure. J. Lakoff and M. Johnson analyze the concept of "struggle" using the metaphor "Debate is war" in their book "Metaphors we live by". The authors emphasized that, we value the person we are arguing with as a competitor and attack his or her position in order to defend our position, if we dominate in certain areas, we lose the opportunity in some process, and we develop strategies to achieve superiority. If we are not confident in defending our position, we will attack again by choosing a new direction. The behaviors we use in the process of arguing will be partly linked to the concept of "war / struggle" [Lakoff, Johnson: 127-128]. J. Lakoff and M. Johnsons emphasize that family quarrels or disputes based on certain customs are carried out within the concept of war / struggle. Therefore, these concepts are considered to belong to the cultural conceptual structure of the society in which we live. Apparently, the debate, the conflict, and the controversy has a conceptual character, in which the addressee, by any means, aims to defend his position, to put pressure, and ultimately to win. This goal is carried out through the use of specific strategies, in particular through the formation of a communicative strategy. Communicative strategies are formed based on the communication purpose, communication process, interlocutor's character, the situation of communication. These strategies can be divided into different components in terms of "position":

1) neutral strategy is characterized by one of the participants (or each) does not pay attention to the attitude of the interlocutor, avoids communication with the person, which can cause communicative inconvenience. Neutral strategy is implemented in different forms, depending on social, national and cultural characteristics. V. S. Dudchengo considers these strategic actions as “an escape strategy (avoidance strategy)” [Dudchenko 2001: 46]. In this case, it is implied refusing to argue in order to avoid a conflict or dispute, giving the interlocutor a chance to dominate, lack of desire to pursue one's own communicative goals and interests, or using ways to end the communication (debate, argument) more quickly. This strategy is directed to ensure not to provide continuity of communication purposefully; 2) the cooperative strategy is focused on building relationships with the interlocutor. This communication strategy is chosen in relation to the speech situation. In particular, in disputable or controversial situations, the actions of one of the interlocutors performed in relation to alleviate the situation, to change the conflicting situation in a favorable direction for communication, to regulate the situation are implied. The cooperative strategy creates an opportunity of maximum implementation the interests of each of the participants of communication in a peaceful way in a contentious situation. V.S.Dudchenko calls this communication strategy with the term "constructive". In this case, it is implied that the negotiating, resolving the dispute wisely, regulating the dispute, and encouraging the participants to come to the discussion (Dudchenko, 2001; 46). Cooperative strategy is manifested in the behaviour by the participants of the dialogue focused on finding a mutually acceptable solution in a constructive conflict situation. Thus, the mentioned communication strategies embody the behaviors and strategic directions of the interlocutors in the conflict situation of the interpersonal relationship, in the contentious debate. These communication strategies serve to determine the course of communication in directly conflicting and contentious debates. The term manipulation is also widely used in communicative strategy analysis. O. Isseris emphasizes that the manipulation is a strategy of focusing only on one's own interests, ignoring the interests, desires and position of the interlocutor in the process of communication (Isseris, 2002; 152). Typically, the phenomenon of manipulation occurs as a result of looking down on the interlocutor. Such behaviors are reflected in the subject’s pressure on the interlocutor, the transmission of his or her thoughts and opinions.

Typically, the phenomenon of manipulation occurs as a result of looking down on the interlocutor. Such behaviors are reflected in the subject's exerting pressure on the interlocutor, conveying their own opinions and feedback. This strategy is implemented through a number of speech tactics, such as the use of deception, the presence of a tone of disregard in the speech units used. Let's pay attention to the following examples:

Imam. "Where are you, son?"

- Taksir, I am from Tashkent.

"What are you doing here?"

- I studied at a madrasah, and now, because it is a holiday, I decided to go to work to earn some money.

- In which madrasah did you study, who is your teacher?

(I was arrested. There are many madrassas in Tashkent, many teachers.)

The teacher laughed:

- Ha-ha, say I am a mullah, not a classroom, say I was educated in a bear house (G.Gulom, 192).

In this example, to the tactics of false information speech used by the subject "I was studying in a madrasah, and now it's vacation time, I chose to travel to work as a laborer in order to earn some money (Ўзим мадрасада ўқир эдим, ҳозир таътил вақти бўлгани учун бироз пул топиш мақсадида мардикор ишлаш учун сафарни ихтиёр қилган эдим)", to the question given by the imam "Which madrasah did you study in, who is your teacher? (Қайси мадрасада ўқир эдинг, мударрисинг ким?)" the answer “Sir, in that great madrasah, our teacher will also be that great teacher (Тақсир, ўша катта мадраса-да, домламиз ҳам ўша катта домла бўладилар)” can be an example of manipulation. Manipulation also implies that the participants in the conversation ignore the thoughts and comments of the interlocutor or are unable to understand the interlocutor’s opinion. The interlocutor (the naughty child) does not have the ability to comprehend the comment in this fragment "Ha-ha, say I am a mullah, say that I was educated in a lust-room, not a classroom (*Ҳа-ҳа, муллаваччаман дегин, дарсхона эмас, хирсхонада таълим олганман, дегин*)". The speech tactic used by him aimed at implementing the strategy of “purpose of finding a place or to spend the night” in any way. Communicative tactics can be applied directly or indirectly in the implementation of a particular strategy by interlocutors. Interlocutors use different communicative tactics in terms of the communication situation, the communication process, depending on the purpose of the communication strategy.

The "manipulation" proposed by E. Malyaga and B. Tomalin is related to the content of the communication and is implied to link the communication strategy to the interlocutor **(Elena N.** Malyuga, Barry Tomalin.,2017; 28-45). The strategy of manipulation is implied primarily to ignore the position of the interlocutor, putting personal interests first. Secondly, manipulation is also used when one communication strategy is superior to another, and is used to control communication. In the process of applying this strategy, the addressee puts the addresser in a lower position than himself. This strategy is manifested in the dominance of the communication process like this, the conduct of one's own opinion, the management of the communication process, indifference to the thoughts and attitudes of the interlocutor, the desire to focus on one's social reputation.

- You killed me, boy, you killed me ...

Azizkhan was in a strange situation. He didn't know what to do, he couldn't find a word to comfort her. It would be very cold if a big man was sitting on top of him, and a famous wrestler was crying. Azizkhan was embarrassed to bend such a proud man and darken the world. Whenever he could lift his spirits, he did not hesitate. What to do? Azizkhan put his hand on his shoulder and asked:

- What can I do, Polvon aka, what can I do to please you?

The wrestler stared at him with tears in his eyes.

- There is only one way. Brother John, you don't say no.

Nobody knows you. He does not blame when he confesses. Tomorrow, after Tamarakhonim's concert in Urgench, there will be a fight in the Jura wrestling tournament. I will demand of you. You will fall. Brother John, if you don't do that, I'll beat myself up.

You are close to my childhood. Azizkhan got up angrily. Ash wrestler also stood up.

He tried to keep his mouth shut.

- What can I say? Well ...

He was speechless. Azizkhan came to the bottom of his mouth as he sighed.

- Who do you think I am? I am not one of the nomads you mentioned. If you have the strength, please come on the field and we will compete.

Ash wrestled.

-Brother, at least let's divorce on an equal footing. Say yes.

Azizkhan got married. Ash Polva was in critical condition. If he didn't listen, there would be no harm in doing so. The situation is different. He never tires of slapping himself.

Azizkhan knows the nature of wrestlers very well.

He even heard a lot about those who hanged themselves. Aziz Khan fell from the sixth floor (Said Ahmad 62.)

In these cited examples exactly the manipulation strategy was used, in which the addressee dominates the interlocutor's strategy was observed. Such a strategy is usually observed in differences in the position of the interlocutors as well. Including, it finds its expression in advising, commanding, prohibiting an action, influencing the interlocutor through intimidation, and so on which is carried out in the process of communication between the parents and children, (in Uzbek culture, in the dialogue of older and relatively young people), leader and the employee, teacher and student. Because, implementing of these speech acts allows him in terms of the social status of the addressee. For example:

The old man was leaving me. He came to the door of a ruined house near the cliff.

I stopped in front of the door. He looked behind the old man.

-Yes, why are you cheating?

I was skeptical again.

"Yes!" Said the old man. This is not a birdhouse. Madrasa, madrasa. That's it. This is where illiteracy comes from. Fearing for my life, I leaned in through the low door, darkened by smoke, and entered (G'ofur G'ulom 241).

Opposite manipulation strategies can also occur in the communication process. This strategy is applied in the developing of conflicting situations or at the highest point of the disputed situation. This mainly involves the use of verbal acts such as threats, intimidation when other tactics or strategies do not work. For example:

Ali was talking to his wrestling partner. Suddenly Ash caught sight of the wrestler.

"Have you heard?" What r u doing Haven't you left yet?

"Shall I go to the open grave?" Ash asked.

Ali Polvan immediately noticed what he was wearing. He responded as if he had kicked the dead man.

- Be the bat. This is the day when the wrestler, who is determined to overcome the strength of his opponent, will build.

Ash chewed on the wrestler's breath.

- I believed in you, Ali aka. He knocked me down.

Why didn't you stand up? I thought I would take revenge without them. (Said Ahmad 69.)In some situations, the manipulation strategy can be implemented using multiple tactics. It can be observed that the communication tactics used in these situations are superior to one another and vice versa. In particular, using reprimand tactics, a strategy of conveying the necessary information to the addressee or a strategy of putting pressure on the interlocutor is applied. For example:

"I liked the hand of a cow that was forbidden to me by my uncle Sendai, and they could pay for it anyway." He said, "No, I will not see you again on the Day of Resurrection."

One of the pragmatic means that is the basis for ensuring an effective flow of communication is the method of addressing. Addressing is not only a lexical-pragmatic element of the rules of speech ethics within the framework of a polite strategy, but also a way of managing the communication situation by the addressee. In addressing, it is important to introduce yourself (if you are communicating for the first time), to apologize for the inconvenience, and to show a positive emotional expression by focusing on the personality of the interlocutor. The courtesy formulas, which are part of the etiquette norms, serve to the communicative situation transition of appeal. These politeness strategies are expressed in different linguistic and extralinguistic means according to the social status of the interlocutor, the parameters of the communication situation, national-cultural relations. For example:

'And here,' she [Lady Montdore] said, to the company in general, 'is Montdore.' She always called her husband Montdoreto those she regarded as her equals, but to borderline cases such as the estate agent or Dr. Simpson he was Lord Montdore, if not His Lordship. I never heard her refer to him as ‘my husband’, it was all part of the attitude to life that made her so generally unbeloved, a determination to show people what she considered to be their proper place and keep them in it. [Nancy Mitford “Love in a cold Climate” 2006: 27]

Kosagul was a shy young man, and he noticed that Haji aka's eyes were shining like beads in water.

- There is nothing wrong with asking, Hoji aka. Lest they .....

"Yu-yu-yu!" - Hoji aka shook his head sharply. "We've been around ... We've been around."

"Not much, just a little," said Kosagul with a smile.

Haji aka was in a difficult situation for a moment.

"Kamina was put in a very embarrassing situation ..." he sighed. "Let the devil's neck be cut off until the boy dies!"

"Which one?"

The fireplace will be "red", said Hoji aka modestly (O. Hoshimov, 338)

The communicative strategy of politeness is not limited to certain ways of greeting (*Assalamu alaykum, how are you?* etc.), but the exchange of ideas with the interlocutor is observed in the process of "There is nothing wrong with asking, Haji aka (*Сўраганни айби йўқ, Ҳожи ака).*” When the active involvement of the addresser in the communication is observed in the exchange of ideas, it is worth noting that this "red" one as well satisfies me (Каминага “қизили”ям бўлаверади)” strategy has worked.

Communicative acts of apology perform important social functions of politeness within the communicative strategy. Apologies can eliminate the inconvenience to the addressee and provide making him feel comfortable in the communication process. The implicit method of apologizing is a feature of English culture. This process can be carried out by fully disclosing his guilt by the addressee, explaining the causes and arguments of the events that took place, and giving reasons.

This strategy in the communication process can be used in certain cases when the addressee does not have a high desire to continue communication with the listener. Negative feelings of the addressee, expressing sympathy in situations related to emotional state are carried out using communicative tactics. In addition to the emotional state of the addressee, the focusing on the internal experiences, psycho-emotional state, and careful selection of linguistic units are required in this tactic. It is also important that the linguistic units and expressions that are widely activated in society and the social environment are delicately conveyed to the addressee. This can be observed in events such as expressing condolences. The means of speech expression applied in such realities are, in a sense, also acquires linguocultural significance. In such cases, the use of such expressions in Uzbek linguistics as *"Bandalik", " May Allah have mercy on you ", " May Allah saves his servant"* is more expressive and widely used than the method of *"Accept my condolences* (typical of Western culture)". In English culture, phrases like “Please accept my / our sincere condolences”, “I am so sorry to hear about your loss”, “I would like to express my sincere condolences on the death of…” (http://englishadmin.com/2013/05/expressing-condolence-in-english) can be important. Compare:

Mr. - Mr.Forsyte,” said Bentworth, “we want you as a lawyer to come on this committee and keep us – err – straight ... Just cast your eye over this, will you be so good”[Galswotrhy Swan Song 2003:194]

- Is it okay? He said, frowning as if he were to blame for everything.

-Шукур, -Умри хола култ этиб ютинди.- Ҳозир ухлади (O.Hoshimov, 242).

In order to ensure a certain flow of communication, it is necessary to pay attention to its illocutive power in the application of communicative tactics of advice, encouragement, and gratitude. For example:

- I am in bondage!

The elder of the neighborhood near Iskandar looked at Shakir aka meaninglessly.

"Everybody has a head," sighed the old man. "When our mother was different, she was a heavenly woman." (O. Hoshimov, 260).

In the example of the Uzbek language, the speech units "In slavery, it is in everyone's head (Бандаликда, Ҳамманинг бошида бор)" is one of the communicative tactical means of expression aimed at encouraging the interlocutor, giving spiritual freshness, are units specific to national culture which usually used in condolence ceremonies.

In this case, the expression of gratitude is manifested in the use of short means of expression, the use of nonverbal methods, the conviction that there is a sense of gratitude for the service performed.

Communicative strategy is one of the means used by any social activity to solve a particular and specific problem. Speech is a way of organizing behavioral actions according to the purpose of

communication. In a broad sense, communicative strategy is understood to be the greatest task of speech, which is determined by the practical goals of the addressee.

Communicative strategies reflect social models approved by the society. They are interpreted as intermediaries that link a person's level of knowledge (verbal, pragmatic, motivational) in the speech process. The study of the social expression of communicative strategy is carried out based on the theories of linguists in the field of strategy (manipulation, vualization, mystification, anonymity or depersonalization strategy, reformation, delegitimization, discretization, amalgamation strategies).

A wide range of lexical and cognitive techniques (irony, hyperbole, metaphor, allusion, allegory) can be used to apply any strategy and tactics.

The communicative goal is a key component of pragmatic analysis. The effective or ineffective outcome of the goal was considered to be related to the speaker's ability to use language, speech acts, as well as the expressive stylistic and figurative capabilities of the language and the skill of choosing nonverbal aids.

CONTEMPORARY CALLIGRAPHY ART OF UZBEKISTAN

Khadjimetov Bekhzod Bakhadirovich*

*Professor,
Department "Miniatures and book graphics",
National Institute of Arts and Design named after Kamoliddin Behzod,
UZBEKISTAN

ABSTRACT

This article focuses on the development of science, education, culture in the ancient cities of Central Asia, such as Samarkand, Bukhara, Khorezm, Kokand, Tashkent, the history of calligraphy, scientists who worked in this area and contributed to the development of calligraphy. In addition, opinions were expressed on the development of calligraphy in Uzbekistan in recent years, its achievements and problems. Images of architectural monuments of historical importance, decoration of modern buildings and compositions used as examples of calligraphy.

KEYWORDS: *Central Asia, Uzbekistan, Samarkand, Bukhara, Khorezm, Kokand, Tashkent, Calligraphy, Composition, Art, Architectural Monuments.*

"Elegant and beautiful writing is enlightening to the eyeand makes the heart rejoice! "
Ibn Sino

INTRODUCTION

Calligraphy is one of the greatest inventions of mankind. When a person is born, he intends to think, to create, to pass on or leave to others some thought, idea, novelty, and discovery that is born in him[1]. In the course of their historical development, mankind has used various objects in order to store, collect, and exchange information in the form of writing, images. They are: stone, pottery, wood, bone, metal, papyrus, parchment, cloth and paper. Each of these objects at one time, in the country, served for writing, image processing, and over time gave way to another. Each piece of writing required a unique approach and writing style. Calligraphy is one of the unique types of fine arts, which expresses its essence in practical-artistic forms through concrete words between architecture, book art, miniature, folk applied decorative art, various decorative forms of art is the most influential art form in the human psyche from a spiritual and enlightenment point of view.

When talking about the art of calligraphy in Uzbekistan, it is impossible not to mention its historical roots. In particular, in the major cities of Central Asia, such as Samarkand, Bukhara, Khorezm, Kokand, Tashkent, located in the territory of modern Uzbekistan, from ancient times great attention was paid to the development of science, enlightenment and culture.

If we look at the history of the development of calligraphy in Central Asia, we can see that in the VII-X centuries the Movarounnahr calligraphy school was established in the central cities of the Arab Caliphate - Mecca, Kufa and Basra, and later spread to other parts of the caliphate. Calligraphers such as Ahmad ibn Umar Ash'as Abu Bakr Samarkandi (XI century), Ahmad Tabibshah Movarounnahri (died 1215), Ali Banokati (XIII century), Jamshid Shoshi (XIV century) became famous as representatives of this school[2].

Among the various branches of science, our ancestors were leaders in the basics of Islam, such as tafsir, hadith, ilmu kalam (philosophy) and Sharia law. The work of such scholars as az-Zamahshari, Imam al-Bukhari, al-Farabi and Burhanuddin al-Margilani Kamoliddin Behzod is invaluable in this regard[3]. In the XIV-XVI centuries, as in all areas of science, culture and art, there was an unprecedented rise in the art of calligraphy. Since that time, several calligraphy schools have sprung up in various parts of Central Asia. In the 15th century, during the Timurid dynasty, Herat, in the 16th century, during the Shaybanid dynasty, Bukhara, then in the early 18th century, Khorezm and Fergana calligraphy schools were formed in Khiva and Kokand khanates, and in the 19th century, Samarkand and Tashkent calligraphy schools. Among their brilliant representatives were Sultanali Mashhadi (1437–1520), Darwish Muhammad Taqi Hirawi (first half of the 15th century), Abduljamil Kotib (died 1505/1506), Mirali Hiravi (died 1557), Mir Ubayd Bukhari (d. 1601).), Mir Hussein Kulanki Bukhari (XVI century), Sayyid Abdullah Bukhari (died 1647), Haji Yodgor (died 1663), Ahmad Donish (1826–1897), Munis Khorezmi (1778–1829), Kamil Khorezmi (1825–1899), Mirzo Sharif Dabir (19th century), Muqimi (1850–1903), Ochildimurod Miri Kattakurgani (1830–1899), Abduljabbor Urguti Samarkandi (1885–1910), Muhammad Yunus Kotib (19th century), Muhammad Shahmurod Kotib (1850–1922).

In Uzbekistan, from the first years of independence, a wide path has been opened for the spiritual and enlightenment development of the people, the restoration of national values. Today, much attention is paid to the study of languages such as Arabic and Persian, which are the key to the study of cultural heritage, and the old Uzbek script based on Arabic spelling. After all, modern students, especially future professionals, need to know how to read and understand the text in manuscripts in order to know and understand the history, language, reason of their people. The reason is that today in various museums and libraries of Uzbekistan there are various manuscripts and documents of historical significance that have not yet been studied. Examples include the Manuscripts Fund of the Abu Rayhan Al Beruni Institute of Oriental Studies, the Alisher Navoi National Library of Uzbekistan, the Central Library of Islamic Civilization, the State Museum of History of Uzbekistan, the State Museum of Timurid History, the Kamoliddin Behzod Oriental Miniature Museum, Samarkand State University and others. We can cite thousands of manuscripts stored in many museums, libraries and private collections in our republic. Manuscripts are being studied not only by their historical significance, but also by scholars as a source for the art of calligraphy.

Our ancestors used calligraphy in all aspects of architecture and folk arts. In particular, they decorated the interior and exterior of the buildings with inscriptions of wise words. The activity of any building or institution is understood from the decorations in its appearance. For example,

in the exterior decoration of places of knowledge and enlightenment there are wise words and hadiths that promote knowledge and spirituality, in caravanserais and teahouses there are call for mercy,verses of hadith from the Qur'an that calling for worshipin mosques, prayers and remembrances in mausoleums and shrines. For example: Registan ensemble in Samarkand— one of the architectural complexes in Samarkand's Registan Square, consisting of 3 Madrasas (Ulugbek Madrassah (Fig.1), Tillakori Madrassah, Sherdor Madrassah), is inscribed on the wall inscriptions of Ulugbek Madrassah. “Education and learning will bring honor in this world and a position in the hereafter"reflected in the inscriptions, we can see that the exterior decorations of the building are embossed and consist of inscriptions expressing different meanings.

1   2

(Figure 1,2) Uzbekistan. Samarkand. Ulugbek Madrassah (1417 - 1420)

In Shakhrisabz, on the walls of the White Palace built by Amir Temur (Fig. 3): on the right side of the building "Let the state (our policy) be a guiding beacon", on the left "Let our eternal kingdom be an example to all in creativity and generosity" reflective words are written.

3   4

(Figure 3) The White Palace is a memorial in Shakhrisabz. Built by Amir Temur. (Figure 4) Words written on the tower floor on either side of the White House.

Today we can observe the development of calligraphy in Uzbekistan in several ways. The first example of this can be seen in the decoration of book art and miniature works, in which

applied art enriches each other in content and harmony with such art forms as pottery, wood carving, painting, carpet weaving, ceramics. The second is in the work of artists and calligraphers in traditional and non-traditional directions, based on independent compositional solutions as an art form. Thirdly, we can observe that the memorials being reconstructed in the republic and the newly built mosques used as traditional and non-traditional decorations in the interior and exterior.

The Uzbek calligrapher KhabibullaSalihov discovered that the Uzbek national atlas fabric, suzanies, embroidery and ceramics were decorated with words that warn the consumer about the hereafter, call for enlightenment, lift the mood and spiritual.This means that in our country we can see architectural monuments, suzana, embroidery, pottery or book art, all of which are texts that call for knowledge and enlightenment. While Kufi and Suls types of writing were widely used in architecture, folk applied art had its own letters of calligraphy in embroidery, weaving, painting, and methods of their application. In embroidery: words such as khuva, ka'ba, kashta, bismillah, olloh (Fig.5). Depending on the type of atlas fabrics, names such as Khan, Shoyi (Fig.6).Words such as Vafo (Fig.7) were written on the men’s belts. These records are written in different ways depending on the material used. In addition, the calligrapher Khabibulla Solikhov noted that the Uzbek national patterns are based on inscriptions. He created an alphabet of letters according to the patterns and named this type of letter "Khatti Zuhruf Habibi" or "Khatti Habibi". Habibullo Salihov used his own writing patterns in the decoration of a number of memorials and in the art of painting (Fig.8). What distinguishes this pattern from other types of decorative writing is that it creates a decorative image from a combination of beautiful, charming patterns, letters, spells and dots. In this text, regardless of the size of the line, the text can be conveniently written in any size based on patterned glosses. From the written text, the reader not only understands the meaning, but also enjoys it spiritually.

(Figure 5) Khuva, Ka'bah, embroidery, Bismillah, Allah. (Figure 6) In textiles, the satin flower is inscribed "Khan". (Figure 7) The word “Vafo” on the men’s belt. (Figure 7) The Holy Quran (below in the center) written in Hatti Zuhruf Habibi.

Along with the restoration of architectural monuments in Uzbekistan, the interiors and exteriors of mosques, which are being reconstructed and rebuilt in accordance with modern requirements, are decorated with traditional types of calligraphy. The work of many calligraphers such as Islam Mamatov, Abdugafir Razzokov, Gaforjon Khakberdiev, Salimjon Badalbaev, Abdulla Mirsoatov, Tukhtamurod Zufarov, Alisher Shomuhamedov, Najmiddin Fayozi, Nizomiddin Tursunaliev should be recognized. In the international calligraphy competition held in Istanbul,

Islam Mamatov was in the top ten in 1996 in the style of "Suls" and Habibulla Salihov in 1998 in the style of "Devonian". Habibulla Salihov was awarded the title of "Parvin Number" at the International Calligraphy Competition in Lahore in 1999 for his discovery of a new style of calligraphy, the alphabet of ornamental writing.

Thus, we can observe that the art of calligraphy is widely used in Uzbekistan not only in the art of writing, but also in various fields, in particular, in the fine and applied arts, architecture. Among the mosques built in Tashkent in recent years, we can see the works of our master calligraphers on the outside and inside of the mosques of Sheikh Muhammad Sadiq Muhammad Yusuf (Fig.9), Minor, Hastimom, Sheikh Zayniddin (Fig.10), Siroj Salih (Fig.11,12).

The Association of Artists of the Academy of Arts of Uzbekistan has a branch "Calligraphy" since 1997. Through the attention to the field of calligraphy, in the field of fine and applied arts of art education in the Republic is aimed at preserving our national values, traditions and improving them at the level of modern requirements. For this purpose, one of the urgent tasks is to train highly qualified specialists and increase their professional training. In recent years, the state has been organizing exhibitions and festivals related to the art of calligraphy in order to build the respect of the younger generation for calligraphy and interest to the field. Among them are the personal exhibition of calligrapher Salimjon Badalbaev “Eternity” at the Kamoliddin Behzod Oriental Miniature Museum (2017), Exhibitions of calligraphers at the Egyptian Education Center (2017), Calligraphy Exhibition at the Abulqasim Madrasa in Tashkent (2017, 2016, 2018), exhibition "The Art of Calligraphy" at the Bukhara State Museum-Reserve "Ark" Regional Museum of Local Lore (2019). In Uzbekistan, for the first time in 2018, the Craftsmen's Association held the Calligraphy Festival under the name World of Wisdom[4]. The aim is to spread the work of calligraphers, to introduce them to our people, to support and encourage their creativity.

The science of calligraphy plays a special role in the development, enrichment and further development of national and cultural traditions in the field of creation of artistic compositions in Arabic script in works of art and historical monuments, especially in the research of young artists to find their creative direction. In the system of higher education, the art of calligraphy is also taught as a science in many areas, as well as studied with interest by young people in non-governmental educational institutions, educational centers.

In conclusion, it can be said that the young generation growing up in Uzbekistan, following the example of masters of calligraphy, mastering the existing types of calligraphy, studying the secrets of the field, with their creative work will take their place in the world of calligraphy and raise the honor of our country.

ABSTRACT

The feeling of directing one's own actions and, via this control, influencing the external environment is defined as agency in cognitive neuroscience. We think that one of the most important factors in how individuals engage with technology is their sense of personal agency. This article relies on cognitive neuroscience theoretical views to present two implicit techniques for investigating personal agency experimentally. We provide the results of two studies in which these techniques were used to HCI issues. One study found that a novel input modality, skin-based interaction, may significantly boost users' feelings of agency. The second shows how changes in the settings of support methods like predictive mouse acceleration may have a big effect on the feeling of agency of users. The approaches offered give designers new tools for assessing and improving empowering interaction strategies and interfaces that give users a natural feeling of control and ownership over their activities.

KEYWORDS: *Cognitive Science, Evaluation Methods, Experience Of Agency, Implicit Measures, Personal Agency.*

1. INTRODUCTION

Designers should aim to build interfaces that "enable an internal center of control," according to the seventh of Shneiderman's Eight Golden Rules of Interface Design. Users "particularly want the feeling that they are in control of the system and that the system reacts to their activities," according to the study. This rule's inclusion in Shneiderman's list shows how crucial a feeling of control is in human-computer interactions. Rotter's early study provided the groundwork for the notion of locus of control. In recent years, a large corpus of research in cognitive neuroscience has focused on the feeling of control, or "Experience of Agency." The feeling of agency is described in this literature as a person's inherent sense of being in control of their acts and, as a result of that control, of being accountable for, or owning, the consequences of those actions.

The feeling of agency may be experimentally examined thanks to methods established by researchers in this area[1]–[3].

We think that people's perceptions of agency, as described in cognitive neuroscience literature, are crucial in how they engage with technology. We look at how implicit metrics for agency experience may be used in HCI research and practice in this article. We provide a short overview of the literature on agency and propose two implicit techniques for investigating it experimentally. Following that, we present two studies that look at the feeling of agency in basic human-computer interactions. The first experiment looks at how changing the input modality of an interaction affects the user's feeling of agency. It contrasts conventional keyboard input to skin or body-based input, demonstrating that input modality has a significant impact on the feeling of agency. The second experiment looks at what occurs when a computer helps people achieve their objectives. The findings of this study indicate that, up to a degree, a computer can help people while maintaining a strong feeling of agency. Users' feeling of agency was significantly diminished after this stage[4]–[6].

This article contributes to the area of HCI in many ways:

- It offers two implicit techniques for assessing a person's feeling of agency.
- It shows how changes in input modalities may have a significant impact on the user's feeling of agency.
- It shows that computer-assisted help may have a substantial impact on a user's feeling of agency.
- It shows how to map the personal agency features of an aided interaction approach using an experimental method.
- It analyzes the consequences of these results and lays forth a research agenda for the future.

In a broader sense, this study shows the advantages of using cognitive neuroscience techniques to get a better understanding of how people engage with technology. As a result, we begin with a quick comparison of different views on agency in the cognitive neuroscience and HCI literature.

1.1. The Feeling of Being in Charge:

Agents are human beings. That is, we have the ability to use our actions to deliberately bring about change in the world. Humans have a conscious experience of this capability as well. This is what it is to have a feeling of control. There is, however, a difference to be made between the reality of directing an action and the immediate feeling or experience of doing so. We can claim, "I accomplished it," because we have had the experience of being agents.

The goal of neurocognitive research on the feeling of agency is to learn more about the mechanisms that underpin this sensation. In general, there are two theoretical perspectives. One perspective looks at the motor system and claims that the feeling of agency is produced by brain processes that initiate and regulate voluntary movement. The feeling of agency, according to this viewpoint, is based on a comparison of the anticipated and actual sensory effects of movement. If there is no disagreement after this comparison, then 'I' am the agent in charge of the specific event. The alternative theoretical viewpoint minimizes the motor system's particular contribution. According to this theory, a more general-purpose cognitive system monitors the connection between ideas (i.e. intents), acts, and their consequences, with the mind inferring and

rebuilding a route between conscious intention and effect. In this case, agency is understood as a reconstructive inference that one's purpose produced an external occurrence.

Much of the fascination in the sense of agency in cognitive neuroscience comes from the fact that it is deteriorated in certain mental and neurological illnesses. The passive phenomenon in schizophrenia is one of the most prominent instances. People here believe that their actions (and occasionally their thoughts and emotions) are controlled by an external force or agency rather than by themselves. According to one patient, "It is my hand and arm that move, and my fingers take up the pen, but I have no control over them." Such accounts reveal a significant disturbance in the processes that promote a feeling of agency, with potentially devastating implications. The feeling of agency, on the other hand, is a very delicate and changeable sensation in each of us. There are times when we have an overabundance of agency. People have been found to make larger wagers when they start a gamble rather than someone else, even though the chances are the same. On the other hand, there are times when we experience a loss of agency, such as when we use facilitated communication, table turning, or Ouija boards. For HCI, this malleability in the human perception of agency presents both possibilities and risks[7]–[11].

1.2. Human-Computer Interaction (HCI) Agency:

In the next sections, we'll propose an implicit metric for assessing human agency. But first, let's have a look at some of the many views on agency that have been explored in past HCI research:

Researchers, in collaboration with partners, have conducted significant study on the 'Media Equation.' People perceive computers as social actors, according to this research, and react to computers and other media in ways that are similar to how they respond to human people. In HCI, one example of an intentional effort to co-opt this reaction as a design resource that engages users and enhances the interaction experience is the development of user interfaces that incorporate embodied agents pictures or animated figures.

Intelligent agents/interfaces: components of intelligent user interfaces often exhibit autonomous behaviour in HCI settings. These systems make use of machine learning and other AI methods to either assist or act on behalf of users. The second experiment described in this article is about such systems, which have the potential to blur the lines between human and machine action.

Semiotic studies of user interfaces consider the created product to be a text, which consumers interpret as a message from the creator. The identification of a design stance, in which the designer as an agent is acknowledged to have had a specific purpose in the presentation of the product, is required for this concept of the interface as the 'designer's deputy.'

The status of machines in laboratories as either neutral instruments or objects of human observation draws attention to the way in which they have characteristics ascribed to them through their participation in social processes of knowledge production and interpretation in science and technology studies. In scientific settings, Suchman has drawn rich links between the agency of robots and software agents, as well as the political and philosophical implications of artificial intelligence, robotics, and HCI.

It's essential to note here that the ideas addressed in this article vary significantly from those studied in previous HCI research. The Media Equation, for example, investigates how people react to computer and media agents, or how they ascribe attributes to them. We do not concentrate on attributions of agency to other persons or objects in this article. Instead, we

provide a fresh viewpoint on how individuals perceive their own sense of personal agency while engaging with technology, which is complimentary to the ones mentioned above.

1.3. Intentional Binding as an Agency Effect in Micro Interactions:

Another large body of research on agency effects has shown that the perceived timing of basic perceptual events is influenced by whether study participants ascribe agency to the source of an observed action. In a nutshell, when we observe ourselves or other individuals, our perceptual experiences vary somewhat from when we witness unintentional occurrences. When an event is seen as an intentional activity, one manifestation of the agency effect is a perceptual shift that delays awareness of the event relative to its real time.

A perceptual shift that predicts awareness of an event that is believed to be the result of deliberate activity is a second manifestation of the agency effect. When a button is pressed and an audible tone is heard, the perceived time of the button push is delayed, but the tone's timing is recorded as happening earlier. These similar effects may also be seen when research participants watch someone else push the button. These two effects have been referred to as "intentional binding" or "temporal binding" when combined. The term "temporal binding" refers to how the action and the following tone are connected in such a manner that the apparent time between them is reduced. The term "intentional binding" refers to the fact that the impact is dependent on whether the action is regarded as deliberate or agent-initiated, rather than being simply physical.

The concept of intentional binding is simple: Human perception of other agents' purposeful actions is based on neurocognitive processes that vary from those employed to perceive nonintentional events, and these processes result in tiny but significant variations in time perception. In other words, different brain circuits (mirror-neurons) have been tuned to fire when we act or when we see another agent acting in a similar manner.

Furthermore, research shows that mirror neurons are not exclusive to macaque monkeys; humans have them as well, and they seem to function similarly across species. To put it another way, we observe and comprehend others by using part of the same brain circuitry we use to do similar activities ourselves. These different brain mechanisms seem to be at the root of small variations in the perceived timing of perceptual events in tightly controlled experimental tasks. Environmental events seen as deliberate actions by other agents are processed differently than nonintentional occurrences, just as environmental noises and language are processed differently in various regions of the brain. This hypothesis has evolutionary validity since creatures benefit greatly from specialized brain circuitry dedicated to detecting the activities of other agents, whether conspecific, predator, or prey.

Previous research on purposeful binding, on the other hand, has shown how it affects human perception in physical settings where individuals see their own or others' voluntary or involuntary motions. When participants watch objects or even their own fingers when their movements are under involuntary external control, the subjective timing between intentional voluntary actions and their effects is consistently reduced. This effect is not observed when participants watch objects or even their own fingers when their movements are under involuntary external control.

Although research by social psychologists suggests that people credit computers with agency, it's uncertain if we'll observe the subtle perceptual impacts of purposeful binding when events and consequences are portrayed in virtual desktop settings common in HCI. Although virtual

environments may seem to be similar to real surroundings, it cannot be expected that the neurocognitive processes that have developed through millions of years in physical contexts would react in the same manner in virtual environments.

Three research are presented in this section that investigate whether agency effects seen in physical settings also exist in virtual desktop environments used in HCI. Each research focuses on a different aspect of the impact of agency on the perception of very basic click–response interactions. To differentiate them from the more complicated and temporally prolonged macro-interactions seen in media equation research, these basic interactions are referred to as micro-interactions.

2. DISCUSSION

Even basic acts and consequences are seen differently by humans depending on agency signals. Given the importance and pervasiveness of HCI, it would seem prudent to investigate the impact of agency effects on software use and user experience. Furthermore, the fact that agency effects may be seen in macro-interactive social behaviors indicates that agency effects can be seen in a variety of settings. However, agency effects in micro interactive settings (i.e., purposeful binding) cannot be expected to be linked to macro-interactive equivalents (i.e., media equation effects) in straightforward ways. Even within micro-interactive settings, there are significant variations in the way agency effects operate, as shown by the distinctions between physical and virtual impacts.

The research presented in this article suggests that agency effects are susceptible to strong learning effects that, while maintaining a connection between perception and behavior, substantially change how agency effects are represented in online settings. Furthermore, if the reversal of timing mistakes in physical and virtual contact can be learnt, additional temporal aspects of subjective experience may be adjusted to achieve desired results. A number of recent studies, for example, have shown that extremely short gaps of 50 milliseconds or less between human action and computer response may be too rapid to be "pleasant," with research subjects preferring longer periods of 100 to 200 milliseconds. However, there are times when delaying computer response for the sake of comfort may cause difficulties.

Gamers may define comfort differently, and a fighter pilot utilizing a heads-up display may be at a disadvantage if a computer's reaction is delayed in the sake of "comfort." However, if training enables individuals to readjust their perceptual experience, there may not be a trade-off between comfort and immediacy. As previously stated, appropriate training may lead to substantial perceptual recalibrations. In other words, the flexibility of perceptual experience seems to imply that agency effects may be acquired in ways that result in the variations seen in the current research. Furthermore, our capacity to change agency effects via learning may have practical implications in time-critical situations where reaction variations of tens of milliseconds can make the difference between success and failure.

Finally, the importance of agency effects in HCI is far wider than the technical emphasis of these research would indicate. Although agency effects such as IB and those described in these research may be regarded as technical byproducts of neurocognitive physiology, evidence that learning may play a role in these effects indicates behavioral and social linkages that need additional investigation. The connection between basic agency cues and elements of social attribution to technology revealed in media equation research is of particular importance in the area of HCI. At this point, linking agency effects expressed in micro-interactions with the macro-

interactive behaviors typical of media equation studies is speculative, but the chasm that has traditionally separated brain and behavior is gradually closing, and there is ample evidence that a genuinely scientific study of how we experience our own and others' agency is within our reach. In addition, current advances in brain–computer interfaces may make mirror neurons, neurophysiology, and neurocognitive processes more accessible and directly useful in understanding or even influencing how humans and computers interact.

Understanding agency effects in HCI will need expanding and expanding current frameworks for linking micro- and macro-interactions, as well as creating a larger foundation of research on agency effects in virtual environments. Studies that include more clearly anthropomorphic elements in basic click response tasks will be a significant step in this approach. All three experiments used basic clocklike interfaces and a minimalist approach to mimicking agency, depending only on pointer movement and click timing to simulate agency. When an experimental activity incorporates an animated agent with anthropomorphic characteristics or click-response tasks are integrated in a more social environment, such as a computer game, people may react very differently to simulated agency circumstances. Studies of anthropomorphism and agency effects are likely to be important in resolving the still-open question of whether the various types of agency effects reported at both micro- and macro levels reflect similar processes at different levels of "granularity" or if they represent distinct processes.

3. CONCLUSION

Finally, one of the most basic sensations we have in our relationships with people and the physical environment is a sense of personal agency. Given the increasing usage of interactive technologies that depend on social signals and reaction, understanding how humans perceive agency in HCI is an issue of great practical importance. The current research clearly demonstrates that agency effects in HCI vary from those in physical settings. As contemporary life grows more virtual, it will be critical to understand how markers of agency, and the social responses they imply, function in HCI.

ABSTRACT

The Man-In-The-Middle attack is one of the most widely discussed assaults in computer security, and it is a significant worry for many security experts. The attackers are after the actual data traveling between the endpoints, as well as the data's integrity and confidentiality. Eavesdropping and message alteration via communication interception are two ways that an adversary may undermine confidentiality and integrity. Adversaries may also intercept, alter, or delete communications to prevent one of the parties from communicating, resulting in a breach of availability problem. We provide a comprehensive overview of MITM in this article in order to classify and analyze the extent of MITM assaults. We looked at the OSI reference model as well as two common networking technologies, GSM and UMTS. MITM attacks are categorized depending on a number of factors, including the attacker's location, impersonation methods, and the channel's type. The current countermeasures are examined. MITM attacks are divided into four types in the paper: spoofing-based MITM, TLS/SSL MITM, BGP MITM, and fake base station-based MITM. Finally, we offer preventive methods for all types of assaults, as well as a few research ideas for the future.

1. INTRODUCTION

Nowadays, cellphone networks and the internet are used in almost every area of our everyday lives. The use of cellular networks or the internet is required for a few applications such as online home banking, social networking, and online shopping, and so on. Because many internet services entail the transmission of sensitive information about users, they are a prime target for hackers. Hackers attack businesses and organizations, resulting in significant financial losses.

The most effective assault for obtaining control over transmitted sensitive end-user data is called Man-In-The-Middle (MITM). One of the most serious dangers to wireless network security is this.

Victims (the two endpoints) and attackers are involved in a typical MITM attack scenario (a third party). The attacker gains access to the communication channel and manipulates the messages sent back and forth between the two destinations. As a result, in MITM attacks, a malicious third-party attacker may intercept, alter, replace, or modify data sent across the communication channel between the endpoints. Because the victims are ignorant of the invaders, they think the communication route is secure. MITM attacks may be carried out via a variety of communication channels, including GSM, LTE, UMTS, Bluetooth, and Wi-Fi. The attackers are after the actual data traveling between the endpoints, as well as the data's integrity and confidentiality. Eavesdropping and message alteration via communication interception are two ways that an adversary may undermine confidentiality and integrity. Adversaries may also intercept, alter, or delete communications to prevent one of the parties from communicating, resulting in a breach of availability problem[1]–[4].There are four different kinds of MITM attacks. First, spoofing-based MITM attacks, in which the adversary uses a spoofing attack to intercept legal traffic and control the data sent without the hosts being aware of the opponent's presence. In DNS spoofing, the adversary spoofs devices between the end points, while in ARP spoofing, the attacker spoofs these end-points or the victim's devices directly. Second, SSL/TSL MITM attacks, in which the attacker enters the communication channel between the two end points or victims. Adversary creates two distinct SSL connections and uses them to relay messages between them. As a result, the attacker may capture all communications and selectively alter the contents. Finally, BGP MITM attacks, in which the adversary sends stolen traffic to the target. IP hijacking occurs when traffic travels via an adversary's autonomous station, where it is possible for traffic to be altered. Finally, the MITM assault known as the false base station, in which the adversary creates a phony transceiver station and then uses it to influence the victim's traffic[4], [5].

2. SPOOFING BASED MITM ATTACK

An adversary or hostile party impersonates any user or device in the network in a spoofing attack. ARP spoofing, DHCP spoofing, DNS spoofing, and IP spoofing are the four main kinds of spoofing attacks. The next sections look at spoofing-based MITM attacks[6].

2.1. ARP Spoofing:

Attack mechanism: ARP protocols map network addresses to MAC addresses. For LAN communications, ARP is a reliable and essential protocol. Adversaries change the local ARP cache table and link the host's MAC address to the target IP. The purpose of an MITM attack is to obtain access to a user's sensitive information. These ARP spoofing attacks may be split into two categories: cheating the host and fooling the internal network gateway. ARP requests are sent throughout the network whenever a host wants to interact with another computer on the same network with an unknown MAC address. Because there are no appropriate authentication methods, it is simple to manufacture cache entries. By avoiding broadcasts, the source computer may store the IP to the MAC entry to speed up communication in the future. In the caching system, ARP, a stateless protocol, has less security.Defense mechanism: Researchers presented an ARP security surveys and analyzed various schemes for prevention and detection of ARP spoofing attacks. Researchers presented a novel defensive strategy as well as a comparison of

current defense models. Below is a list of existing defensive methods against ARP spoofing attacks[7].

2.2. DNS Spoofing:

Attack mechanism: DNS server is used for URL resolution and is a hierarchical naming scheme used in client-server architecture. Lower level domains, subordinate domains, and higher level domains are organized hierarchically in domain names and DNS servers. DNS spoofing is the most serious attack that takes use of cache placement to enhance speed. There are three main kinds of DNS spoofing attacks. Sniffing or hijacking packets during the query answer process is the first step. Second, cache placement through a birthday attack, and third, illegal DNS hijacking. To do DNS spoofing, the adversary changes the victim's local DNS entry, causing the victim to access rogue servers. DNS renews its cache based on the TTL of records. This is used by the adversary in a DNS spoofing attack. Two techniques are enforced in order to place cache. First, introduce rogue DNS into the network to generate fraudulent data, and then transmit a false DNS response before delivering a genuine DNS response.

2.3. DHCP Spoofing:

Attack mechanism: DHCP protocol is responsible for providing network configuration parameters for new hosts. Subnet mask, DNS server, default gateway, leased time, and IP addresses are among the factors. It has a client-server architecture that allows data packets to be exchanged between DHCP servers and hosts. DHCP has a high security level and is used extensively in network administration. Every DHCP message is sent as plain text, with no authentication of the DHCP message origin. These do not ensure a reliable DHCP server or valid client communication. The adversary conducts a DoS attack or a DHCP starvation assault on the DHCP server. These allocate the DHCP server's IP address pool, preventing new computers from obtaining IP addresses. An attacker may create three types of misconfigurations: incorrect DNS server, incorrect default gateway, and incorrect IP address.Defense mechanism: Researchers presented DNS spoofing solutions to make DHCP even more secure. These are cryptography-based solutions. A second hardware class called DHCP snooping serves as a barrier between trustworthy DHCP servers and untrusted hosts. These prevent DHCP replies from ports that aren't connected to a DHCP server[8], [9].

2.4. IP Spoofing:

Attack mechanism: IP operates at network layer of the OSI reference model. It is in charge of delivering data packets from the source to the destination based on the IP addresses in the packet headers. It specifies packet architectures for encapsulating and delivering data. It specifies addressing methods for labeling datagrams with information about their destination and source. A hostile adversary intercepts lawful parties' communications in an IP spoofing attack. These adversaries have complete control over the communication flow and are able to remove information provided by original parties while remaining unaware of the original endpoints. The different IP spoofing methods that the adversary may use are listed below[10], [11].

- Blind and non-blind spoofing: In non-blind spoofing, the attacker and victim are both on the same subnet, while in blind spoofing, the attacker must first make a request to the network before analyzing the packet transmission sequence. The adversary may spy on sequence as well as acknowledgement numbers via non-blind spoofing.

- ICMP spoofing: IP uses ICMP to deliver one-way communications, as well as to help with problem reporting, testing, and feedback. The ICMP redirect messages inform the router that a better route is available. These messages may be exploited to conduct MITM attacks since ICMP does not ensure authentication.
- TCP sequence prediction: Because TCP is a connection-oriented protocol, a connection link must be established before communication can begin. TCP sequence numbers aid the protocol in detecting out-of-order packets and minimizing data loss, guaranteeing dependability.

The most common IP spoofing defense methods are ingress filtering and IPSec. The following are some examples of IP spoofing solutions:

- Router-based solutions: Distributed packet filtering is a technique for filtering packets based on interface and flow. It looks to see whether the packet has taken an unusual path from its origin to its destination. A packet passport system based on the hash algorithm and symmetric cryptography was presented in.
- Host-based solutions: A reactive system known as stack path identifier was suggested, in which each router's IP field is used to identify packets. It ensures that all packets traveling in the same direction are marked similarly. This ensures that the address is accurate.

2. DISCUSSION

2.1. TSL/SSL MITM ATTACKS:

The encryption technologies Safe Socket Layer (SSL) and Transport Layer Security (TLS) enable secure data transmission and communication over the internet. These provide a secure channel of communication between two parties (client and a server). These protocols require the use of four additional protocols in order to create a session. Record Protocols are used to ensure trustworthiness and secrecy, Handshaking Protocol is used to negotiate session variables, Cipher Spec Protocol is used to install newly negotiated connections, and Alert Protocol is used to alert any type of error.Attack mechanism: The process of certificate validation is critical to security. If the attacker has a valid certificate, he or she has hacked a CA or forced it to issue one. If the attackers have an invalid certificate and the victim ignores the security warnings, they may succeed.

Defence mechanism: solutions for defending SSL/TSL attacks uses third party entities for protection of first connection of new domain, scalable certificate attestation and minimum web applications requirements. However, they raise operational and deployment costs, complicate certificate revocation processes, and introduce additional privacy concerns to the trust paradigm. Forged Certificates Detection (these provide additional data regarding the certificates to validate the certificates origin and use third parties), Certificate Pinning (deals with hosts public keys and servers publish the public keys and the certificates and users verify any changes in them), Multipath Probing (it is not a global attack) are some of the defense mechanisms against TSL/SSL MITM attacks (attackers in this mechanism cannot impersonate clients therefore it blocks most of the MITM attacks).

2.2. BGP BASED MITM ATTACK:

The network reachability information is exchanged via the Border Gateway Protocol, an inter-autonomous systems protocol. This data is utilized to create an AS connection graph, which is

used to enforce specific policy choices at the AS level. BGP is a fundamental internet routing technology that allows Ass to choose the quickest route for data delivery. This typically chooses the shortest AS route, which has the fewest amount of AS names. Because BGP does not conduct peer-to-peer authentication, it does not offer security against MITM attacks.

Attack mechanism: This BGP related MITM attack is based on IP hijacking and thus is sometimes known as BGP hijacking or prefix hijacking or route hijacking. IP hijacking occurs when a hacked BGP speaker advertises that AS may access more particular routes with lengthy network prefixes. When a BGP MITM attack is conducted, communication intended for a certain IP address does not reach its target. To carry out such attacks, the adversary needs configure routers to advertise network availability. Then, inside the global routing database, it must advertise particular routes. The attacker then directs the network traffic to the proper locations. Some parts of the internet are lost as a result of these BGP MITM attacks.

Defense mechanisms: Researchers surveyed BGP security and focused on weaknesses to make the protocol more secure.

2.3.MITM ATTACK BASED ON FBS:

A hostile attacker impersonates a transceiver base station in a false base station (FBS) attack. A false BTS may imitate a genuine BTS by broadcasting BTS signals over the air, allowing nearby mobile phones to interact with it. It has a real-time jamming mechanism that disables all active connections. The jammer mechanism forces victims to connect to false BTS since the adversary can drown legitimate BTS. FBS-based MITM attacks are susceptible to systems that do not verify network authenticity or display one-way authentication. A third party may compel the victim to connect to a false BTS, causing the victim's network traffic to be manipulated. In order to carry out an MITM attack, the adversary may utilize phony BTSs with various protocols.

2.4.MITM attack based on GSM:

The BTS and mobile stations that make up the GSM architecture interact with each other through radio links. The BTS connects to the mobile switching center's base station controller connections, which route signals to any fixed network. The GSM design uses two databases: the visitor location register (VLR) and the home location register (HLR). HLR keeps track of subscriber information and current location, while VLR keeps track of visiting users' information. GSM took security into account and ensured the cellular network's integrity and privacy. Authentication, user data, signal protection, and privacy are all met by the GSM security standards.

Attack mechanism: Idea behind MITM attack on GSM is to impersonate mobile network code to false BTS and convince station to be valid for the victim. The adversary's network is made up of a mix of fake MS and false BTS. The fake BTS utilized must be more powerful and closer to the target than the real. In order to conduct a GSM-based MITM attack, the attacker must take the following steps.

- The attacker establishes a connection between the genuine MS and the phony BTS.
- The fake MS impersonates the victim's MS.
- The cipher suites and authentication information are sent to the fake BTS via MS.
- The communication is forwarded to the genuine BTS by the adversary.

- Authentication response and challenge between a valid BTS and a legitimate MS exchange.

Defense mechanism: better cipher algorithms and better authentication protocol can be used to prevent MITM attack on GSM. Researchers proposed a method for VLR authentication that relies on HLR-generated certificates and a secret key. It is possible to enhance this approach by requiring mutual authentication for all communications. However, this protocol was still susceptible to a brute-force assault. This method is also unsuitable for roaming users and requires regular architectural modifications.

2.5. MITM attack based on UMTS:

UMTS is the successor of GSM, and it includes certain improvements to eliminate security flaws. The radio interface between BTS and MS is encrypted and subscriber authentication is supported by GSM. Signal traffic integrity protection and authentication token are two of the improvements and extra capabilities provided by UMTS. Stronger cryptographic primitives and 128-bit cipher keys are also supported by UMTS. UMTS networks also provide faster communication rates.

3. CONCLUSION

We examined different MITM attacks in this article and provided a thorough review of all such attacks based on impersonation methods. The descriptions of several MITM defense methods are given. The attackers are after the actual data traveling between the endpoints, as well as the data's integrity and confidentiality. MITM attacks are divided into four types in this paper: spoofing-based MITM, TLS/SSL MITM, BGP MITM, and fake base station-based MITM. This article also details the assault methods and their countermeasures. Most current MITM attacks require traffic passing via a middleman, but there isn't yet an unique MITM method, thus this might be a new study area. Several cryptographic approaches, such as elliptic curve cryptography, key distribution, and authentication mechanisms, may be used in MITM attacks.

ABSTRACT

The use of conventional Internet protocols for human-to-thing or thing-to-thing communication in embedded networks is a straightforward interpretation of the phrase Internet of Things. The primary goal of the Internet of Things is to build a virtual footprint of all connected devices and people. It establishes a new means of communication between all things and humans, as well as between objects themselves. IoT allows us a new degree of connectivity. This paper summarizes all of the IoT ideas and mechanisms. RFID systems, sensor networks, and intelligence technologies are all key technologies that allow IoT. The possible uses of these technologies are discussed, as well as the main research challenges.

KEYWORDS: *Actuator, Frid, Microcontroller, Sensor, Wsn.*

49. INTRODUCTION

In the area of wireless communications, a new paradigm known as "The Internet of Things (IoT)" was presented many years ago. Kevin Ashton created this phrase in his demo in the year 1998, and its significance has grown steadily since then[1]. Incorporating Internet of Things (IoT) into embedded mobile transceivers in a broad variety of products would take information and communication technologies to a whole new level. The Internet of Things (IoT) is a critical component in corporate change. The concept of the Internet of Things was examined during the 20th Tyrrhenian workshop on digital communications. The Internet of Things (IoT) is defined as a network of different “things” or “objects” around us, such as sensors, mobile phones, and Radio Frequency Identification (RFID) tags that interact with one another and effectively perform their duties using a unique addressing system[2].

To comprehend the Internet of Things, we must first comprehend the function of RFID technologies (used to identify and communicate with other devices). Wireless Sensor Networks (which compose information gathering, processing, and transformation), intelligent technologies (to solve issues and initiate and regulate machine-to-machine interaction), and Nano-meter technologies are the mainstays of the Internet of Things (to construct small devices in order to socialize the IOT applications). In the area of IoT, research is continually being done to make it easier to use while also increasing the security of the data transmitted via it. In Japan, the Unique Identifier (UID) is the best architecture, and the EPC worldwide networks provided by Auto-Id labs are the finest in the sector. The primary goal of these organizations is to create a system that connects every item using RFID tags and wireless communications on a global platform known as the "Internet." Every object is given a unique name known as an Electronic Product Code (EPC) and is controlled by the RFID system. In 2009, IBM CEO Palmisano proposed the idea of a "Smart Planet" by incorporating sensors into all things and other systems such as railroads, electricity grids, and other gadgets that interact with one another and other devices using intelligent architecture[3].

The concept of "Sensing China" was first proposed in 2009, and a sensor network hub was established in Wuxi, Jiangsu Province, which is a major source of science and technology patents in the nation[1]. The entire principle amount is about 11.1 billion RMB. Other big nations have also begun research in this area in order to build stronger IoT infrastructure.

50. DISCUSSION

IoT has been described or defined from a variety of viewpoints, and as a result, IoT is explained in a variety of ways. The two terms "Internet" and "Things" are the primary reason for the many meanings. The term "internet" refers to a collection of networks and entities that are mostly made up of generic items.

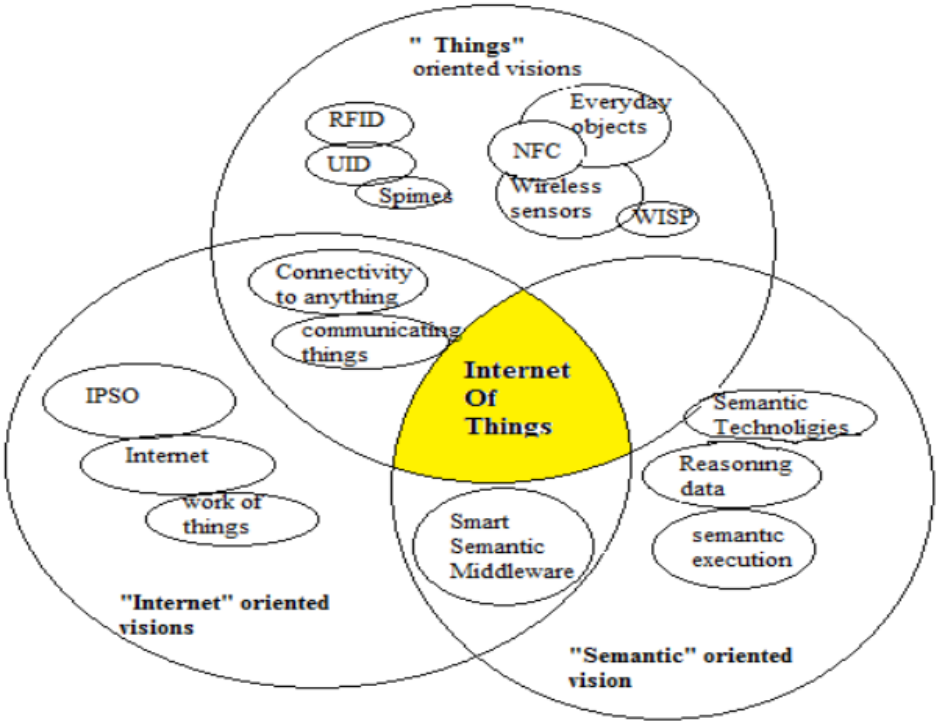

Fig. 1: Convergence of different visions of IoT[4].

When you mix the terms Internet and Things, you get a whole new level of progress in the world of ICT. The phrase "Internet of Things" refers to a worldwide network of linked things with a unique EPC, or address. The most perplexing job in this system is identifying the objects and preserving the information transferred. As a result, a new notion of semantic viewpoint emerges in the IoT. The IoT idea is shown in Fig. 1, which shows the convergence of the three circles. CASAGARAS consortium presented an advanced method that is much superior to RFID's approach[5]. The consortium's primary goals are twofold.

i. It supports IoT globalization, which allows us to link the virtual and physical worlds.
ii. Assists with current and future internet and network improvements.

IoT is a natural enabler for the implementation of independent federated services and applications, with a high degree of autonomous data collection, event transmission, network connection, and interoperability. A thing focuses on combining generic items into a framework that is simple to access, whereas the Internet focuses on creating an integrated network. A forum founded in 2008 in line with the IP for Smart Objects (IPSO) alliance, which includes a protocol that links a huge number of battery-powered communication devices. This shows that IP offers a variety of methods for making IoT a reality. By integrating IEEE 802.15.4 and IP addresses, as well as 6LoWPAN, IoT may be made to operate. IoT implementation is largely determined by the architecture, which consists of many levels ranging from the field data collection layer to the application layer on top. These layered architectures are designed to meet the needs of different industries, companies, society, institutions, and governments, among others. A typical layered design for IoT is shown in Fig. 2. The layered architecture is divided into two halves, with an Internet layer in the middle to provide a common communication medium. The two bottom levels help to capture data, while the two upper layers are in charge of data usage.

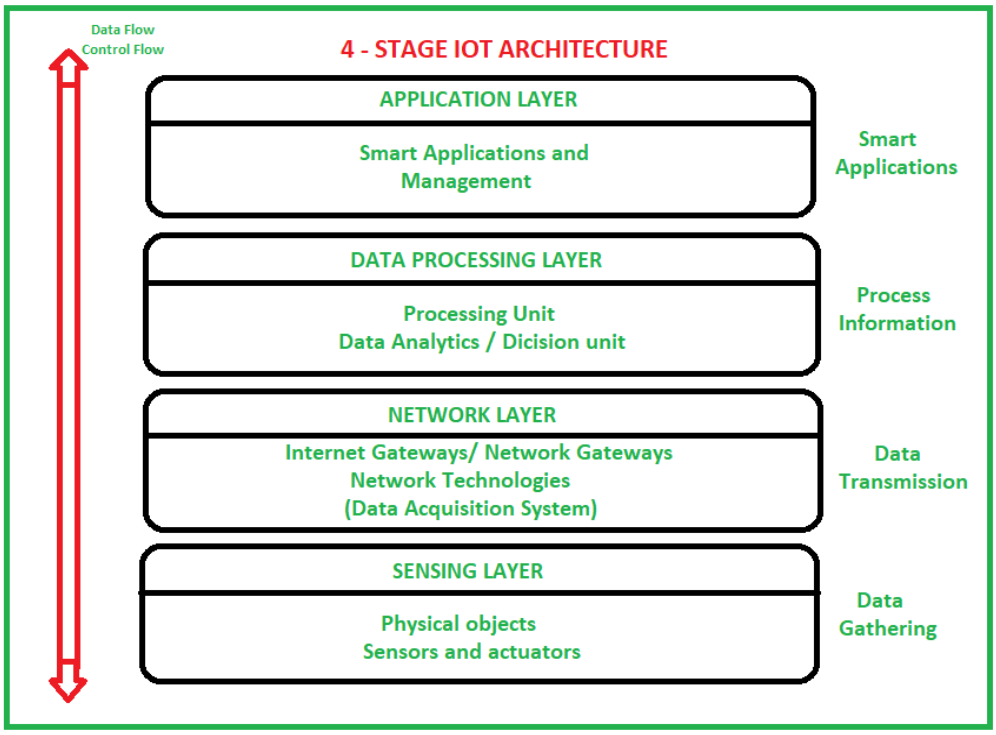

Fig. 2: Layered architecture of Internet of Things[6]

- **Edge layer:**

Embedded systems, sensor networks, and other types of hardware are included in this hardware layer. The main data sensors that have been installed are among them. RFID tags, sensor networks, and embedded edge processors are all provided by these hardware components.

- **Access gateway layer:**

This is where the initial stage of data handling takes place. It can conduct cross-platform communication as well as message routing, publishing, and subscribing.

- **Middleware layer:**

In bidirectional mode, this is the most important layer. It serves as a link between the hardware layer and the application layer at the top of the stack. It is in charge of essential tasks including device management and information management, as well as data filtering, data aggregation, semantic analysis, access control, and information discovery, such as the ONS (Object Naming Service) and EPC (Electronic Product Code) information service.

- **Application layer:**

This layer sits at the top of the stack and is in charge of delivering various IoT apps to diverse consumers. Manufacturing, logistics, retail, environment, public safety, healthcare, food and medicine, and other industry verticals may all have uses. With the maturation of RFID technology, a slew of new applications are emerging that fall under the IoT umbrella.

50.1. Applications:

IoT allows items in our daily working or living environments to interact and comment on data gathered from their surroundings, allowing for a wide range of applications. IoT applications that are either immediately relevant or closer to our present living environments are divided into three areas.

50.1.1. Supply Chain Management:

In the Internet of Things, real-time information processing technology based on RFID and NFC is utilized. We can precisely monitor and manage real-time data, work-in-progress, and in-transit phases, and get dependable due dates. This would result in a more accurate prediction and an increase in the forecast[7]. It would be feasible to automatically replace out-of-stock items and reduce inventory. It would just take a few days to implement these technologies, and they would operate with no safety stock. Transportation Sensors, actuators, and processing power will be added to cars, buses, and taxis, as well as road junctions. Important data may be gathered to assist with traffic control and direction, depot management, and providing visitors with relevant transit information. The Traffic Information Grid (TIG), which is deployed on Shanghai Grid, is one of the most significant IoT applications.

50.1.2. Healthcare:

RFID, WSN, and other IoT technologies may have a lot of applications in the healthcare field. A person's health condition, for example, might be deduced from RFID tags on clothing or the discovery of a wearable medical equipment[8]. Hospital applications may be divided into four categories: hospital personnel and patient monitoring, person identity and authentication, automated data gathering and sensing, and remote healthcare.

50.1.3. Disaster Alert and Recovery:

Natural catastrophes and unintentional disasters have become more common in recent years. RFID and WSN technologies play a critical role in predicting disasters and assisting with recovery when they occur[9]. Residents in the surrounding region would have more time to prepare themselves if they had timely access to appropriate information about dangerous environmental conditions, minimizing the amount of damage and casualties caused by the event. WSN allows for the collection, analysis, and transfer of environmental data from catastrophe sites to potentially vulnerable cities. Authorities may then utilize this information to quickly evaluate urgent situations and arrange resources. In the event of an accident catastrophe, for example, immediate monitoring and location of trapped employees using RFID technology may enable prompt rescue and reduce fatalities and economic damage to the greatest degree possible. The rescue operation would be more targeted and time efficient if the trapped employees' geographic distribution and relative precise location were known. Apart from the aforementioned applications, many others may be classified as futuristic since they depend on technology (communications, sensing, materials, and industrial processes) that are yet to be developed or whose implementation is too difficult. Robot taxi, city information model, and improved gaming room were among the most attractive future uses.

50.2. Open Issues:

50.2.1. Standardization:

Although scientific communities, European Standards Organizations (ETSI, CEN, CENELEC, etc.), Standardization Institutions (ISO, ITU), and global Interest Groups and Alliances (IETF, EPC global, etc.) have made significant efforts to standardize the IoT paradigm, they are not integrated in a comprehensive framework. Efforts to standardize have centered on three main areas: RFID frequency, communication protocols between readers and tags, and data formats utilized on tags and labels[10], [11]. Major standardization organizations working with RFID technology include EPC Global, the European Commission, and ISO. The primary goal of EPC worldwide is to promote the global adoption of an EPC for each tag as well as associated industry-driven standards. The European Commission has put together a coordinated effort to define RFID technology and assist the move from localized RFID applications to the Internet of Things. ISO, on the other hand, is concerned with how to modulate, use frequencies, and avoid collisions from a technical standpoint.

The Machine-to-Machine (M2M) Technical Committee has been established by the European Telecommunications Standards Institute (ETSI) to undertake standardization efforts related to M2M systems and identify cost-effective M2M communications solutions. Standard Internet, Cellular, and Web technologies have been utilized to solve standards due to the absence of standardization of this driving paradigm towards IoT. As a result, the ETSI M2M committee intends to create and maintain an end-to-end architecture for M2M (based on an end-to-end IP concept), as well as enhance M2M standardization activities. 6LoWPAN and ROLL are two working groups of the Internet Engineering Task Force (IETF) that deal with integrating sensor nodes into IPv6 networks. The goal of 6LoWPAN is to create a collection of protocols that will allow IPv6 to work with low-capacity devices. The core protocols have already been defined. While ROLL has just released the RPL (pronounced "ripple") proposal for routing across low-power, low-loss networks, such as 6LoWPAN. To achieve a complete answer, a large number of contributions are required.

50.2.2. Security and Privacy:

The primary issue of security is authentication and data integrity. Authentication is especially challenging in IoT situations due to a lack of appropriate infrastructure and servers to transmit messages across nodes[12], [13]. Furthermore, compared to PCs, PDAs, mobile phones, and other devices, objects have less resources to do sophisticated computations. Some authentication solutions have been suggested, however they all have significant flaws and will not help address the issue of man-in-the-middle attacks. An attacker cannot alter data in a transaction without the system noticing the change, according to data integrity solutions. The issue of data integrity has received a lot of attention in the conventional information field. There will be a new issue when RFID systems and sensor networks are linked into the Internet. Sensor nodes or RFID tags are dispersed over a large region and are unattended for the most part. Adversaries may alter data while it is stored in the node or as it travels across the network. Memory is secured in most tag systems to safeguard data from the first kind of attack, and solutions have been suggested for wireless sensor networks as well.

Messages may be secured using the Keyed-Hash Message Authentication Code (HMAC) method to protect data against the second kind of attack. To help with security, several cryptographic methods have been suggested. Such solutions cannot be fully applied to the IoT since they will incorporate IoT components with limited energy, communications, and computing capabilities, such as RFID tags and sensor nodes. As a result, new solutions are needed in order to strike a balance between security and resource scarcity. The right to privacy may be thought of as a personal property or right. People's privacy concerns in the IoT are mostly related to data collection (which of their personal data is being gathered, who is collecting it, and when), data usage (only for approved services by authorized service providers), and just started data gathering (the collected data should be stored only until it is strictly needed). There are two issues with data gathering in RFID systems. On the one hand, most RFID tags are passive and respond to reader inquiries regardless of the owner's preference. Individuals' data may be gathered in this way without their knowledge.

An attacker, on the other hand, may listen in on a tag's response to another authorized reader. Authentication of authorized readers, as previously stated, cannot address the first kind of issue. In order to negotiate privacy on behalf of individuals, a new mechanism based on user choices has been suggested. The aforementioned system's privacy choices may be enforced by causing wireless channel collisions with responses sent by RFID tags that should not be read. Malicious readers may still identify the existence of RFID tags by scanning even using encryption to shield communication from eavesdropping.

There is a novel family of solutions suggested for the aforementioned issue, where the signal sent by the reader takes the form of pseudo-noise. Because the RFID tags modify such a chaotic signal, hostile readers are unable to identify its transmission. To address the issue of unauthorized use of acquired personal data, solutions have been suggested, most of which depend on a mechanism known as a privacy broker. The proxy communicates with the user on one hand and with the services on the other, ensuring that the provider only receives the information about the user that is absolutely necessary. The proxy's preferences may be adjusted by the user. However, depending on privacy proxies, such systems have scalability issues. Individuals could not affect the policy chosen by privacy brokers. Digital forgetting is currently being researched as a significant problem that has just been identified. In reality, as the cost of storage falls, the quantity of data that can be stored grows exponentially. As a result, once information is produced, it is almost certain to be kept forever. As a result, solutions that

regularly erase information that is no longer useful for the reason for which it was created are required. Such forgetting capabilities should be supported by the complete deployment of IoT, which will need further study.

50.2.3. Governance:

In the IoT ecosystem, like in the current Internet, issues of "thin" legitimacy and a lack of adequate openness and accountability emerge. Because the Internet of Things is more than just an extension of today's Internet, but rather a network of autonomous yet compatible systems, the Internet Governance principles can no longer be used in the same way. The idea of "multi-stakeholder governance" should be seen as a new way forward in favor of the participation of the whole society, based on the regulation of the Internet. This trend calls into question the conventional notion of legitimacy and necessitates addressing the broad issue of who is a legitimate stakeholder. As a result, architectural principles must be established and documented within a global legal framework. Only if the result reflects the value of the represented stakeholders does representation become legitimate. This idea necessitates openness, accountability, and the involvement of public opinion in IoT governance, in addition to equal negotiating power and fair procedures.

51. CONCLUSION

We review the state-of-the-art on the Internet of Things in this paper, which covers a variety of definitions, enabling technologies, and various applications, as well as open research problems and initiatives. This paper, on the other hand, offers a thorough examination of the pertinent technology. The realization of the goal of "anytime, anywhere connection for anybody, we will now have connectivity for everything" is expected to rely on cross-discipline and cooperation work in related areas in the near future.

THE ROLE OF THE VOLLEYBALL GAME IN THE SYSTEM OF PHYSICAL EDUCATION (A LOOK AT HISTORY)

Oribdjan Madaminov*

*Lecturer,
Fergana State University, UZBEKISTAN

ABSTRACT

Today the content of all reforms in our country is development human factor development. Because man is the keeper, creator and perfection of all riches. Therefore, the comprehensive development of man, expansion of his opportunities, creation of conditions remains a guarantee of achieving the intended goal. In particular, it is necessary to pay special attention to human health, to development, which serves to ensure health, to develop measures and to study the existing problems. Therefore, it is important to study the effect of all omens in the development of physical education and sports. In this article, the role of the volleyball game in the system of physical education is studied.

KEYWORDS: *Sports, Volleyball, Physical Training, National Team, Bounce Endurance, Jump Endurance, Training Cycles.*

INTRODUCTION

In each period, the essence of upbringing is diverse, the meaning of which comes from social goals. Although the idea of upbringing is expressed differently, but expresses unanimity according to the nature and object of orientation.

"Physical Culture, physical education and sports are an important factor in not only physical but also spiritual perfection. He purifies the will, teaches to strive towards a clear goal, to withstand difficulties and to cope with endurance. It nurtures confidence, pride and pride feelings of victory in the human heart"[1, 67].

Some tend to consider the American Halstead from Springfield as the ancestor of volleyball, who in 1866 began to promote the game of "flying ball", which he called volleyball. Let's try to follow the development of the ancestor of volleyball.

Preserved, for example, the chronicles of the Roman chroniclers of the 3rd century BC. They describe a game in which the ball was beaten with fists. The rules described by historians in 1500 have also reached our time. The game was then called "faustball". Two teams of 3-6 players

competed on a 90x20 meter square separated by a low stone wall. The players of one team tried to shoot the ball over the wall to the opponents' side.

The inventor of volleyball is William Morgan, a teacher of physical education at the College of the Young Christians Association in Holyoke (Massachusetts, USA). On February 9, 1895, he hung a tennis net at height of 197 cm in the gym and his students, whose number on the court was not limited, began to throw a basketball camera over it. Morgan called the new game "mint net". A year later, the game was demonstrated at a college conference of the Young Christians Association in Springfield and at the suggestion of Professor Alfred T.Halsted, received a new name - "volleyball". In 1916, the first rules of volleyball were published.

The basic rules of the game were formed in 1915-25. In the countries of America, Africa, Europe, volleyball was practiced with six players on the court, in Asia - with nine or twelve players on the 11x22 m court without changing the positions of the players during the match.

MAIN PART

In 1922, the first nationwide competitions were held – the YMCA championship was held in Brooklyn with the participation of 23 men's teams. In the same year, the Basketball and Volleyball Federation of Czechoslovakia was formed – the world's first volleyball sports organization. A commission was formed, which included 13 European countries, 5 American countries and 4 Asian countries. The members of this commission adopted the American rules as the main ones with minor changes: measurements were carried out in metric proportions, the ball could be touched with the whole body above the waist, after touching the ball on the block, the player was forbidden to touch again in a row, the height of the net for women was 224 cm, the feed area was strictly limited.

In 1949, the first World Championship among men's teams was held in Prague. In 1951, at the congress in Marseille, the FIVB approved the official international rules, and an arbitration commission and a commission for the development and improvement of the rules of the game were formed in its composition.

The 1980s. New rules. In volleyball, the activity of the game takes place on both sides of the net, which is 2,43 cm above the floor height (for men), and the need to perform multi-joint blocking actions during 3-5 part-time games (60-90 minutes), during which the attack blows, a high degree of developed sakrovchanlikeness and jumping resistance is required.

"Judging by the statistics, the slowdown in the resistance of the gum and jump in the volleyball players by going to 4-5 parties of the competition games, as a result of which the effectiveness of the attack and the blocking fell (A.V.Belyaev, Savin M.V. 2009; A.V.Sukhanov, E.V.Famin, L.V.Boligina, 2012; A.V.Osadchi, 2006). Therefore, it is of urgent importance to study the dynamics of changes in these special physical qualities in different cycles of the annual preparatory process"[2, 121].

Execution of attack and defense methods in modern volleyball with a useful result depends on the degree of development in the appropriate direction of specific types of force, which are related to the activity of the "hand-foot" (A.V.Belyaev, 2009; A.V.Sukhanov, 2012 and etc.; A.G.Garipov, 2009 and etc.). In this regard, especially explosive, dynamic, inertial and reactive power types are paramount importance. It was noted by the authors that it is expedient to go to the Coordination of technical and tactical methods of execution of such types of power with the help of stand-by exercises, starting from the age of adolescence. Because it is from the age of 15-

16 that the advantage of shading these power types in a direction adapted to the upcoming game function (amplua)is known from advanced experience (L.P.Sergienko, A.V.Ablikova, 2016; S.V.Garkusha, 2005).

In 1984, Paul Libo was replaced as president of the FIVB by Dr. Ruben Acosta, a lawyer from Mexico. At the initiative of Ruben Acosta, numerous changes were made to the rules of the game aimed at increasing the entertainment of the competition. On the eve of the 1988 Olympic Games, the 21st FIVB Congress was held in Seoul, where changes were made to the rules of the decisive fifth game: now it should be played according to the "rally point" system ("draw-point"). Since 1998, such a scoring system has been applied to the entire match, in the same year the libero role appeared.

In the early 1980s, a jump serve appeared and the side feed almost ceased to be used, the frequency of attacking strikes from the back line increased, there were changes in the methods of receiving the ball - the previously unpopular reception from below became dominant, and the reception from above with a fall almost disappeared. The game functions of volleyball players have narrowed: for example, if earlier all six players were involved in the reception, then since the 1980s, the fulfillment of this element has become the responsibility of two players.

The game has become more forceful and fast. Volleyball has increased the requirements for the growth and athletic training of athletes. If in the 1970s there could not have been a single player taller than 2 meters in the team at all, then everything has changed since the 1990s. In high-class teams below 195-200 cm, usually only a binder and a libero.

Since 1990, the World Volleyball League has been played, an annual cycle of competitions designed to increase the popularity of this sport around the world. A similar women's Grand Prix competition has been held since 1993.

Varieties of volleyball. Beach volleyball. There is also another kind of game - beach volley (sand volleyball, beach volleyball). Sand volleyball in the twenties and thirties was played in Bulgaria, Latvia, the USSR, the USA, France, Czechoslovakia. Beach-volley with two players on the court appeared in the USA in 1930. At the end of the twentieth century, beach-volley became very widespread in the world and in 1993, at the IOC session in Monte Carlo, it was recognized as an Olympic sport.

Now the official FIVB calendar includes the following beach-will competitions: tournaments in the program of the Summer Olympic Games (since 1996), World Championships (since 1987 for men, since 1992 for women) and the World Tour (since 1989 for men, since 1993 for women), the stages (tournaments) of which are held in different countries during the season.

Mini-volleyball. A game for children under 14 years old. Mini-volleyball appeared in 1961 in the GDR. In 1972, its rules were officially approved. There are two levels: mini-3 and mini-4. Each team has three (four) players plus two substitutes. Both boys and girls can play for the team at the same time, but their ratio in the rival teams should be the same. The game takes place on a 6x4.5 (6x6) m platform, divided in half by a grid at a height of 2.15 (2.05) m. Ball weight: 210-230 grams, circumference: 61-63 cm. The game in the game goes up to 15 points.

Pioner ball. Its main technical difference from classical volleyball is that the ball is picked up during the game. Accordingly, the submission, the pass to the partner and the transfer of the ball to the opponent's side is carried out not by a blow, but by a throw. The match consists of three games, the game in which is played up to 15 points. The team that wins in two games wins.

Pionerball is included in the program of secondary schools for physical training and is a preparatory stage in mastering the basics of not only volleyball, but also basketball.

Wallyball (English "wallyball", from "wall" – wall) was invented in 1979 by American Joe Garcia. Two teams of two, three or four people play. It is allowed to use the side walls of the gym. The game is played up to 15, 18 or 21 points (but the difference in the score must be at least 2 points). There are many representatives of classical volleyball among the volleyball players, including members of the US Olympic team Paul Sunderland and Rita Crockett, and famous people from the world of politics and show business, including US President George W.Bush. In the early 1980s, businessman Mike O'Hara (formerly a member of the U.S. Olympic team) founded the company "Wallyball International Inc." (WII), which took over the organization of regional and international tournaments in the country. In 1989, several members of the WII executive committee who did not agree with O'Hare's policy created the American Volleyball Association. The Association has held a number of alternative events in the USA and international tournaments in different countries. Currently, both organizations are practically inactive. In November 2001, through the efforts of the inventor of the volleyball, a non-profit United Association of volleyball players was formed. Garcia intends to revive the former interest in his brainchild and achieve its recognition as an Olympic sport. Now several million people are engaged in volleyball all over the world.

Faustball. Faustball (from the German "Faust" - fist), in English–speaking countries the name "fistball" (English "fist" - fist) is adopted. One of the oldest sports. The first rules were adopted in 1555 in Italy. At the end of the 19th century, the game came to Germany, which eventually became the center of world faustball. Currently, the game is extremely common in a number of European countries, as well as in North and South America, Japan and some African states. Faustball is played by two teams of five players each (plus three substitutes) on a 50x20 meter court - both indoors and outdoors. The game consists of 2 15-minute halves. If the rules of the tournament exclude a draw in the match, then in case of a draw, two additional 5 minutes are assigned, if necessary, two more, etc. - until one of the teams wins with a margin of at least two points. The ball is slightly heavier than a volleyball ball (320-380 grams). Instead of a net, a rope is used, stretched at a height of two meters.

CONCLUSION

Conditions were created in accordance with the modern requirements of the younger generation for regular physical education and mass sports, strengthening confidence in their will, strength and opportunities in young people through sports competitions, perfection of courage and patriotism, feelings of loyalty to the motherland, selection of athletes from among them and systematic organization of purposeful training were carried out. In conclusion, the application of modern forms and techniques of teaching in the lessons plays a big role in the conscious, quick, thoughtful thinking of students. We will also be able to guarantee the achievement of education, quality and efficiency, the training of competitive personnel, if teachers are able to master pedagogical technologies and apply them efficiently in practice in their activities.

ANALYSIS OF FOREIGN EXPERIENCE ON THE DEVELOPMENT OF ECO-AESTHETIC CULTURE OF FUTURE PRESCHOOL EDUCATION SPECIALISTS

Oygul Ashurova*

*Lecturer,
Fergana State University, UZBEKISTAN

ABSTRACT

At the new stage of development of Uzbekistan, issues of reforming education, bringing new approaches to it, as well as studying advanced foreign experience, researching the position of developed countries in the training of personnel and localization of productive aspects is becoming relevant. In order to carry out such a responsible task at an excellent level, it attaches great importance to the rapid development of national science and personnel training system.

KEYWORDS: *Education, Culture, Innovation, Educational Effectiveness, Preschool Education, Culture, Eco-Aesthetic Culture.*

INTRODUCTION

The most important of modern education has been formed since ancient times. The purpose, content, form, method and tools of education are considered to be traditional categories applied to analyze the content of educational processes. The same categories arise as the subject of pedagogical activity, which constitutes the educational process of a certain subject, specialty or specialty. As the president of the Republic of Uzbekistan ShavkatMirziyoyev noted in his speech at the expanded meeting of the Cabinet of Ministers dedicated to the main results of socio-economic development of our country in 2016 and the most important priorities of the economic program for 2017: "at previous meetings, the state of affairs in the field of education and science, the implementation of due to the fact that the implementation of the actual tasks in this area is of strategic importance for the future of our youth, society and the country, the work in this area is personally entrusted to the head of State. I draw your attention to the implementation of the following tasks. The first task is in the field of preschool education"[1, 44-45].

During the current year, the head of our state adopted a number of important documents on improvement of preschool education as an integral and primary link of continuous education system. Further improvement of the pre-school education system, strengthening the material and technical base, expansion of the network of preschool educational institutions, provision of

qualified pedagogical personnel, radical improvement of the level of preparation of children for school education, application of modern educational programs and technologies to the educational process, comprehensive moral and educational development of children, in order to create conditions for aesthetic and physical development, the decree of the president of the Republic of Uzbekistan № PP-2707 "on measures for further improvement of the preschool education system in 2017-2021" dated December 29, 2016 was adopted. The main objectives and directions of the "program on further improvement of preschool education system for 2017-2021" approved by the same decree to create conditions for comprehensive, moral, aesthetic and physical development of children taking into account the advanced foreign experience.

MAIN PART

Further expansion of public and non-public sectors of preschool institutions, creation of conditions for the formation of a healthy competitive environment between public and non-public preschool institutions, introduction of new forms of preschool institutions under the conditions of public and private partnership, as well as, In order to ensure effective organization of the activities of the Ministry of preschool education of the Republic of Uzbekistan, the decree of the president of the Republic of Uzbekistan "on Organization of the activities of the Ministry of preschool education of the Republic of Uzbekistan" on September 30, 2017 was adopted. In this decision, it is envisaged to carry out large-scale activities in order to eliminate the existing problems in the reform of the pre-school education system, including the effective organization of the process of professional development of pedagogical and managerial staff, the use of modern pedagogical and information technologies, advanced experience of foreign countries, provision of educational institutions with highly qualified,

In order to further improve the preschool education system, which is an important part of the continuous education system, in accordance with this decision, the task of the Ministry of preschool education of the Republic of Uzbekistan, the Ministry of preschool education of the Republic of Karakalpakstan, the main department of preschool education of Tashkent City, the Departments of preschool education of regions and their Ministry of preschool education of the Republic of Uzbekistan, among the main tasks and activities of its regional divisions, taking into account the advanced foreign experience, has established conditions for the comprehensive spiritual, moral, aesthetic and physical development of preschool children. Below is an analysis of the experience of several foreign countries.

Features of the pre-school education system of the Russian Federation[2] public policy within the framework of education is built on the ideas of humanism and democracy, which are reflected in the law on the Constitution and education of the country. It is directly stated in these documents that education is the process of teaching and educating a person purposefully oriented towards the benefit of the state, society and the individual. The composition of Russian education includes educational programs and state standards and directions of various degrees, as well as governing organizations – in addition to the educational system and institutions subordinate to the educational system. Preschool education is the first step in the system of education of the Russian Federation. The idea of giving the opportunity to receive education even for children of the youngest age appeared after the establishment of the "regulations on the single labor school" in 1918 year. From the date of adoption of the charter, it is guaranteed that every child can have the right to study, starting from birth. Today's educational standards are expressed in the International Convention on the rights of children, which states:

– Children should be able to attend educational institutions;

– Adult children should be provided with conditions for reading activities;

– It is necessary that education covers all the necessary conditions to prepare the little man to understand his life within the framework of society;

– The interaction of the participants in the learning process should be based on the expression of respect for the child. The system of pre-school education in Russia is constantly changing, it is constantly updated, changing its appearance and improving. The first teachers for the child are his parents. They should educate children in matters of infancy, social and moral.

The activities of pre-school educational institutions (NSM) are aimed at helping families to acquire knowledge and at the next stage of education. Some experts do not need kindergartens, and pre-school education should be entrusted to full-time parents, and they themselves argue that they will decide where and how to prepare the child for the 1st class. But according to statistics, most of the services of PEI are used by parents. Therefore, the strategy for the development of the educational system defines the modernization of Russian preschool education as one of the first-level issues in the future. According to the standard regulations, children's educational institutions are divided into five types:

– Kindergartens that recognize the implementation of one or two directions of development as important;

- Kindergartens of the compensatory type, aimed at the competent correction of children whose psyche has deviated from the norm;

- Kindergartens, where health exercises are conducted with children under the supervision of a tutor;

- Kindergartens, where general development, health improvement and compensatory groups are concentrated in different variants on their territory;

- Centers for early development of children

– The system of preschool education is characterized by multifunctionality, colorful planning, the direction of Priority Development and the determination of various programming, so that kindergartens can become healthier, acquire new knowledge and abilities, receive mental support. The system of pre-school education of Russia is based on the concept of "modernization of the educational process". In this concept, an important role has been given to the provision of quality indicators of Education. This document is based on the law on education, the Constitution of the Russian Federation, the standard regulations on NPM and other decisions of the Ministry of Education. It is mentioned in the concept that it is necessary to update the content of training based on the useful experience of individual organizations.

Theoretical research has shown that stereotyped approaches to filling the content of preschool education should be modified, while the process of teaching should be seen on the basis of the following principles departure:

– On the basis of the developing nature of teaching, the conduct of teaching manifests the hidden and potential qualities of children;

– Systematic education helps children to determine the interconnectedness of events, objects under study and life values;

– The development of the child relies on rational forms of acquisition of knowledge corresponding to his feelings and age;

– The content of multicultural education consists in bringing the little ones closer to the originality of culture and traditions of their native and other nationalities and nationalities, resisting the opinion of others, expressing their discontent, anger and sadness in a normalized manner;

– It is based on the need for a healthy lifestyle of health, the need to follow the rules of hygiene and engage in sports.

The English system of preschool education [3] Great Britain is a state of unique culture and traditions. The English teaching system is considered to be one of the best systems in the world, the Britain training programs comply with the highest standards. The provision of preschool education in the UK has been largely due to the efforts of poor working families to volunteer assistance to their children. In 1816, Robert Owen first opened a kindergarten in Scotland for the first time for the children of his factory workers. At the beginning of the twentieth century, several kindergartens were opened on the initiative of the sisters Macmillan, in which care was shown for the health and well-being of their children, mainly in low-income families. Stages of development. In 1988 year, the law "on education" came into force, in which it established not only the standards of education, but also the basic assessment of the level of mental development at the time of admission of children to school. Compulsory education in England, Scotland and Wales starts at the age of 5 years, and in Northern Ireland at the age of 4 years. The deadline for the start of training is considered the earliest in Europe. Preschool education fell into the category of priority direction in 1996 year after the adoption of the law on the system of preschool education. The main purpose of its adoption is to improve the quality of teaching in kindergartens, increase the standard of education and increase the financing of early education. Within the framework of the proposed system, a specific training plan should be established, the implementation of which must meet the requirements of the state educational system of the preschool institution. Special attention is paid to children who need special needs and English is not their native language. It is worth noting that the difference between the upbringing and education of children does not exist in all countries. In Great Britain, however, two is also recognized as significant and necessary. In the United Kingdom, there are 25 types of institutions that provide such services, and therefore the education system here is diverse and not equal in importance. Since 1997, the reform of early education is being carried out in England. Prior to this period, the approach to early education and training was not systematized – the preschool institution could apply the types of training program or service as desired. This situation led to the spread of "unique" approaches that are not concentrated on a single educational system. The quality of services for training was hostels changed. While preschool education for children aged 3-4 in England was recognized as one of the best in Europe, in the UK only 20 percent of children were used to it by the beginning of the 90-ies of the last century. The reform adopted was aimed at the production of a single educational program for the upbringing of children aged 3-4 years. In 1988 for the development of preschool education 15 billion. funds in dollars are credited. At the same time, by 1997 year in the UK there was not a single private system of preschool education, but so far their number has exceeded 20. The kindergarten is financed by the state only after the state registration. In kindergartens, extinction is conducted by independent experts, the results of which are published in open media. According to the results of the state examination in 1977, 77 percent of preschool institutions did not comply with the accepted

standards: there were no detailed educational plans in kindergartens, no children's development monitoring system was provided, no clear link between the various aspects of educational programs was established. 40 percent of the expert reports indicate that teachers do not have enough concepts about the state of children's development; there is no proportional system of interaction between the activities proposed by the child and the activities organized by the educator in accordance with the educational program.

Today, such problems are partially solved by themselves, but the big difference between the training of kindergarten graduates and the extreme requirements of school leavers for preschool education "how should the child develop? "there is a number of disagreements between the theoretical point of view and the current approach of educators to this issue. It should also be noted that work in preschool institutions all over the UK is not carried out within the same educational standards. For example, in the Scotland, reforms in the field of early education - are not related to the early support centers (about which it is told below). In contrast, open seminars and conferences are held, where educators exchange experiences with ways of demonstrating the characteristics of their approach to the educational process. Approach to education.

In Great Britain, education is usually directed not to the subject or teacher under study, but to the child. This approach is based on the history of English education, whose development was influenced by Russo, Frebel, Montessori. They believed that it is necessary to develop the individuality of the child and protect his independence. The main objectives of preschool education are: to meet the needs and interests of each child, to respect the difference between children. Such is assumed that the child is inquisitive and instinctively brisk, has an inner desire to read. Training should be conducted during the game, which the child himself proposed. The main task of the teacher is not to pamper the child, but to support the game, providing him with various materials for conducting research. On the study of the system of preschool education of Great Britain. Y.Kwong conducted a large research work. He conducted questionnaires between employees of kindergartens and parents, observed the activities of kindergartens. Freely 10 pre-school educational institutions were selected for the study, of which two groups were regularly monitored for five days. In groups of English kindergartens, children are brought up in an amount not exceeding 25 people (the number of educators and children is taken together in a ratio of ten). The results showed that 75 percent of English educators believe that it is inappropriate to motivate children from outside to be interested in learning (for example, the form of competition among children).

On the basis of such a position lies scientifically based data. For Example, in the study, M.Lepper and D.Grin an example is given that children of preschool age are rewarded for drawing (children are very interested in this). After that, the children did not want to draw on their own in their spare time, but only wanted to draw for the prize. In other words, internal motivation in children is lost, and external motivation is replaced by it. In the English kindergarten, children are engaged independently for a long time, and the educator follows them from the outside. Only 15 percent of the total time is allocated for group training under the guidance of a teacher. Such training is conducted in small groups, the level of development of which is made up of children equal to each other. In this way, the rule of taking into account the development of preschool children is practically applicable. Almost all educators believe that for the diagnosis of both the degree of development and mental formation of children, it is necessary to use the method of meaningful role-playing games, drawing and making things. In practice, in English kindergartens (except for compulsory classes in the current language and mathematics),

they attach great importance to research activities through games with water, sand and moving games. In pedagogues for meaningful-role-playing, there is almost no time left. How can I work as a tutor? In order to obtain a work permit in the kindergarten it is necessary to make appropriate preparations separately. These preparations are either basic for three years and consist of one year additional study or four years studying in different educational structures. Only 20 percent of educators have the status of a bachelor. To become a pedagogical Assistant or nanny, they need to study a special 15-hour training program. Such training can be conducted in educational associations, which are now increasing. The undoubted advantage of the system of training specialists in the UK is that it is aimed at a high level of practice. 50 percent of the classes in this regard are held in pre-school educational institutions (compared to 12 percent in Spain, 20 percent in Italy and Denmark, 25 percent in France, Belgium and the Netherlands, 30 percent in Germany and Sweden). Experts estimate that in the next 10 years in preschool institutions in the UK, jobs will increase by 250000 units.

The system of pre-school education in Germany [4] the German law establishes the free right to pre-school education. Children can be taken to the nursery from 4 months. Many Germans use this right. Grandmothers and grandmothers, who are representatives of the older generation in the Germans, after the birth of grandchildren, do not have the concept of alimony and obligations to look after them. Therefore, parents are forced to give their children to kindergartens and daycare. Surprise admire the colorful forms and types of preschool education institutions (PEI).

CONCLUSION

In conclusion, it should be said that through the direction of national education, such qualities as self-awareness, patriotism, national pride, national harmony, speech, culture of communication, national ideological consciousness, national decency self-sacrifice will be formed, as well as legal, economic, physical, intellectual, aesthetic, hygienic and other areas of education will be implemented. How a child grows up as a person depends on the influence of the teacher, parent upbringing and the environment. The child from a young age receives spiritual food from his parents, educators, comrades, those around him, imitating them, mastering many customs, manners. In the upbringing of the child, it is necessary to attach special importance to their age, spirituality and understanding, in character.

ABSTRACT

The article examines the problems of social gerontology of the new Uzbekistan. Various social groups and communities of elderly and old people are studied. It was found out that the process of demographic aging in Uzbekistan is more typical for women than for men. And also, on the basis of socio-demographic facts, the issues of social protection of the elderly are disclosed. In conclusion, scientific recommendations on improving the work of the state form of social protection management for the elderly and old people are presented.

KEYWORDS: *New Uzbekistan, Demographic Truth, The Process Of Demographic Aging, Social Protection, Population, The Ratio Of Elderly Persons, Elderly And Old People, People Of The Older Generation, Social Gerontology.*

INTRODUCTION

The new Uzbekistan is a state whose main goal is to ensure a free, well-ordered and prosperous life of our multinational people. It is necessary to openly declare the demographic truth. During the years of independence, that is, over the past 30 years, the population of Uzbekistan has increased by 15 million people, which is comparable to the population of one average country [1]. It is a state developing in strict accordance with universally recognized norms in the field of democracy, human rights and freedoms, based on the principles of social protection of the population, friendship and cooperation with the international community.

Over the years of independence, the population of the Republic of Uzbekistan has increased 1.8 times and today 35.2 million people live on the territory of 448.97 thousand square kilometers (23.10/2021) [2]. Currently, 2 million 873 thousand residents, out of the total population of the Republic of Uzbekistan, are over 60 years old, 225 thousand residents are over 80 years old, 44

thousand residents are over 90 years old and 8700 people are over 100 years old (2018) [3]. That is, in the constituent part of the population of Uzbekistan, the ratio of elderly persons is 10.6% [4]. Domestic demographers also highlight the problem of older women [5]. The process of demographic aging in Uzbekistan is more typical for women than for men [6]. Large-scale work is being carried out in the Republic to increase the level of literacy and vocational training of women, to realize their abilities, to create decent working conditions for them, to provide them with affordable housing, as well as various measures to protect motherhood and childhood, to ensure gender equality in the country. The further development of trends in the decline in the birth rate will undoubtedly strengthen the aging processes of the population of the republic, which will result in a faster shift in the demographic structure of the population towards older ages. Women have a higher life expectancy than men. This is a global pattern, but the overall level of differences in this indicator between men and women in transition economies differs significantly from developed countries. Uzbekistan is no exception in this regard, although the gender gap here is smaller than in many countries and tends to decrease [7, p. 131].

Since ancient times, respect, attention and care for the elderly have been a kind of moral and cultural feature of society in the republic. In accordance with this, respect for elders, giving them attention and care has turned into a kind of spiritual and cultural standard.

In this regard, the study of socio-demographic processes shows that the scientific community of the New Uzbekistan needs the development of social gerontology. Social gerontology is a social discipline designed to solve demographic and socio-economic problems of population aging.

During the last 50 years (late XX-early XXI centuries) of our century, the process of population aging on a global scale has been developing with such rapidity and consistency that any ignoring of its significance is associated with negative consequences for the social policy of any state. Currently, the elderly and old people have become the third most important category of the population, which has given rise to very serious economic, social, and medical problems, the possibility of the existence of which in the past humanity could not even imagine. By the end of the 40s of the XX century, the health and social security authorities of many industrially developed countries faced many problems that they were unprepared to meet and that required immediate solutions. However, the first place was taken by the economic problems of population aging, which contributed to a large extent to the allocation and formation of an independent academic discipline-social gerontology-with special training for scientific and practical work in countries such as the USA, Japan, England and in Western European countries. The term "social gerontology" was first used by the American scientist E. Stiglitz in the late 40s of the XX century [8].

Socio-demographic problems of modern New Uzbekistan also require special attention. Consider the demographic indicators of the aging population of modern Uzbekistan. According to domestic demographers, the aging of Uzbekistan has been felt since the late 10s - early 20s of the XXI century. As of October 1, 2021, the total number of pensioners in the country amounted to 3,548,093 people (10.9% of the total population). Of these, by age (including superannuation pensions) 2568.3 thousand people (7.9%), disability 368.5 thousand people (1.1%), loss of breadwinner 247.7 thousand people (0.7%), as well as 304.4 thousand people (0.9%) receiving social benefits [9].

As you know, the decline in the birth rate is inevitably accompanied by an aging population. Currently, these processes are taking place almost imperceptibly in Uzbekistan. Uzbekistan is not

yet characterized by the processes of "aging from above". But the consequences of "aging from below" are already visible, manifested in a relative structural decrease in children's and adolescent contingents. In accordance with the international classification, the modern gender and age structure and the size of the average age of the population allows Uzbekistan to be classified as a country with a young population [7, pp. 32-38,71]. In Uzbekistan, given the rapid development of the trend of declining fertility, depopulation can be achieved even faster. Such a situation requires the State to pursue a more effective policy of supporting and maintaining the average birth rate, capable of providing moderately expanded reproduction of the population.

By order of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, the Concept of the National Strategy for Social Protection of the Population for 2021-2030 was approved. According to this concept, until 2025, on the basis of the Agency of Medical and Social Services under the Ministry of Health, Social Support Centers for the population at the level of districts (cities) will be created. The most important thing is that the state budget expenditures on social protection of the population will grow from 1 percent in 2019 to 1.5 percent in 2030 in relation to gross domestic product [10]. Thus, today, the New Uzbekistan has entered the path of development, having achieved success in all spheres of life. In particular, social work is an activity aimed at solving relationships between people, providing material and moral support.

Over the years of independence, a system of social protection for the elderly has been formed, social services for the elderly have been improved. The elderly, the elderly and long-livers, consist of various socio-demographic layers in their internal structure as a demographic social layer. At the same time, the uniqueness of this social stratum is an age indicator. In Uzbekistan, the retirement age for women is set at 55 years, for men 60 years. The retirement age of an individual can be reduced by working conditions (harm to health and difficult working conditions), the number of children in the family. In Uzbekistan, the reduction of the retirement age is 50-55 years for men, 45-50 years for women. Here it is necessary to clarify why the problem of studying social gerontology in Uzbekistan is important.

The problem of studying is that social gerontology studies the biological processes of human aging in order to find social measures and opportunities to preserve the spiritual significance inherent in old age. The problem of the living conditions and lifestyle of an old person comes to the fore here. Social gerontology is closely related to issues of general culture, being to a certain extent its measure, if we keep in mind the degree of care of the state, society and family about the old man, his somatic and psychological well-being. Integrating various aspects of the study of the aging process, social gerontology as a multi-disciplinary science has taken a strong position in the system of disciplines exploring humanity and society. Biology, ecology and sociology form a triangle within which the life of a healthy and sick person, his old age, longevity and death are studied.

The well-being of the population has increased in the republic, measures aimed at social protection of the older generation have increased. For example, in Uzbekistan, the average life expectancy has increased, as a result of the measures taken compared with 1990, the average life expectancy of a person has increased from 67 years to 73.5 years. On the basis of the decree of the President of the Republic of Uzbekistan dated October 13, 2014 "On measures to further strengthen social support for veterans of the war and labor front of 1941-1945", conditions for social protection of veterans of the war and labor front have been created, in particular, vouchers to the sanatorium are provided at a convenient time for them at the expense of the state.

Social gerontology has another important aspect of its activity - social work. Social gerontology considers one of its important tasks to study the patterns of demographic shifts in the country, the social and economic consequences of population aging, the causes of relatively low life expectancy and high mortality of people of pre-retirement and retirement age.

The process of demographic aging requires a revision of the foundations of the organization of existing health and social services, as these organizations face tasks that they are unable to solve with their modern organizational and economic capabilities. This applies to many countries of the world.

It is for this reason that material and moral assistance from social structures is increasing in the Republic of Uzbekistan. There are 33 nursing homes "Sakhovat", "Muruvvat", 11 centers for medical, social and labor rehabilitation of disabled people, 8 sanatorium adapted for the treatment of disabled people, 2 vocational colleges for the education of disabled people in the republic.

Based on the above, scientific research in social gerontology is conducted in three directions.

The social determinants of biological and mental aging of an individual are studied. The influence of the aging process on the personality at the final stages of a person's life cycle, changes in his social needs, attitudes, value orientations, motivations, structure of activity and behavior, activity, i.e. the whole lifestyle is investigated. In general, this direction focuses on the individual and personal characteristics of aging and old age.

Various social groups and communities of elderly and old people are studied. As well as groups and communities of which they are members, family, relatives, circle of acquaintances, neighbors, etc. The task of social gerontology in this case is to determine the place, role and functions of elderly people in these groups, their relationship with the group as a whole and its individual members; to investigate the influence exerted by the immediate social environment on the aging process.

The social status of the elderly and old people as a special social and age group, which is an important element of the social and demographic structure of society, influencing various social processes, is studied. This direction studies the goals, structure and functions of institutions and organizations engaged in social welfare, protection and service of old people.

Thus, in the social aspect, gerontology studies:

- Individual experiences of old people;
- The place and position of old people in society;
- Social policy in relation to old people.

The focus of social gerontology is also on the causes of early professional aging, pre-retirement and retirement periods of life, working capacity, professional and social activity of old people.

And also, at present, purposeful work is being carried out in Uzbekistan by the self-government bodies of citizens - "Mahalla" and the employment center for employment and social protection of the population. The main place in the social protection of the population, in modern conditions, is occupied by the expansion of types, requirements and changes in the basics of service, and the amount of pension funds spent. The considered theories are aimed at a comprehensive analysis and characterization of the aging process, comprehensive scientific

observation and study, enhanced support and social protection of elderly people. Every person who has reached old age passes into a new socio-demographic stratum and must necessarily be socially protected or comprehensively supported by state and non-state organizations (NGOs-non-governmental non-profit organizations).

Employees of the Ministry of Employment and Labor Relations of Uzbekistan are conducting research on the created social protection plan for the elderly. In particular, the improvement of systematic pension provision by state and non-state organizations, monitoring the implementation of the tasks of the right to work in the retirement age of older people.

The tasks of social protection of the population, in particular the elderly, the elderly and long-livers, are assigned jointly with social security to the Ministries of Employment and Labor Relations, the Ministry of Finance, Health, Pension Fund, public organizations, the Society of the Blind, the Mute-deaf, the disabled, the Red Crescent Society, the Mahalla Charitable Foundation, for healthy generation, as well as the Ministry of Mahalla and Family Support" [11].

The Ministry of Mahalla and Family Support of the Republic of Uzbekistan was established in accordance with the Decree of the President of the Republic of Uzbekistan No. PP-4602 dated February 18, 2020 "On organizing the activities of the Ministry of Mahalla and Family Support of the Republic of Uzbekistan" and Decree of the President of the Republic of Uzbekistan No. UP-5938 dated February 18, 2020 "On measures to improve the socio-spiritual atmosphere in society, further support of the mahalla institute, as well as raising the system of work with families and women to a new level"[12].

The year 2021 was declared by the President of the country "The Year of Youth Support and Public Health Promotion", the name of the year has a deep meaning. This year, in order to implement the tasks set by the state program "Year of Youth Support and Public Health Promotion", close attention will be paid to the development of the social sphere, strengthening social protection of the population and further improvement of the wage system, which allowed to increase the real incomes of the population by 12 percent compared to 2017. Starting in 2019, all pensioners have the right to receive full pensions and work.

Socio-demographic analysis reveals that a person's transition from working age to retirement age causes broad social changes in his life, that is, a person's transition from one social group to another. In this regard, it should be noted that in accordance with the Decrees of the President of the Republic of Uzbekistan for 1991-2021, the size of pensions increased 67 times [13]. As of January 1, 2016, the average monthly pension was 421,629 soums, in September 2021 -924,780 soums [13]. It is known that 96-98% of the labor resources of Uzbekistan are the age-able-bodied population. The work of pensioners and teenagers does not exceed 4% of the workforce. Of these, mostly 3.5% are pensioners [13]. In this proportion, the composition of the labor resources of Uzbekistan is determined. As a result of objective and subjective factors, qualitative and quantitative indicators of labor resources, distribution and their use are formed. This process, in turn, is associated with natural, territorial and social conditions.

It is worth noting that work has been carried out in Uzbekistan to eliminate problems related to the registration of pensions and benefits, their timely payment, access to various social services. By the Resolution of the Cabinet of Ministers "On measures to further improve the social protection system of the population and the widespread introduction of modern information and communication technologies into the sphere" dated March 5, 2021, the information system "Unified Register of Social Protection of Low-income Families" was created[14]. Only in the

Samarkand region of the republic, from November 1, 2020 to February 2021, about 158 thousand applications for social benefits or financial assistance were received. Of these, 49.6 percent, that is, 78,408 citizens, received a positive permit. In March of this year, 60.2 million soums of social benefits and 7.7 million soums of compensation were paid to 155,038 recipients of benefits and material assistance. The payment of 29.6 million soums to 68,288 recipients of benefits under the age of 2 years and 16.9 million soums to 68,488 recipients of benefits under the age of 14 years was also financed [15].

Thus, based on all this, the social worker needs to form the following main problems peculiar to the elderly:

1. The active life activity characteristic of people gradually decreases as a result of aging. A decrease in activity and performance is a sign of aging. With increasing age in the elderly, there are various diseases associated with age and disability. This condition, in turn, limits the relationship of the older generation with others. The lives of elderly people are limited.

2. A decrease in labor skills, a decrease in activity in social life, predisposes the emergence of various types of relationships to the elderly. The relations of society peculiar only to the elderly are being formed.

3. Due to aging, their emotional, psychological and physiological states are disturbed. A decrease in social activity has a negative effect on the elderly themselves.

4. There is a problem of excess free time in the elderly. Many of them who have worked well and raised enough funds, physically healthy people, after retiring, face two types of cases. In the first case, relatives say: "We worked so hard. Now rest, we will provide for you ourselves." As a result, they have fear, i.e. the feeling that they are not able to work. In another case, there is a fear of "servants" telling them "you are free from work, now do housework, look after your grandchildren, etc.".

Therefore, we can say that, based on the problems inherent in old age, the social protection of the elderly: First, we need to get rid of the views that the elderly have a sharply reduced ability to work, it is impossible to oblige pensioners to do housework, care for grandchildren. Currently, many pensioners have higher education, as leaders they have earned the honor and respect of society. Therefore, it is necessary to treat individually when implementing measures related to the implementation of social protection. You can't treat the elderly as "cheap labor." Older people will never agree with this.

Secondly, it is not necessary to work with the old methods when conducting social work with the elderly and the elderly. Especially, it is impossible to limit social work to standard methods and technologies. When determining the methods of social work with the elderly, it is necessary to take into account, as they say, that not only military force determines the strength and power of the state, it is also determined by patriotism, worldview, well-being, attention and care provided to older people.

In conclusion, we note that at present the task of improving and developing both the system of state organizations and institutions working with the elderly is urgent for society and the state. The state program for the protection of elderly people is not just words, but the policy of the New Uzbekistan, proceeding from humanity and justice. The social protection system is being improved and, most importantly, the protection of the elderly, the elderly and long-livers is developing.

METROLOGICAL PROVISION IN THE PRODUCTION AND ITS BRANCHES

Z. I. Abdumalikova*

*Fergana Polytechnic Institute,
Fergana, UZBEKISTAN

ABSTRACT

The article examines the definition and implementation of technical means, procedures and rules, norms, scientific and organizational bases necessary for ensuring the unity of measurements in production enterprises and achieving the required clarity, that is, significant aspects of Metrological supply.

KEYWORDS: *Metrology, Measuring Instrument, State Benchmark, State Metrological Control, Metrological Service, Metrological Supply, Production, Unit Of Measurement.*

INTRODUCTION

Measurement information is not only required by quantity, but also by quality. This includes descriptions of its (measurement) accuracy, reliability, recognition price and efficiency.

On the basis of all these qualitative characteristics lies Metrological supply.

Metrological provision can be described as follows:

Determination and implementation of technical means of coping, procedures and rules, norms, scientific and organizational bases necessary to ensure the unity of measurements and achieve the required uniformity.

Proceeding from this description, it can be said that the duty of the Metrological supply is imposed on the spouses:

- organization, provision and implementation of operational suitability of tools;
- development and implementation of normative documents on implementation of measurements, performance and recommendation of its results;
- conducting expert documentation;
- state tests of measuring instruments;

- metrological attestation and measurement of methods of measuring instruments;

There are 4 organizations of Metrological supply;

1. The scientific basis is the science of Metrological measurements.

2. The technical basis is the state benchmark of the unit of magnitude, the transfer of the unit of magnitude from the Eons to the working medium, the creation of measuring instruments and the development of the output from the burn to the road, the Metrological attestation of the mandatory state tests of measuring instruments and the methods of their performance, the utkasification of the

3. Organizational basis-UZR Metrological service consisting of state and regional Metrological service;

4. The normative legal basis is the normative acts of the relevant Republican laws, state standards, state and branches.

The main objectives of Metrological supply:

- improve product quality, production and product efficiency by automating it;
- ensuring mutual exchange of details and aggregates;
- ensuring the reliability of material accounting of wealth and energy resources;
- protection of the environment;
- see the error message at the bottom of this page for more information;
- The Metrological supply system interacts with the system of ensuring the unity of State measurements of the Republic of Uzbekistan, with the state system of standardization of the Republic of Uzbekistan, with the systems of standardization and certificate-bonding sphere.

The systems of ensuring the unity of measurements of other countries and their interaction with international bodies are regulated in accordance with the current legislation of the Republic of Uzbekistan, the normative documents of the Uzbek Agency of communications and information, the agency "Uzstandard".

Legal and physical persons of the Republic of Uzbekistan, which are guilty of violation of the rules of the metrology, as well as the norms and regulations of the metrology, the bodies of the head of State will be responsible for the documents of the current law.

Administrative-territorial standardization facilities may include norms and rules for managing the territory, ensuring the quality of products specific to the territory.

One of the main tasks of the concept of development and improvement of the national system of ensuring unity of measurements for the period of 2019-2023 is the development of the benchmark base of the Republic of Uzbekistan, the improvement of the Metrological supply of priority directions of development of economic sectors on account of modernization of laboratories of State Metrological In addition, the development of proposals in the field of formation of priority tasks, scientific and technical policy and coordination of works on metrology, consideration of legislative and practical issues of Metrological supply of Uzbekistan economy sectors and making decisions based on them are included in the infrastructure of the concept.

Through the organization of outsourcing services on the issues of Metrological provision of production in the state, consultations on assistance to representatives of small business and private entrepreneurship not provided for by the position of metrologies are provided, equipment and modernization of the technical Park.

The level of Metrological supply directly affects the quality of the product. A special importance is attached to the work of Metrological prophylactics and the issues of Metrological procurement in the preparation of production in the objective of further increasing the effectiveness of this effect. This created a worthy basis for the formation of deeper market relations in our country in due time and increasing the export opportunities of the products produced.

ABSTRACT

The Internet of Things (IoT), being a "network of networks", promises to allow billions of humans and machines to interact with each other. Owing to this rapid growth, the deployment of IoT-oriented networks based on mesh topologies is very attractive, thanks to their scalability and reliability (in the presence of failures). In this paper, we provide a comprehensive survey of the following relevant wireless technologies: IEEE 802.11, Bluetooth, IEEE 802.15.4-oriented, and Sub-GHz-based LoRa. Our goal is to highlight how various communication technologies may be suitable for mesh networking, either providing a native support or being adapted subsequently. Hence, we discuss how these wireless technologies, being either standard or proprietary, can adapt to IoT scenarios (e.g., smart cities and smart agriculture) in which the heterogeneity of the involved devices is a key feature. Finally, we provide reference use cases involving all the analyzed mesh-oriented technologies.

KEYWORDS: *Internet of Things, Mesh Networks, Routing Algorithms, Smart City.*

1. INTRODUCTION

In the current era, the fourth industrial revolution and new generation wireless communication technologies are enabling pervasive connectivity between objects. These communication systems, involved in the so called "network of networks" Internet of Things (IoT), will eventually allow humans to interact with billions of devices, including sensors, actuators, services, and other connected objects, in an Internet-like way, with a forecast of more than 40 billion connected (with short-range radio communication technologies) "things" (and more than 125 billion), and more than 2.7 billion Low Power Wide Area Network (LPWAN) connections[1]. In this context, connected things are generally defined as Smart Objects (SOs) and, thanks to the IoT, dynamically integrated in several scenarios, such as: smart industries applications, smart cities, smart agriculture, smart health, etc.

Each application area has specific requirements to be taken into account, thus having implications for the communication technologies to be considered and, possibly, adopted. In particular, IoT-related wireless technologies developed in recent years are extremely heterogeneous in terms of protocols, performance, reliability, latency, cost effectiveness, and coverage. For instance, some of them are designed for short-range radio communications (e.g., Bluetooth and ZigBee), others are more suitable to cover wide areas with very small bandwidth (e.g., Sub-GHz), while others are designed for middle-range communications and high transmission rate (e.g., IEEE 802.11)[2]. Moreover, IoT network topologies are generally star- or tree-based, with data collected by groups of sensors and sent to a central collector or border router, in order to guarantee centralized processing.

The emerging and constantly evolving IoT applications require more complex network topologies, without a predefined hierarchy but able to dynamically adapt themselves to changing conditions. For this reason, there is a strong academic and industrial interest on the development of hardware and protocols able to support Wireless Mesh Networks (WMNs). In mesh topologies, network nodes are directly and dynamically connected in a non-hierarchical way, thus allowing many-to-many communications (among nodes cooperating with each other) to efficiently route data from a generic source to a generic destination[3]. In fact, in a WMN each node composing the network can operate both as a host and as a router, relaying packets sent by other nodes when the destination is not in the visibility range of the source. Moreover, mesh networks do not require an infrastructure, since they dynamically self-organize and configure themselves, with consequent relevant advantages, in terms of:

- Deployment, installation and maintenance's overhead and cost reduction;
- Dynamic workload distribution;
- Better reaction to node failures; and
- Easy network topology modification.

The organization of a WMN is generally handled through the definition of a routing policy shared among all nodes, aiming at discovering and determining the best routes, on the base of different metrics (e.g., throughput, link quality, hops number, etc.) measured on data streams. Therefore, streams of data in WMNs cross all nodes connecting the source and the destination. Mesh topologies are thus the most attractive alternative to traditional centralized or tree-based network topologies, where nodes are directly linked to small subset of other nodes and the links between these infrastructure neighbors are hierarchically organized[4]. While star- and tree-oriented topologies are very well established, highly standardized and vendor-neutral, in the case of mesh networks the research community and vendors have not yet all agreed on common standards, with the interoperability among devices from different vendors seldom assured. Moreover, comprehensive surveys on available options in the field of mesh networks for IoT are lacking in the literature.

In this paper, we aim at highlighting how a mesh network can be built under heterogeneous communication technologies, thus providing a comprehensive survey of relevant wireless communication technologies which can be employed in different IoT scenarios, namely: IEEE 802.11-based, Bluetooth, IEEE 802.15.4-based, and LoRa. We analyze these protocols from the point of view of their support to mesh networking, either as native applications or by proper

adaptation. To provide a global vision of the state of the art on WMNs, our survey includes both standard and academic/industrial solutions.

1.1.Mesh in IEEE 802.11

In the last decade, a growing interest in mesh networking, from both academic and industrial entities, brought to the definition of an IEEE 802.11 standard amendment[5], specifically addressed to IEEE 802.11 mesh networks, denoted as IEEE 802.11s. The physical layers of IEEE 802.11s and IEEE 802.11 standards are the same: it introduces new routing procedures that are performed at the Medium Access Control (MAC) layer, rather than at the network layer. To have an efficient routing, the nodes must have an accurate knowledge of the wireless links connecting them to their 1-hop neighbors. This leads to a seamless routing for protocols of the higher layer. In an IEEE 802.11s mesh network, also named as Mesh Basic Service Set (MBSS), there are different logical components. The main ones are the mesh stations (mesh STAs) that can participate to the formation of the MBSS, in which each node has the same level of complexity and there is no hierarchical structure. The mesh STAs, moreover, participate to the path selection and forwarding, leading to a very simple self-organizing network.

In case of integration with other type of networks, such as the "traditional" IEEE 802.11 infrastructure BSS, or if the MBSS has to access external networks, other logical components are needed; the one that guarantees the access to the mesh network for "traditional" IEEE 802.11 stations is named as Mesh APs (MAPs). A MAP, however, does not enable the communication between a mesh STA and a non-mesh STA[6]. In fact, the logical component that enables the integration between meshes BSS and infrastructure BSS—thus enabling the communication between mesh STAs and non-mesh STAs—is the mesh gate. Furthermore, in order to enable also the communication between the mesh BSS and non-IEEE 802.11 Local Area Networks (LANs), such as wired LAN, other logical components are used, namely the Mesh Portal Points (MPPs), which enable the communication with some external entities.

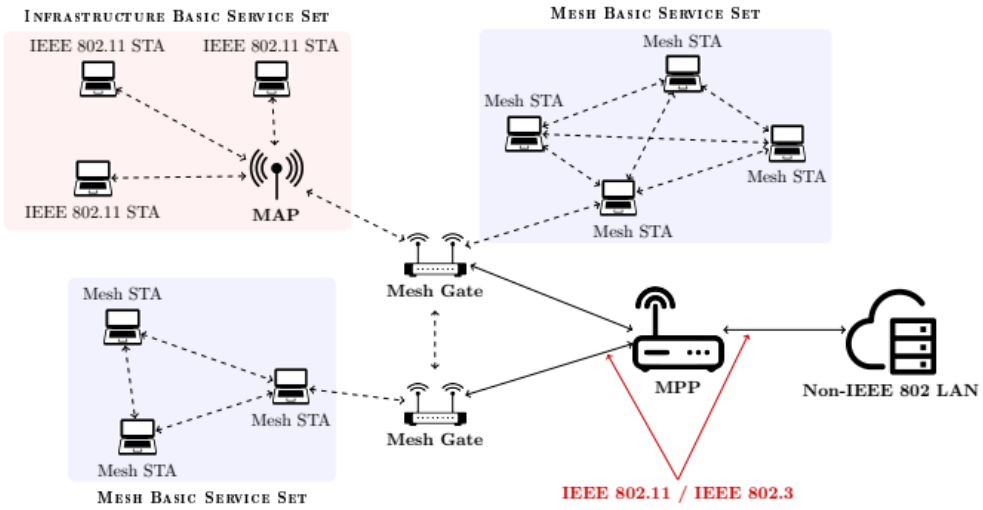

Figure 1. Architecture of MBSS containing mesh STAs, APs and portals as designed in IEEE 802.11s standard

1.2.Mesh in Bluetooth/BLE Networks

Among the different releases of the Bluetooth protocol, the Bluetooth Low Energy (BLE) corresponds to its low-power variant and is a promising technology which allows to build low-power and low-cost networks composed by a large amount of nodes. BLE is presently raising more and more attention and is becoming one of the leading technologies for both IoT-oriented and industrial scenarios. Moreover, the relevance of BLE technology is due to the fact that it can be found as a natively implemented feature in the majority of current devices (e.g., laptops, smartphones, mobile tablets, and other smart devices), thus enabling users to interact with environmental BLE objects without the use of additional gateways[6]. Despite that, most applications developed in last year's focus on different network topologies, either point-to-point or star-based, where the smart device (i.e., a smartphone or another BLE-enabled device) acts as the center of the network. Looking at the technological aspects, BLE may be described as a short-range technology: in order to cover large areas or to allow complex networking behaviors, a multi-hop network is required. Therefore, BLE has recently shown a great attention even for its use as a reference technology to build mesh networks, in order to enable many-to-many communications in network scenarios. Hence, this general interest has led to the definition of a plethora of proprietary BLE-oriented networking solutions that generally lack of interoperability due to missing common mesh standards[7]. A first change happened in 2017 thanks to the release of the official Bluetooth mesh networking standard specifications by the Bluetooth Special Interest Group (SIG). With respect to the original and classical version of the Bluetooth protocol, able to achieve high-speed transmission, the low-power BLE protocol aims at significantly reducing the power consumption of a BLE node itself. Moreover, it is notable that BLE-enabled devices (especially those oriented to IoT) are generally battery-powered (by coin-cell batteries) and should operate for a long time (e.g., several years) with a limited duty cycle without the need for replacing the internal battery.

Similarly, to the classic Bluetooth, BLE uses frequencies in the range of 2402–2480 MHz, thus working in the 2.4 GHz band; at the opposite, BLE is provided with 40 2 MHz-spaced channels. Looking at the operating plane, BLE provides two different communication ways among the devices participating to the communication:

- Advertising mode, in which a BLE node broadcasting packets allows its neighbors (within its transmission range) to receive the transmitted data; and
- Connection-oriented mode, where the packet transmission happens only between two BLE nodes which, through a handshake, establish a direct connection.

Focusing on these modes, in2013 the iBeacon protocol has been announced by Apple with the goal of building applications and services in a location-aware fashion[8].

Hence, in order to mark a BLE advertising packet as an iBeacon message, it has to contain the following information (useful for identifying the specific iBeacon device which sent the iBeacon message):

- A 16-byte Universally Unique IDentifier (UUID), and
- Two 2-byte fields identifying Major and Minor identifiers.

1.3.Mesh Networking with IEEE 802.15.4

One of the most promising emerging technologies for IoT applications is represented by LoRa (and its MAC layer denoted as LoRaWAN). This technology allows long-range communications,

reaching (in optimal propagation conditions) tens of kilometers of distance. The classical topology of a LoRaWAN network is a single-hop star of star topology, as shown in Figure 7a, in which gateways relay messages between end-devices and a Network Server. Gateways are connected to Internet in any available way (e.g., via Wi-Fi, cellular, or Ethernet connections)[9]. Despite the long-range capability between end nodes and gateways, there may be the necessity for multi-hop support, for example if one wants to reach very remote areas, avoiding the deployment of a larger number of gateways which are expensive to deploy and maintain. In this case, the topology of a LoRaWAN network changes in a mesh network, as shown in Figure 7b. Therefore, among the many research activities regarding LoRaWAN, one of the last aspects under investigation is the implementation of routing protocols to bring multi-hop capabilities to LoRaWAN networks. In general, the considered number of hops is limited, due to the intrinsic high coverage capability of LoRa. In [74], the authors propose and evaluate an alternative MAC layer for LoRa (called LoRaBlink) enabling multi-hop communication in a network of battery-powered and duty-cycled devices. In their work, the authors make the assumption that the network is characterized by a low node spatial density, low data traffic, a small number of nodes (i.e., no more than 6), and there is only one sink. The protocol integrates MAC and routing in a single simple protocol. Time synchronization among nodes is used to define slotted channel access. Nodes transmit concurrently within slots and properties of the LoRa PHY layer ensure that only one of the concurrent transmissions is received[10]. Messages are distributed from the sink to nodes using flooding. Messages from nodes to the sink use a direct flooding approach. They use beacons for synchronization and divide the time in epochs. Each epoch contains: NB beacon slots, used to send information about hop distance, and ND data slots, which carry the actual data. The performance of the proposed system has been evaluated in a small scale scenario (the maximum distance at 1 hop is 269 m, while at 2 hops it is about 300 m), and the Packet Delivery Ratio (PDR) is on the order of 80%.

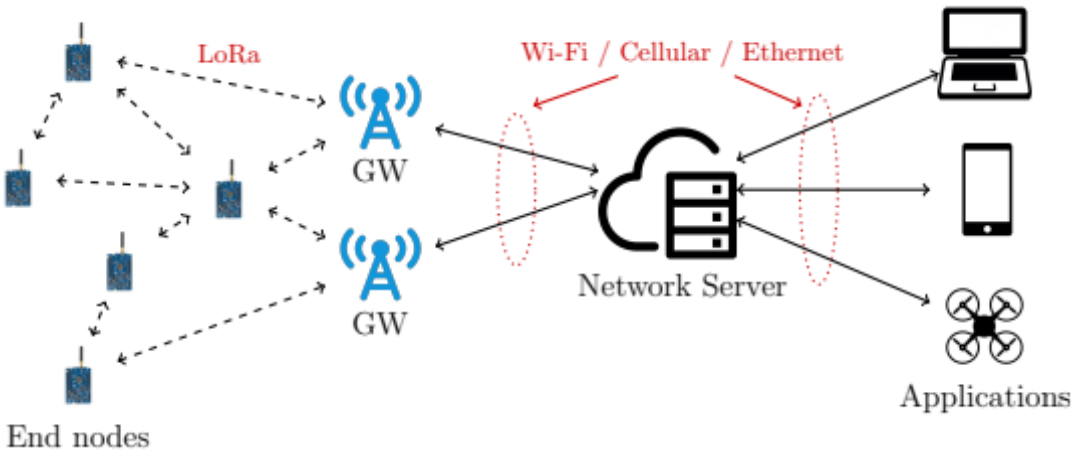

Figure 2: LoRaWAN network topology Mesh topology in LoRaWAN network.

2. DISCUSSION

For the transmission protocols analyzed in Sections 3–6, in the case of a target application where low-rate communications are acceptable, the most suitable mesh protocol that can be adopted is LoRa, due to its long-range capability, battery life and power consumption, even though it requires the presence of a backbone infrastructure, in terms of Network Servers and gateways.

As an alternative, both Thread and Zigbee can be seen as adequate mesh technologies, especially in terms of scalability and power consumption. With the same transmission range there exists also the possibility to adopt the LWMesh protocol, which seems to ensure better performance in terms of data rate, but, with the lack of being proprietary and, thus, available only employing specific hardware devices. Considering instead target applications where a short transmission range is required, another interesting and upcoming mesh technology is represented by BLE, which increases the data rate over that typical of LWMesh and provides good performance in terms of network topology, power consumption and network coverage (even if it requires a large number of connected nodes with respect to other technologies). Finally, the IEEE 802.11 mesh protocol guarantees an acceptable transmission range, with the highest data rate among all considered communication protocols, but with a power consumption higher than other transmission protocols—it is well-known that an IEEE 802.11-based chip require more energy rather than transmission chips based on alternative protocols.

Another remark is that complex systems often require the employment of different and heterogeneous technologies as the ones considered in this survey. Since each solution is characterized by different objectives and data handling policies, in order to integrate data flows across different technologies, it is expedient to define an abstraction middleware placed on top of all the considered stacks. In this way, there is no need to directly modify a predefined protocol stack, but it is sufficient to prepare a "connector" which allows to extract the data arriving through a specific mesh protocol and translate them for the destination mesh protocol. As a final remark, future research works should involve the performance analysis of several mesh networks, each of them composed by a different number of devices and denoted by different network depths. The performance is expected to degrade for increasing values of the network depth.

3. CONCLUSION

In this survey paper, we have analyzed several approaches that can be adopted in scenarios in which mesh networking is attractive/necessary (e.g., IoT-oriented scenarios). On top of this, we have discussed on how mesh networking can be carried out through different wireless technologies, ranging from IEEE 802.11 to Bluetooth (and its lightweight Bluetooth Low Energy (BLE) version), IEEE 802.15.4-oriented protocols (such as Thread, LWMesh, and ZigBee Pro and ZigBee 3.0), till Sub-GHz-based LoRa protocol. We have outlined how some protocols were born with a native support for mesh networking (i.e., being specifically tailored for mesh scenarios), while other communication protocols have been extended to support this type of networking. An interesting conclusion from our survey is that the considered technologies, being either standard as well as proprietary, well adapt to scenarios in which the heterogeneity of devices composing the mesh network is a must, such as IoT environments. In this case, a "network of networks" is the best definition that can be used and that better represents the variety of communications, ranging from short-range to long-range, that can be found in modern scenarios—such as in smart city and smart agriculture scenarios.

JAPANESE LANGUAGE REVIEW OF SYNTAX RELATIONSHIP: SCIENTIFIC ANALYSIS

Sitorabonu Farxodovna Malikova*

*Teacher,
Uzbekistan State World Languages University,
UZBEKISTAN

ABSTRACT

Although Japanese belongs to the Altaic language family, the issue of syntactic relations has always been in the focus of scholars, and this phenomenon has become more widespread since Japan emerged from the "closed" period. Different Japanese scholars have given different descriptions of syntactic relations, among them T.Hideo summed up all the events and noted that the connection of words in a sentence is equal and subordinate. A number of Russian scholars have contributed to the wider coverage of syntactic phenomena in Japanese in other countries. However, in the analysis of Russian scholars, a specific analysis of the grammatical structure of the language in the Romano-Germanic language family is observed.

KEYWORDS: *Syntax, Syntactic Relations; Equal and Subordinate Attitude; Agreement Indicators, Management, M.Kieda Analysis.*

INTRODUCTION

It is known that Japanese and Uzbek languages belong to the same family of languages, the Altaic language family. It has been observed by scholars that the grammatical structure of these two languages, which belong to the same language family, is also almost the same. Although the two languages being compared belong to the same language family, they cannot be said to be the same. After all, Uzbek belongs to the category of Turkic languages, while Japanese is a separate category, not another.

The issue of syntactic relations is one of the most comprehensively analyzed issues in linguistics. This issue is widely covered in both Japanese and Uzbek. In Japanese it is called a syntactic relationship 統語的関係(tougoteki kankei). Many Japanese linguists have conducted a number of studies on the interrelationships of words in speech and the syntactic nature of the means involved in them, and they have differed in their views.

Until the 1950s, the role of form was paramount in the interconnection of words, with content declining. However, in a sentence, both the form and the content must be in equal proportions. M. Shizuo referred to auxiliaries and auxiliary verbs as morphemes in the connection of words.

THE MAIN FINDINGS AND RESULTS

M. Kieda, a Japanese linguist, argues that in order to study the concept of speech, it is necessary to begin with the study of how words relate to each other. He makes a comparative analysis of the speech of linguists such as F. Otsuki, Hashimoto, Mitsuya, and draws general conclusions. In M. Kieda's speech, there are two conditions: in terms of form, which means the interconnection of words, and in terms of content, that is, it means the expression of a complete idea. Linguist divides words into equal (並立) and descriptive (managerial) and prepositional relations, depending on the relationship between them. According to him, if the word is a building material, then the word is a building. He also admits that the word is not used outside the sentence. Kieda's views have also been praised by Japanese scholars. Thus, it can be seen that during this period, Japanese linguistics paid special attention to the definition of speech.

T. Hideo was one of the first in his book Volume III on the syntax of the Japanese language to analyze the relationship between words in a sentence as equal (並立結合) and subordinate (主従結合) and which system of syntactic means of communication. In it, he reveals the peculiarities that exist in the interconnection of words in Japanese. For example, in expressing an equal relationship between words, not only the conjunctions, but also the word itself in the same category undergoes a form change, as well as a single equal conjunction, such as a noun, a verb, an adjective. Cannot link words belonging to a word group. In Japanese, he points out that there are different means (auxiliary words) that connect words in a sentence, such as nouns, adjectives, and verbs.

K. Chisato and a number of linguists grouped the indicators and auxiliaries into 助詞 group and cited their place in the sentence. In this case, the main indicators of the agreement are mixed with the auxiliaries, but their differences are revealed.

It is commendable that Sh.Moriyama conducted research on the practical application of the morphological tool−agreement (格助詞) in the educational process by revealing the semantic aspect of cognitive linguistics and analyzing it on three indicators of agreement.

It should also be noted that a number of scientific studies have been published on each of the means of expressing the syntactic relationship. For example, I. Shoji in his article explains the syntactic feature of the consonant index “に” in Japanese on the basis of Hobunka's views, and also explains the auxiliaries that come with “に”. Of particular interest was M. Shegel's introduction of the 句– ku year-old hierarchical system in English, and V. Ribin's research on the substitution of intonation in Japanese speech.

Although a number of studies have been conducted on the syntax of the Japanese language, the means of syntactic communication have not been presented in their entirety in the studied sources. As mentioned above, Japanese is one of the agglutinative languages, so it is rich in affixes.

Well-known Japanese scholar V.Alpatov in his book on the theoretical study of the Japanese language in the team used syntactic means in the interconnection of words in the Japanese language: ; b) There are types of verbs that are related to a group of words (auxiliary words,

auxiliary verbs). He also briefly explained their place in the speech. However, he did not include word order or tone in this group. In this scientific work, the analysis was made taking into account Alpatov's views.

B.Lavrentev is more focused on practical grammar. He was one of the first to try to name consonants in Japanese based on Russian grammar, as well as auxiliary words and their syntactic functions. Although he has studied syntactic tools in practice, his contribution to the naming of consonant types is cited as an important source in our research.

It should be noted that the types of agreements in Japanese are not named. Sources only provide agreement data. The function of the contraction indicators in a sentence is determined by the context.

V. Golovnin begins to put the means of syntactic relations in a system of separate affixes and names all of them in Russian in different terms with the terms available in linguistics, for example, describes the conjunctions as “gaonyms”. The system also divides the auxiliary words into subgroups, giving the semantics of the words represented by the auxiliary words. The services of V.Ribin, V.Kutafyeva and her students in this field are also very important.

Theoretical research of Japanese scholars allows for a comparative study of the means of word association in Japanese with Uzbek.Because their research is an important source of information for Japanese language professionals.

CONCLUSION

Regarding the syntactic relationship in Japanese, it can be concluded that affixes play an important role in the interconnection of words, as Japanese is a grammatically agglutinative language. The issue of syntactic relations is a well-studied phenomenon in Japanese linguistics, although the means of expressing syntactic relations are not fully described in various sources. In the early years, the syntactic relationship took precedence over form, while content took second place. A number of Japanese scholars have also made significant contributions to the study of syntactic phenomena.

ABSTRACT

This article describes the methods of providing information on music and singing to 9th and 10th grade students of secondary schools, as well as suggestions and recommendations for additional information on this topic. In addition to human labor, effective recreation also plays an important role. Of course, in the process of recreation, a person feels the need for music. For this reason, humankind has regularly created music and folk songs since ancient times. In general, the art of music and singing has become an integral part of human life. The Uzbek people also have a great tradition and experience in this area.

KEYWORDS: *Music, Troupe, Musical Instrument, Style, Song, Composer, Conservatory, Note, Lesson, Lesson, Exhibition, Tradition.*

INTRODUCTION

One of the important aspects of human history is the history of cultural life. This is because man, in the course of his conscious activity, rises in the midst of such processes as reading, learning, and gaining experience.

In addition to human labor, effective recreation also plays an important role. Of course, in the process of recreation, a person feels the need for music. For this reason, humankind has regularly created music and folk songs since ancient times. In general, the art of music and singing has become an integral part of human life. The Uzbek people also have a great tradition and experience in this area. Holidays, festivals, weddings, songs and music of the Uzbek people have not passed. Musicians, singers, bakhshi-poets, hafiz, who grew up among the people, have been in the service of the people on all festive days and have contributed to the cultural recreation of the people. Therefore, the effectiveness of history lessons in teaching the history of Uzbekistan in secondary schools can be achieved by linking the history of music with the history of cultural life during the lessons. It is possible to work in small groups, organize small quizzes, watch

documentaries on music and singing outside of class hours, prepare an album under the auspices of Uzbek musical figures. In addition, it is possible to determine the knowledge and skills of students by creating crossword puzzles on topics such as "Uzbek classical melodies", "Uzbek musical instruments", "Uzbek composers", "Uzbek folk songs", "Uzbek singers", "Uzbek musicians". It is also possible easily convey Uzbek musical genres to students through the method of fish skeleton. Through the pyramid method, it is possible to gradually study the periods of historical formation and rise of Uzbek musical culture. When explaining the topic "Uzbek theater and music in the late XIX and early XX centuries" to 9th grade students, it is advisable to explain the musical instruments in categories.

For example:

A) Stringed bowed instruments - gijjak, kobiz, uchtor

C) Stringed instruments - rubob, drum, dutar, tanbur, ud

C) Percussion stringed instrument - dust

D) Puffing instrument - nay, trumpet

E) Trumpet - blower

G) Percussion membrane instrument - circle, drum, chindovul [1].

It would also be useful to show that both soloists and ensemble performances developed in the musical culture of Turkestan at that time. At the same time, the teacher explains to the students that musical instruments are categorized based on the possibility of performing at public parties, chamber (room) and concert (round). It is useful to explain this classification in the table below.

1	Musical instruments designed to be a chorus at traditional festivals, public performances and weddings.	Speakers, drums, circles (loud resonant musical instruments)
2	Instruments for chamber (room) and concert (round) performances	Trumpet, dutar, gijjak, tanbur, chang, setor, nay, (some low-pitched musical instruments)

In explaining to students the development of music in the XIX and early XX centuries, it is useful to explain the existence of Fergana, Bukhara, and Khorezmmaqom and music schools. In addition, the Khorezm School of maqom and music developed during the reign of Khiva khan Muhammad Rahimkhan II (Feruz), in particular, by reading an excerpt from his decree in 1882 declaring Khorezmmaqoms as the inviolable property of the people [2].

The history of socio-economic and cultural processes that took place in Uzbekistan during the dictatorial Soviet system is studied in the 10th grade of secondary schools. There is no doubt that music and the art of singing played an important role in the cultural life of this period. The teacher should explain to the students that the development of the cultural life of the republic in the Soviet era had serious negative affect by communist ideology and dictatorial regimes, nevertheless due to the relentless pursuit of Uzbek intellectuals and cultural figures.

Especially, in the vocal and dance art of Uzbekistan in the 20-30s of the XX century Halima Nosirova, Karim Zokirov, MuhiddinQoriYakubov, BobarahimMirzaev, LutfikhanimSarimsakova, Tamarahonim, MukarramaTurgunbaeva. In addition to noting the high skill of many other art masters fragments of melodies and songs sung by these artists can be released, which are preserved in the golden fund of the art of singing. He also noted that the opening of the Tashkent State Conservatory in 1936, and the opening of the Opera and Ballet Theater in the capital in 1939 was an important event in the cultural life of the republic [3]. It is recommended to watch a documentary with students outside the classroom, which includes songs and melodies sung by artists who took part in the construction of the "Big Fergana Canal", which is a great courage of the Uzbek people. Students' knowledge of the subject can be assessed through methods such as test questions, crossword puzzles, questionnaires. It is possible to expand the knowledge and skills of students on this topic by providing some additional information about the state of Uzbek music and singing in the Soviet era, which is not described in school textbooks. For example, MuhiddinQoriYakubov founded the first Uzbek School of folk music, the first Uzbek musical theater was established in 1926, and the Institute of Music and Choreography was opened in Samarkand in 1928 to study Uzbek national art [4]. During the Second World War, when Uzbek artists were divided into 30 concert brigades, giving 35,000 concerts to soldiers at the front and 26,000 to hospitals, the teacher can refer to social networks and present to the students' attention, as evidence of his opinion, tablets dedicated to the rest of the soldiers during the war. [5]. H.Nosirova, G.Rahimova, K.Zokirov, M.QoriYakubov, M.Turgunbaeva and others were among the artists who worked in the concert brigades during the war. It is worthwhile to dwell on the activities of artists who played an important role in the development of traditional Uzbek singing and music in the postwar years. In particular, the contribution of M. Burkhanov, D. Zokirov, S. Yudakov, Yu. Rajabiy, K. Otaniyizov, and B. Zokirov's to Uzbek music and singing arts can be further enhanced through the broadcasting of audio recordings of their songs. Teacher should explain the students that YunusRajabi alone created more than 100 songs; KomiljonOtaniyozov as a famous singer, musician and composer created a unique school where he was the artistic director of the Khorezm Song and Dance Ensemble (now "Lazgi") under the Uzbekistan State Philharmonic School. BotirZokirov, on the other hand, founded modern Uzbek professional pop music. This should serve as a provident, that Uzbek music and singing had not stopped despite the hardships of the Soviet era [6].

Here we can focus on the work of the teacher BotirZokirov in popularizing Uzbek pop art in the world. For example, important facts, such as awarding the song "Uzbekistan is my Homeland" performed by BotirZakirov and his sister LuizaZakirova at the International Student Festival in Moscow in 1957. Performing the song "Arabic Tango" which was composed by famous Arab composer Farid al-Atrosh during the Week of Uzbek Literature and Art in Moscow in 1959 should be take into consideration. Then people all over the USSR sang this song. In 1960, BotirZakirov sang twice on the stage of the Olympic Theater in Paris. In order to substantiate the attitude of the communist ideology and Soviet power to the Uzbek musical art based on the great state chauvinism in 1951 on the instructions of the center with the participation of representatives of the republican art the issue of "The state of music in Uzbekistan and measures for its further development" was discussed. However, the decision on this issue, focused on the priority development of Russian and Soviet music in the country. As a result, traditional music and the art of singing had been severely damaged, but the content of music and songs created in the new spirit was disproportionate, which did not correspond to the national spirit, and such works could not meet the needs of the people. [8].

In explaining the processes associated with cultural life in the 60s and 80s of the twentieth century, one can also focus on areas related to the art of teaching and music and singing.

In particular, during this period in the republic were formed folk dance ensembles "Lazgi", "Shodlik", "Gozal", "Bahor", vocal and instrumental ensembles "Yalla", especially "Yalla" became one of the most popular ensembles in the USSR. The song "Three Wells" will make the lesson livelier, noting that "Song-81" has reached the finals of the All-Union Television Song Contest and the song has become a popular hit of its time [9].

In conclusion, the provision of information on music in the teaching of history of Uzbekistan to 9th and 10th grades of secondary schools will further increase the spiritual level of students. It also provides an opportunity to use new innovative and pedagogical technologies in the classroom by providing students with relevant information in the form of videos, multimedia and audio formats.

ABSTRACT

This article describes in detail the directions of employment, the factors of unemployment. The employment and unemployment rate in the Republic of Uzbekistan, the dynamics of their change and employment are analyzed by industry. Proposals have also been developed to ensure employment and reduce unemployment.

KEYWORDS: *Employment, Labor Resources, Unemployment, Jobs, Labor Migrant, Self-Employment.*

INTRODUCTION

Today, reforms and global projects are being implemented in any country to ensure employment. In particular, the International Labor Organization supports the technical, organizational and institutional capacity of countries around the world to ensure sustainable employment.

Among the countries withdrawing from the global pandemic, Uzbekistan is experiencing a decline in unemployment caused by the pandemic in 2020, and existing jobs are being restored. However, employment has not returned to pre-pandemic levels. The main reason for this is related to external migration.

According to the Ministry of Employment and Labor Relations, today the number of labor migrants working in other countries in our country is 2.6 million. This figure is 7.5% of the total population and 13.6% of the total labor force. Due to the closure of many jobs and difficult living conditions during the pandemic, most labor migrants returned to our country. This has led to rising unemployment and declining incomes.

Therefore, at the initiative of the head of our state, consistent measures are being taken to create new jobs by stimulating active entrepreneurship, improving the investment climate and business

environment. In particular, the Resolution of the President of the Republic of Uzbekistan dated July 14, 2018 No PP-3856 "On measures to improve and increase the efficiency of work to ensure employment" [1]. In addition, the country is taking effective measures to implement the approved annual programs to ensure employment, improve the mechanisms of employment in vacancies and quotas, the development of effective forms of self-employment.

However, the labor market in the regions is still highly tense, the creation of permanent jobs, employment of young people, women, members of low-income families, especially in rural areas, as well as the regulation of external labor migration remain unresolved. This shows how relevant the topic is and the need for research in this area.

Analysis of the literature

Employment has always been one of the most pressing issues. Especially in the context of the global pandemic, the issue of employment has once again shown to be a global problem and requires more scientific research in this regard. Including:

From foreign scholars, B.D. on solutions to existing problems in providing employment to the population. Breev [2], V.N. on informal employment and its impact on public finances. Salin and V.V. Narbuts [3], E.A. on Statistical Analysis of Employment and Unemployment. Dolgix [4], C. Krittanawong, A. Kumar, Z. Wang, U. Baber, and D.L. on the risk of cardiovascular disease as a result of self-employment and long labor. Bhatt [5], P.Ge, W.Sun and Z.Zhao [6] on the impact of demographic changes on employment [6] and J. Grashuis on the analysis of the duration and competitiveness of self-employment during the COVID-19 pandemic [7]. are conducting research.

Nasimov, D.A. from local scholars [8] to improve the methodological and methodological framework for the introduction of modern forms of employment in the digital economy, M.K. Abdullaev and D.B. Begalova [9] conducted an analysis of employment indicators in our country, S.A. Bozorova [10] described the state of the service sector in increasing the employment of the population, A.B. Irmatova [11] on the problems of women's intellectual labor, A. Tashpulatov [12] and Sh.R. Xolmuminov, B.X. Umurzakov, T.A. The Mahmudovs [13] have been studying the strategic socio-economic importance of reducing the employment of the rural population and their informal employment.

The results of these studies, in addition to their scientifically based proposals, practical recommendations and conclusions, provide a further scientific study of the organizational, economic and institutional aspects of solving the existing problems of employment and statistical analysis. as well as the development of innovative approaches.

Research methodology

In this study, expert evaluation, comparison, comparative analysis and systematic approach, statistical tables and graphs and diagrams, as well as official statistics of the International Labor Organization, the State Statistics Committee of the Republic of Uzbekistan, the Ministry of Employment and Labor Relations and local and foreign scientists. research work has been widely used.

Analysis and results

International labor migration is expanding due to the integration of economies and the development of interstate socio-economic, strategic ties, as well as countries with stable or low population growth due to low birth rates (European countries, Russia, South Korea, etc.).

This process benefits every state. That is, if labor migrants contribute to the growth and development of the countries they go to, remittances and the experience they gain will greatly benefit their countries.

However, the management of the migration process, the protection of labor migrants, the regulation of migration and development relations, and international cooperation are among the most complex issues.

In countries with high population growth rates and most developing and underdeveloped countries, there are sufficient employment problems. These include, for example, lack of jobs, low wages, lack of professional skills and knowledge of the workforce.

There are five main causes of unemployment in the economy:

- Other structural changes in the economy associated with the introduction of new technologies;

- Economic downturn leading to a decline in demand for labor resources;

- Public policy, increase in the minimum wage and therefore decrease in demand for labor;

- Seasonal fluctuations in some sectors of the economy;

- Demographic change, ie the growth of the working age population.

Today, practical measures are being taken in our country to ensure employment. These include increasing employment through the full support of entrepreneurship and small business, family entrepreneurship and self-employment, as well as the creation of new jobs through the creation of favorable conditions for their development.

As of January 2021, the population of our country is 34.6 million. 17.5 million of them. in cities and 17.1 mln. one lives in rural areas.

The population density is 77,000 people per square kilometer in the country. However, the distribution of the population varies sharply by region, in particular, in the Republic of Karakalpakstan there are 11.5 thousand people per 1 sq. Km, in Andijan - 741.4 thousand, in Bukhara - 48.4 thousand, in Jizzakh - 66.5 thousand, in Kashkadarya - 116.7 thousand. 9.1 thousand in Navoi, 385.4 thousand in Namangan, 235.4 thousand in Samarkand, 133.4 thousand in Surkhandarya, 201.2 thousand in Syrdarya, 196.3 thousand in Tashkent, 565.1 thousand in Fergana, 312.9 thousand in Khorezm and in Tashkent. and 7874.1 thousand people. This indicates the strength of internal labor migration across regions with different levels of socio-economic development.

According to the analysis, the number of labor resources in the country is 19.1 million. people, which is 55.9 percent of the permanent population. Of the total labor resources, 19.01 mln. 0.9 million people, or 99.5% of the working age population. or 0.5 percent of workers younger and older than working age (Table 1).

TABLE 1**DYNAMICS OF LABOR FORCE STRUCTURE IN THE REPUBLIC OF UZBEKISTAN(THOUSAND PEOPLE)**

Structure of labor resources	**2004**	**2008**	**2012**	**2016**	**2020**
Labor resources	14048,8	15685,7	17564,3	18488,9	19142,3
as a percentage of the permanent population	54,3	57,5	59,0	58,1	55,9
including:					
Able-bodied population of working age	13880,4	15474,6	17451,5	18371,7	19052,0
as a percentage of the permanent population	53,7	56,7	58,6	57,7	55,7
as a percentage of labor resources	98,8	98,7	99,4	99,4	99,5
Workers younger and older than working age	168,4	211,1	112,8	117,2	95,1
as a percentage of the permanent population	0,6	0,8	0,4	0,4	0,3
as a percentage of labor resources	1,2	1,3	0,6	0,6	0,5

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

77.3% or 14.8 mln. one of them is the economically active population. In addition, 13.2 mln. people or 69.2% of the labor force are employed in the economy.

According to the analysis, by 2020, the employed population will reach 3.6 million. or 26.9 percent in agriculture, forestry and fisheries, 1.8 million. or 13.5 percent in industry, 1.3 million. or 9.6 percent construction, 1.4 million. or 10.3 percent of sales, 0.6 million. or 4.7 percent of transportation and storage, 1.1 million. or 8.8 percent education, 0.7 million. health care and social services, or 4.9 percent. or 21.3 percent of other activities (Figure 1).

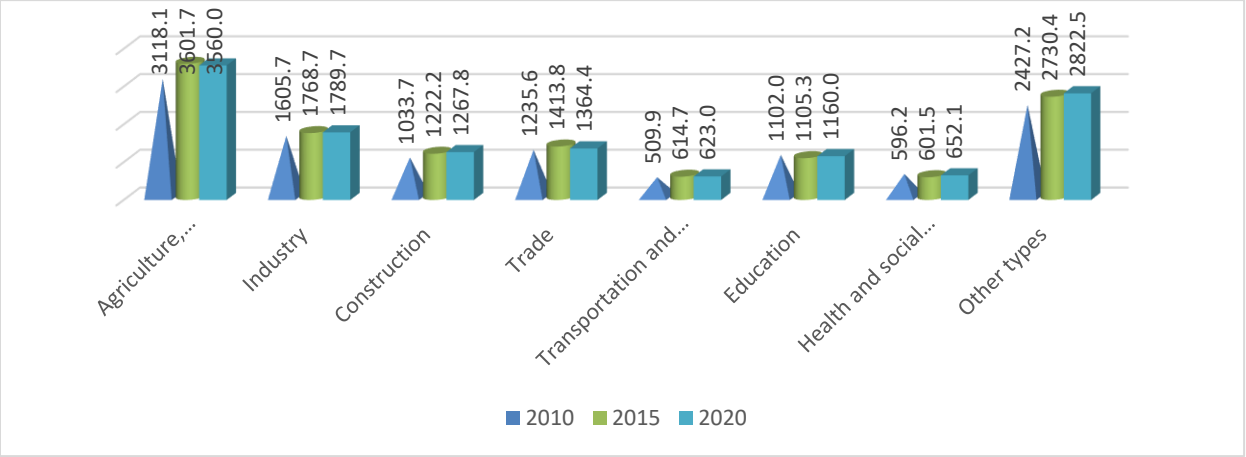

Figure 1. Structure of the employed population by type of economic activity (thousand people).

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

The analysis shows that in 2020, the employment rate increased by 113.9% compared to 2010 and 101.4% compared to 2015, while by type of economic activity, agriculture, forestry and fisheries increased by 114.2% and 98.8%, respectively, industry 111.5 and 101.2 percent,

construction 122.6 and 103.7 percent, trade 110.4 and 96.5 percent, transportation and storage 122.2 and 101.4 percent, education 105.3 and 104.9 percent, respectively. , health and social services by 109.4 and 108.4 percent, and other activities by 116.3 and 103.4 percent, respectively.

Also, according to the analysis of the types of ownership of the employed population, in 2020 the number of employed in the public sector will reach 2.5 million. and 10.7 million in the private sector. formed a person. In recent years, the number of people employed in the public sector is increasing. In particular, the growth rate of banking in the public sector in 2012 (compared to 2010) was 98.0%, in 2014 (compared to 2012) was 98.4%, in 2016 (compared to 2014) was 100.2%, in 2018 (compared to 2016) 104.1 percent, an increase of 102.9 percent in 2020 (compared to 2018).

As of January 2021, the number of registered unemployed in the country amounted to 37.1 thousand people. Compared to 2010, this figure increased by almost 2.3 times, its growth rate was 0.4% in 2000, 0.4% in 2004, 4.9% in 2008, 4.9% in 2012 and 5.2% in 2016. and 110.5 percent in 2020 (Figure 3).

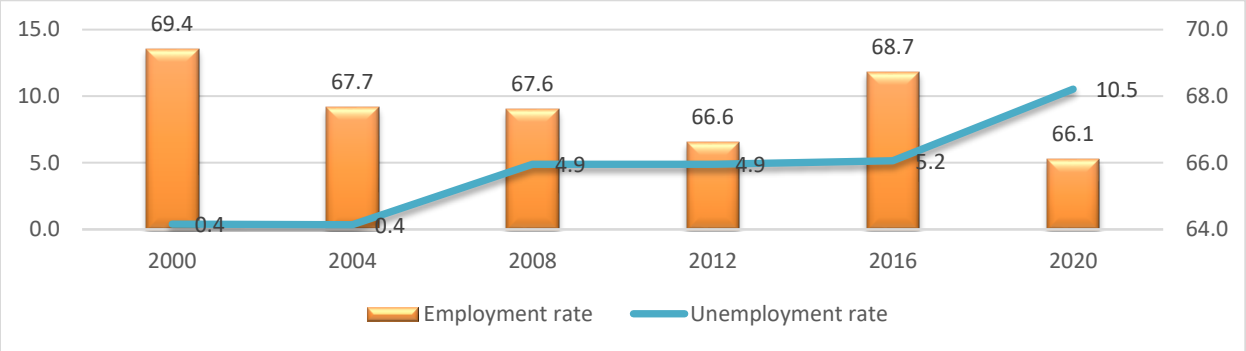

Figure 3. Rate of employment and unemployment (percentage).

Source: Data of the State Statistics Committee of the Republic of Uzbekistan.

The employment rate in the country compared to the working age population in 2000-2020 averaged 67.7%. In particular, it was 69.4 percent in 2000, 67.7 percent in 2004, 67.6 percent in 2008, 66.6 percent in 2012, 68.7 percent in 2016, and 66.1 percent in 2020.

Conclusions and suggestions

Based on the above, it is expedient to take into account the following in order to ensure employment and reduce unemployment in our country:

1. It is necessary to thoroughly analyze the problems of increasing employment from the bottom up and develop practical solutions and monitor their implementation.
2. In general, the shadow economy plays an important role in reducing unemployment. Therefore, the fight against the shadow economy should be organized not through bureaucratic means, but through the application of economic incentives.
3. In parallel with the demographic changes of the population, it is necessary to create new jobs and use the experience of developed countries in this regard.

4. In the process of digitization of the economy, the resulting unemployment rate will be higher than for emerging professions. Therefore, it is necessary to increase the number of low-skilled jobs in the public and private sectors, in particular, to further encourage self-employment.
5. Today, the database on vacancies is based on a number of online platforms among the non-governmental sectors. However, there is very little information on vacancies on public sector websites and most recruitment processes are closed and narrow. This has a negative impact not only on employment, but also on the productivity of these agencies. Therefore, it is necessary to create a single online platform with complete information on vacancies in the public and private sectors.
6. It is necessary to expand the activities of state and non-state agencies and strengthen control over those in need of social protection and those who have difficulty finding employment.

In conclusion, it should be noted that, first of all, it is necessary to provide the population with real and correct treatment. This will serve to increase the effectiveness of the results of analysis and research on population change and employment. It will also allow for the real development of promising strategies to ensure employment, reduce unemployment and improve living conditions. In general, the use of decent wage rates in the creation of new jobs not only has a positive impact on labor productivity, but also leads to an increase in socio-economic development.

ABSTRACT

Applications will have to address the integration of numerous diverse data sources in order to achieve the promise of Big Data. This activity poses a variety of problems due to data heterogeneity, which may not be fully addressed by existing Extract-Transform-Load (ETL)-based frameworks. The potential of Semantic Web Technologies as a way of integrating and developing Big Data applications is explored in this article. A use case study investigating supplier chain activities is given as an example. We also go through the general problems of data integration in this area. Big Data concept of variety is a broadening of semantic heterogeneity as researched in databases, artificial intelligence, the semantic web, and cognitive science. To reach the aim of extracting maximum value from Big Data collections, one must have the ability to swiftly define and execute strategies across extraordinarily massive data sets.

KEYWORDS: *Big Data, Extract-Transform-Load,Ontologies, Semantics Web,Web Technologies.*

52. INTRODUCTION

Researchers now spend more time extracting, reformatting, and integrating data for analytics than actually doing the analysis. Each analytics tool often requires data to be in a certain format, which necessitates a series of cleaning, normalization, reformatting, and integration steps. The processing of data at the terabyte and above levels aggravates this process even more[1].While there are a several definitions for Big Data, there isn't one that everyone agrees on. The volume dimension has been strongly emphasised, despite the fact that it has been defined by a number of

V's (volume, velocity, variety, and veracity)[2]. Variety has long been a popular feature in Big Data due of data heterogeneity. The task of extracting value from a Big Data collection is intriguing. In such instances, there are several options for using external data to enhance value creation. Due to a number of factors, such as data heterogeneity, schema and ontology isolation, context interdependence across knowledge collections, and knowledge provenance, the term variety takes on even more significance.

As a result of the popularity of Big Data, analytics researchers and corporate IT have gathered a number of new data sources. As a result, organizations are looking for answers to their Big Data problems outside of traditional databases. ETL has been provided in several situations to justify essential changes. The present toolkits, on the other hand, have not yet evolved to accommodate the complexity of Big Data. Consideration of Semantic Web technologies, in our opinion, can considerably help in this field.

The technologies required to facilitate Big Data integration are discussed in this article. We propose, in particular, that Industrial Ontologies be used to facilitate the linkages across diverse data sources. The knowledge processing with Big Data and Semantic Web technologies is depicted in Fig. 1. Inference methods over these ontologies are used to facilitate the identification of linkages in this application. The inference activity, we believe, may be seen as an iterative process that supports the creation and subsequent implementation of heuristics. As a result, a data strategy to enable continuous data integration may be linked to this. We discuss previous research in this area in the next section, and then we provide our case study in the third section. Our conclusion is presented in Section Four.

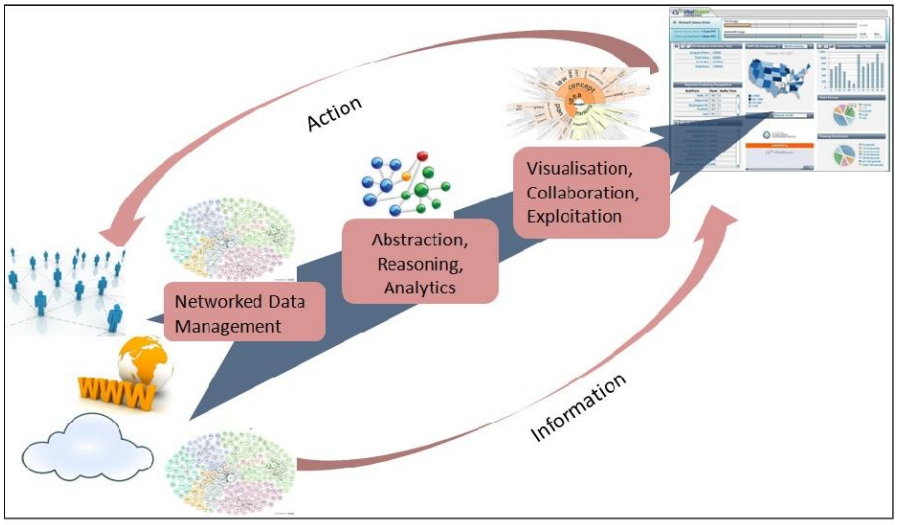

Fig. 1: Illustrates Knowledge Processing with Big Data and Semantic Web Technologies.[3]**.**

53. LITRATURE REVIEW

In the field of ontologies, a lot of study has been done. Noy and Hafner investigated a framework for comparing ontologies as part of their study[4]. They analyzed features across chosen ontologies, including design process, taxonomy, concept structure, axioms, inference methods, applications, and contributions, in order to identify the requirement for reusability. D'Aquin and Noy analyzed eleven ontology libraries' characteristics, content, volume, search methods, possible application exploitation, and technical infrastructures [5].

In the integration of Big Data, semantics has played a significant role. Knoblock and Szekely, for example, mapped a number of data sources (expressed in XML, KML, JSON structured text files, or databases) into a shared domain ontology that enabled data integration, reasoning, and processing[6]. Pasquier demonstrated that as Semantic Web Technologies evolve, they may be used to the construction of big applications by using a test case of biological data integration[7].

Brank et al. investigated state-of-the-art ontology assessment approaches, categorizing them into layers like lexical, syntactic, and structural[8]. The necessity for a common nomenclature in the ontology community was addressed by Flouris et al. They conducted research into ontology change and developed a standard nomenclature[9].

Ahmed et al. aim to concentrate on the consequences of combining Big Data with Semantic Web, how Semantic Web makes Big Data wiser, examine the Big Data and Semantic Web problems and possibilities, and the link between them, before concluding with the integration's future path [10]. Large and complicated quantities of data have been produced in recent years, making standard data processing systems challenging to handle. The introduction of the Internet resulted in a massive increase in the amount of information created and made available. The Semantic Web was disseminated by the World Wide Web Consortium W3C, an international standards authority for the web. It's a more advanced version of the existing web that makes it simpler to find, reuse, combine, and distribute information.

54. DISCUSSION

54.1. Use Case- Supply Chain Risk Detection:

Our use case scenario was created with the goal of utilizing a variety of data sources to aid in the discovery of scenarios that would minimize risk mitigation. The term "risk" may be defined in our case study as a product of impact and probability, where impact is the potential harm that an unpleasant event might do and probability is the likelihood of the event occurring. It is proportional to the number of mitigation plans that may be implemented in an indirect manner. Honda, for example, warned in 2011 that catastrophic floods in Thailand had resulted in a lack of parts, putting the company's operations in jeopardy. They had to halve their output for Canada and the United States, resulting in a massive drop in earnings. Volkswagen's East Coast shipments were also delayed in 2015 owing to a heavy blizzard and cold weather.

Weather isn't the only issue impacting production and shipping; Honda's output has also been hampered by labor problems at West Coast ports. Political events can also have an impact on production, as was the case in the early 2000s in the United States, when tariffs were imposed to safeguard workers in western Pennsylvania, a key swing area in the 2004 election [Wikipedia]. Prior to the tariffs taking effect, US automakers with institutional memory began stockpiling steel. Steel prices rose as a result of this action, providing those who stockpiled early an edge. In this situation, qualitative historical risk analysis proved to be a significant advantage.

Both qualitative and quantitative risk assessment approaches are available. Risk may be viewed as a function of both possible loss and the chance of a loss in a quantitative evaluation. A model of acceptable risk, defined as the amount of risk a company is prepared to take, is also required. This is typically a cost vs. risk connection that is based on the diversity provided by the company's complete portfolio of investments.

To conclude, risk in the automobile sector may arise from a variety of places:

i. Political:

Politics may have an influence on a country's business climate and prosperity. This risk might be "macro", affecting all businesses, or "micro", affecting only a few industries or firms.

ii. Financial:

Fiscal statistics and economic indicators that might point to a supplier's potential difficulties;

iii. Single Source:

For a certain material or component, sole source providers pose a significant risk. Due to a lack of alternatives, a disruption at a single source provider may disrupt the supply chain.

iv. Supplier Organization Risk:

Production might be impacted by problems with a certain supplier. Management changes, labor concerns, mergers, and other challenges may be among them.

v. Nature:

Natural disasters including hurricanes, tsunamis, earthquakes, and other meteorological phenomena may create havoc. Suppliers who are located in locations that are vulnerable to specific risks must be identified.

The importance of various sorts of risks is determined by their impact on the business. Severe weather hazards are the most hardest to plan for since they can strike without warning and cause significant business interruption. Other hazards may arise over time; nevertheless, all of these risks can have a significant impact on the firm and must be anticipated.

In our use case, we explore several ontologies and build namespaces to improve supply chain risk management in an automotive context, as shown in Table 1.

TABLE 1: ILLUSTRATES VARIOUS ONTOLOGIES AND NAMESPACE[11]**.**

1	Automotive	http://purl.org/vvo/ns#
2	Weather	http://www.scs.ryerson.ca/~bgajdero/msc_thesis/code/ontologies/weather-ont-t2.owl
3	Geo Positioning	http://www.w3.org/2003/01/geo/wgs84_po#
4	Postal Code	http://schema.org/PostalAddress#
5	Good Relations Vocabulary	http://purl.org/goodrelations/v1#

We provided more location data for the dealers, including street address, zip code, latitude and longitude, to enable the federation of weather information. Latitude and longitude data may be supplied to dealers using the Geo Positioning Ontology described above. Figure 1 displays an Allegro Graph [20] query for displaying a dealer's geo-spatial position. Dealer names (commercial and legal) are presented, as well as geo-spatial data such as zip code, street location, latitude and longitude.

Using the Weather ontology supplied above, we also incorporated weather information for dealers. The ontologies of Weather and Vehicle Sales correspond to geospatial data such as

latitude and longitude. Wind speed, wind direction, visibility, temperature, pressure, humidity, latitude, and longitude are all part of the weather ontology.

The two ontologies, Vehicle Sales and Weather, were then federated in Allegro Graph. We were able to obtain dealers with specified weather conditions using a SPARQL query against our federated ontology, where the geo-spatial information of dealers is supplied. The federation of automotive ontologies and climate ontologies could be a technique for effectively predicting any dangerous weather events such as natural disasters which might impede or delay the production process or sales in the automotive domain, depending on the location of the dealers or manufacturing plants/facilities. For example, forecasting meteorological conditions such as a snowstorm, which may be devastating for car and component manufacturers' sales. Here, such businesses may plan ahead of time how they will compensate for a loss of revenue and/or output before it happens. In Fig. 2 example sparql query over federated ontology.

Through the process of ontology federation, our use case may be broadened to deal with different sorts of hazards. Data quality concerns, on the other hand, must be explored and rectified. Many industrial data sources have inaccuracies and omissions. To assist detect and clean up erroneous data, a variety of approaches can be used.

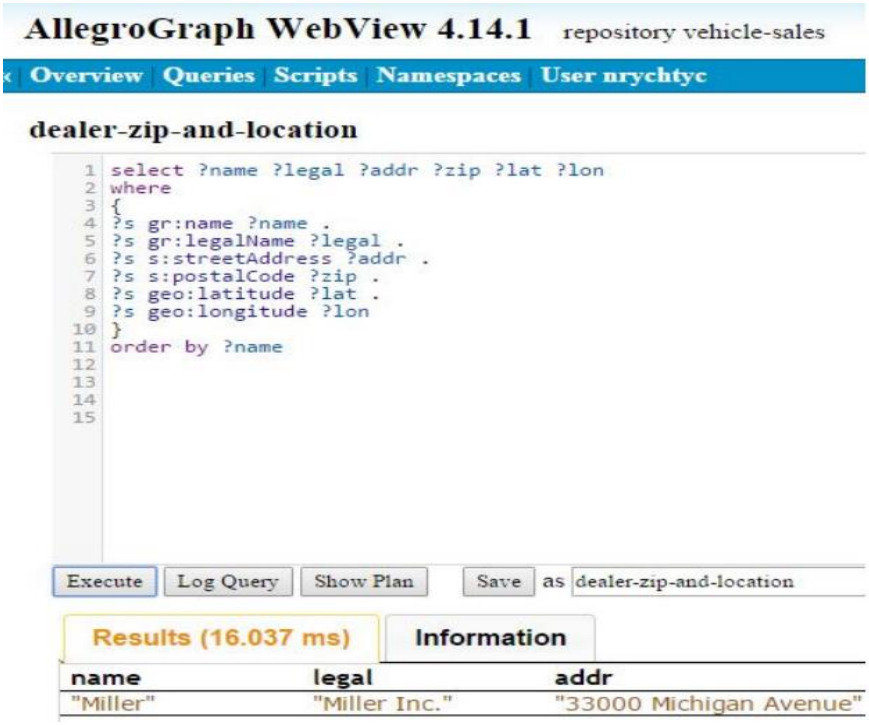

Fig. 2: Example SPARQL query over federated ontology[11]**.**

Although technologies for "Data Cleaning" are available, proper use of these techniques still need domain expertise of the data. It is critical to comprehend the data models and context. Finding the right link between components and materials necessitates exact data matching and the usage of the proper representation to guarantee that the analysis is accurate. Having a model for a federated ontology may help manufacturers overcome various problems, as demonstrated in our use case. Optimized risk management utilizing a federated ontology model for detecting blindside hazards that might cause large disruptions in manufacturing processes can be used to practice more intelligent manufacturing.

54.2. Challenges:

There are a number of obstacles in our endeavor to promote Big Data integration, as we mentioned in our case study and in our assessment of previous studies. These issues, as we've seen in our sector, are present in a variety of Big Data contexts.

54.2.1. Scalability of Semantic Web Tools:

Most existing Semantic Web technologies that have been used in relational database applications struggle to accommodate Big Data (terabytes and beyond). They need to be better integrated with Hadoop's fundamental technologies.

54.2.2. Incomplete Data:

Existing data sources are usually limited, ambiguous, and incomplete, making logical conclusions difficult to reach.

54.2.3. New Applications:

There are now more application cases in the support of mobility and driver awareness. In terms of autonomous cars, driver behaviors, routing, scheduling, and urban planning, they exist in our domain. The integration process becomes much more complicated as a result of this.

54.2.4. Lack of Industrial Ontologies:

While some ontology is available, much more work is needed to support detailed semantic annotation of data sets.

54.2.5. Parallelization of Big Data tools:

Few software programs, while being promoted as "Big Data" tools, provide true support for parallel architectures, forcing developers to typically deliver analysis only at filtered or summarized data levels rather than fully leveraging the promise of Big Data.

54.2.6. Support for Real-Time Streaming:

As Big Data systems begin to support real-time processing, support for high-speed data streams must be considered.

54.2.7. Incompatible Data:

Vehicle data may be linked to specific vehicle programs and may differ according to various standards. Frequently, characteristics may not be shared across all vehicle kinds, resulting in data that is incompatible.

55. CONCLUSION

We investigated the quality of our data sources in the context of a Big Data environment in this paper. We discovered a data strategy and framework that enables the semi-automated mapping of various data sources using shared domain ontology. Several advantages of the methodology for adding additional data sources were detailed during this process. The utility of Supply Chain risk detection has been demonstrated through a test scenario and case study.

For this example, the ontology federation process was done manually, but our goal is to automate it. While it may not be possible to entirely automate the process, employing semantics and annotation to aid ontology federation can be beneficial. Geospatial data, such as latitude and longitude, for example, can be easily identified, but other types of data cannot. Because zip

codes are used in the United States but not in other countries, the system must be aware of this information. Ontologies will have good descriptions that can be read and understood in some cases, but information will have to be found in other ways in others. This is a crucial step in the ontology federation process, and using the federated ontologies will necessitate semantic knowledge.

In our application space, we've also identified a number of challenges. They must be addressed in order for Big Data applications to reach their full potential, as previously stated. There will be noticeable advances in application development for Big Data as a result of this, as well as a more developed Semantic Web technology stack.

PSYCHOLOGICAL ASPECTS DETERMINING THE PROFESSIONAL COMPETENCE OF FUTURE MILITARY PILOTS

Kuldashev R.Sh*

*Senior Teacher,
Higher Military Aviation School the Republic of UZBEKISTAN

ABSTRACT

The article provides a more detailed analysis of the socio-psychological features of the formation of professional competence in future military pilots. The criterion of factor analysis was also used in the joint surveys. Also, socio-psychological features of the formation of professional competence in future military pilots were used in cluster analysis, along with the results of the research, as well as the ratios of officers to the questionnaires. In order to express the degree of closeness of the scales in the survey, the following indicators were used in the cluster analysis: aspiration and self-confidence for dominance in the first cluster, confidence-doubt and emotional stability in the second cluster, social type and entrepreneurial type in the third cluster, fourth factors such as responsibility and courage in the cluster, courage and high self-esteem in the fifth cluster, and striving for dominance and professional tolerance in the sixth cluster.

KEYWORDS: *Socio-Psychological Features, Military Pilots, Cluster Analysis, Questionnaires, Indicators, Professional Tolerance, Emotional Stability, Courage, Dominance.*

I. INTRODUCTION

The questionnaire "Study of the person by means of 16 factors" developed by R.B. Kettell, Holland's questionniare "Professional level", Chumakova's "Professional will" methods such as “Study of qualities” and “Study of professional institutions” developed by IM Kondakov were used in order to identifying professional competence and the cause of psychological features of future military pilots who study in military institution with the help of factor analysis. Factor analysis is considered such a statistical indicator that the methodologies or questionnaires used in the study are one of the criteria for determining whether the scales are important and attaining a high result in achieving the goal of the study. The following table shows the factor analysis of the results of surveys of fourth-year cadets of the Higher Military Aviation School of the

Republic of Uzbekistan on the study of personality using 16 factors and the study of professional qualities.

II. MAIN PART

TABLE 1KETTELL AND FACTOR ANALYSIS INDICATORS OF THE LEVEL OF PROFESSIONAL QUALIFICATIONS SURVEYS

Scales	Factors

tension-relaxation	0,506	0,340	0,486	0,521	0,486	-0,300
responsibility	0,527	0,575	0,161	0,022	-0,267	0,042
courage	-0,443	-0,324	0,679	0,120	0,541	0,093
tenacity	0,260	0,178	0,117	-0,202	0,786	0,253
perseverance	0,713	0,553	0,254	0,582	0,001	0,472

The results of the study on the socio-psychological features of the formation of professional competence in future military pilots showed that the results of surveys of cadets of the Higher Military Aviation School of the Republic of Uzbekistan using 16 factors and professional qualities determine their socio-psychological characteristics in the process. The results of the cadets' results on factor analysis were combined into 6 factors. The psychological factors that make up the first scale are: emotionally stable-unstable 0.439, social maturity-consciousness 0.812, courage-shyness 0.454, confidence-doubt 0.552, self-confidence 0.431, tension-relaxation 0.506, responsibility 0.527, courage 0.443 and determination which mutually differentiated with them. Psychological factors that make up the second scale: propensity to communicate 0.431, emotionally stable-unstable 0.659, courage-shyness 0.625, confidence-doubt 0.542, independence-dependence 0.505, self-control 0.495, responsibility 0.575 and persistence 0.553 are characterized by results. The psychological factors that made up the third scale were emotionally stable-unstable at 0.555, courage at 0.508, independence at 0.569, self-control at 0.533, tension at 0.486, and courage at 0.679. The psychological units that made up the fourth scale were distinguished by psychological characteristics such as propensity to communicate 0.603, dominance aspiration-dependence 0.676, confidence-doubt 0.557, self-doubt 0.554, tension-relaxation 0.521 and persistence 0.582. The psychological units that made up the fifth

factor were differentiated by characteristics such as propensity to communicate 0.664, social maturity-consciousness 0.581, lack of self-confidence 0.525, self-control 0.550, tension-relaxation 0.486, courage 0.541 and resilience 0.786. the units that made up the final scale were: psychological characteristics such as propensity to communicate 0.549, courage-shyness 0.506, independence-dependence 0.524, self-control 0.615 and persistence 0.472. The cumulative values of the cadets are grouped into six factors, and these factors constitute the key features that determine the key values and significant differences in the survey. The following table shows the factors of factor analysis obtained by fifth-year cadets on surveys of occupational types and occupations.

TABLE 2 FACTOR ANALYSIS INDICATORS OF OCCUPATIONAL TYPES AND LEVEL OF INQUIRIES OF PROFESSIONAL INSTALLATIONS

Scales	Factors			
	1	2	3	4
Realistic type	-0,686	0,001	-0,310	0,535
Mental type	0,434	0,685	0,520	0,182
social type	0,656	0,553	0,108	0,585
conventional-conditional type	-0,732	0,491	0,464	0,222
entrepreneur type	0,450	0,642	-0,114	0,511
artistic type	0,535	-0,114	0,631	-0,049
irrational career choice	-0,060	-0,402	0,485	0,697
rational professional choice	0,452	0,190	-0,455	-0,445
professional activity	0,699	-0,310	-0,077	0,073
high self-esteem	-0,296	-0,482	0,632	-0,249
professional endurance	0,294	-0,585	-0,482	0,319

In order to clarify our research on the socio-psychological features of the formation of professional competence in future military pilots, we can see that the units that make up the factor analysis of surveys among cadets of the Higher Military Aviation School of the Republic of Uzbekistan to determine the degree of impact of military training on cadets. The results of the subjects showed that the indicators of factor analysis were combined into 4 factors. The psychological factors made up the first scale differed with results such as realistic type 0.686, mental type 0.434, social type 0.656, conventional-conditional type 0.732, entrepreneurial type 0.450, artistic type 0.535, rational professional choice 0.452 and professional activity 0.699. The psychological factors that make up the second scale are characterized by results such as mental type 0.685, social type 0.553, conventional-conditional type 0.491, entrepreneurial type 0.642, high self-esteem 0.482, and professional tolerance 0.585. The psychological factors that make up the third scale are: mental type 0.520, conventional-conditional type 0.464, artistic type 0.631, irrational career choice 0.485, rational career choice 0.455, high self-esteem 0.632 and professional endurance 0.482 degrees. It should be noted that the psychological units that make up the fourth scale are distinguished by psychological characteristics such as realistic type 0.535, social type 0.585, entrepreneurial type 0.511, irrational professional choice 0.697 and rational

professional choice 0.445. We can see that the results of the study of cadets of the Higher Military Aviation School of the Republic of Uzbekistan are combined into four factors, and these factors are the main indicators that determine the main results and indicators in the survey. The following table shows the indicators of factor analysis obtained by the cadets of the Higher Military Aviation School of the Republic of Uzbekistan on the study of 16 personality factors and surveys of professional qualities.

III. METHODS AND RESULTS

TABLE 3 KETTELL AND FACTOR ANALYSIS INDICATORS OF THE LEVEL OF PROFESSIONAL QUALIFICATIONS SURVEYS

Scales	Factors					
	1	2	3	4	5	6
propensity to communicate	-0,641	0,293	-0,272	0,036	0,546	-0,166
emotionally stable-unstable	-0,251	-0,537	0,517	0,465	-0,295	0,442
striving for dominance - dependence	0,683	0,543	0,487	0,295	0,110	-0,089
social maturity-consciousness	0,230	0,725	0,293	-0,559	-0,112	-0,098
boldness - shyness	0,826	0,285	0,045	0,089	0,118	-0,472
reliability-doubt	0,610	-0,095	-0,527	0,565	0,013	-0,127
self-confidence - disbelief	-0,660	-0,022	0,497	0,165	0,046	-0,235
independence-dependence	0,144	0,584	0,342	0,214	0,498	0,460
self-control	-0,518	0,089	-0,234	-0,089	0,758	0,073
tension-relaxation	-0,238	0,650	0,549	-0,310	-0,072	-0,048
responsibility	0,465	-0,527	0,068	-0,527	0,077	-0,077
courage	0,215	-0,462	0,651	-0,393	0,509	-0,143
tenacity	0,545	0,120	-0,200	-0,318	0,060	0,629
perseverance	0,031	-0,599	0,504	0,510	0,505	0,055

Socio-psychological features of the formation of professional competence show that the results of surveys of cadets of the Higher Military Aviation School of the Republic of Uzbekistan using 16 factors and the study of psychological factors such as professional qualities and the identification of important factors are key priorities. The results of the fifth stage cadets on factor analysis were 6 factors. The psychological factors that made up the first scale were different: 0.641 for communication, 0.683 for dominance, 0.826 for courage, 0.610 for confidence, 0.660 for lack of self-confidence, 0.518 for self-control, 0.465 for responsibility and 0.545 for perseverance. The psychological factors that make up the second scale are characterized by the desire for dominance - 0.543, emotionally stable - 0.537, social maturity - 0.725, independence - 0.584, tension - 0.650, responsibility - 0.527, courage - 0.462 and perseverance - 0.599. The psychological factors that made up the third scale were emotionally stable-unstable at 0.517, striving for dominance at 0.487, confidence at 0.527, self-doubt at 0.497, tension-relaxation at

0.549, tenacity at 0.504, and courage at 0.651. The psychological units that made up the fourth scale were distinguished by psychological characteristics such as emotionally stable-unstable 0.465, social maturity-consciousness 0.559, confidence-doubt 0.565, responsibility 0.527, and persistence 0.510. The psychological units that make up the fifth factor differed in characteristics such as: propensity to communicate 0.546, independence-dependence 0.498, self-control 0.758, courage 0.509, and perseverance 0.505. The units that made up the last scale were psychological characteristics such as emotionally stable-unstable 0.442, courage-shyness 0.472, independence-dependence 0.460 and resilience 0.629. The results of the survey of cadets of the Higher Military Aviation School of the Republic of Uzbekistan were divided into six factors, and these factors formed the main features that reflect the main features and specifics of the survey. The following table shows the indicators of factor analysis obtained on the survey of professional types and professional installations of cadets studying at the Higher Military Aviation School of the Republic of Uzbekistan.

TABLE 4 FACTOR ANALYSIS INDICATORS OF OCCUPATIONAL TYPES AND LEVEL OF INQUIRIES OF PROFESSIONAL INSTALLATIONS

Scales	Factors			
	1	2	3	4
Realistic type	0,801	0,110	0,577	-0,553
Mental type	0,525	0,515	0,678	-0,104
social type	-0,459	0,512	-0,531	0,499
conventional-conditional type	0,603	0,478	0,127	0,234
entrepreneur type	-0,480	0,113	0,420	-0,187
artistic type	0,024	-0,744	0,303	-0,275
irrational career choice	0,737	-0,365	-0,280	0,595
rational professional choice	0,195	0,581	-0,459	-0,475
professional activity	0,276	0,498	0,515	0,392
high self-esteem	-0,633	0,005	0,486	0,450
professional endurance	0,490	-0,441	-0,117	0,623

The results of the study on the methods of studying the socio-psychological features of the formation of professional competence in future military pilots distinguishing factors cover key priorities. The results of the test results on the factor analysis were 4 factors. The psychological factors that made up the first scale differed with results such as realistic type 0.801, mental type 0.525, social type 0.459, conventional-conditional type 0.603, entrepreneurial type 0.480, high self-esteem 0.633, irrational career choice 0.737 and professional tolerance 0.490. The psychological factors that make up the second scale are characterized by results such as mental type 0.515, social type 0.512, conventional-conditional type 0.478, artistic type 0.744, rational professional choice 0.581, professional activity 0.498, and professional tolerance 0.441. The psychological factors that make up the third scale are: realistic type 0.577, mental type 0.678, social type 0.531, rational professional choice 0.459, high self-esteem 0.486, and professional activity 0.515 degrees. It should be noted that the psychological units that make up the fourth scale are characterized by psychological characteristics such as realistic type 0.553, social type 0.499, irrational career choice 0.595, high self-esteem 0.450, professional tolerance 0.623 and

rational career choice 0.475. The results of the survey of cadets of the Higher Military Aviation School of the Republic of Uzbekistan were divided into four factors, and these factors formed the main features that reflect the main features and specifics of the survey. The following table presents the factors of factor analysis obtained from the study of personality using 16 factors and professional qualification surveys of pilot officers engaged in professional activities during military service.

TABLE 5 KETTELL AND FACTOR ANALYSIS INDICATORS OF THE LEVEL OF PROFESSIONAL QUALIFICATIONS SURVEYS

Scales	Factors

The results of the study show that we will clarify our research on the socio-psychological features of the formation of professional competence. The results of surveys of psychological characteristics of officers serving in the military using 16 factors and the study of psychological characteristics, such as professional qualities, and how to distinguish between them psychological characteristics and the factors that are important to them, cover key priorities. The performance of the officers on the factor analysis was 6 factors. The psychological factors that made up the first scale were different: 0.643 for emotional stability, 0.550 for dominance, 0.684 for courage, 0.615 for confidence, 0.515 for independence, 0.518 for self-control, 0.758 for perseverance, and 0.533 for resilience. The psychological factors that make up the second scale are characterized by a tendency to communicate: 0.644, the desire for dominance - 0.507, social maturity - 0.434, independence - 0.526, self-control - 0.550, responsibility - 0.539 and courage - 0.548. Psychological factors that formed the third scale were recorded as 0.481 for emotional stability, 0.707 for social maturity, 0.431 for courage, 0.535 for self-control, 0.483 for responsibility, and 0.459 for resilience. The psychological units that made up the fourth scale were characterized by psychological characteristics such as propensity to communicate 0.464,

lack of self-confidence 0.498, independence-dependence 0.553, tension-relaxation 0.684, responsibility 0.559, and courage 0.485. The psychological units that make up the fifth factor are distinguished by features such as courage-shyness 0.482, independence-dependence 0.547, tension-relaxation 0.528 and resilience 0.506. The units that formed the final scale were emotionally stable-unstable 0.504, self-doubt 0.712, independence-dependence 0.518, courage 0.543, and resilience 0.523. The results of the study obtained from cadets serving in the military are divided into six factors, and these factors are the psychological features that constitute the main psychological characteristics. The table below presents the interrelationships of surveys between officers 'occupational types and occupations.

TABLE 6FACTOR ANALYSIS INDICATORS OF OCCUPATIONAL TYPES AND LEVEL OF INQUIRIES OF PROFESSIONAL INSTALLATIONS

Scales	Factors			
	1	2	3	4
Realistic type	0,547	-0,128	0,634	0,534
Mental type	-0,559	-0,531	-0,471	0,035
social type	0,676	0,508	-0,567	0,040
conventional-conditional type	0,707	-0,053	-0,173	-0,129
entrepreneur type	-0,074	0,525	0,310	0,546
artistic type	-0,445	0,601	0,474	-0,532
irrational career choice	-0,717	0,018	0,151	0,512
rational professional choice	-0,558	-0,473	0,505	-0,231
professional activity	0,312	0,673	0,270	-0,302
high self-esteem	0,307	-0,531	0,505	0,272
professional endurance	-0,490	0,439	-0,244	0,517

The results of a study on the socio-psychological features of the formation of professional competence in pilots serving in the Defense System of the Republic of Uzbekistan show that factor analysis is characterized by the separation of psychological characteristics into significant and insignificant factors. The psychological factors that made up the first scale differed with results such as realistic type 0.547, mental type 0.559, social type 0.676, conventional-conditional type 0.707, artistic type 0.445, irrational career choice 0.717, rational career choice 0.558 and professional tolerance 0.490. The psychological factors that make up the second scale are characterized by results such as mental type 0.531, social type 0.508, entrepreneurial type 0.525, artistic type 0.601, rational professional choice 0.473, professional activity 0.673, high self-esteem 0.531 and professional tolerance 0.439. The psychological factors that make up the third scale are characterized by: realistic type 0.634, mental type 0.471, social type 0.567, artistic type 0.474, rational professional choice 0.505 and high self-esteem 0.505 degrees. It should be noted that the psychological units that make up the fourth scale are distinguished by psychological characteristics such as realistic type 0.534, entrepreneurial type 0.546, artistic type 0.532, irrational professional choice 0.512 and professional tolerance 0.517. The results of the study, obtained from officers serving in the military, were divided into four factors, and these factors formed the main features that reflected the key features and individual aspects of the survey. The following table shows the total cluster analysis indicators obtained from the surveys of cadets and officers.

Figure 1. Dendogram indicators of professional competency surveys

IV. CONCLUSION

The results of the above research show that the feedback of cadets and officers on the questionnaires provided is a significant reflection of the scales on the criteria of factor analysis, which is important in their professional activities.

To ensure that pilots possess the necessary skills for effective teamwork during line operation, airlines have introduced various diagnostic methods into their selection procedures that are designed to assess the social competence of pilot applicants prior to employment. Results show moderate to high correlations between 2 social competence questionnaires and certain personality dimensions, although only 1 social competence questionnaire (the Social Skills Inventory [SSI]) confirms systematic common variance with the behavior-oriented assessments of related concepts in the AC. In addition to traditional selection procedures, the SSI could neither improve the prediction of applicants' overall performance in pilot selection nor did it show substantial intercorrelations with an external criterion in the pilot training. Therefore, social competence and personality questionnaires could serve as an additional component in the preselection, but might not replace the AC, which provides information about the behavioral component of social competence in real social interactions.

YOUTH VOCABULARY IN GERMAN AND ITS HISTORICAL DEVELOPMENT

Shukhratkhon Imjaminova*; Saidova Durdona**

ABSTRACT

„Ich hör` es gerne, when the Jugend plappert:
Das Neue klingt. Das Alte klappert “
(W. J. Geothe)

The study of the vocabulary of German-speaking youth is one of the new and little-studied topics in linguistics. In particular, its semantic and morphological-syntactic analysis is found only in the works of a small number of scholars, and it is not uncommon to compare and analyze it with other languages, especially with unrelated languages. That is why the semantic and syntactic analysis of the lexicon of young people in German, its comparative study with a non-related language - Uzbek, and its consideration in the Uzbek language determine the main content of this article.

KEYWORDS: *Consideration, Vocabulary, Semantic, Morphological, Lexicon.*

INTRODUCTION

The main purpose is to analyze words related to youth lexicon in German on the basis of the dictionary "Wörterbuch der 2012 Jugendsprache" published by PONS, to determine the morphological and semantic features of these words and to draw the necessary conclusions.

As noted above, the scientific study of youth vocabulary in linguistics is a little-studied field. The scientific novelty of this article is determined by the fact that the semantic features of the lexicon of young people in German, especially its syntactic features, are rarely studied not only in our country but also in German-speaking countries.

Although the analysis of the concept of youth lexicon in German is a relatively new direction in linguistics, a number of scholars in these studies have come to the attention of the general scientific community. Among the scholars who have made significant contributions to the study

of youth lexicon in the German language are J.K. The case of Cailleux is an example. But of the scholars named above, only J.K. Androutsopulus is a scholar who has syntactically studied the lexicon of youth. H. Henne, E. Neuland, P. Shlobinski, and H. Ehman, on the other hand, were more concerned with the general analysis of youth vocabulary, and with the scientific question of whether there is a special vocabulary in linguistics called "youth vocabulary."

The article is based on the Wörterbuch der 2012 Jugendsprache published in 2012 by PONS and the Wörterbuch der Jugendsprache 2014 published in 2013.

It should be noted that in the study of modern German it is not difficult to understand the diversity of lexical vocabulary. The lexical analysis of the language shows that this diversity is the product of a long process of development of the German vocabulary. Recent lexical scientific analysis of the German language has made it possible to differentiate and group words according to their origin, structure, usage, and semantics. Word stratification is the differentiation of layers according to the layers that develop the language and are considered to be the multifaceted communication of a language society. Every language is diverse not only territorially but also socially and functionally. Here we can see different versions of the language. According to linguist A. Meillet, a language has its own vocabulary, which is used by autonomous social groups within the society that uses that language.

A similar situation can be found in modern German. Some words in German sound different in one area depending on personal or everyday relationships, professional relationships, and in another. Such words appear when the different conditions and requirements of social communication are matched by an instrument of understanding.

The heterogeneity of natural language (diversity within a natural language) is an important area of sociolinguistic research. At the heart of sociolinguistics is the description and explanation of language variants, their dynamic as well as interchangeable relationships. The basis of the lexical layers of the German language lies primarily in the territorial, social and functional boundaries and differences in language variants. The division of the German language into groups according to these differences was first developed by R. Gross. Although its stratification is not fully consistent today, some groups do agree with the currently recognized stratification.

The national language (die Nationalsprache), which serves as a communication for the whole nation, is a form of reflection of national culture. The term also includes literary language (die Schriftsprache) and regional dialects (territorialeDialekte).

In Germanism, the most appropriate form of language is ad called abiy language. The emergence of this term is associated with a long historical process. Before the norms of oral speech were strengthened, the norms of written speech, which included the norms of writing and traditions, emerged. In the early 1960s, Schriftsprache and Literatursprache were described by researchers as different concepts. Today, however, the two terms are used interchangeably to describe literary language. Literary language is the normative form of oral and written speech in the German national language accepted throughout Germany.

The second most important form of language that is part of a common language form with its clear boundaries and characteristics is the spoken language (Umgangsprache). Spoken language transcends local boundaries. Spoken language is a language between literary language and dialects. Functionally, it is a means of communication in oral language. Spoken language is often

used in private conversations, in informal situations. According to their closeness to literary language, colloquial language is divided into 3 main groups:

1. Conversational language close to literary language

2. A colloquial language that covers a large area

3. Spoken language spoken in a small area

It should be noted that these groups are divided according to the degree of accumulation of literary language features. A colloquial language that covers a small area contains a large number of dialects, and this group is a colloquial language that is close to the dialect (Halbmundart).

According to the sociolinguistic classification of language forms, words in German differ as follows:

• Words and phrases that are understandable to everyone in the language community and are used in general language communication

• Words and phrases used in a particular field or social group

• Territorially limited words and phrases

The characteristics and alternating relationships of these groups serve as the object of sociolinguistic research.

Many terms are used in Germanistics to analyze the vocabulary of the German language from a socio-professional point of view. For example: Sondersprachen, Sonderwortschatz, Sonderlexik and others. Vocabulary develops on the basis of common professions, common interests, common lifestyles, conditions in different groups of language society. Sondersprache are words and phrases that go beyond the literary language of social groups in a language society, but are understandable to members of that group. This language is limited by different characteristics of different professions and group members. When talking about the vocabulary of a particular language, it is not the individual violation of the norms of literary language that is taken into account, but the linguistic characteristics of the whole group of speakers. These distinctive features form the basis of sociolinguistic research. The aspect of the specificity of language features in relation to socio-political groups and strata is called sociolect.

In German studies, special languages are traditionally divided into 3 groups:

• Standessprache (Jargonlar)

• Berufssprachen (Kasb-korga oid til)

• Fachsprachen (Terms)

It should be noted that there are a number of theoretical differences in the division of a particular language into groups. According to the theory of the German linguist F. Kluge, special languages are divided into 2 major groups:

• According to the distribution of the language in different places - Standessprachen

• Used by different professions - Berufssprachen (This language includes the language of traders, the language of farmers, the language of the military, the language of hunters, etc.)

According to Kluge, even the language of poets, men and women differs in the structure of this language. According to him, the word "language" (Sprache) used in the term "special language"

is also not used in the full sense. Because this language is not a language with a grammatical, phonetic, lexical system, but only based on the vocabulary of special layers. Thus, according to linguist F. Klugen, social lexicon is unique to oral speech. In written speech, these words are used in a stylistic way.

There is no single correct answer to this question in Russian linguistics. Russian linguist EM Galkina-Fedoruk distinguishes between groups of aristocrats, merchants and citizens in this language. A. Efimov divides them into groups of aristocrats, believers, merchants and bureaucrats. There are many such classifications. This topic is always full of controversy.

Well-known linguists L.R. Sinder and T.V. Stroyeva divide special language into 2 major groups: Occupational language (Berufslexik) and jargons. According to them, the language of the profession is called professionalism. Professionalisms are words and phrases that occur in the process of the general influence of people in different spheres of society and often express scientific terms. In this case, the scientific and technical term It is a bit difficult to tell the difference between ingenuity and professionalism. It should be noted that the terms differ from professionalism in their neutral stylistic coloring. The descriptiveness of professionalism in professional lexicon is higher than in terms. The terms are mostly international in nature. M .: Voltmeter, operation, mathematics, philology. At the heart of most of the terms are Latin and Greek. The difference between professionalism and terminology is that professionalism, like terms, is not defined by a clear rule. Professionalism is a word that is not clearly defined, but belongs to science. Jargon, on the other hand, is a language between people belonging to a certain group, consisting of words and phrases that represent different concepts of the profession of the group of people they serve, so such words and phrases can be understood only by this group of people. Will be.

From the above data, it is clear that the socio-professional classification of language is one of the unresolved problems in linguistics. However, in our view, the views of Russian linguists MD Stepanova and II Chernyasheva on the classification of special languages (Sonderlexik) are much more accurate. They divided the special language into 2 groups:

• Scientific language (Fachsprachen- Fachwortschätze)

• Language specific to certain groups (gruppenspezifischeWortschätze)

According to them, scientific language includes terms, professional words and jargons, as well as professionalism. A language that specializes in groups is a special vocabulary that belongs to different social groups in a particular language community. The linguistic features of social groups are manifested primarily in words that specialize in that group.

The concept of youth lexicon (Jugendsprache) began to be used in German linguistics in the 1930s. Youth vocabulary is an important and integral part of group vocabulary. Language is constantly evolving and constantly under new influences. Sometimes under such influences new words are accepted, in some words the meaning changes. This happens especially quickly in the vocabulary of young people. The topic of youth language (Jugendsprache) has always been one of the most interesting and controversial topics.

Youth vocabulary consists of words or phrases that have been used or are being used at different times by different groups of young people of a certain age. It should be noted that such a lexicon can be observed all over the world. This vocabulary is usually used among peers, and new words spread faster than usual.

In sociolinguistic research, the vocabulary of young people is studied in several directions, in each aspect. Nowadays, youth lexicon is considered as a new phenomenon of modern language. However, it is not well known that in ancient times, young people had their own language styles and that there were significant differences between the language used by adults and young people living in those times. In the historical study of youth vocabulary, we come across ancient dictionaries and documents on the language of historical students, known as the first forms of modern youth language in Germany. These documents, dictionaries, and correspondence reflect the language style, lifestyle, level of education, and social status and dignity of the youth of that time. By the XVI-XVII centuries, the socio-political status of young people, especially students, increased significantly. During the Reformation, students gained much freedom. This has led to the development of youth vocabulary. Student lexicon (Burschensprache), which appeared in the XVIII-XIX centuries, is important in the study of youth vocabulary. Since the middle of the 19th century, special dictionaries have been created for this language. Early literary sources on the language include Zacharies'sRennomist (1744), Kortum'sJobsiade (1784), Lauhard's Correspondence (1792), Wedekind's Diaries (1824), and Goethe's Dichtung und Wahrheit (1811). we can quote. The most famous example of medieval student writing today belongs to Robert Salmasius:

„O Zeiten! O Sitten!

How many people in the Feldgeschrei district of Purschen go to Gasse and aus den Fenster? ... ”(Salmasius, 1974, p. 67)

In a call that begins with these words, Salmasius called on students to be free and free. The words are the preface to Salmasius's Handlexikon der unter den Herren Purschen auf Universitäten gebräuchlichsten Kunstwörter. The dictionary was compiled in 1749 and has since been used by historical German students iStudentenlexikon (1781), Augustin's Idiotikon der Burschensprache (1795) and Academicajuventus. Die deutschenStudentennachSprache und Sitte ”(1781). A serious study of student vocabulary began in the late 19th century with Myers's HallischerStudentensprache (1894) and Klugen'sDeutscherStudentensprache (1895). When studying the language of historical German students, it becomes clear that the vocabulary of young people cannot develop autonomously from a single social vacuum. The vocabulary of young people is simultaneously reflected in the linguistic heterogeneity of socio-cultural life, as well as in the influence of cultural and historical events.

It should be noted that the lexicon of historical students, as well as the lexicon of modern youth, was greatly influenced by different words. In the lexicon of historical German students, there are a large number of words, primarily from Greek and Latin. It should be noted that in this case, we can encounter not only the words alone, but also in some cases, mixed with the German language. The combination of German and Latin in the lexicon of historical students is called "makkoronischLatein". Examples of such words are "gassatumgehen", "Konkneipant", "Lappalien", "Sammelsurium", "verlustieren" used at that time. There was also a mixture of German and Greek at that time. Examples of such phenomena are "burschikos", "studikos", "Illiade", "luftikus", "Musen", "schwulibus". Such confusing words often served as irony or word play, and in some cases as a style of language adapted to a new group. Another aspect of the language of Old German students is that this lexicon in some places also served as the criminal language of the time (das Rotwelsch). Some of these words are still used today. For example: blechen, pumpen, foppen, schofel, mogeln, stibitzen and others.

By the seventeenth and eighteenth centuries, as in many European countries, the influence of the French language could be traced back to the lexicon of German youth. This period is called the "a-la-mode Zeit" and, along with all other spheres, the influence of the French language on the German lexicon is observed. During this period, under the influence of the French language, special lexicons and styles specific to specific groups of students called the petits maîtres and the Rennomiste also emerged. It is noteworthy that at this time there were significant differences in the vocabulary of students at the universities of Göttingen, Leipzig and Jena. More detailed information about such differences can be found in Friedrich Laukhard Christian's memoirs on regional differences in his 1792 student lexicon.

By the beginning of the twentieth century, there was an interest in the vocabulary of schoolchildren. The first serious research on student vocabulary (Schüler-oderPennalersprache) was conducted by linguists Rudolf Eilenberg (1910) and Friso Melzer (1928). Melzer identifies three major topics in student language:

- School (for example, Streberleiche, Klatschmemme)

- Sports and games (egKullewatzen, Halla)

- People in the community, words related to others (for example, Na, du altesReff! Jux, Fez machen, doppelknorke)

The study of student vocabulary lasted until the 60s and 70s of the last century. The contributions of Heinz and Marianna Küpper, in particular, are significant in this study. They included words and phrases related to youth vocabulary (Jugenddeutsch 1970) in one section of their German dictionary. According to them, students' vocabulary covers the following areas:

• Education and school: Arschpauker, Poofstunden

• Education: pauken, fuschen, spicken, ponzen

• Authority: (a topic widely discussed in the 70s) Autoritetsbonze, Mecker-Monster.

• Holidays and leisure: Party, Heulbojen

• Words related to groups that are socially and stratified categories of youth: dufterKumpel, Strebelleiche

• Words under the influence of English: stress, homework, actionmäßig

It should be noted that the term student vocabulary is not used today. Only this sweat minni can be found only in some classifications of youth lexicon.

In short, the concept of youth lexicon is not only relevant to modern life today, but also a historical process. There is no clear definition of the concept of youth lexicon, and there is a lot of controversy about it.

ABSTRACT

Phraseological synonyms may be partially consistent with each other in terms of lexical content. An important role in the formation of phraseological synonyms is played by the formation of an analogy based on lexical-phraseological attraction, that is, the semantic conflict of language units based on any common features, during which their mutual semantic effect occurs.By studying the semantic features of phraseological units, it was found that they have the phenomena of phraseological polysemy, phraseological synonymy, phraseological antonymy, phraseological homonymy and paronymy. Phraseological synonyms are phraseologies that are semantically identical or very similar. They may differ from each other in terms of secondary semantic features, methodological features, syntactic structure (valence, etc.).

KEYWORDS: *Linguistics (German), Phraseological Synonymy, Semantic Microsystems, Phraseological Units.*

INTRODUCTION

Phraseological synonymy - Synonymy is one of the semantic microsystems between language units and is also quite common among phraseological units. To call two phraseological units synonymous, they must have the same meaning. We can't talk about synonymy without it. The same meaning cannot be understood as equal meaning. Each synonym has its own semantic edge, in addition to the general meaning core for that synonym slot. Synonyms usually differ in

one or more respects, one of which may be a difference in meaning. For example, to be destroyed by the earth - to be destroyed by the earth, to be thrown into the sky - the ashes were blown into the sky. These synonyms differ in the edge of meaning, regardless of other character traits: in the latter the meaning is somewhat stronger.

In defining phraseological synonyms, the underlying other image is also taken into account. For example, a mouth, a snout, a pinch are synonymous phraseological units, based on various images: the body of speech, a part of a head of grapes, the amount to be pinched.

Synonymy is a phenomenon defined by meaning. The same meaning is defined between phrase and phrase in monosemantic phraseological units. If a polysemantic phraseological unit is involved in a synonymous relationship, it must be derived from a specific phraseological meaning, not from a phraseological unit. Because each phraseological meaning may or may not have its own synonym.

Synonyms are language units that have a common meaning (denotative meaning is the same) and additional (connotative) meaning (features that express expressive, methodological and other relations). The phenomenon of linguistic units having the same meaning is called synonymy. This phenomenon is divided into lexical (lexical) synonymy, phraseological synonymy, syntactic synonymy, etc., depending on what language units are specific. A group of words that are mutually synonymous is called a series of synonyms. A series of synonyms consists of two or more words. For example, a series of synonyms for a spring consists of two words, and a series of synonyms for a face consists of many words. Polysemous words can be one or more synonyms with a specific meaning or meanings. For example, the word finish is one of the words to finish, to finish, to finish ... in one sense, and to do, to lose, to destroy in another sense.

K.Proost argues that phraseological synonyms are more common than lexical synonyms. In particular, he points out that various “figurative” expressions cannot be considered synonymous, at least not completely synonymous. In our view, the idea that there are no absolute synonyms in phraseological expressions is closer to the truth. In general, language never recognizes uniformity.

Indeed, "the number of phraseologically synonymous synonyms is very small." For example, - writes U. Tursunov and other linguists, - although the general content for the phrases "raised nose" and "swollen mouth" is "arrogance", the embodiment of this common meaning is different. However, the meaning of the phrase "swollen nose" is stronger than the phrase "the nose is raised."

Synonymous phrases should be distinguished from variants of a phrase by paying attention to the word components of the phrases. There is no doubt that phrases that do not contain a single word in the lexical structure are synonymous. For example, "to be angry" means: jm kocht das Blut in den Adern - to boil blood from anger, sich grün und blau ärgern - to blush with anger, jm platzt der Kragen - magic wütend sein, da geht jm der Hut hoch - top hair , die Galle läuft jm über - magic wütend sein, eine Wut im Bauch haben, (die) Geduld verlieren - keine Geduld mehr haben, einen Bauch voll Zorn (oder Wut) haben - magic wütend sein, auf der Palme sein - jemanden it Wut bring, versetzen, in Harnisch geraten- zornig werden, aus der Haut fahren– ausrasten, die Beherrschung verlieren, in die Luft gehen - exp there is no doubt that expressions with different lexical content, such as lodieren, are synonymous. But it should be borne in mind that a component in the lexical structure of synonymous expressions may be represented by the same word. However, the components of a phrase must not be synonymous. Otherwise it is equal

to the variants of a phrase. For example::jmdm. eins / etwasaufsDachgeben, jmdm. eins / etwas auf den Deckelgeben, jmdm. eins / etwas auf den Hut geben, jmdm. eins / etwas auf die Nasegeben or to meet suddenly, the following combinations of meanings can also be a clear example of this: jm in die Armelaufen –zufälligtreffen, jmüber den Weglaufen - to get out of someone's way, jmvor die Füßelaufen - to get out of someone's way, jemandemvor die Füßelaufen - to get out of someone's foot. Although the word "laufen" in this synonymous series is repeated, they are not variants, because the words "Arme, Weg, Füße" in the phrases are not synonymous with each other.

There are the following types of phraseological synonyms:

1. Ideographic synonyms. Ideographic synonyms are distinguished by semantic coloring. According to the compatibility of archetypes, that is, common semantics, they differ from different semantics, either individually or in several metaphors. For example: einen Affen [sitzen] haben; betrunken sein - einen kleinen Aal haben –leicht betrunken sein. Ideographic synonyms are semantic synonyms in which the lexical meaning of the words they contain differs from each other in terms of the volume of expression. It is necessary to pay attention to the synonym of love and affection, which is assimilated from Arabic into Uzbek. These words are synonymous in the lexical sense of “passion given to a person from the heart”. But the lexical meanings of these two words differ according to the size of the expression. The experience in the lexical sense of the word love is only for yor and Allah, and the experience in the lexical sense of the word love is also for yor, Allah, parents, children and relatives. This shows that the words love and affection are ideographic synonyms.

2. Methodological synonyms. Methodological synonyms represent the same concept, but differ in methodological connection. Understanding the methodological connection of this or that phraseology helps the system of phraseological signs. Phraseological units can be biblical (literary), neutral (general literary), verbal (informal), rude (vulgar). Sometimes a single phraseological unit is the source of synonymy, if a single word belonging to another style is replaced by a synonym, then two phraseological units that are considered stylistic synonyms are formed. For example: die Augen schließen, ins Graß beißen (salopp), derb –sterben.

3. Methodological and ideographic synonyms. Both pure semantic and stylistic differences are observed in these types of synonyms. Phraseological synonyms are coherent phraseologies belonging to the same grammatical class, with lexically partially compatible or completely incompatible, having common and differential semantic components, stylistically different or mutually compatible relationships. Methodological synonyms have a certain lexical meaning that is exactly the same in terms of core semantics, and the words that occur with it differ from each other according to their belonging to a particular social stratum.

4. The fact that semantic synonyms are composed of two or more, or even about ten synonymous words, creates synonymous series. There are also semantic lines in language richness. From these semantic rows, synonymous rows differ in the mutual semantic relationship of the words. This view of semantic synonyms is called speech synonyms in some literatures due to the fact that they have a mutual semantic difference with which speech is specific. In the same literature, a series of beautiful, beautiful, heartwarming synonyms are given and analyzed. The first is shown to belong to general lexicon, the second to poetic speech, and the third to colloquial speech. The semantic difference of the words in this synonymous series is also appropriate for the criterion given to methodological synonyms. Organically stressed synonyms have a certain

lexical meaning that is exactly the same in terms of core semantics, and is specific to which of these core semantics is emphasized. More precisely, the lexical meaning of words in a synonymous series is characterized by the fact that the core semaphore is the same, but the emphasis on the semaphores in this core semaphore is different.

For example, the lexical meaning of the words in the synonymous series to look, to look, to see, that is, the semantics consists of the semantics of "looking at an object", "lowering", "perceiving". The lexical meanings of words also convey connotative meanings in communication. But this core semantics of the lexeme semema will consist of these semantics. The verb to look has a 1-sema in the lexical sense, the 2-sema in the verb to look, the 3-sema in the verb to see, the word is brought to the center of attention in the core semantics of the lexical meaning. In other words, in the verb to look, the focus is on the object;

Is significant. The verb to look differs from the others in the inactivity of the language, the verb to see is permeable. Nevertheless, from a semantic point of view, the above difference determines their appearance. Because synonymy is determined by the lexical meaning of the words.

Based on the above classification, V.A. Of the 1,140 phraseological expressions cited in Caslandz's Handbook of Phraseological Synonymy in German, 336 are grouped into synonymous groups and are of particular importance for linguistic analysis with 76 practical directions. It provides a brief overview of the general content of the synonymous group, as well as the definition of semantic relationships, characteristics, and the scope of application of each member of the synonymous group.

Ideographic synonyms

• „Will you like Abteil lying next to him or her?

- Das ist mir Jacke wie Hose “.

Es ist jedem Jacke wie Hose (anyway, it doesn't matter)

• „Ob er sich ärgert oder nicht, das ist mir ganz schnuppe“

Es ist jedem alles schnuppe (no one cares)

Methodological synonyms

• „Frag doch meinen Bruder. Er kennt sich in Finanzdingen hervorragend aus. Er ist mit allen Wassern gewaschen “

Mit allen Wassern gewaschen sein (pixini quilt, pixi twisted)

• „Die Burschen sind mit allen Salben geschmiert. Man bekommt sie schwer zu fassen “

Mit allen Salben geschmiert sein (licking the snake's fat)

Methodological and ideographic synonyms

• „Er hat ja manchmal ganz gute Ideen, wenn er nur sich nicht so aufblasen wollte wie ein Frosch“.

Sich aufblasen wie ein Frosch (eingebildet, hochmütig sein)

• „Seit Fritz seine Leutnantsuniform bekommen hat, kennt man ihn überhaupt nicht wieder. Er stolziert einher wie Hahn auf dem Mist. “

Einherstolzieren wie der Hahn auf dem Mist (eingebildet, stolz sein).

• Einer der berühmtesten Schlager aller Zeiten ist der von Marlene Dietrich: „Ich bin von Kopf bis Fuß auf Liebe eingestellt“

Von Kopf bis Fuß (from head to toe)

• “Er ist Gentleman vom Scheitel bis zur Sohle” Vom Scheitel bis zur Sohle (from head to toe).

The considered examples of phraseological synonyms reveal how rich and colorful the German language is, the peculiarity of German culture. the phenomenon of synonymy in phraseology contributes to the diversity of stable compounds, while the application of any phraseology helps to describe the situation differently, to find the best linguistic solution in the processes of comprehension and translation. In addition, some phraseological synonyms also differ from each other in ideographic terms, i.e. with their specific nuances. For example, compare the following units that mean "drunk":

EinenAffen (sitzen) haben (can't stand)

Einen (kleinen) Aal haben (a little shirakayf).

Phraseological synonyms also differ according to their use in certain territories. "Arm sein wieeineKirchenmaus", which means "very poor" in all parts of Germany, is replaced by the phrase "poor as a church mouse" in the Swabian dialect "Dear haut nix as Laus, und dio send crank (diesind crank) phraseology is used. The Berlin dialect uses the phrase "Das istmirJackewie Hose" meaning "I don't care", while the Viennese dialect uses the synonyms "Das istmirWurst" and "Das istmir Pomade".

The same is true of Uzbek dialects. The authors of the textbook "Modern Uzbek literary language" write: In the dialects of Tashkent region, phraseological synonyms are used, such as to play the mountain - to announce something to everyone, to close the oven in the heat - to press the iron in the heat.

Group phraseologies with different structures are synonymous due to similarity of meaning. For example, there are various phraseologies in German to express the meaning of "out of place": Einen Vogel haben - nichtganzbeiVerstand sein; There are no Tassen in Schrankhaben - no ganzbeiVerstand sein.

Consider the synonymous line used to express the meaning of ‘doing useless work’: HolznachdemWaldetragen - carrying firewood into the woods; Wasser imSiebetragen - to carry water in a sieve; Wasser miteinemSiebeschöpfen - sichumsonstanstrengen. In addition, a number of phraseological synonyms may also be historically distinguished by the fact that they are assimilated from other languages, but such phenomena are not uncommon.

Most linguists work on the basis of AV Kunin's definition of phraseology: Phraseological units are important for general stability, in addition, word components are legally related to each other, which is characterized by a structural semantic model.

Phraseological synonyms also play an important role in the field of phraseology. Phraseologisms with the help of phraseological synonyms it is possible to apply them in different contexts according to different stylistic styles, while it is possible to express any idea using. The components in the structure of phraseologies are often figurative. At the heart of phraseology, which consists of word components with a figurative meaning, its original meaning is hidden.

There are also synonyms that can have the same meaning in different languages and become equivalent to each other. "The exact equivalent is a phraseology that has the same meaning in different languages," said Borisova in her scientific views. Such phraseologies may exist in different languages. However, the translation of their synonyms is not always consistent.

For example: von Kopf bis Fuss, von Scheitel bis zur Sohle, von Wirbel bis zur Zehe. Among these phraseological synonyms, only von Kopf bis Fuss has the same meaning when translated into Uzbek as in German, because in Uzbek there is a phrase "from head to toe" and can be equivalent to this phrase. It is possible to translate other phraseologies from German into our native language as "detailed, complete, complete" without the exact equivalents that can be translated into Uzbek. Also, if we want to translate them as expressions, such expressions as from head to toe, from thread to needle, from hair to tail are synonymous phraseological units that are equally suitable for translating these phraseologies.

Meaningful phraseological combinations in German, such as Grosse Augenmachen, den Mundaufsperren, are also synonyms that are completely consistent in context and differ from most other phraseologies in that they have their own equivalent in Uzbek. The equivalent of these phrases in our native language is the phraseology "open your eyes wide", "open your mouth".

For example, the palm of the soul (i) and the palm of the heart (i) are synonymous phrases: one lexical component is represented by the same word, and the other lexical component is represented by another word, and they are not mutually synonymous. Clicking on the kungl (i) and clicking on the heart (i) are equivalent to variants of a reciprocal expression. Because a lexicon | the component is the same word itself, and the second lexical component is mutually synonymous; (These options are based on the replacement of synonymous word-components).

Synonymy is an event defined by meaning. The same meaning is defined between a phrase and a phrase in monosemantic phraseological units. Because each phraseological meaning may or may not have a synonym in its own right. For example, the phrase monosemantic confession is synonymous in the first sense with the phrase polysemantic (triple) neck (i). This three-meaning phrase is not synonymous with the second meaning, but the third meaning is synonymous with the first meaning of the phrase zimma (si) (the next phrase is three-meaning and not synonymous with the other two meanings).

The amount of phrases that combine into a single synonymous series also varies: most synonymous series have two synonyms; the three synonymous rows are also quite numerous; there is also a series that combines four phrases. For example, the phrase tazir (i) is eaten, and so on.

In defining phraseological synonyms, different images are taken into account on their basis.

Phraseological synonyms play an important role in the field of phraseology. While it is possible to express any idea using phraseology, with the help of phraseological synonyms it is possible to apply them in different contexts according to different stylistic styles.

Thus, phraseologisms, as a unit of language that is common in language, expressing an idea broadly, figuratively, sharply, comprehensively, are composed according to the structure of all time. According to their morphological properties, the components of phraseologies belong to different word families and exist in the correct syntactic relationship with each other.

According to the structure of phraseology in linguistics, it is divided into two main groups:

1. Phraseologisms that are structurally equivalent to speech

2. Phraseologisms that are structurally equivalent to a phrase

These phraseologies differ in their lexical-grammatical features. But according to their stylistic function in speech, they perform essentially the same function. Phraseologisms that are equivalent to a sentence also have different meanings and semantic aspects and serve to express reality in existence.

In German linguistics, phraseologies can range from two components to ten components and more. Phraseologisms that are equivalent to a sentence are mostly multi-component.

By studying the semantic features of phraseological units, it was found that they have the phenomena of phraseological polysemy, phraseological synonymy, phraseological antonymy, phraseological homonymy and paronymy.

Phraseological synonyms are phraseologies that are semantically identical or very similar. They are secondary meaning properties methodological features may differ from each other syntactically according to their structure (valence, etc.).

To call two phrases synonymous, they must mean exactly the same thing. But it is wrong to understand this one meaning as equal meaning. Each synonym, in addition to the general meaning for this synonym slot, also has its own semantic edge, methodological and functional features.

Phraseological synonyms play an important role in the field of phraseology. While it is possible to express any idea using phraseology, with the help of phraseological synonyms it is possible to apply them in different contexts according to different stylistic styles.

In conclusion, it should be noted that the study of synonymous phenomena serves as a basis for a broader understanding of German phraseology and a broader understanding of their mutual semantic-stylistic relationship. Synonymous relationships are characteristic of phraseological expressions. It is precisely because of these semantic relations that we can form the spiritual paradigms of phraseological units, as well as their semantic interpretation, expressing their methodological peculiarities.

TEACHING TECHNOLOGY OF HANDS CRAFTS SUBJECT INTO ENGLISH LANGUAGE

Madina Bo'ronovna Akobirova*; Mirjon Sharopov Nurxono'g'li**

Bukhara State University, UZBEKISTAN

ABSTRACT

This article discusses the specifics of improving the quality of teaching the subject "Folk Crafts" in English using innovative and non-traditional technologies in the specialty "Technological Education" in higher education institutions, students in both science and English. to arouse their interest in the language, to develop students' ability to think and speak independently and fluently in English, as well as to develop their creative abilities.

KEYWORDS: *specialization, science, technology, activity, purpose, problem, student, foreign language, educational technology, independent, educational institutions, motivation, cultural heritage, folk crafts, ancient monuments.*

INTRODUCTION

I like to use technology in class, first of all, because students always find it much more motivating than any other activities. Partly due to the fact that in our public schools and in higher education even computers are still considered as something in a way "luxurious", nothing to be said of the internet, Wi-Fi, laptops, tablets, etc. However, despite all the advantages and being of primary superiority the technology itself does not automatically effect the process of learning. Schools undoubtedly avoid using technology because they lack the sufficient budget spending it entails. On the opposite, the government spends the considerable amount of money on teacher training; consequently, most of us have received varied intensity education in the field of using technology in the classroom. Language teacher, teacher trainer, technology trainer and educational technology consultant, talks about the impact teaching- and learning-technology has had on students and teachers.

Does technology make language learning easier? Although advances in technology and improved accessibility have improved the level of resource available to many classrooms, it has not made the act of learning a language easier. Students are, however, given access to almost infinite learning materials, which compliments their efforts in the classroom. Indeed, technology helps students think more critically. It encourages them to question what they are learning with access to a "wider range of opinion".

As well as the learning opportunities it offers, it also affords collaborative learning to improve creativity and evaluation. Truly integrating technology into English language courses. Tech should not run alongside lesson plans but compliment or even enhance them.

Motivation in studying hand crafts and arts in English. Technology plays a massive part in day to day life for so many of us. It makes sense that it is incorporated into learning and studying. Technology fascinates us and engages us. Encouraging students to take part is arguably the most important part of any lesson plan, incorporating technology – especially creatively – could be the element that transforms a dull lesson into a captivating one.

As so much of learning comes from practice outside of the classroom, motivating students with innovative ideas is also important. If a student is interested in what is being taught, they are far more likely to seek more information on their own. Learning materials are now so much more than simply reading from a textbook, extending now to tablets and smart phones. Learners can continue to teach themselves beyond the classroom, in real life situations.

So providing the lesson hands craft and art in English in real life situations is one of the best of technologies.The students can get great deal of information about theme by hearing, sensing and watching. For instance there is various type of the art culture in Uzbekistan. As the best way to teach these folk arts and crafts to students in English, to show them the cultural heritage of our people and to provide them with complete information in English increases the importance of science. Another motivating part of the English language course for students is to take the theoretical and practical lessons of the subject to the historical monuments of our country and the shops of folk crafts and to communicate directly with foreign guests. I think this kind of teaching technology will encourage students to learn English and our cultural heritage quickly and effectively. Practice makes perfect the students. Below are some examples of creations created by folk artisans of our country.

The art culture of Uzbekistan is based on all the best achievements of the Uzbek people throughout history. National arts and crafts occupy a prominent place in the cultural heritage of Uzbekistan. In the middle Ages, Uzbek arts developed in the context of the art of tracery, which had become prevalent.

The extensive national crafts and arts include engraving on copper, wood, and plaster-based material; jeweler's arts; carpet making; ceramics; ornamental embroidery, gold embroidery; decorative currying of tanned leather; silk spinning; making of decorative braids; inlaid works on musical instruments; painting on papier-mache; creation of decorative boxes for local tobacco; baskets, cradles, chests, and many other types. Throughout the centuries, the national Uzbek crafts and arts have both risen and declined, but the handing down of artistic traditions from one generation to the next has never stopped.

Folk art. Since the ancient times, Uzbekistan has been a home to extremely talented people who carefully preserve and pass on the unique traditions of folk art from generation to generation. These traditions do not allow us to forget about our roots, our amazing culture and ethnicity.

Uzbek national arts and crafts have long enjoyed a well-deserved fame. The historical conditions, in which the culture of the Uzbek people developed, predetermined applied art a special role. For many centuries the people created its technical and artistic traditions. Applied art is genre, the main feature of which is a deep connection of artistic creativity and material needs. The organic fusion of the artistic and practically necessary creates an indissoluble unity of

ideologically- artistic and socially-practical functions. The work of applied art is distinguished by expediency and unity of forms and design. The social nature of decorative art is its collectivity; art is the heritage of many ages. It performs a series of successive layers, the most ancient of which reflect the original culture of the people deeply imprinted in its art. The works of all the genres of this art are designated by the variety of artistic traditions brought by the peoples who made up the Uzbek nation.

Kinds of national arts and crafts of Uzbekistan are the original and exclusive creativity of folk artists and artisans who pass their skills from seniors to juniors. By investing a piece of the soul in each thing, they for centuries have created unique examples of products: whether it is a house utensil or a home decoration, a unique fabric for a festive dress or special utensils.

The creations of Fergana, Samarkand, Bukhara, Khiva and other masters have long been famous far beyond their homeland. Their works continue to arouse interest among lovers of beauty from all over the world. Various schools of embroidered suzane and ceramics, Uzbek pictures on leather, skullcaps of various kinds and purposes, Uzbek national knives-pichoks, silk and wool carpets, souvenirs of papier-mache, wooden items, Uzbek jewelry, wonderful works from iron, which for many centuries are being created by the hands of local craftsmen and masters make up the unique exotic of Uzbekistan.

On the territory of Uzbekistan, the original centers and schools of folk art crafts were formed. Each terrain has its own direction. Namangan Chust is widely known for its skullcaps and knives; Rishtan is famous for cerulean ceramics; ancient Margilan attracts tourists with iridescent khan-atlas and sacred Bukhara is well-known for gold embroidery.

In the villages of Uba (Bukhara region), Nurata (Navoi region), as well as in Denau (Surkhandarya region), skilled craftsmen make clay toys. Fantastic animals, birds, horses, sheep, constitute the main stock of images of clay toys. The most popular toys are whistles. And how not to say about Uzbek national dolls! Masters literally create real images, investing in each of them the soul, strength and warmth.

Past and present of Uzbekistan art and craft. Decorative and applied arts of Uzbekistan developed from century to century, leaving in the inheritance unique products of famous and nameless masters, striking with richness of artistic imagination and consummation of forms.

Unique examples of folk architecture, fine and decorative arts of the Uzbeks go back to the era of primitive. Closely connected with material and spiritual culture, examples of the ancestors of the Uzbeks and other Central Asian peoples, ranging from primitive painting and sculpture to art monuments of the antiquity and the Middle Ages, testify to their high endowments and rich spirituality. Having common ethnogenetic roots, these peoples for centuries have been creating in the region a variety of tools, weapons of war, richly decorated clothes and jewelry, homes and household utensils that meet their aesthetic needs. The study of ethnocultural traditions of the Central Asian ethnoses showed that they have not only a common historical destiny and common ethnographic origins. The basis for creating samples of the national culture and art of each people, including Uzbeks, was shared ground. This is evidenced by the rich monuments of the ancient era, created by ancient Khorezmians, Bactrians, Sogdians, Margilans, and subsequently Turkic-speaking ethnic groups.

The Uzbek folk fine and applied arts in all its forms have long attracted the attention of boffins to the profound democracy of the ideas embedded in it, reflecting the way of life, culture and worldview of the people themselves. For many centuries, the people have created unique monuments in all genres of folklore, fine and decorative art, putting in them their understanding of beauty, their desire for beauty. Developing and improving, Uzbek folk art has brought to the present day its best traditions, which could not but have a huge influence on the development of professional art. But nowadays, we are witnessing the renewal of all kinds of folk art, which today perceive ethno-cultural traditions much more widely and many times than before. At the same time, the arts and crafts of the Uzbeks, like the art of any other people, absorbed the characteristics of the culture of different epochs and various ethnic groups that have merged into the ethnogenesis of the Uzbek people, accumulating not only certain elements of other cultures, but also those or other significant events.

Being an integral part of folk creation, decorative and applied art of Uzbekistan, which has found its vivid expression in architecture, household utensils, clothes and ornaments, helps to reveal not only the general and particular features of life and culture, but also to determine their ethnogenetic origins.

Although the types of folk art that have survived to us have retained their techniques and style, they have undergone some changes in form and content. Instead of colorful images of people, animals and other creatures, scenes of separate events with the establishment of the rule of Islam, various geometric and floral ornaments appear. On ordinary household objects and ornaments, magnificent architectural structures in accordance with Muslim dogmatics, images of living beings almost completely disappear.

Thus, in the richest ethno-cultural heritage of the Uzbek people, a special place is occupied by a multifaceted and highly decorative arts and crafts. It finds a vivid expression of artistic thought and closely interwoven with it artistic creativity, the originality of the national mentality of the Uzbeks.

Having a craft and art classes outside with art masters, and even practicing how to make or using them, and explain it in English it would be attractive and extremely unforgettable lessons for students.

Practice makes perfect the students. For those students who are less familiar with the technology used in the classroom, using it in lessons provides much-needed practice. Technology isn't set to take a back seat in learning, nor in life in general. So students value the opportunity to familiarize themselves with using different devices in different ways, not just in developing language skills.

Obviously, technology is not to be used in place of effective teaching, but interactive tasks, text-to-speech conversion and online tutorials allow students to translate on-the-go. Independent learning and studying, with access to relevant teaching material for support. Students are given the courage to try books beyond their current reading level, for example.

Providing context for the English language. For our students, practising there specialty English outside of a lesson offers **exposure to English culture**, and so context around what they are learning. Opportunities to practice English in a real-life setting are far more readily available.

Advancements in technology have propelled the education sector in the lastfew decades. As the name suggests, the high tech approach to learning utilizesdifferent technology to aid students in their classroom learning. Many educatorsuse computers and tablets in the classroom, and others may use the internet toassign homework. The internet is also beneficial in a classroom setting as itprovides unlimited resources. Teachers may also use the internet in order toconnect their students with people from around the world.

A teaching method of hand craft comprises the principles and methods used by teachers to enable student learning. These strategies are determined partly on subject matter to be taught and partly by the nature of the learner. For a particular teaching method of specialty in English has to be appropriate and efficient it has to be in relation with the characteristic of the learner and the type of learning it is supposed to bring about. Suggestions are there to design and selection of teaching methods must take into account not only the nature of the subject matter but also how students learn. In today's school the trend is that it encourages a lot of creativity. It is a known

fact that human advancement comes through reasoning. This reason and original thought enhances creativity.

COMPARATIVE ANALYSIS OF THE PROFITABILITY RATIOS OF SBI, ICICI AND HDFC BANKS IN THE INDIA

Dr. Nandkumar Baburao Bodhgire*

*Assistant Professor in Economics,
SRTM University, Nanded,
Maharashtra, INDIA

ABSTRACT

The present study analyzed selected profitability ratios of SBI, ICICI and HDFC banks in India for the Period of Jan 2016 to Jan 2020. Selected profitability ratios consists Earning per Ratio (EPS), Dividend Per Ratio (DPR), Operating Profit Margin (OPM), Net Profit Margin (NPM), Return on Equity (RoE), Cost to Income (CtI), Net Interest Margin (NIM) for the study. For measuring profit of selected banks, ANOVA techniques is used.

KEYWORDS: *Earning Per Ratio(EPS), Dividend Per Ratio (DPR), Operating Profit Margin (OPM), Net Profit Margin (NPM), Return On Equity (Roe), Cost To Income (Cti), Net Interest Margin (NIM).*

INTRODUCTION

Rohit (2014) evaluated financial performance in terms of liquidity ratios, activity ratios, leverage ratios, profitability ratios and market value ratios of Axis bank, ICICI bank, Federal bank and HDFC bank for the period of 2011-2014 in India. It is observed that federal bank has the ideal current ratio of 2:1 which is better than rest of the four banks. By and large, federal bank has best price earnings ratio and asset turnover ratio among other bank. Chakraborty (2017) assessed how efficiently the carry on their business operations and showed variations among four selected banks in terms of assets, interest spread and net worth ratio. Chandan and Rajput (2002) evaluated banks profitability through multiple regression technique taking independent factors. The study also found that progress of public sector is decreased rather than foreign and private banks. Therefore, public sector banks need to focus on non performing assets and technology up gradation. Sangmi (2002) analyzed profitability of ten banks which are categorized in two group that indicate best performance banks and poor performing banks. The study revealed higher operating cost which can be improved by using technology as well as increasing productivity per employee. Kumari (2003) research study focused on progress of public and private sector bank in terms of deposit mobilization, expansion of branch, employment generation is consistently increased. It is shown that private sector banks have higher growth as compared to public sector

banks. Therefore, adopting innovation modern technological changes and proper recovery of loans is correct solution to improve for public sector banks themselves.

Qamar (2003) All types of banks found differences in terms of total assets, share capital efficiency ratio and business per employees.Arora and Verma (2005) studied that removing subjectivity in banking sector, important steps are taken like prudential norms income recognition provisioning. Researcher also suggested that impact of directed investments on profitability reserve requirements must be decreased. Reddy and Rao (2005) this study endeavored to find factors related to financial sector reforms in terms of banking industry in India. New competitive environment impacted on share of public sector banks. The researcher also suggested that public sector banks have to adopt customer oriented banking practices with new technologies. Arora and Kaur (2006) this study analyzed financial performance of banks based on Non-performing assets to Net advances, business per employee, Net profitability ratio, return on asset. The researcher suggested that banks have to take efforts to reduce the non performing assets for enhancing financial viability of public sector banks. Shukla (2009) this study analysed that banks have made many changes for their development and profitability. They have to focus on high operating cost and activities for attracting customer. Banking and financial policies and security are the important component in which Indian banks have to do improvement. Uppal (2010) the study concluded that Mobile banking services is one of the crucial part among e-channels for banking sector. This service is widely used in foreign banks and new private banks rather than old private and public banks. Mobile banking services has impacted positively on net profit and business per employees of foreign and new private banks. Prasad and Ravinder (2011) This study is analysed profitability of SBI, PNB, ICICI and HDFC bank for the period 2005 to 2010 in terms of Operating Profit Margin, Gross Profit Margin, Net Profit Margin, Earning Per Share, Return on Equity, Return on assets, Prices Earnings Ratio and Dividend payout Ratio. It is concluded that earning per share and dividend payout ratio is better for State Bank of India while Operating Profit Margin and Return on Equity is better for Panjab National Bank. The study found that HDFC bank outperformed in terms of gross profit margin, net profit margin, return on assets and price earnings ratio The objectives of this Study are: To find comparative analysis of profitability ratios of SBI, ICICI, and HDFC banks and to verify the year-wise differences in selected key ratio's of selected banks in India. Subsequently, proposed the hypothesis: There is no significant difference among selected banks in terms of profitability ratios Vs. There is significant difference among selected banks in terms of profitability ratios

METHODOLOGY:

Basic definitions and terminology

- EPS (Earning Per Ratio): This financial indicator measures the profitability of company. This is calculated by dividing the company's net income with its total number of outstanding shares.
- DPR (Dividend Per Ratio): A company issues a particular amount as dividend for every ordinary share outstanding is called Dividend Per Share.
- OPM (Operating Profit Margin): Operating margin measures how much profit a company makes on a dollar of sales after paying on variable costs of production such as wages and raw materials, but before paying interest or tax.

- NPM (Net Profit Margin): This measures net income in percentage form which helps investors assess company's management is getting enough profit from its sales including operating and overhead costs are being contained.
- RoE (Return on Equity): This measures corporation's profitability in relation to stockholders' equity.
- CI (Cost to Income): This ratio indicates profitability of banks and also depicts the efficiency at which the bank is being run. The lower ratio represents more profitability and vice versa.
- NIM (Net Interest Margin): is a measurement comparing the net interest income a financial firm generates from credit products like loans and mortgages, with the outgoing interest it pays holders of savings accounts and certificates o deposits (CDs).

Sample: The present study is descriptive and analytical in nature. The sample consists of three banks that are SBI, ICICI and HDFC.

Time Period: Jan 2016 to Jan 2020

Source of Data: The data on key variables was compiled from www.iba.org.in

Statistical Tools: The Statistical tools that have been used in this study include Mean, Standard Deviation and Two way analysis of Variance (ANOVA).

RESULT AND DISCUSSION:

In this section the analysis of the data is represented in the graphical form (Fig. 1-7) and further, inferential analysis is performed and the results were stored in the Table 1-7.

TABLE 1 ANOVA FOR EARNING PER RATIO

Source of Variance	SS	df	MS	F	P-value	F-crit
Rows	52.5702	4	13.142	0.093	0.9818	3.8378
Columns	8552.95	2	4276.47	30.359	0.0001	4.4589
Error	1126.88	8	140.86			
Total						

Table 1 explained that calculated value (0.093) is less than critical value (3.8378) at the 5% level of significance in the table no. 1, the null hypothesis (H01) is accepted, and hence, it can be concluded that there is no significant year wise difference from March 2016 to March 2019 in terms of Earning per Ratio of Selected Banks in India. This is statistically insignificant. Similarly, as calculated value (30.359) is greater than critical value (4.4589) at the 5% level of significance in the same table, the null hypothesis (H01) is rejected, hence, it can be concluded that there is significant difference among SBI, ICICI and HDFC banks in terms of Earning per ratio.

TABLE 2 ANOVA FOR DIVIDEND PER RATIO

Source of Variance	SS	df	MS	F	P-value	F-crit
Rows	49.210	4	12.302	1.5211	0.2839	3.837
Columns	253.445	2	126.72	15.668	0.0017	4.458
Error	64.701	8	8.0876			

Total	367.357	14

Table 2 explained that calculated value (1.5211) is less than critical value (3.8378) at the 5% level of significance in the table no. 1, the null hypothesis (H01) is accepted, and hence, it can be concluded that there is no significant year wise difference from March 2016 to March 2019 in terms of Dividend per ratio of Selected Banks in India. This is statistically insignificant. Similarly, as calculated value (15.668) is greater than critical value (4.458) at the 5% level of significance in the same table, the null hypothesis (H01) is rejected, hence, it can be concluded that there is significant difference among SBI, ICICI and HDFC banks in terms of Dividend per ratio.

TABLE 3 ANOVA FOR OPERATING PROFIT MARGIN

Source of Variance	SS	df	MS	F	P-value	F-crit
Rows	88.61049	4	22.1526	2.548	0.1211	3.8378
Columns	1092.417	2	546.208	62.843	1.282	4.458
Error	69.5329	8	8.6916			
Total						

Table 3 explained that calculated value (2.548) is less than critical value (3.8378) at the 5% level of significance in the table no. 1, the null hypothesis (H01) is accepted, and hence, it can be concluded that there is no significant year wise difference from March 2016 to March 2019 in terms of Operating Profit Margin of Selected Banks in India. Similarly, as calculated value (62.843) is greater than critical value (4.458) at the 5% level of significance in the same table, the null hypothesis (H01) is rejected, hence, it can be concluded that there is significant difference among SBI, ICICI and HDFC banks in terms of Operating Profit Margin. These are statistically insignificant.

TABLE 4 ANOVA FOR NET PROFIT MARGIN

Source of Variance	SS	df	MS	F	P-value	F-crit
Rows	88.7078	4	22.17695	1.716695456	0.23876105	3.837853355

Error	24.334947	8	3.041868333			
Total	213.67473	14				

Table 6 explained that calculated value (6.323) is greater than critical value (3.8378) at the 5% level of significance in the table no. 1, the null hypothesis (H01) is rejected, and hence, it can be concluded that there is significant year wise difference from March 2016 to March 2019 in terms of Cost to Income of Selected Banks in India. This is statistically significant. Similarly, as calculated value (18.4747) is greater than critical value (4.458) at the 5% level of significance in the same table, the null hypothesis (H01) is rejected, hence, it can be concluded that there is significant difference among SBI, ICICI and HDFC banks in terms of Cost to Income. This is statistically significant

TABLE 7 ANOVA FOR NET INTEREST MARGIN

Source of	SS	df	MS	F	P-value	F-crit

Variance						
Rows	0.107627	4	0.026906667	2.454614566	0.13019275	3.837853355
Columns	5.49184	2	2.74592	250.5020526	6.10204E-0	4.458970108
Error	0.087693	8	0.010961667			
Total	5.68716	14				

Table 7 explained that calculated value (2.454) is less than critical value (3.8378) at the 5% level of significance in the table no. 1, the null hypothesis (H01) is accepted, and hence, it can be concluded that there is no significant year wise difference from March 2016 to March 2019 in terms of Net Interest Margin of Selected Banks in India. This is statistically significant. Similarly, as calculated value (250.50) is greater than critical value (4.458) at the 5% level of significance in the same table, the null hypothesis (H01) is rejected, hence, it can be concluded that there is significant difference among SBI, ICICI and HDFC banks in terms of Net Interest Margin. This is statistically significant.

CONCLUSION

The Study is mainly focused on financial indicators which reflected profitability of selected banks from public and private sector. State Bank of India from public sector and ICICI along with HDFC banks from private sector. The study concluded HDFC is one of the best performer bank in comparison with SBI and ICICI in terms of Selected Profitability Ratio. ICICI and SBI bank have almost equal proportion of EPS, DPR, OPM, Cost to Income and Net Interest Margin. Barring Net Interest Margin and Cost to Income, All other financial ratios decreased in Jan 2018 and increased in Jan 2020. Earning Per Ratio and Dividend Per Ratio drastically reduced during Jan 2019-Jan 2020.

Limitations of the Study and Scope for Further Research:

The Study has considered one public sector and two private sector banks which could be taken more banks from public, private and foreign banks also. Duration of data and variables can be different sector-wise analysis.

THE ROLE OF MONOOPERATORS IN THE FORMATION OF SYNTAXIC DERIVATION OF ADDITIONAL PRESENTATIONS OF TIME IN FRENCH

Boboev Ulash Nematovich*

*Senior Lecturer, (PhD),
Department of French Language and Literature,
Samarkand State Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

This article deals with the question of syntactic derivation of a subordinate clause of time a morphological element «when», «like». The subordinate clause of time in French among adverbial clauses is one of the largest, since more than twenty union elements are used in its syntactic formation. Here, mono-operator derivation types are characterized mainly by the morphological elements quand, comme, lorsque. The subordinate clauses of the time with simple allied elements are traditionally distinguished in French linguistics as a separate type [4,582]. At the same time, as we can see, the principles of classification of the derivational and traditional syntax coincide.

KEYWORDS: *Syntax, Conclusion, Morphology, Element, Monooperator, Transformation, Formation.*

INTRODUCTION

First of all, it should be mentioned that the French language belongs to one of the most thoroughly and comprehensively studied languages in the world. The question of the syntactic derivation of a sentence on the material of the French language is not a completely new phenomenon, since this theory has already been applied in some works. So, for example, in the "Foundations of Structural Syntax" L. Tenier describes the ways and means of forming the syntactic structure of both simple and complex sentences. In this case, junction and translation are considered relevant for expanding the structure of a simple sentence, the main markers of which are unit and translative. Whereas in the formation of a complex sentence, especially a complex one, the translation of the second stage is important, that is, secondary translation, where various types of translative and junctive can be used, such as adjunctive, disjunctive, antinomic, causal, investigative, etc. [1 , 335]

In “Структуральнойграмматике” by J. Dubois, along with the description of lexical derivation, one can notice brilliant thoughts about the formation of syntactic structures by using various transformational techniques. He thoroughly explained the syntactic functions of pronouns and pronouns / substitutes /, which are used within the syntactic structure of a complex sentence. [2, 170]

When it comes to the formation of syntactic structures, one cannot fail to mention the name of B. Potier, who has fundamental works on the theoretical issues of modern syntactic science. B. Potier created his original theory about the French utterance, about the methods and techniques of its structural formation. [3,376]

In all the above-mentioned works, along with simple sentences, we are talking to a certain extent about complex sentences, in particular about its structural formation.

The subordinate clause of time in French among adverbial clauses is one of the largest, since more than twenty union elements are used in its syntactic formation. Here, mono-operator derivation types are characterized mainly by the morphological elements quand, comme, lorsque.

The subordinate clauses of the time with simple allied elements are traditionally distinguished in French linguistics as a separate type [4,582]. At the same time, as we can see, the principles of classification of the derivational and traditional syntax coincide, i.e. in both cases, the shape of the union element is taken into account. In other words, the operators of this derivational type of time subordinate clause are indivisible into separate constituent parts: Quandellefutpartie, je courus chez le docteur (Maupassant. Contesetnouvelles, [5,295] 'When she left, I ran to the doctor.

First, let us pay attention to the transformation process, the final result of which is the syntactic derivation of the given subordinate clause:

Elle futpartie; (après cela) je courus chez le docteur 'She left; then I ran to the doctor.

The transformation process first of all requires a transpositional change, with the help of which one of a given independent sentence is functionally transposed into a non-independent one. In this case, the choice is made according to the time plans of independent proposals. Therefore, in this case, the first of them is transposed into the non-self-dependent under the pressure of the quand element introduced from the outside, which simultaneously performs the function of a subordinate union. After that, the transformation process already begins, within the framework of which a complex sentence is formed.

As already mentioned, at the level of a complex sentence, transformational and derivational processes are equivalent. In this regard, the transposer, which transposes an independent sentence into a non-independent one, also functions as a syntactic derivation operator. As for the time plan of a given subordinate clause of time, in this case it expresses a difference in timing, because the action of the subordinate clause is performed earlier than the actions of the main clause. In addition, in mono-operator subordinate clauses with the quand operator, the simultaneous execution of the actions of their constituent parts is often observed:

Op te les rendraquandtusortirasClavel. La saison des loups, [6,276] they will be returned to you when you go out.

From the above sentence it is clear that the syntactic position of the constituent parts of the mono-operator subordinate clause of the time in quand is not immanent. Therefore, the operator

can be positioned both at the beginning of a sentence and between two operands. Despite this, he is the sole master of the entire derivational process, because his removal from the sentence will completely destroy the content and syntactic structure of the derivative. However, this does not mean that the quand operator is irreplaceable. It can be replaced by appropriate operators if they are both semantically and syntactically synonymous with it.

At the same time, the syntactic positions of the directly constituent parts of a complex sentence remain unchanged. Compare: Des qu'ellefutpartie ... ↔ Quandellefutpartie ... On te les rendracomme ... ↔On te les rendraquand ….

As the above examples show, the paradigm of derivative-forming elements in this case can include both simple and complex, i.e. duplicate operators, the choice of which is made by the informant in accordance with the prevailing situation.

In the terminology of L. Tenier in French, the precedence and adherence of one action to another is expressed in a double translational. In such cases, the broadcast of the first stage is superimposed on the broadcast of the second stage. The marker of the second stage translation is the preposition / eg après 'after', avant 'before', / depending on the general meaning of the sentence [7,572]

A similar opinion, i.e. the opinion on the use of après que for expressing the following of an action, avant que for expressing precedence, is also observed by the French linguists R.L. Wagner and J. Pinschon [8,582]. However, as the analysis of the factual material shows, similar functions can be performed with the help of a mono-operator. Wed: On finissait le café, quand le brigadier de gendarmerie parut sur le seuil Maupassant. Contesetnouvelles, [9,291]. They were finishing their coffee when the gendarmerie brigadier appeared at the doorstep '↔ Après que le brigadier de gendarmerie parut sur le seuil, ↔ Avant qu'onfinissait le café, ….

Of course, the use of each individual operator has its own purposes and purposes. But, despite this, the possibility of creating invariant forms of derivatives with the help of other operators in accordance with the internal laws of natural language is not excluded.

In the process of syntactic derivation of mono-operator subordinate clauses in quand, a syntactic relation of almost independent sentences is established. Therefore, the entire burden of derivational operations is experienced here by the derivative-forming element. In other words, the derivation operator is the only support in the syntactic design of a complex complex of this type.

In advance, i.e. before the creation of a derivational process, within the framework of independent sentences, such functions of any words are inconceivable. They will only be possible during the derivation process. As GS Shchur notes: “In language, unlike chess, we, as a rule, do not know in advance either the possible“ moves ”of individual elements, much less the possible results of their interaction and further combinatorics [10,49].

TERMINATION OF THE EMPLOYMENT CONTRACT DUE TO CHANGES IN THE NUMBER OF EMPLOYEES (STAFF TABLE) AND THE NATURE OF THE WORK

M.R. Toshov*

*Independent Researcher,
Academy of the Prosecutor General's Office of the Republic of UZBEKISTAN

ABSTRACT

In this article, based on the analysis of national legislation and scientific literature,the author discusses the termination of the employment contract on the initiative of the employer due to changes in the number of employees, in the staff table and in the nature of the work.In particular, the author highlightsthe differences between the concepts of "number of employees" and "staff table", the essence of the concept of "change in the nature of work", issues that should be paid attention to terminate an employment contract due to staff reductions. In addition, the author suggests proposals to improve the legislation in this area.

KEYWORDS: *"Change In The Number Of Employees", "Change In The Staff Table", "Change In The Nature Of Work", "Changes In Technology, Organization Of Production And Labor", "Reduction In The Volume Of Work".*

INTRODUCTION

The termination of labor relations due to the changes in technology, production and organization of labor, the reduction of workload are characterized by their economic and administrative-legal nature as one of the specific problematic grounds for termination of the employment contract.

This basis is specified in Paragraph 1 of the second part of Article 100 of the Labor Code of the Republic of Uzbekistan as "changes in technology, organization of production and labor, reduction of the volume of work or termination of the enterprise, which led to a change in the number of employees (staff) or the nature of work". "

Analyzing this paragraph in parts, we can see that there are 4 grounds for termination of an employment contract at the initiative of the employer:

1. Change in the number of employees;

2. Change in the staff number;

3. Changes in the nature of work;

4. Liquidation of the enterprise.

If we analyze the above norm in the Uzbek and Russian texts of the Labor Code of the Republic of Uzbekistan, we can see a discrepancy between them. The Russian text states that "changes in technology, organization of production and labor, reduction of production volumes, reduced changes in the number of employees (staff) or change in the nature of work, or liquidation of the enterprise."

Accordingly, in order to eliminate the incompatibility between these two languages it is proposed to edit the text in Uzbek as “change in the number of employees (staff) or the nature of work as a result of changes in technology, production and labor organization, reduced workload”. This ensures that this norm is stated in a concise, clear, simple and fluent language, excluding different interpretations.

Another common misunderstanding that arises in practice is that no normative legal document clarifies the concept of "number of employees (staff)". There is no clear distinction between these two concepts (“number of employees” and “staff”). This creates certain difficulties in the proper execution of documents in this regard, when it is necessary to terminate the employment contract on one of these grounds.

In fact, Article 107 of the Labor Code of the Republic of Uzbekistan stipulates that the employer's order must contain the grounds for termination of the employment contract in full accordance with the definition of the relevant articles of the Code or other normative acts providing additional grounds for termination of the employment contract.

Correspondingly, there is a necessity to clearly state in the order that the employment contract was terminated on the basis of “change in the number of employees” or “change in the number staff”. It should be highlighted that it is difficult to find an answer to this question, both in theory and in practice. At the same time, as a rule, these concepts are used inseparably in court decisions, scientific and practical comments.

To understand the difference between staff reductions and employees number reductions, we focus on the etymology of the words “number” and “staff”. The term "number" represents a certain quantity (a tool used to calculate the number, quantity, number of things) and "staff" is a set of information about positions, their number, salary and other information.

This means, a reduction in the number of employees means a reduction in one or more units provided for a particular staff (s), and the staff is retained (with at least 1 staff unit). When the employees staff is reduced, any position in the staffing table (for example, deputy chief accountant), or a particular component network is completely excluded from the list of staff with all staff.

Accordingly, these concepts were analyzed and the author's definition was developed: "number of employees" is the number (quantity) of positions in a particular state unit, provided by the staffing table of the enterprise, and "staff" is a set of information about a particular position, its number, salary and other information provided for in the staffing table of the enterprise.

Another peculiarity of termination of an employment contract on this basis is that according to which the termination of the employment relationship can be applied to a wide group of employees (and this does not depend on their will). Here, non-performance or improper

performance of work duties is not a major aspect; an employment relationship can also be terminated with employees who have been performing their job duties conscientiously and with quality for many years.

With regard to the "change in the nature of work", according to the scientist M.Yu.Gasanov, "... the former Labor Code used the term "reduction in the number of employees or staff" (Paragraph 1 of Article 41). It did not fully reflect the essence of the event under consideration. It should be noted that this rules was used both in the past and now, not only in cases where the number of employees has been reduced or the number of positions provided for in the staff list has been reduced, but also termination of the employment contract on this basis is also allowed when the enterprise needs employees of other professions (for example, change of its type of work or automation of production), or (due to the fact that previous employees did not have the knowledge and skills necessary to perform this work) when it is impossible to maintain an employment relationship with them.

In the above circumstances and similar cases, the number of employees of the enterprise may decrease or increase. For this reason, the Labor Code uses the term "change in the number of employees (staff) or the nature of work[1]".

According to Russian scientist N.V.Demidov, the legislation of Uzbekistan does not clarify the meaning of the concept of "change in the nature of work" and does not specify the types of such changes and the exact criteria for justifying dismissal on that basis.

It is up to the court to answer any questions that may arise in this regard (depending on the circumstances of each individual case). "This approach is explained by the fact that the dismissal has been adopted from the legal regulation system adopted in the United States. This tendency in the legislation of Uzbekistan is evident in some other cases as well"[2].

That is, if the nature of the work assigned to this position changes (even if a certain position in the enterprise is not reduced by a staff unit), due to the fact that previous employees did not have the knowledge and skills necessary to perform this work, the employer has the right to terminate the employment contract when it is impossible to maintain an employment relationship with them.

It should be emphasized that the clarification of the concept of "change in the nature of work" in labor law plays an important role in law enforcement practice, because, in practice, it is hard to find cases of termination of an employment contract on the basis of a "change in the nature of work." The lack of clarity in this concept may lead to the termination of the employment contract by the introduction of another staff unit for the same position (and due to the reduction of the employee staff unit) by reducing a certain staff unit.

Accordingly, it is expedient to clarify this concept in the Labor Code of the Republic of Uzbekistan in the sense that "a change in the nature of work means a change in the terms of employment conditioned by the employment contract for a position in a particular state unit".

In general, the current legislation is additional guarantee related to the termination of contract based on paragraph 1 second part of Article 100 of the Labor Code of the Republic of Uzbekistan.

In particular, the difference between the labor legislation of the Republic of Uzbekistan and the legislation of a number of other foreign countries (Article 81, Part 1, Paragraph 2 of the Labor

Code of the Russian Federation, Article 40 of the Labor Code of Ukraine) is that to terminate an employment contract on this basis in our national legislation is legal only if the number of employees (staff) or the nature of the work changes as a result of changes in technology, production and labor organization or reduction of workload.

Because changes in technology, production and labor organization, or a reduction in the volume of work do not always lead to a change in the number of employees (staff) or the nature of the work. Employment contract may not be terminated in accordance with paragraph 1 of the second part of Article 100 of the Labor Code of the Republic of Uzbekistan, for example, when there are changes in technology, production and organization of labor, or when the volume of work is reduced, retaining the previous number of employees (staff) or the previous feature of the job (only if certain working conditions change).

For instance, the Labor Code of Georgia, which has similar approach (Article 47) states that "economic circumstances, technological or organizational changes that determine the need to reduce the workforce" are grounds for termination of an employment contract[3].

Termination of the employment contract on this basis is considered legal only if main reason for the change in the number of employees (staff) or the nature of the work is changes in technology, production and organization of labor, or a reduction in the volume of work.

Definitely, each of the examples above must be supported by evidence. For example, introduction of production mode, which involves doing a certain amount of work in a manufacturing plant with fewer employees than the number of employees available, may be evidence of changes in the organization of production and labor. In this example, the approval of a new staffing schedule as a result of a change in this production schedule is evidence of a change in staffing.

The employer must have the relevant documents proving that the scope of work actually performed in the enterprise is less than before, in cases where the reduction in workload is the main reason for the change in the number of employees (staff) or the nature of the work. For example, this may include in service organizations with a lack of contracts with customers over a period of time, such as a much lower number of orders.

It should be emphasized that if there are other vacancies for this category of employees in a particular organization, pursuant to paragraph 1 of the the second part of Article 100 of the Labor Code of the Republic of Uzbekistan, termination of an employment contract may not be effected at the expense of existing employees. In such cases, it is legal to make staff reductions by removing a vacancy from the staffing table.

For instance, if there are 3 specialist positions in the organization and 2 of them are actually working, first of all, termination of the employment contract with the employee without removing the vacancy from the staffing table is a violation of the employee's labor rights. If dismissed in such case, s/he must be restored to his former job.

It is also necessary to pay special attention to the scope of employees whose activities are related to this change or reduction in the termination of the employment contract due to changes in technology, production and organization of labor or reduction of workload.

If the changes in technology, production and organization of labor, or a reduction in the volume of work are to be applied to a specific group of employees, it would be legal to terminate the

employment contract with these particular employees. For example, in an organization, it is unreasonable to dismiss support staff in the process of terminating an employment relationship in connection with a reduction in the workload of management staff.

It should be highlighted that even when a particular organization is reorganized, there may arise a need to terminate the employment contract with a number of employees. At such times, upon completion of the reorganization, the employment contract with them shall be carried out in compliance with all rules and guarantees, regardless of the grounds for termination. Noted that,in reorganization (for example, when two organizations are merged into a single organization) an increase in the number of employees relative to the workload may occur, and it is illegal to terminate an employment contract with these employees (grounds: reduction in the number of employees (staff) or the volume of work that led to a change in the nature of work) before the reorganization process is completed.

As mentioned above, this basis for dismissal is also enshrined in the labor legislation of foreign countries. In most national legal systems, the reduction of the number of employees or the number of employees is the subject of regulation of labor legislation and is regulated by specially developed norms.

According to Article 40 of the Labor Code of Ukraine, and the Labor Code of USSR (1971), the grounds for dismissal in connection with the termination of the enterprise and the reduction of the number of employees or staff were combined[4].

The Law of the Republic of Estonia (December 17, 2008) "On the employment contract" (Article 89), which deals with the termination of employment by the employer for economic reasons, according to it the employer may terminate the employment contract in an emergency if it is not possible to continue the employment relationship on the agreed terms due to the reduction of the workload, reorganization of the work or other termination (reduction) of the work[5].

In accordance with the Labor Law of the Republic of Latvia (June 20, 2001) (Article 101), “reduction of the number of employees” is listed as one of the grounds for termination of an employment contract at the initiative of the employer. And according to Article 104 of the same Law, "reduction of the number of employees is the termination of the employment contract for reasons not related to the behavior or qualifications of the employee, but sufficiently justified by the need to carry out urgent economic, organizational, technological or similar measures”[6].

In the countries where the Anglo-Saxon legal family operates, the regulation of dismissals in connection with the reduction of the number of employees or staff is of a dual nature. On the one hand, there is the practice of applying the general principles of contract law in terminating an employment contract on this basis (i.e., direct use of civil law structures), on the other hand, the social significance of the consequences of mass dismissal has led to some standards in labor law.

The first concept is practiced in the United States. According to the historical traditions, the economic management of the employer is recognized. And this is applies to dismissal due to a reduction in the number of states or employees. Only dismissal for violation of rights and guarantees established by law, and discriminatory reasons is prohibited. At the same time, the meaning of the concept of "discrimination" is not absolutely defined, and will be assessed by the court on a case-by-case basis.

Pursuant to the 1996 Labor Rights Act (ERA 1996) in the United Kingdom, "reduction" is one of the legal grounds for dismissal. According to the law (Article 139), the literal translation of

dismissal in connection with the reduction of the number of staff or employees is an integral part of the concept of "redundancy" (which means, "no need/redundancy"). This concept also includes dismissal in the event of termination of the organization (ERA 1996, p. 139 (1) (a)) and transfer of employees to another job (ERA 1996, p. 139 (1) (c)). Selection criteria for dismissed employees should be applied equally and without exception (ERA 1996, p. 105 (1) (b)). Article 100 of the ERA 1996 defines an employee's knowledge and skills as selection criteria, but the list of indicators to be compared is not detailed or limited.

Nonetheless, this law limits the number of employees who can receive compensation for dismissal. This list includes unskilled workers (article135), those with less than two years of work experience (article 155), workers who refused alternative vacancies (article141 (2) s), foreign nationals (article 159), and the Overseas government employment) (article 160) employees, as well as individuals who missed the six-month claim period (article 164).

Editorial Board

Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of ithenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
