ABSTRACT

This article is about the preparation of a well for operation and refers to all operations that are carried out from the moment the top of the formation is opened a bit until the well is put into operation. These works can be divided into the following stages: opening the reservoir, causing the well, and perforating and developing the well. Thus, well preparation for operation is the final stage of the good construction process.

KEYWORDS: *Reservoir Opening, Well Casing, Perforation, Well Completion.*
